Note: Ergot alkaloids produce blue fluorescence which on overnight contact with formamide and air changes to yellow fluorescence. Paper must be completely dry and std 2 spot clearly visible. In humid weather it may be necessary to dry developed paper 2–3 days in well ventilated hood.

**38.049 Homatropine in Tablets—Official Final Action**

See **38.002**.

**Ipecac Alkaloids (15)—Official Final Action**

(Applicable to sirup, fluidextract, and powd prepn)

(Caution: See **51.011**, **51.052**, **51.054**, **51.056**, and **51.062**.)

**38.050****Principle**

Principal ipecac alkaloids, phenolic cephaeline and its Me ether emetine, constitute over 90% of total alkaloids of ipecac. They occur in ratios varying from 3:1 to 1:3 in the several species and constitute total of ca 2–3% of wt of root. Minor alkaloids, mainly psychotrine, o-methyl psychotrine, and emetamine, are closely related structurally to emetine, differing principally by presence of addnl double bonds, which affect their UV spectra.

Four-column system isolates emetine and cephaeline from ipecac sirup, fluidext, and powd root. Prepn of sample itself, made alk. with  $\text{NaHCO}_3$ , constitutes immobile phase in first column. Ether eluate of this column, contg total alkaloids together with other ether extractives from sample, is passed thru phosphate buffer column 1V with respect to chloride ion. Alkaloids are retained in column while nonalkaloidal extractives are partly washed thru column. Major purification is achieved in next step in which mixt. of  $\text{CHCl}_3$  and ether selectively removes emetine and cephaeline (with perhaps trace amts of other alkaloids) from phosphate column, and carries them onto pH 4.0 column, on which they are retained. Purification achieved in this step is 2-fold: (1) Phosphate buffer column retains alkaloids (presumably emetamine and psychotrine) which absorb in UV region between 380 and 300 nm, in which region emetine and cephaeline do not absorb. (Retained alkaloids can be recovered in part by elution with  $\text{CHCl}_3$ , and remainder with ether soln of di(ethylhexyl)phosphoric acid, which is very effective counter-ion for extn of alkaloids.) (2) Eluate from phosphate column carries thru pH 4.0 column material which absorbs in UV. This material, if not removed, would accompany emetine and thus give spuriously high assay values. This is especially significant in the case of ipecac sirup, which contains large amt of substance, provisionally identified as 5-hydroxymethyl-2-furaldehyde, spectrum of which closely resembles that of emetine.

Emetine and cephaeline are sepd in final partition step. Combined alkaloids are eluted from pH 4.0 column after raising pH to  $>8$  *in situ* with soln of  $\text{Et}_3\text{N}$  in mixt. of ether and isooctane. This eluate continues thru 0.5N NaOH column which retains phenolic alkaloid cephaeline. Finally, cephaeline is eluted directly with  $\text{CHCl}_3$  from NaOH column, with no adjustment of pH.

Respective eluates are extd with 0.5N  $\text{H}_2\text{SO}_4$  and  $A$  of acid solns are measured at 283 nm. Since only emetine std is available, and inasmuch as cephaeline and its Me ether emetine have essentially same molar  $A$ , this std is used for both emetine and cephaeline.

### 38.051

#### Reagents

(a) *Triethylamine*.—Must pass following test: Transfer 3.0 mL to 50 mL graduate or vol. flask contg 15 mL 4N  $\text{H}_2\text{SO}_4$ , dil. to vol. with 0.5N  $\text{H}_2\text{SO}_4$ , and mix. Scan spectrum from 350 to 240 nm against 0.5N  $\text{H}_2\text{SO}_4$  as blank. If  $A$  at ca 250 nm is  $>0.040$ , purify as in 38.006(a).

(b) *Dimethyl sulfoxide (DMSO)*.—Spectral grade (Fisher Scientific Co., or equiv.).

(c) *Ethyl ether*.—Peroxide-free. See Definitions of Terms and Explanatory Notes, item 3.

(d) *Phosphate buffer*.—Mix 3 vols 0.5M  $\text{KH}_2\text{PO}_4$  with 1 vol. 0.5M  $\text{K}_2\text{HPO}_4$ , and adjust to pH  $6.0 \pm 0.05$ . Dissolve 7.46 g KCl/100 mL mixt.

(e) *Citrate buffer*.—Mix equal vols 0.5M citric acid and 0.5M Na citrate, and adjust to pH  $4.0 \pm 0.05$ .

(f) *Emetine std soln*.—Accurately weigh ca 3 mg emetine.  $2\text{HCl} \cdot 3\text{H}_2\text{O}$  and dissolve in 50 mL 0.5N  $\text{H}_2\text{SO}_4$  (1 mg emetine.  $2\text{HCl} \cdot 3\text{H}_2\text{O}$  is equiv. to 0.79 mg emetine base). If alkaloid content of std is not known, det. as in 38.002.

### 38.052

#### Preparation of Sample

(a) *Sirup*.—Pipet 10 mL  $\text{H}_2\text{O}$  into 25 mL vol. flask. Using 20 mL pipet, add sirup to vol., avoiding wetting neck of flask above graduation mark, and mix. Use 4.0 mL for prepn of Column I.

(b) *Fluidextract*.—Pipet 5 mL fluidext into 50 mL vol. flask, dil. to vol. with  $\text{H}_2\text{O}$ , and mix. Pipet 2 mL into 150 mL beaker. Evap. almost to dryness on steam bath, using gentle stream of air to

remove alcohol. Add 3 mL  $\text{H}_2\text{O}$  and ca 1 g  $\text{NaHCO}_3$ , and mix. Proceed as in 38.053(a), beginning "... add 6 g diat. earth, and mix."

(c) *Powdered ipecac*.—Accurately weigh ca 200 mg powd ipecac (60 mesh) in 150 mL beaker, add 2 mL DMSO, and mix thoroly with flattened stirring rod to assure complete wetting of powder. Let stand ca 30 min. Add 2 mL  $\text{H}_2\text{O}$  and ca 1 g  $\text{NaHCO}_3$ , and mix. Proceed as in 38.053(a), beginning "... add 6 g diat. earth, and mix."

### 38.053

#### Preparation of Columns

Transfer specified soln to 150 mL beaker, add specified wt acid-washed diat. earth, and mix until uniform fluffy mixt. is obtained.

(a) *Column I*.—To 4.0 mL sample soln, add 1 g  $\text{NaHCO}_3$ , mix, add 6 g diat. earth, and mix. Dry-wash beaker with 1 g diat. earth and add to column. (Since emetine is unstable in alk. soln and in  $\text{CHCl}_3$ , proceed with detn without delay.)

(b) *Column II*.—Add 3 g diat. earth to 2 mL phosphate buffer and mix.

(c) *Column III*.—Add 3 g diat. earth to 2 mL citrate buffer and mix.

(d) *Column IV*.—Add 3 g diat. earth to 2 mL 0.5N NaOH and mix.

Quant. transfer mixts to sep. chromatgc tubes, 37.002. Tamp each to uniform mass and top with glass wool pad.

### 38.054

#### Determination

(Use  $\text{H}_2\text{O}$ -satd solvs thruout. Rinse tips of columns with ether before discarding columns and when changing solvs. Remove metal leashes from separators and vol. flasks.)

Mount Column II under Column I. Pass three 50 mL portions ether thru columns. Discard eluate and Column I. Mount Column III below Column II. Pass three 50 mL portions  $\text{CHCl}_3$ -ether (3+1) thru columns. Let each portion pass thru completely before next addn. Continue elution without delay. Discard eluate and Column II. Pass 25 mL  $\text{CHCl}_3$ -ether (3+1) thru Column III. Discard eluate. Pass 25 mL ether-isooctane (1+1) thru Column III. Discard eluate. Prewash Column IV with 20 mL 2%  $\text{Et}_3\text{N}$  in ether-isooctane (1+1) and discard eluate. Mount Column IV below Column III. Collect emetine eluate in 125 mL separator contg 15 mL 4N  $\text{H}_2\text{SO}_4$  by passing 10 mL 20%  $\text{Et}_3\text{N}$  in ether-isooctane (1+1), followed by three 10 mL portions 2%  $\text{Et}_3\text{N}$  in ether-isooctane (1+1) thru Columns III and IV. Discard Column III. Pass two 10 mL portions of 2%  $\text{Et}_3\text{N}$  in ether-isooctane (1+1) thru Column IV, collecting eluate in same 125 mL separator. Shake separator, and transfer acid layer to 50 mL vol. flask. Ext solv. with two 10 mL portions 0.5N  $\text{H}_2\text{SO}_4$  and combine in vol. flask. Dil. to vol. with 0.5N  $\text{H}_2\text{SO}_4$ .

Elute cephaeline from Column IV with 75 mL  $\text{CHCl}_3$ . Collect eluate in 250 mL separator contg 20 mL 0.5N  $\text{H}_2\text{SO}_4$  and 150 mL ether. Shake and transfer acid layer to 50 mL vol. flask. Ext solv. with 2 addnl 10 mL portions 0.5N  $\text{H}_2\text{SO}_4$  and combine in vol. flask. Dil. to vol. with 0.5N  $\text{H}_2\text{SO}_4$ .

Scan spectra of emetine std and sample fractions from 350 to 240 nm against 0.5N  $\text{H}_2\text{SO}_4$ . Correct  $A$  at 283 nm by subtracting  $A$  at 350 nm for samples ( $\Delta A$ ) and for stds ( $\Delta A'$ ).

### 38.055

#### Calculations

(a) *Sirup*.—Calc. mg drug/100 mL =  $0.1 \times (\Delta A / \Delta A') \times C \times D \times F$ , where  $C$  = concn std in  $\mu\text{g/mL}$ ,  $D$  = diln factor =  $(25/15) \times (50/4) = 20.8$ , and  $F$  for emetine = 0.79 if emetine.  $2\text{HCl} \cdot 3\text{H}_2\text{O}$  is used as std; if  $\text{H}_2\text{O}$  content differs from  $3\text{H}_2\text{O}$ , recalc. factor

from MW of anhyd. salt = 554.  $F$  for cephaeline =  $0.79 \times 0.971 = 0.767$ , where 0.971 is ratio of MW of emetine and cephaeline.

(b) *Fluidextract*.—Calc. mg drug/100 mL as in (a), using  $D_s = (50/2) \times (50/5) = 250$ .

(c) *Powdered ipecac*.—Calc. % drug =  $(\Delta A/\Delta A') \times (F \times 5C/W)$ , where  $C$  and  $F$  are defined in (a), and  $W$  = mg sample.

#### Norepinephrine (Arterenol) in Preparations of Epinephrine (Adrenalin) (76)—Official Final Action

##### 38.056

##### Apparatus

(a) *Chromatographic tube and tamping rod*.—See 37.002.

(b) *Hypodermic syringe*.—1 mL without needle, graduated in 0.01 mL.

##### 38.057

##### Reagents

(a) *Diatomaceous earth*.—See 36.002.

(b) *Glass wool*.—Pyrex No. 3950.

(c) *Benzene*.—Distil reagent grade benzene in all-glass app. Shake distillate with  $H_2O$  2–3 min and filter benzene layer thru paper. Use this  $H_2O$ -satd solv. unless dry benzene is specified. (Caution: See 51.011, 51.039, 51.040, and 51.045.)

(d) *Concentrated phosphate buffer*.—pH 6. Dil. 50.0 mL 0.2M  $KH_2PO_4$  soln, 50.009(b), and 5.64 mL 0.2M NaOH, 50.009(d), to 100 mL with  $H_2O$ .

(e) *Iodine-potassium iodide soln*.—Dissolve 2 g I and 6 g KI in  $H_2O$ , and dil. to 100 mL.

(f) *Norepinephrine std soln*.—0.100 mg norepinephrine base/mL. Dissolve 19.9 mg *l*-norepinephrine (levarterenol) bitartrate in exactly 100 mL  $H_2O$ . Discard after 8 hr.

##### 38.058

##### Preparation of Sample

(a) *Aqueous solns of epinephrine.HCl containing bisulfite and chlorobutanol*.—If soln is 0.1% with respect to "total epinephrine" (epinephrine + norepinephrine), pipet 30 mL sample into 125 mL separator provided with tightly fitting stopper and stopcock. If soln is more concd, use sample contg 30 mg "total epinephrine," and dil. to 30 mL with  $H_2O$ .

(b) *Suspensions of epinephrine in oil*.—Mix suspension by gentle swirling and agitation; add to separator accurately measured vol. contg ca 30 mg epinephrine and 25 mL pet ether, and swirl until oily base dissolves. Add 10 mL 0.05N  $H_2SO_4$  and ext epinephrine by shaking 1 min. Drain aq. layer into 125 mL separator, and wash pet ether layer with two 10 mL portions  $H_2O$ . Add washes to acid ext, wash combined aq. layers with two 10 mL portions  $CCl_4$ , and discard  $CCl_4$ . Rinse stopper and mouth of separator with few drops  $H_2O$  and let rinsings drain into separator. Proceed as in 38.059, beginning "Add 2.10 g  $NaHCO_3$  . . ."

(c) *Ointments of epinephrine bitartrate (petrolatum base)*.—Transfer to separator accurately weighed sample contg ca 60 mg epinephrine bitartrate. Add 25 mL benzene and swirl until ointment base dissolves. Proceed as in (b), beginning "Add 10 mL 0.05N  $H_2SO_4$  . . ." except if bisulfite is present, it must be removed with I, as below, before proceeding with acetylation.

##### 38.059

##### Acetylation

(Caution: See 51.011, 51.040, and 51.056.)

Add 25 mL  $CCl_4$  and shake vigorously to ext chlorobutanol. After layers sep. completely, drain and discard solv., and repeat extn with two 25 mL portions  $CCl_4$ . After each extn, drain as much solv. as possible. Rinse stopper and mouth of separator with few drops of  $H_2O$ , and let rinsings drain into separator. Add 4 drops starch indicator, 38.153(b); then, while swirling,

destroy  $NaHSO_3$  by adding I-KI soln, (e), dropwise until soln remains blue. Immediately discharge blue color by adding 0.1N  $Na_2S_2O_3$  dropwise. Add 2.10 g  $NaHCO_3$  (prevent it from contacting wet mouth of separator) and swirl few sec to dissolve most of  $NaHCO_3$ . Immediately, using hypodermic syringe, rapidly inject into separator exactly 1 mL  $Ac_2O$  (prevent reagent from contacting mouth of funnel). Stopper separator at once and shake vigorously until evolution of  $CO_2$  stops (ca 7–8 min). Release pressure as necessary by momentarily inverting separator and cautiously opening stopcock.

Let mixt. stand 5 min; then ext with six 30 mL portions  $CHCl_3$ . Filter each ext thru  $CHCl_3$ -washed compact pledget of absorbent cotton into beaker, and evap. combined exts to small vol. or to dryness on steam bath under air current. Quant. transfer residue with small portions  $CHCl_3$  to tared 50 mL beaker and continue evapn until solv. is removed. Dry 30 min at  $105^\circ$ , let cool in desiccator, and weigh. Wt mixed amorphous triacetyl derivatives of epinephrine and norepinephrine  $\times 0.5923 = E =$  "total epinephrine."

##### 38.060

##### Chromatographic Separation of Acetylation Product

(Caution: See 51.011, 51.039, 51.040, 51.045, and 51.056.)

Place wad of glass wool in chromatgc tube and compress it tightly at juncture of tube and stem, using packing rod.

Place 10 g diat. earth and ca 175 mL benzene in 250 mL beaker. While stirring vigorously and continuously, add 7.0 mL  $H_2O$ , dropwise, to produce uniform solid phase. Transfer to chromatgc tube ca  $1/10$  of the solid, under benzene, and compress it firmly and evenly with packing rod. While keeping column of benzene above solid in tube, add remainder of solid in beaker in ca 5 equal portions and compress each portion firmly and evenly before adding next. Properly prepd column is ca 65 mm high and permits flow of ca 2–4 mL benzene/min under head of 8 cm solv. With wad of absorbent cotton affixed to stiff wire, remove any solid adhering to tube above column. Keep layer of benzene above column until used.

To beaker contg mixt. of triacetyl derivatives, add exactly 6 mL dry benzene. Warm gently and dissolve residue completely by stirring and swirling. Cover beaker with watch glass to retard evapn, and cool to room temp.

Remove supernate benzene from tube by careful aspiration, pipet onto top of column accurately measured aliquot of soln of derivative equiv. to 20–25 mg total epinephrine, and immediately place graduate under tube. As soon as last of benzene soln is absorbed by column, rinse down wall of tube with three 2 mL portions benzene, delivered conveniently from pipet. Let each rinse be completely absorbed before adding next portion. Then carefully add benzene into tube to ht of ca 8 cm above top of column, and maintain level of the benzene with suitable constant level device. After 160 mL effluent (contg triacetylepinephrine) collects, thoroly rinse tip of tube with  $CHCl_3$  and discard effluent and rinsings, or reserve for qual. tests.

Remove layer of benzene above column by aspiration, place clean receiver under tube, and let  $CHCl_3$  pass thru column until 100 mL effluent (contg triacetylnorepinephrine) collects. Evap. effluent to dryness and transfer to 50 mL beaker, confining residue near bottom of beaker.

##### 38.061

##### Determination of Norepinephrine

Add exactly 10 mL 0.50N HCl to residue of triacetylnorepinephrine, warm gently, and dissolve by stirring and rubbing with rubber policeman. Pour soln into g-s test tube (15  $\times$  150 mm is convenient), place tube in boiling  $H_2O$  bath, and stopper

loosely. After 5 min, stopper tightly and maintain 30 addnl min at 100°. Remove tube and cool to room temp., lifting stopper slightly from time to time to keep vac. from forming.

Thoroughly mix contents and transfer 1 mL aliquot to another g-s test tube. Neutralize acid by adding exactly 42 mg  $\text{NaHCO}_3$ . (Ensure that all  $\text{NaHCO}_3$  is delivered to bottom of tube, and that none adheres to wall above acid layer.) After effervescence stops, add 1.5 mL  $\text{H}_2\text{O}$  and 2.5 mL buffer, (d). Mix by swirling, and add 4 drops 0.1N I. Swirl, and after exactly 3 min (timed by stopwatch) from addn of I, add 6 drops 0.1N  $\text{Na}_2\text{S}_2\text{O}_3$ , stopper, and mix thoroughly. Measure *A* at 520 nm,  $3 \pm 0.5$  min after addn of  $\text{Na}_2\text{S}_2\text{O}_3$  soln, in 1 cm cells against the pH 6 buffer blank in Beckman Model DU spectrophtr, or equiv.

Transfer 1.5 mL aliquot std soln to g-s test tube. Add 1 mL  $\text{H}_2\text{O}$  and 2.5 mL pH 6 buffer, (d), and swirl. Develop color and measure *A'* at 520 nm as above.

Calc. amt norepinephrine in sample originally taken for analysis, and from this value and *E*, 38.059, calc. % norepinephrine in "total epinephrine."

**38.070**

**Reagents**

(a) *Strychnine sulfate std solns*.—(1) *Stock soln*.—250  $\mu\text{g/mL}$ . Dissolve 25.0 mg strychnine sulfate in MeOH and dil. to 100 mL with MeOH. (2) *Working soln*.—50  $\mu\text{g/mL}$ . To 10 mL stock soln add 5 drops HCl and dil. to 50 mL with  $\text{CHCl}_3$ .

(b) *Triethylamine*.—See 38.006(a).

**38.071**

**Preparation of Sample and Columns**

*Sample*.—Pipet 10 mL sample into 100 mL beaker, add 0.2 g *p*-toluenesulfonic acid, and heat on steam bath under gentle air current to remove alcohol.

*Column I*.—Add 2 mL 2N NaOH to 3 g diat. earth, 36.002. Mix thoroughly by kneading with flexible spatula, transfer to column, and tamp, using gentle pressure, to uniform mass. Add 8 g diat. earth to alcohol-free sample. (If sample is too sirupy from excess evapn of  $\text{H}_2\text{O}$ , add small amt of  $\text{H}_2\text{O}$ .) Mix thoroughly, transfer to column above NaOH layer, and tamp. Dry-wash with ca 1 g diat. earth for quant. transfer.

*Column II*.—Mix 3 g diat. earth and 2 mL 2N NaOH, and tamp as above. Mix 8 g diat. earth and 7 mL 1N HCl, transfer to column above NaOH layer, and tamp.

*Column III*.—Mix 3 g diat. earth and 2 mL 1N tartaric acid, and tamp as above.

Place small pad of glass wool above each column.

**38.072**

**Determination**

(Use  $\text{H}_2\text{O}$ -satd solvs thruout.)

Pass 100 mL ether thru Column I, discarding eluate contg aromatic flavoring components and bulk of transformation product of quinine which forms in aged prepn.

Mount columns so that eluate from I passes thru II onto III. Pass 100 mL  $\text{CHCl}_3$  thru columns and discard Column I. Pass 50 mL  $\text{CHCl}_3$  thru Column II onto III and finally pass 50 mL  $\text{CHCl}_3$  thru Column III. Discard eluate. Column II may be used for quinine detn as in 38.074★, 12th ed.

Place 50 mL vol. flask contg 10 mL MeOH and 1 mL HCl under Column III which contains strychnine. Pass thru column 5 mL  $\text{CHCl}_3$  contg 1 mL triethylamine, followed by 32 mL 1% triethylamine in  $\text{CHCl}_3$ . Dil. to vol. with  $\text{CHCl}_3$ . Det. *A* at 350, 320, and 288 nm against  $\text{CHCl}_3$  or, preferably, record spectrum over this region. (Film of  $\text{Et}_3\text{N.HCl}$  may adhere to walls of cells. Rinse cells carefully with  $\text{H}_2\text{O}$  and alcohol; then wipe clean before use.) Background *A* at 310–360 nm should be  $<0.02$ . Deduct av. reading at 320 and 350 nm from reading at inflection at 288 nm. (Max. *A* of strychnine is at ca 255 nm but nature of solvs makes it undesirable to use this wavelength.)

Deduct *A* of blank of 10 mL MeOH, 1 mL triethylamine, and 1 mL HCl dild to 50 mL with  $\text{CHCl}_3$ . Compare net *A* with that of dild strychnine sulfate std soln, *A'*, and calc. strychnine content.

**Reserpine**

**Method I (22)—Official Final Action**

**38.073**

**Reagents**

(a) *Sulfamic acid soln*.—2.5%. Prep. fresh every 2–3 days.

(b) *Alcoholic sodium nitrite soln*.—Dissolve 10 g  $\text{NaNO}_2$  in 100 mL  $\text{H}_2\text{O}$ . Store in refrigerator. Mix 1 mL of this aq. soln with 50 mL alcohol.

(c) *Reserpine std soln*.—50  $\mu\text{g/mL}$ . Dissolve 25 mg USP Reserpine Ref. Std, previously dried 3 hr at 60°, in ca 40 mL boiling alcohol, cool, and dil. to 100 mL with alcohol. Dil. 10 mL of this stock soln to 50 mL with alcohol. When stored in tightly stoppered brown bottle in dark, solns are stable for weeks.

## 38.074

**Determination**

(a) *Crystalline reserpine*.—Accurately weigh ca 25 mg reserpine, dissolve in ca 40 mL boiling alcohol, cool, and dil. to 100 mL with alcohol. Transfer 10.0 mL to separator contg 50 mL 1%  $\text{NaHCO}_3$  soln. Ext with 20, 10, and 10 mL  $\text{CHCl}_3$ , washing each  $\text{CHCl}_3$  ext in second separator with 50 mL 2% citric acid soln. Filter  $\text{CHCl}_3$  exts thru cotton into 50 mL vol. flask contg 5 mL alcohol, dil. to 50 mL with  $\text{CHCl}_3$ , and mix.

Transfer duplicate 5.0 mL aliquots to 25 mL vol. flasks contg 15 mL alcohol. Transfer duplicate 5.0 mL aliquots dil. reserpine std soln to 25 mL vol. flasks contg 10 mL alcohol and 4.5 mL  $\text{CHCl}_3$ . Add 1.0 mL alc.  $\text{NaNO}_2$  soln to 1 std and 1 sample soln. Add 10 drops HCl to all flasks, swirl, and let stand 30 min. Add 1.0 mL sulfamic acid soln, dil. with alcohol to 25 mL, and mix. Let stand 15 min and det. *A* in matched 1 cm cells at 390 nm against alcohol.

mg Reserpine in sample weighed =  $25 \times (A - A_0)/(A' - A'_0)$ , where *A* and *A*<sub>0</sub> refer to nitrite-treated and untreated sample, resp., and *A'* and *A'*<sub>0</sub> refer to corresponding std aliquots.

(b) *Tablets*.—Transfer accurately weighed portion powd tablets contg ca 5 mg reserpine to 100 mL beaker. Add 20 mL alcohol, cover with watch glass, and heat to simmering. Boil gently 20 min, stirring occasionally, adding small portions alcohol to maintain vol. Cool to <50°, add 10 mL  $\text{CHCl}_3$ , and mix. Filter thru pledget of cotton, and collect filtrate in 50 mL vol. flask. Wash filter and solids with several portions  $\text{CHCl}_3$ . Cool, dil. to 50 mL, and mix. Transfer 25 mL aliquot to separator contg 50 mL 1%  $\text{NaHCO}_3$ . Add 5 mL  $\text{CHCl}_3$  and shake vigorously. Transfer  $\text{CHCl}_3$  layer to separator contg 50 mL 2% citric acid soln, and shake. Repeat extns with two 10 mL portions  $\text{CHCl}_3$ . Filter exts thru cotton and collect in 50 mL vol. flask contg 5 mL alcohol. Proceed as in (a), second par., after dilg to vol. with  $\text{CHCl}_3$ .

mg Reserpine in portion powd tablets weighed  
=  $5 \times (A - A_0)/(A' - A'_0)$ .

**Method II (23)—Official Final Action**

## 38.075

**Reagents**

(Prep. std, sample, and blank solns from same lots of  $\text{CHCl}_3$  and MeOH.)

(a) *Treated fiberglass*.—Soak Pyrex fiberglass, Corning Glass Works No. 3950, in  $\text{CHCl}_3$ , rinse several times with  $\text{CHCl}_3$ , and air dry on filter paper or dry in forced-draft oven.

(b) *Dimethylsulfoxide (DMSO)*.—See 37.085(f).

(c) *Sodium nitrite in dilute methanol soln*.—0.3% in MeOH (1+1). Stable ≥1 month when stored in refrigerator. Bring to room temp. before use.

(d) *Methanolic hydrochloric acid soln*.—Dil. 6.0 mL HCl to 100 mL with MeOH.

(e) *Reserpine std soln*.—20 μg/mL. Dissolve 25.0 mg accurately weighed USP Reserpine Ref. Std, previously dried 3 hr at 60°, in 0.25 mL  $\text{CHCl}_3$ . Mix with ca 30 mL MeOH, previously warmed to 50°; transfer mixt. to 250 mL vol. flask with warm MeOH. Cool soln to room temp., dil. to vol. with MeOH, and mix. Protect soln from light. Just prior to use, pipet 10 mL into 50 mL vol. flask, add 36 mL  $\text{CHCl}_3$ , and dil. to vol. with MeOH.

(f) *Diatomaceous earth*.—See 36.002.

## 38.076

**Preparation of Column**

Place small pledget of treated fiberglass in base of 200 × 22 mm id tube. *Lower layer*: Mix 1 g diat. earth, 36.002, with 0.5 mL freshly prep'd 2%  $\text{NaHCO}_3$ , transfer to column, and tamp to uniform mass. *Acid layer*: Mix 1 g diat. earth with 0.5 mL freshly

prep'd 0.5% citric acid soln, transfer to column, and tamp. *Water layer*: Mix 1 g diat. earth with 0.5 mL  $\text{H}_2\text{O}$ ; transfer to column, and tamp.

Proceed with entire assay *quickly*, without interruption, avoiding exposure of sample to direct light. Read UV spectrum immediately after column elution is completed.

## 38.077

**Chromatography**

Powder tablets and pass thru No. 60 sieve. Transfer accurately weighed amt, contg ca 1 mg reserpine, but ≤1 g of the powder, to 150 mL beaker. Dry-mix powder with ca 500 mg diat. earth. Add 1 mL DMSO and wet sample thoroly by mixing with spatula. Let mixt. stand, with spatula remaining in beaker, 5 min. Add addnl 500 mg diat. earth and mix thoroly. Add addnl diat. earth to total wt of 2 g and mix thoroly. Quant. transfer to column thru wide-mouth funnel. Dry-wash beaker with ca 1 g diat. earth and transfer to column. Wipe beaker, spatula, and funnel with small pledget of treated glass wool. Tamp sample, drywash, and glass wool firmly. Pass ca 45 mL  $\text{CHCl}_3$  thru sample column. Collect eluate in 50 mL vol. flask contg 14 mL MeOH, rinsing tip of column with  $\text{CHCl}_3$ , and dil. sample to vol. with  $\text{CHCl}_3$ .

Prep. and elute blank column exactly as above, replacing sample layer with 1 mL DMSO + 2 g diat. earth.

## 38.078

**UV Assay**

Scan UV absorption spectrum of sample eluate from 250 to 350 nm, against column blank eluate. Likewise, scan spectrum of std soln in same range against ref. blank of 3.6 parts  $\text{CHCl}_3$  and 1.4 parts MeOH.

mg Reserpine in sample portion =  $(A/A') \times (C \times 50)$ ,

where *A* and *A'* refer to sample and std, resp., at 268 nm, and *C* = mg reserpine/mL in std soln (0.02).

## 38.079

**Colorimetric Assay**

Pipet duplicate 5.0 mL aliquots of sample eluate and std soln into sep. 10 mL vol. flasks. Add 2.0 mL methanolic HCl soln to each flask and swirl. To one std and one sample flask, add 1.0 mL MeOH (1+1) (blanks). To remaining std and sample flasks, add 1.0 mL 0.3%  $\text{NaNO}_2$  soln and mix. Let stand exactly 30 min. Add 0.5 mL freshly prep'd 5%  $\text{NH}_4$  sulfamate soln to each flask, dil. with MeOH, and let stand ≥10 min. Read *A* from 450 to 350 nm for each soln against blank of 3.6 parts  $\text{CHCl}_3$ , 5.4 parts MeOH, and 1 part  $\text{H}_2\text{O}$ .

mg Reserpine in sample portion

=  $[(A - A_0) \times C \times 50]/(A' - A'_0)$ ,

where *A*, *A*<sub>0</sub>, *A'*, and *A'*<sub>0</sub> refer to sample, sample blank, std, and std blank, resp., at 390 nm and *C* = mg reserpine/mL in std soln (0.02).

**Single Tablet Assay (24)—Official Final Action**

## 38.080

**Reagents**

(a) *Vanadium pentoxide-phosphoric acid (VP-PA) solns*.—(1) *Stock soln*.—Sat. 85%  $\text{H}_3\text{PO}_4$  with  $\text{V}_2\text{O}_5$  by shaking mech. 2 hr. Filter thru medium porosity fritted glass funnel. (Satd soln contains ca 0.8 mg  $\text{V}_2\text{O}_5$ /mL.) Soln is stable ca 1 month. (2) *Working soln*.—Dil. 10 mL stock soln to 100 mL with  $\text{H}_2\text{O}$ . Prep. fresh daily.

(b) *Reserpine std solns*.—(1) *Stock soln*.—0.1 mg/mL. Accurately weigh ca 10 mg USP Reserpine Ref. Std, previously dried 3 hr at 60°, into 100 mL vol. flask. Dissolve in 0.1 mL  $\text{CHCl}_3$ ; then add 30 mL alcohol previously warmed to 50°. Cool to room temp. and dil. to vol. with alcohol. (2) *Working soln I*.—0.002 mg/mL. Transfer 2.0 mL stock soln to 100 mL vol. flask contg

ca 50 mL alcohol. Add following vols  $\text{CHCl}_3$ : for 1 mg tablets, 1.0 mL; 0.5 mg, 2 mL; 0.25 mg, 2.4 mL. Dil. to vol. with alcohol. (3) *Working soln II*.—0.001 mg/mL. Transfer 1.0 mL stock soln to 100 mL vol. flask contg ca 50 mL alcohol, add 2.0 mL  $\text{CHCl}_3$ , and dil. to vol. with alcohol. Protect all std solns from light as in 38.073(c).

## 38.081

## Apparatus

*Spectrophotofluorometer*.—Adjusted so that reserpine working std solns II and I give ca 40 and 80% *F*, resp. Wavelengths of max. excitation and fluorescence of reserpine treated with VP-PA are 400 and 500 nm, resp. (Caution: See 51.008.)

## 38.082

## Preparation of Sample

Drop single tablet into 100 mL vol. flask. Add 2 mL  $\text{H}_2\text{O}$ , crush tablet with fire-polished glass rod, and, leaving rod in flask, heat on steam bath ca 15 min or until tablet is dispersed. Frequently crush particles with rod to aid soln. Cool. Rinse rod into flask with following vols  $\text{CHCl}_3$ : 2 mL for 0.1 mg tablets; 3 mL for 0.25; and 5 mL for 0.5 and 1. Remove rod. Protect  $\text{CHCl}_3$  solns of reserpine from light. Vigorously shake flask ca 2 min. Dil. to vol. with alcohol, shake vigorously, and filter thru rapid paper, discarding first 25 mL filtrate. Collect remaining filtrate in g-s erlenmeyer. Further dil. filtrate as follows: For 0.1 mg tablets, use directly; 0.25 mg, dil. 20 mL to 25 mL; 0.5, 20 to 50; and 1, 10 to 50.

## 38.083

## Determination

Transfer 5.0 mL std soln II (for 0.1 mg tablets) or std soln I (for all others) and 5.0 mL final sample diln to sep. 50 mL g-s erlenmeyers. Add 5.0 mL VP-PA working soln to each flask, shake vigorously, and let stand 15–60 min. Det. fluorescence of sample and std solns. (Blank is unnecessary, since its reading is negligible compared to sample and std solns.)

Relative fluorescence = %*F* × meter multiplier reading.

mg Reserpine/tablet =  $(R/R') \times C \times f$ ,

where *R* and *R'* = relative fluorescence of sample and std solns, resp., *C* = concn reserpine stock soln, and factor *f* = 1, 2.5, 5, and 10 for 0.1, 0.25, 0.5, and 1 mg tablets, resp.

### Semiautomated Fluorometric Method (25) Official Final Action

## 38.084

## Principle

Reserpine is dissolved in 0.25*M*  $\text{H}_3\text{PO}_4$  soln contg 20% MeOH and mixed with  $\text{V}_2\text{O}_5$ , and fluorescence of oxidized reserpine is detd.

## 38.085

## Apparatus

(Other equiv. instruments may be used.)

(a) *Automatic analyzer*.—AutoAnalyzer with following modules (Technicon Instruments Corp.): Sampler II with 30/hr (2:1) cam; proportioning pump I; manifold (see Fig. 38.01).

(b) *Ratio fluorometer*.—Equipped with flowcell and Corning No. 5113 filter for 395 nm excitation and Wratten No. 8 filter for 495 nm emission.

(c) *Recorder*.—Texas Instruments Servo/Riter II (Texas Instruments, Inc., PO Box 1444, Houston, TX 77001), or equiv.

## 38.086

## Reagents

(a) *Phosphoric acid-methanol soln*.—Add 20 mL  $\text{H}_3\text{PO}_4$  to 200 mL MeOH and dil. to 1 L with  $\text{H}_2\text{O}$ .

(b) *Vanadium pentoxide-phosphoric acid (VP-PA) solns*.—(1) *Stock soln*.—Sat. 85%  $\text{H}_3\text{PO}_4$  with  $\text{V}_2\text{O}_5$  by stirring mag. 3 hr. Let settle overnight. (Satd soln contains ca 0.8 mg  $\text{V}_2\text{O}_5$ /mL.) Soln is stable ca 1 month. (2) *Working soln*.—Dil. 200 mL stock soln to 1 L with  $\text{H}_2\text{O}$ . Prep. fresh daily.

(c) *Reserpine std solns*.—(1) *Stock soln*.—0.125 mg/mL. Accurately weigh ca 25 mg USP Reserpine Ref. Std, previously dried 3 hr at 60°, into 200 mL vol. flask, dissolve in  $\text{H}_3\text{PO}_4$ -MeOH soln, and dil. to vol. (2) *Working soln I*.—0.0025 mg/mL. Dil. 5.0 mL stock soln to 250 mL with  $\text{H}_3\text{PO}_4$ -MeOH soln. (3) *Working soln II*.—0.002 mg/mL. Dil. 4.0 mL stock soln to 250 mL with  $\text{H}_3\text{PO}_4$ -MeOH soln.

## 38.087

## Preparation of Sample

Place tablet in suitable vol. flask to give reserpine concn of 0.002–0.0025 mg/mL. Add  $\text{H}_3\text{PO}_4$ -MeOH soln to ca ½ vol. of flask and place in ultrasonic generator to disintegrate tablet. After complete disintegration, agitate 15 min on mech. shaker. Dil. to vol. and mix. Let soln settle 2 hr.

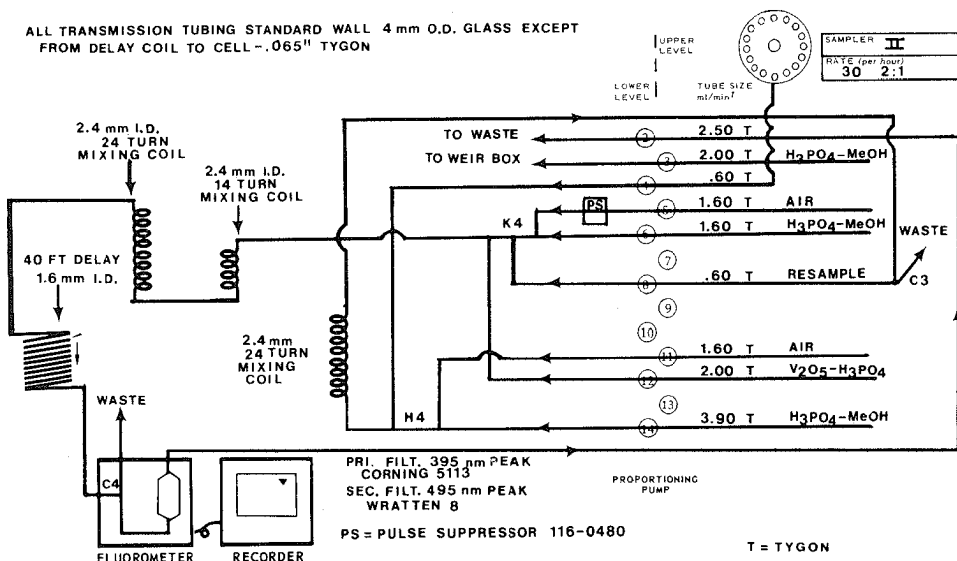

FIG. 38.01—Flow diagram for semiautomated fluorometric analysis for reserpine

**38.088 Analytical System**

Sample is withdrawn, segmented with air, and dild with  $\text{H}_3\text{PO}_4$ -MeOH soln. Soln is resampled into stream of solv. that has been segmented with air and then mixed with VA-PA working soln. After flowing thru full delay coil (ca 10 min delay), soln is debubbled and passed thru flowcell, and fluorescence is measured at excitation and emission wavelengths of 395 and 495 nm, resp.

**38.089 Start-Up and Shut-Down Operations**

Place all tubes in resp. solns and pump until steady baseline is obtained. To shut down system, place all lines in  $\text{H}_2\text{O}$  and pump 15 min. Remove lines from  $\text{H}_2\text{O}$  reservoir and pump system dry.

**38.090 Determination**

Fill 3 mL sample cups in following order: 5 cups std soln, 5 cups sample solns, 1 cup std soln, 5 cups sample solns, etc., ending with 2 cups std soln. Start Sampler II. After last cup has been sampled, let system operate until steady baseline is obtained. Draw tangent to initial and final baselines. Subtract baseline to det. net fluorescence for each sample,  $F$ , and std,  $F'$ , peak, resp. Using av. of 2 stds which bracket sample peak, calc. reserpine as follows:

$$\text{mg Reserpine in sample taken} = (F/F') \times C \times D,$$

where  $C$  = concn of std in mg/mL and  $D$  = diln factor.

**Reserpine-Rescinnamine Group Alkaloids in  
*Rauwolfia serpentina***

**Spectrophotofluorometric Method (26)  
Official Final Action**

**38.091 Principle**

Reserpine-rescinnamine is extd with DMSO-MeOH. After addn of  $\text{H}_2\text{SO}_4$ , drug is extd into  $\text{CHCl}_3$ , then sepd from interfering materials by chromatgy on 0.1*N* NaOH-diat. earth and silica gel columns. Reserpine-rescinnamine is eluted from latter column with  $\text{CHCl}_3$ -MeOH and detd by spectrophotofluorometry against std treated similarly.

**38.092 Apparatus**

(a) *Chromatographic tube and tamping rod*.—200 × 22 (id) mm. See 37.002.

(b) *Shaker*.—Wrist action (Model BT, Burrell Corp., or equiv.).

(c) *Spectrophotofluorometer*.—Excitation and emission wavelengths 400 and 502 nm (uncorrected), resp. Use excitation and emission slit widths consistent with good quantitation according to manufacturer's recommendations. Sensitivity setting depends upon slit widths. (Caution: See 51.008.)

**38.093 Reagents**

(a) *Acidic alcohol soln*.—Add 10 mL 85%  $\text{H}_3\text{PO}_4$  to 40 mL  $\text{H}_2\text{O}$  and 50 mL alcohol. Mix well and cool before use.

(b) *Chloroform-methanol mixture*.—(1+1). Mix equal vols  $\text{CHCl}_3$  and MeOH; 105 mL/detn is required.

(c) *Diatomaceous earth*.—See 36.002.

(d) *Dimethyl sulfoxide-methanol mixture*.—(1+1). Mix equal vols DMSO and MeOH. 10 mL/detn is required. (Caution: DMSO can be harmful. Avoid skin contact by wearing heavy rubber gloves. Use effective fume removal device.)

(e) *Silica gel for column chromatography*.—0.063–0.2 mm. See 26.027(a).

(f) *Sulfuric acid*.—0.5*N*. Add 7 mL  $\text{H}_2\text{SO}_4$  to 500 mL  $\text{H}_2\text{O}$ , and mix well.

(g) *Vanadium pentoxide-phosphoric acid (VP-PA) solns*.—(1) *Stock soln*.—0.8 mg  $\text{V}_2\text{O}_5$ /mL. Sat. 85%  $\text{H}_3\text{PO}_4$  with  $\text{V}_2\text{O}_5$  by shaking mech. 2 hr. Filter thru medium porosity fritted glass funnel. Soln is stable ca 1 month. (2) *Working soln*.—0.08 mg  $\text{V}_2\text{O}_5$ /mL. Dil. 10 mL stock soln and 40 mL  $\text{H}_2\text{O}$  to 100 mL with alcohol. Prep. fresh daily.

(h) *Reserpine std solns*.—(1) *Stock soln*.—40  $\mu\text{g}$ /mL. Accurately weigh 20 mg USP Reserpine Ref. Std, previously dried 3 hr at 60°, into 500 mL vol. flask. Dissolve with 50 mL hot alcohol, cool, and dil. to vol. with alcohol. Protect soln from direct sunlight. Soln, when stored in g-s brown glass bottle, is stable for weeks. (2) *Working soln*.—2  $\mu\text{g}$ /mL. Pipet 5 mL stock soln into 100 mL vol. flask, and dil. to vol. with alcohol. Prep. fresh daily.

**38.094 Preparation of Sample**

Grind tablets to pass No. 60 sieve. Mix well. Use powd root samples as received.

**38.095 Preparation of Columns**

(a) *Column I*.—Mix 2 mL 0.1*N* NaOH with 3 g diat. earth. Transfer to chromatgc tube plugged with glass wool, and tamp. Cover with pad of glass wool.

(b) *Column II*.—Pour silica gel into chromatgc tube (plugged with glass wool) to ht of ca 4 cm. Tap side of tube lightly with tamping rod. Cover silica gel with pad of glass wool. Arrange columns so that eluate from Column I flows directly into Column II. Wet columns with 25 mL freshly prepd  $\text{H}_2\text{O}$ -satd  $\text{CHCl}_3$ .

**38.096 Cleanup**

(Perform in subdued light.)

Accurately weigh prepd sample contg ca 200 mg *Rauwolfia serpentina* and transfer to 50 mL g-s centrf. tube. Add 10.0 mL DMSO-MeOH (1+1), stopper, and shake vigorously by hand until entire sample is thoroly wetted. Shake mech. 30 min at most vigorous setting. (Wrap tube with Al foil if shaker is not in dark place.) Centrf. 5 min at 1200 rpm. Pipet 5 mL aliquot of supernate into 125 mL separator contg 50 mL 0.5*N*  $\text{H}_2\text{SO}_4$ . (Caution: DMSO can be harmful. Do not use mouth suction to fill pipet.) (Do not pipet any undissolved residue.) Ext with four 25 mL portions  $\text{CHCl}_3$ .

In second separator contg 25 mL 0.5*N*  $\text{H}_2\text{SO}_4$ , shake each 25 mL  $\text{CHCl}_3$  ext individually, and drain into Column I. Let each ext sink entirely into both columns before adding next 25 mL ext. After draining fourth ext into second separator, rinse tip of first separator into second with 1–2 mL  $\text{CHCl}_3$ . Then rinse tip of second separator into Column I, and tip of Column I into Column II. Discard all  $\text{CHCl}_3$  eluted from Column II. Sep. columns and discard Column I.

Place 100 mL vol. flask under Column II, and elute with ca 90 mL  $\text{CHCl}_3$ -MeOH (1+1). Rinse tip of Column II into vol. flask with ca 5 mL  $\text{CHCl}_3$ -MeOH (1+1), and dil. eluate to vol. with  $\text{CHCl}_3$ -MeOH (1+1).

**38.097 Determination**

Transfer duplicate 5.0 mL aliquots  $\text{CHCl}_3$ -MeOH eluate to sep. 25 mL vol. flasks. Transfer duplicate 5.0 mL aliquots working std soln to sep. 25 mL vol. flasks, each contg 5 mL  $\text{CHCl}_3$ -MeOH (1+1). Add 5.0 mL VP-PA working soln, (g)(2), to 1 flask of each set, and mix well. Add 5.0 mL acidic alcohol soln, (a), to other (blank) flasks, dil. to vol. with alcohol, and mix well. Det. fluorescence intensity of each soln within 15–60 min.

## 38.098

## Calculations

(a) *Tablets*.—Calc. % reserpine-rescinamine group alkaloids in labeled amt *Rauwolfia serpentina*/tablet:

$$[(F - F_0)/(F' - F'_0)] \times (C/W) \times (T/L) \times 100 \times D,$$

where  $F$  and  $F'$  = fluorescence of sample and std, resp.;  $F_0$  and  $F'_0$  = fluorescence of sample and std blanks, resp.;  $C$  = mg reserpine/mL in working std soln (0.002);  $W$  = g sample;  $T$  = av. tablet wt in g;  $L$  = labeled mg *Rauwolfia serpentina*/tablet; and  $D$  = sample diln factor (200 mL).

(b) *Powdered root*.—Calc. % reserpine-rescinamine group alkaloids in *Rauwolfia serpentina* powd root:

$$[(F - F_0)/(F' - F'_0)] \times (C/W) \times 100 \times D,$$

where symbols are defined in (a).

## Spectrophotometric Method (27)—Official Final Action

## 38.099

## Reagents

(a) *1,1,1-Trichloroethane*.—(Caution: Trichloroethane is toxic. See 51.040.) Redistil in all-glass app., collecting fraction boiling at 73–76°.

(b) *Reserpine std soln*.—20 µg/mL. Dissolve 20.0 mg USP Reserpine Ref. Std, previously dried 3 hr at 60°, in 25 mL hot alcohol, cool, and dil. to 50 mL with alcohol. Dil. 5 mL of this soln to 100 mL with alcohol.

(c) *Dilute sulfuric acid*.—0.5*N*. Dissolve ca 30 mL H<sub>2</sub>SO<sub>4</sub> in 2 L H<sub>2</sub>O.

(d) *Sulfamic acid soln*.—5% aq. soln. Prep. fresh every 2–3 days.

## 38.100

## Apparatus

*Soxhlet extraction apparatus*.—Medium size extractor with 250 mL flask and 35 × 80 mm thimble is most convenient, although smaller app. may be used.

## 38.101

## Determination

Ext 2–3 g finely powd *Rauwolfia serpentina* root, or equiv. in powd tablets, in Soxhlet extn app. 4 hr, using ca 100 mL vigorously boiling alcohol. Protect flask and thimble, and all solns of rauwolfia alkaloids, from strong or direct light.

Wash ext into 100 mL vol. flask with alcohol, cool, dil. to vol., and mix. Transfer 20 mL aliquot to separator contg 200 mL 0.5*N* H<sub>2</sub>SO<sub>4</sub>, mix, and ext with three 25 mL portions trichloroethane. Drain lower solv. phase as completely as possible. Wash each trichloroethane ext in second separator contg 50 mL 0.5*N* H<sub>2</sub>SO<sub>4</sub>, and discard.

Ext main aq. soln with 25, 15, 15, 10, 10, and 10 mL CHCl<sub>3</sub>. Wash each CHCl<sub>3</sub> ext with the acid in second separator, and then with two 10 mL portions 2% NaHCO<sub>3</sub> soln in third and fourth separators. Filter CHCl<sub>3</sub> exts thru cotton into 100 mL vol. flask contg 10 mL alcohol. Dil. to 100 mL with CHCl<sub>3</sub> and mix.

Transfer duplicate 10.0 mL aliquots to 18 × 150 mm test tubes and mix each with 4 mL alcohol. Add two or three "20-mesh" SiC boiling chips, and heat to boiling in H<sub>2</sub>O bath at ca 70°. Gradually raise bath temp. to 100°, or until boiling in tube just stops (avoid prolonged heating in absence of solv.). Wipe outsides of warm tubes, place in vac. desiccator, and evap. to dryness under vac. Dissolve residues by agitating with 5.0 mL alcohol.

Take duplicate 5 mL aliquots reserpine std soln, and add 2.0 mL 0.5*N* H<sub>2</sub>SO<sub>4</sub> to one sample tube and to one std tube (blanks). To other tubes add 1.0 mL 0.5*N* H<sub>2</sub>SO<sub>4</sub> and 1.0 mL 0.3% NaNO<sub>2</sub> soln. Mix contents of each tube, and warm in H<sub>2</sub>O bath 20 min at 50–60°. Cool, add 0.5 mL sulfamic acid soln to each tube, and

mix. Let stand 15 min and det.  $A$  in matched 1 cm cells at 390 nm against alcohol-H<sub>2</sub>O (2+1).

$$\text{mg Reserpine-rescinamine alkaloids in sample weighed} = 5 \times (A - A_0)/(A' - A'_0),$$

where  $A$  and  $A_0$  refer to nitrite-treated and untreated samples, resp., and  $A'$  and  $A'_0$  refer to std soln aliquots.

## Rescinamine (28)—Official Final Action

## 38.102

## Reagents

(a) *Ammonium sulfamate soln*.—2.5%. Prep. fresh every 2–3 days.

(b) *Alcoholic sodium nitrite soln*.—See 38.073(b).

(c) *Rescinamine std soln*.—40 µg/mL. Dissolve 20.0 mg USP Rescinamine Ref. Std in 0.5 mL CHCl<sub>3</sub>, transfer to 50 mL vol. flask, and dil. to vol. with alcohol. Protect all rescinamine solns from direct or strong light. Alc. soln is stable several weeks in dark. Dil. 5.0 mL std soln to 50 mL with CHCl<sub>3</sub>.

## 38.103

## Determination

(a) *Crystalline rescinamine*.—Accurately weigh ca 20 mg sample, dissolve in 0.5 mL CHCl<sub>3</sub>, transfer to 50 mL vol. flask, and dil. to vol. with alcohol. Pipet 5 mL aliquot into separator contg 50 mL 0.5*N* H<sub>2</sub>SO<sub>4</sub>, add 22 mL CHCl<sub>3</sub> and 3 mL alcohol, and shake vigorously 2 min. Transfer CHCl<sub>3</sub> layer to second separator contg 50 mL 1% NaHCO<sub>3</sub> soln, and shake again. Filter CHCl<sub>3</sub> layer thru cotton previously washed with CHCl<sub>3</sub> into 50 mL vol. flask contg 5.0 mL alcohol. Ext acid and alk. solns with 2 addnl 10 mL portions CHCl<sub>3</sub>, filter into vol. flask, and dil. to vol. with CHCl<sub>3</sub>.

Transfer duplicate 10 mL aliquots prepd sample soln and std soln, (c), to 25 mL vol. flasks, each contg 10 mL alcohol. Add 1 mL alc. NaNO<sub>2</sub> soln, 38.073(b), to 1 flask of each set; to remaining flasks add 1 mL alcohol. Add 10 drops HCl to all flasks, swirl, and let stand 30 min. Add 1 mL 2.5% NH<sub>4</sub> sulfamate soln, dil. to vol. with alcohol, mix, and let stand 10 min.

Det  $A$  in matched 1 cm cells at 390 nm against mixt. of CHCl<sub>3</sub>, alcohol, and H<sub>2</sub>O (9+15+1) as ref.

mg Rescinamine in sample weighed

$$= 20 \times (A - A_0)/(A' - A'_0),$$

where  $A$  and  $A_0$  refer to nitrite-treated and untreated sample, resp., and  $A'$  and  $A'_0$  refer to corresponding std aliquots.

(b) *Tablets*.—Transfer accurately weighed portion powd tablets contg ca 2.5 mg rescinamine to 50 mL beaker. Insert small glass rod and cover with watch glass. Add 10 mL alcohol, mark vol., and boil gently 20 min with occasional stirring, maintaining original vol. by adding alcohol when necessary. Cool to <50°, add 5 mL CHCl<sub>3</sub>, and filter thru pledget of cotton previously washed with CHCl<sub>3</sub> into 25 mL vol. flask. Wash filter and solids with CHCl<sub>3</sub>, cool, and dil. to vol. Mix, and let settle ca 10 min. (If soln is not clear, transfer to g-s graduate and let settle 10 min more.)

Pipet 20 mL aliquot into separator contg 50 mL 0.5*N* H<sub>2</sub>SO<sub>4</sub>, add 10 mL CHCl<sub>3</sub>, and shake vigorously 2 min. Transfer CHCl<sub>3</sub> to second separator contg 50 mL 1% NaHCO<sub>3</sub> soln, and shake again. Filter CHCl<sub>3</sub> layer thru cotton previously washed with CHCl<sub>3</sub> into 50 mL vol. flask contg 5.0 mL alcohol. Ext acid and alk. solns with two 10 mL portions CHCl<sub>3</sub>, filter into vol. flask, and dil. to vol. with CHCl<sub>3</sub>.

Proceed as in (a), second par.

mg Rescinamine in sample weighed

$$= 2.5 \times (A - A_0)/(A' - A'_0).$$

**38.104 Determination of Total Alkaloids**

Transfer 10 mL aliquot prepd sample soln and 10 mL std soln, (c), to sep. 25 mL vol. flasks, and dil. to vol. with alcohol. Det. spectrum of each soln in region 250–360 nm against blank of 9 mL  $\text{CHCl}_3$  dild to 25 mL with alcohol.

$\text{mg Total alkaloids in sample weighed} = 2.5 \times T/S$ ,

where  $T$  and  $S$  are  $A$  of sample and std solns at max. near 304 nm, resp.

Presence of other alkaloids is indicated by difference between the 2 spectra; presence of reserpine in particular is indicated by difference between colorimetric and UV detns.

**38.105 Strychnine in Liquid Preparations (29) Official Final Action**

(Other alkaloids absent. See 38.068★.)

Into evapg dish measure 50 mL sample, or enough to yield  $\geq 0.065$  g strychnine, and remove alcohol by evapn. Transfer to separator, add 1 mL  $\text{NH}_4\text{OH}$ , or enough to render soln alk., and proceed as in 38.002, beginning "... ext with four 25 mL portions  $\text{CHCl}_3$  (use . . ."

**38.106 Strychnine in Tablets—Official Final Action**

(Other alkaloids absent)

See 38.002.

**Theobromine in Theobromine-Calcium Salicylate (30) Official Final Action****38.107 Method I**

Dry ca 0.5 g sample at  $110^\circ$  to const wt. Weigh 0.2 g dried substance into g-s 100 mL vol. flask, add 2 mL  $\text{HOAc}$ , and warm on steam bath. Add 10 mL boiling  $\text{H}_2\text{O}$  and shake until dissolved, adding more boiling  $\text{H}_2\text{O}$  if necessary. Cool soln to room temp. (Soln should be clear or nearly so.) Add 50 mL 0.1*N* I, 20 mL satd  $\text{NaCl}$  soln, and 2 mL  $\text{HCl}$ . Shake well and dil. to vol. with  $\text{H}_2\text{O}$ . Shake again and let stand overnight. Filter, discarding first 10 mL filtrate. Titr. 50 mL filtrate with 0.1*N*  $\text{Na}_2\text{S}_2\text{O}_3$ , using starch soln, 6.005(f), as indicator. 1 mL 0.1*N* I = 0.00450 g theobromine,  $\text{C}_7\text{H}_8\text{O}_2\text{N}_4$ .

**Method II (31)****38.108****Indicator**

*Phenol red indicator*.—Triturate 0.1 g phenol red in agate mortar with 15 mL 0.02*N*  $\text{NaOH}$  until dissolved and dil. soln to 200 mL with recently boiled  $\text{H}_2\text{O}$ .

**38.109****Determination**

Weigh 0.5 g powd tablets, 0.4 g powder, or 0.2 g theobromine alkaloid into 300 mL beaker and add 100 mL  $\text{H}_2\text{O}$ . Warm moderately over flame and add 15 mL ca 0.1*N*  $\text{H}_2\text{SO}_4$ . Heat to boiling to ensure complete soln and to remove  $\text{CO}_2$ . Cool to room temp. Add 1.5 mL phenol red indicator and make slightly alk. with ca 0.1*N*  $\text{NaOH}$  (violet-red); then titr. carefully to acid reaction with 0.1*N*  $\text{H}_2\text{SO}_4$  (yellow). To this soln add 25 mL (an excess) neut. 0.1*N*  $\text{AgNO}_3$ , 50.027, and immediately titr. liberated  $\text{HNO}_3$  with 0.1*N*  $\text{NaOH}$  to distinct violet-red. Cautiously titr. dropwise with const stirring near end point. 1 mL 0.1*N*  $\text{NaOH}$  = 0.01802 g  $\text{C}_7\text{H}_8\text{O}_2\text{N}_4$ .

**38.110 ★ Theophylline (32)—Official Final Action ★**

(Applicable to solns and tablets. *Caution:* See 51.011, 51.040, and 51.056.)

Extn from acid soln and gravimetric detn. See 38.101, 12th ed.

**OTHER BASES****Selected Drug Combinations by Ion Exchange Chromatography (33) Official Final Action**

(Applicable to 14 antihistamines, antitussive agents, expectorants, and sedatives, alone or combined. See Tables 38.02 for alphabetical listing of compds and 38.03 for analyzable combinations.)

**38.111****Principle**

Nitrogenous bases are sepd from excipients by retention on sulfonated polystyrene resin column. Bases are eluted with  $\text{HCl}$  and detd by UV absorption. Org. acids are retained on quaternary  $\text{NH}_4$  anion resin, eluted with  $\text{HCl}$ , and detd by UV absorption.

**38.112****Apparatus**

(a) *Chromatographic tubes*.—250 and 150  $\times$  12 mm id Chromaflex (Kontes Glass Co., K-422281, sizes 25-12 and 15-12) with 125 mL glass reservoir (K-422450), 2 replaceable coarse fritted glass disks (K-952050, 12 mm size), 2 Teflon stopcock adapters with  $\text{F}$  inner drip joint (K-422400, 12 mm size), 2 Teflon stopcock adapters with non- $\text{F}$  drip tip (K-422400, 12 mm size), Buna-N "O" rings (K-758200, 12 mm size) to seal adapter to column, and 2 clamps (K-675000, 12 mm size); or equiv.

(b) *Recording spectrophotometer*.—Suitable for measurement in 250–350 nm range, with 1 and 5 cm cells.

**38.113****Reagents**

(a) *Hydrochloric acid*.—1.2*N*. Dil. 10.0 mL  $\text{HCl}$  to 100 mL in vol. flask and stdze as in 50.012. Use normality to calc. vol. concd  $\text{HCl}$  needed to prep. eluting solns, (b)(2).

(b) *Alcoholic hydrochloric acid solns*.—(1) *Washing soln*.—6*N*. Dil. 50 mL  $\text{HCl}$  to 100 mL with alcohol (normality not critical). (2) *Eluting solns*.—0.055, 0.27, 0.30, 0.60, 1.00, and 2.50*N*. Add 500 mL alcohol to sep. 1 L vol. flasks and add enough  $\text{HCl}$  to each to give exact normality when dild to vol. Cool to room temp., dil. to vol. with  $\text{H}_2\text{O}$ , and mix.

(c) *Buffers*.—(1) *Concentrated alkaline borate buffer soln*.—pH 9; 42.025(a), pHydron buffers (Micro Essential Laboratory, Inc., 4224 Ave H, Brooklyn, NY 11210), USP alk. borate buffer, or equiv., may be used. (2) *Diluted soln*.—Dil. 5 mL concd soln with 95 mL isopropanol (1+1). (3) *pH 6 buffer*.—pHydron buffer (Micro Essential Laboratory, Inc.), phosphate buffer, 50.010, or equiv.

(d) *Cation exchange resin*.—Bio-Rad AG 50W-X4, 100–200 mesh, H-form (Bio-Rad Laboratories, 32nd and Griffin Aves, Richmond, CA 94804), or equiv. (This is washed and sized Dowex 50W-X4 resin with max. impurities (ppm): Fe 1.00, Cu 0.8, Ni 0.05, Pb 0.2, and Al 15.)

(e) *Anion exchange resin*.—Bio-Rad AGI-X2, 200–400 mesh, Cl-form, or equiv. (This is washed and sized Dowex 1-X2 resin with max. impurities (ppm): Fe 0.5, Cu 0.2, Ni 0.05, Pb 0.005, and Al 5.)

(f) *Isopropanol*.—Undild and dild (1+1).

★ Surplus method—see inside front cover.

## 38.114

**Preparation of Columns**

(a) *Column I.*—Place fritted glass disk over small glass wool pad in  $\frac{3}{8}$  adapter. Seal adapter to 250 mm column with Buna-N "O" ring. Hold in place with metal clamp and tighten thumb screw on clamp. Mix 3.0 g cation exchange resin with 15 mL H<sub>2</sub>O in beaker. Add slurry to 250 mm tube contg some H<sub>2</sub>O. Rinse beaker with H<sub>2</sub>O and add wash to column.

Pretreat column by adding five 10 mL portions 6*N* alc. HCl. Stir gently few sec after each addn and let soln pass to level of resin before further addn. Follow with H<sub>2</sub>O, stirring gently few sec until pH of eluate is 4–7. Condition resin by washing with 200 mL, followed by 10 mL 2.5*N* alc. HCl. Collect each eluate sep. and mix each. Scan 200 mL eluate against 10 mL eluate, using 1 cm cells, over 360–220 nm to det. whether any adsorbing material is being eluted from resin bed. If *A* is >0.05 at 258 and 310 nm, repeat conditioning. Pass H<sub>2</sub>O thru column until neutrd to pH 4–7. Drain to level of resin. Column is ready for use.

(b) *Column II.*—Place fritted glass disk over small glass wool pad in non- $\frac{3}{8}$  adapter. Seal adapter to 150 mm length tube with Buna-N "O" ring. Hold in place with metal clamp and tighten thumb screw on clamp. Mix 1.5 g anion exchange resin with 15 mL H<sub>2</sub>O in beaker. Add slurry to 150 mm tube contg some H<sub>2</sub>O. Rinse beaker with H<sub>2</sub>O and add to column.

Pretreat column as in (a) and wash until pH of eluate is 4–7. Condition resin by washing with 50 mL isopropanol (1+1). Drain to level of resin. Column is ready for use.

(c) *Regeneration (both columns).*—(Repeat after each analysis.) Add five 10 mL portions 6*N* alc. HCl. Stir gently few sec after each addn. Let soln drain to level of resin before further addn to column. Follow with H<sub>2</sub>O and stir gently until pH of eluate is 4–7. Store with H<sub>2</sub>O on each column. Drain H<sub>2</sub>O to level of resin before use.

## 38.115

**Preparation of Standard Solutions**

Prep. stds fresh daily as in Table 38:02, using USP ref. stds, where available.

## 38.116

**Preparation of Samples**

(a) *Powders and tablets.*—From Table 38:02 and final vol. in 38.117, calc. amt of finely pulverized sample to weigh accurately. Transfer to 50 mL Florence or vol. flask with three 5 mL portions alcohol followed by three 5 mL portions isopropanol (1+1). Warm 5 min on steam bath and mix on mech. wrist-action shaker until sample is thoroly dispersed. Filter onto indicated ion exchange column, 38.117, thru Whatman No. 541 dry paper,

rinse flask and funnel with 4 portions warm isopropanol (1+1), and add rinses to column.

(b) *Individual tablet assay.*—Crush tablet and completely transfer to 50 mL Florence or vol. flask and continue as in (a).

(c) *Capsules.*—From Table 38:02, final vol. in 38.117, and amt of sample available, calc. amt of active ingredients and final vol. (V). Quant. transfer capsule contents to erlenmeyer. Place emptied capsules in beaker, add (V/4) mL cold H<sub>2</sub>O to cover, and let stand 10 min with frequent agitation. Transfer soln in beaker to erlenmeyer, rinse beaker with four 5 mL portions cold H<sub>2</sub>O, and add rinses to flask. Add equal vol. undild isopropanol to flask and mix. Warm erlenmeyer on steam bath 5 min and mix contents until thoroly dispersed. Filter soln into vol. flask thru Whatman No. 541 dry paper and wash paper with four 5 mL portions warm isopropanol (1+1). Cool, dil. to vol. with isopropanol (1+1), and mix.

(d) *Sirups or viscous liquids.*—Using 25 mL "to contain" pipet, draw sirup or viscous liq. just to meniscus and transfer to 50 mL vol. flask. Dil. to vol. with appropriate solv. and mix. (Solv. may be H<sub>2</sub>O, alcohol, undild isopropanol, or dild isopropanol (1+1). Test small portion sirup for solubility in each solv. If alcohol ppts Me cellulose (excipient), filter and take portion clear filtrate for analysis.) From Table 38:02 and final vol. in 38.117, calc. vol. aliquot to pipet from vol. flask onto ion exchange column.

(e) *Aqueous liquids.*—From Table 38:02 and final vol. in 38.117, calc. vol. sample to pipet onto ion exchange column.

## 38.117

**Determination**

Complete sample prepn and detn within same day. No flow rate adjustment for columns is necessary except for amphetamine sulfate. Elute columns with stopcocks fully opened.

(a) Arrange columns so eluate from Column I flows thru Column II into 200 mL vol. flask. Let sample soln pass thru columns until it sinks into resin. Pass ca 150 mL isopropanol (1+1) thru columns. (To prevent resin disturbance, establish ca 5 mL solv. head on Column II before each elution as follows: Break seal between columns. Close Column II stopcock and let eluate from Column I drain onto II until 5 mL is added. Close Column I stopcock. Re-establish seal between columns and open both stopcocks. Each eluate should pass completely thru resin in both columns before next eluate is added.) Remove Column II.

Add 10.0 mL concd pH 9.0 buffer to the vol. flask, dil. to vol. with isopropanol (1+1), and mix. This flask contains barbital Na or phenobarbital. Dil. sample solns with dild pH 9.0 buffer to

Table 38:02 Preparation of Standards (Use 100 mL Volumetric Flasks)<sup>a</sup>

Std	Abbrev.	Solv. (and Column Eluant)	Concn. mg/mL	Detd by Method 38.108
Amphetamine sulfate (USP)	AS	0.60 <i>N</i> alc. HCl	0.15	a
Barbital sodium (ICN-K&K Laboratories, Inc.)	BS	<sup>b</sup>	0.01	a, c
Codeine phosphate	CP	0.30 <i>N</i> alc. HCl	0.10	d
Dextromethorphan.HBr (USP)	DM	1.00 <i>N</i> alc. HCl	0.10	f, g
Ephedrine sulfate (USP)	ES	0.60 <i>N</i> alc. HCl	0.15	a
Glyceryl guaiacolate	GG	isopropanol (1+1)	0.04	g
Methapyrilene.HCl (USP)	MP	2.50 <i>N</i> alc. HCl	0.02	a, b
Phenobarbital (USP)	PB	<sup>b</sup>	0.01	a, c
Phenylephrine.HCl (USP)	PE	0.30 <i>N</i> alc. HCl	0.05	e, f, g
Phenylpropanolamine.HCl (USP)	PP	0.60 <i>N</i> alc. HCl	0.15	e, f, g
Potassium guaiacolsulfonate	PG	0.055 <i>N</i> alc. HCl	0.04	d, e, f
Promethazine.HCl (USP)	PZ	2.50 <i>N</i> alc. HCl	0.04	d, e
Pyrimamine maleate (USP)	PM	2.50 <i>N</i> alc. HCl	0.02	a, b, f, g
Tripeleennamine citrate (USP)	TC	2.50 <i>N</i> alc. HCl	0.025	a, b

<sup>a</sup> Use 1 cm cell for detn, except for AS, ES, and PP where 5 cm is used.

<sup>b</sup> Weigh std into 100 mL vol. flask, dissolve in 5.0 mL concd pH 9 buffer soln, and dil. to vol. with isopropanol (1+1).

give final concn ca 1 mg/100 mL. Scan sample and std solns from 350 to 220 nm against dild pH 9.0 buffer. Det. *A* at max., ca 240 nm, and calc. sample soln concn.

Wash Column / with 50 mL 0.055*N* alc. HCl. Follow with 10.0 mL 0.27*N* alc. HCl to elute excipients and any remaining color. Discard wash. Place 100 mL vol. flask beneath column and elute amphetamine sulfate or ephedrine sulfate with 100 mL 0.60*N* alc. HCl. (Use max. gravity flow for ephedrine but adjust flow to 2–3 mL/min for amphetamine sulfate.) Scan sample and std solns from 350 to 220 nm in 5 cm cells against 0.60*N* alc. HCl. Calc. sample soln concn by drawing baseline between min. at ca 265 and 255 nm. Measure *A* between max. and baseline at ca 258 nm.

For methapyrilene.HCl, pyrilamine maleate, or tripeleminamine citrate, place 250 mL vol. flask beneath Column /, elute antihistamine with 250 mL 2.50*N* alc. HCl, and mix. Dil. sample with 2.50*N* alc. HCl to give concn ca 2.5 mg/100 mL. Scan sample and std solns from 360 to 220 nm against 2.50*N* alc. HCl. Det. *A* at max., ca 310 nm, and calc. sample soln concn.

In absence of barbiturate, omit Column //, and proceed as in par. 3.

In absence of antihistamine, omit par. 4.

(b) Proceed as in (a), omitting Column // and 0.60*N* alc. HCl eluant.

(c) Proceed as in (a), omitting pars 3 and 4.

(d) Arrange columns so eluate from Column // flows thru Column / and into beaker. Proceed as in (a), until columns are sepd.

Promethazine.HCl and codeine phosphate are retained on Column /; K guaiacolsulfonate is retained on Column //.

For K guaiacolsulfonate, place 250 mL vol. flask beneath Column // and elute guaiacolsulfonate anion with 250.0 mL 0.055*N* alc. HCl. Dil. to vol. with 0.055*N* alc. HCl and mix. Further dil. with 0.055*N* alc. HCl to give concn ca 0.04 mg/mL. Scan sample and std solns from 350 to 240 nm in 1 cm cells against 0.055*N* alc. HCl as ref. Calc. sample soln concn by drawing baseline tangent from 350 to 290 nm and extended to 240 nm. Measure *A* between max. and baseline at ca 278 nm.

For codeine phosphate, place 250 mL vol. flask beneath Column / and elute with 250.0 mL 0.30*N* alc. HCl. Dil. to vol. with 0.30*N* alc. HCl and mix. Further dil. with 0.30*N* alc. HCl to give concn ca 0.10 mg/mL. Scan sample and std solns between 350 and 220 nm in 1 cm cells against 0.30*N* alc. HCl as ref. Calc. sample soln concn by drawing baseline tangent from ca 300 to

<sup>a</sup> *Explanation:* Single compds will be found at intersection of identical column and row heads. For combinations of  $\geq 2$  compds (*n*), arrange compds alphabetically in order of their abbreviations. Locate the first group of 1 less than total number present (*n* - 1) in first column; entire combination is given at intersection of row list of (*n* - 1) compds with column headed by last compd. *Abbreviations—dosage forms:* s = solid prepn (tablet, capsule, or powder); f = fluid prepn (elixir, sirup, or aq. soln). *Method:* appropriate sec. in 38.117 given in parentheses, (a)–(g). When only the method sec. appears as entry, both solid and fluid preps, except in footnote *b* below, can be analyzed.

<sup>b</sup> DM can be detd in s form only; PP can be detd in f form only.

260 nm. Measure *A* between max. and baseline at ca 285 nm.

For promethazine.HCl, place 250 mL vol. flask beneath Column / and elute with 250.0 mL 2.50*N* alc. HCl. Dil. to vol. with 2.50*N* alc. HCl and mix. Further dil. with 2.50*N* alc. HCl to give concn ca 0.04 mg/mL. Scan sample and std solns between 360 and 240 nm in 1 cm cells against 2.50*N* alc. HCl as ref. Det. *A* at max., ca 300 nm, and calc. sample soln concn.

In absence of K guaiacolsulfonate, omit Column //.

In absence of codeine phosphate, omit 0.30*N* alc. HCl eluate.

In absence of promethazine.HCl, omit 2.50*N* alc. HCl eluant.

(e) Arrange columns so eluate from Column / flows thru Column // and into beaker. Proceed as in (d) until K guaiacolsulfonate has been detd. Phenylephrine.HCl or phenylpropanolamine.HCl and promethazine.HCl are retained on Column /.

Wash Column / with 50 mL 0.055*N* alc. HCl to elute excipients and any remaining color, and discard wash. Place 100 mL vol. flask beneath column and elute phenylephrine.HCl or phenylpropanolamine.HCl with 100.0 mL 0.30*N* alc. HCl. Dil. to vol. with 0.30*N* alc. HCl and mix. Further dil. with 0.30*N* alc. HCl to give concns ca 0.05 and 0.10 mg/mL, resp. For phenylephrine.HCl, scan sample and std solns between 350 and 220 nm in 1 cm cells against 0.30*N* alc. HCl as ref. Calc. sample soln concn by using baseline drawn tangent from 295 to 240 nm. Measure *A* between max. and baseline at ca 272 nm.

For phenylpropanolamine.HCl, scan sample and std solns between 350 and 220 nm in 5 cm cells against 0.30*N* alc. HCl as ref. Calc. sample soln concn by using baseline drawn tangent from ca 265 to 255 nm. Measure *A* between max. and baseline at ca 258 nm.

For promethazine.HCl, proceed as in (d).

(f) Proceed as in (e) until phenylephrine.HCl or phenylpropanolamine.HCl has been detd.

For dextromethorphan.HBr, place 200 mL vol. flask beneath Column / and elute with 120.0 mL 1.00*N* alc. HCl. Dil. to vol. with 1.00*N* alc. HCl and mix. Further dil. with 1.00*N* alc. HCl to give concn ca 0.10 mg/mL. Scan sample and std solns between 350 and 235 nm in 1 cm cells against 1.00*N* alc. HCl as ref. Calc. sample soln concn by using baseline drawn tangent from 350 to 300 nm and extended to 235 nm. Measure *A* between max. and baseline at ca 280 nm.

For pyrilamine maleate, place 250 mL vol. flask beneath Column / and elute with 250.0 mL 2.50*N* alc. HCl. Dil. to vol. with 2.50*N* alc. HCl and mix. Further dil. with 2.50*N* alc. HCl to give concn ca 0.020 mg/mL. Scan sample and std solns from 360 to 220 nm against 2.50*N* alc. HCl as ref. Det. *A* at max., ca 310 nm, and calc. sample soln concn.

In absence of dextromethorphan.HBr, omit 1.00*N* alc. HCl eluant.

In absence of phenylephrine.HCl or phenylpropanolamine.HCl, discard 0.30*N* alc. HCl eluant.

In absence of pyrilamine maleate, omit 2.50*N* alc. HCl eluant.

(g) Proceed as for phenylephrine.HCl or phenylpropanolamine.HCl, etc. in (e) except arrange columns so eluate from Column // flows thru Column / and into 250 mL vol. flask. Let sample soln flow thru column until it sinks into resin. Pass ca 150 mL isopropanol (1+1) thru columns. (To prevent resin disturbance, establish ca 5 mL solv. head on Column / before each elution as in (a).) Remove Column // and wash Column / with 50.0 mL 0.055*N* alc. HCl; collect eluate in same vol. flask. Dil. glyceryl guaiacolate to vol. with isopropanol (1+1) and mix. Further dil. sample with isopropanol (1+1) to give concn ca 0.04 mg/mL. Scan sample and std solns from 350 to 220 nm against isopropanol (1+1) as ref. Det. *A* at max., ca 274 nm, and calc. sample soln concn.

In absence of dextromethorphan.HBr, omit 1.00*N* alc. HCl eluant.

In absence of pyrilamine maleate, omit 2.50*N* alc. HCl eluant.  
In absence of phenylephrine.HCl or phenylpropanolamine.HCl, discard 0.30*N* alc. HCl eluant.

#### Amphetamine (34)—Official Final Action

#### 38.120 ★ *Titrimetric Method* ★

Extn from alk. soln and titrn. See 38.116, 12th ed.

#### 38.121 ★ *Confirmatory Gravimetric Determination* ★

Acetylation and gravimetric detn of acetylamphetamine. See 38.117, 12th ed.

#### *Spectrophotometric Method (35)*—Official First Action

(Applicable in presence of thyroid, phenobarbital, atropine, and aloin)

#### 38.122

#### *Apparatus*

(a) *Spectrophotometer*.—Capable of isolating bands  $\leq 1$  nm in 225–300 nm region; with 1 cm cells.

(b) *Distillation apparatus*.—Use following or equiv.: 500 mL Kjeldahl flask (Kontes Glass Co., No. K-742000) to which is fitted bulb-type distg head (K-517000). Attach connector (K-169500) from distg head to H<sub>2</sub>O-cooled West condenser (K-452000). Attach adapter to bottom of condenser to dip below surface of liq. in 300 mL erlenmeyer. All joints are  $\frac{1}{8}$  24/40. Lightly coat flask joint with Dow Corning high vac. grease to prevent freezing.

#### 38.123

#### *Preparation of Standard Solution*

Accurately weigh 80–90 mg amphetamine sulfate of known purity, transfer to 100 mL vol. flask, and dissolve in 1*N* H<sub>2</sub>SO<sub>4</sub>. Dil. to vol. with 1*N* H<sub>2</sub>SO<sub>4</sub> and mix well.

#### 38.124

#### *Preparation of Sample*

Det. av. wt of tablets or capsule contents. Grind tablets or capsule contents to pass No. 60 sieve without appreciable loss.

#### 38.125

#### *Determination*

Accurately weigh portion prepd sample contg ca 20–22 mg amphetamine sulfate (or equiv. of other salt). Transfer to Kjeldahl flask, add 25 mL 1*N* H<sub>2</sub>SO<sub>4</sub>, ca 0.5 g granulated Zn, and 100 mL H<sub>2</sub>O, and heat on steam bath ca 5 min. Swirl occasionally to completely disperse sample. Cool and wash down sides of flask with 75 mL H<sub>2</sub>O contg small amt of antifoam agent such as Dow Corning Antifoam A spray. Place 300 mL erlenmeyer contg 50 mL 0.5*N* H<sub>2</sub>SO<sub>4</sub> under condenser so that adapter extends nearly to bottom of flask.

Place Kjeldahl flask on wire gauze sq from which 4 cm circle of asbestos has been removed. Add 25 mL 10% NaOH soln to flask and quickly connect distn app. Make sure all joints are tight. Begin heating with Bunsen burner and bring to rolling boil (shield receiver from excessive heat). Collect 150–175 mL distillate or enough so total vol. in receiver is 200–225 mL. Distil 60 ± 15 min.

When distn is complete, remove connector first, then burner. Rinse condenser and adapter into receiver with few mL H<sub>2</sub>O. Transfer distillate to 500 mL separator, washing flask with few mL H<sub>2</sub>O, and add washing to separator. Make soln alk. with 25 mL 10% NaOH soln, immediately add 50 mL CHCl<sub>3</sub>, and shake

★ Surplus method—see inside front cover.

cautiously but thoroly 2 min. Let layers sep. completely. Carefully drain  $\text{CHCl}_3$  ext into clean, dry 250 mL separator and re-ext alk. soln with 50, 25, 25, and 25 mL  $\text{CHCl}_3$ . Add 25 mL 1*N*  $\text{H}_2\text{SO}_4$  by pipet to separator contg combined  $\text{CHCl}_3$  exts and shake vigorously 2–3 min. Let layers sep. completely and discard  $\text{CHCl}_3$ . Obtain UV spectrum of aq. phase in 1 cm cell between 225 and 300 nm against ref. soln of  $\text{CHCl}_3$ -satd 1*N*  $\text{H}_2\text{SO}_4$ .

Shake 250 mL  $\text{H}_2\text{O}$  and 175 mL  $\text{CHCl}_3$  in 500 mL separator 1–2 min. Withdraw clear  $\text{CHCl}_3$  layer into separator contg 25 mL std soln. Shake vigorously 2–3 min. Obtain UV spectrum of aq. phase in 1 cm cell as above.

**38.126****Calculations**

mg Amphetamine sulfate/g sample taken  

$$= (A/A') \times (\text{mg std per mL/g sample}) \times 25,$$
 where  $A = A_{\text{max.}}$  of sample at ca 257 nm – ( $A_{\text{min.}}$  at ca 254 nm +  $A_{\text{min.}}$  at ca 262 nm)/2 and  $A'$  is corresponding value for std.

★ **Stereochemical Composition of Amphetamines (36)** ★**38.127****Polarimetric Method**

Accurately weigh 90 mg acetyl derivative, **38.121**★, transfer quant. to 5 mL vol. flask, and dil. to vol. with  $\text{CHCl}_3$ . Det. optical rotation of soln in semimicro 2 dm (200 mm) tube (bore, ca 4.5 mm; vol., 3–4 mL) at same temp. at which soln was dild to vol. Acetyl-*d*-amphetamine is levorotatory in  $\text{CHCl}_3$ .

In measuring rotation with polariscope, take 10 readings on soln and calc. av. to 0.001°. Det. av. reading with same tube filled with  $\text{CHCl}_3$  similarly, and use av. zero-point reading thus obtained to correct av. reading of soln. If saccharimeter is used instead of polariscope, est. all readings to 0.05 division, calc. av. to 0.01 division, correct for zero-point, and multiply value so obtained by appropriate factor, **31.020(c)**, or by 0.3462 (°S) to obtain rotation,  $\alpha$ , in angular degrees.

Calc. sp rotation,  $[\alpha]$  (to 0.1°) =  $100\alpha/c \times l$ ,

in which  $c$  = acetylamphetamine concn in g/100 mL and  $l$  = tube length in decimeters.

% Dextroamphetamine =  $50 + (50[\alpha]/44)$ ,

in which  $[\alpha]$  = sp rotation of acetyl derivative from sample, and 44 = sp rotation of pure acetyl-*d*-amphetamine; sign of rotation is ignored.

**38.128****Confirmatory Thermal Analysis**

In mp tube, 2–3 mm id at bottom and ca 70 mm long, place enough finely powd acetyl-*d*-amphetamine (ca 8 mg) to form column 5–6 mm high after tube and contents have been tapped firmly several times on hard surface.

Select thermometer with 90–130° range, with graduations permitting readings to 0.5° with aid of low-power hand lens. Thermometer need not be calibrated, but if not, same thermometer must be used in detg std mp curve and mp of derivative from sample.

Securely fix mp tube to thermometer by 2 small rubber bands, one near top of tube and other as far down as possible without letting liq. in bath touch band. (Bands may be cut from rubber tubing of proper size.) Adjust tube so that middle of column of specimen coincides approx. with middle of thermometer bulb.

Support assembly in mech.-stirred mp bath. Rapidly raise temp. of bath until it is ca 5° below anticipated mp (temp. at which specimen becomes entirely clear liq.); then regulate heating carefully so that rise in temp. is  $\leq 0.5^\circ/\text{min}$ . After specimen begins to melt, stir continuously with chromel wire (0.4 mm diam.; flatten ca 3 mm of lower end and bend flattened portion at right angle ca 1 mm from tip so as to form hoe-like

stirrer) while carefully inspecting it with ca 10× hand lens. (Observation is facilitated by passing beam of light thru specimen from rear.) Note temp. at which last crystal disappears, and record this as mp. Remove tube and thermometer from bath, induce melt to solidify by stirring (seeding if necessary), and repeat detn. Replicate detns will not differ by  $> 1^\circ$  if carefully performed. Following same procedure, det. mp of pure acetyl-*d*-amphetamine.

Prep. series of std mixts of acetyl-*d*- and acetyl-*l*-amphetamine with following compositions, expressed in mg: 80*d* + 20*l*, 60*d* + 40*l*, 40*d* + 60*l*, and 20*d* + 80*l*. These mixts contain, resp., 90, 80, 70, and 60% *d*-isomer. In each case, accurately weigh each component into small (18 × 55 mm) test tube, hold tube in bath heated to 130–135° until contents melt completely, stir molten contents with small stainless steel spatula until well mixed, and then withdraw tube from bath and continue to stir until melt solidifies completely. Transfer solidified material as completely as possible to small mortar, powder finely, and mix thoroly. Det. mp of each mixt. as above. In each mixt., beginning of fusion (softening, appearance of liq. phase) will be noted at ca same temp. (ca 93°), but temp. at which system becomes entirely liq. (mp) will depend on composition of mixt. Unlike mp detns of pure *dl*- and *d*-derivatives, it is not important to stir mixts continuously after first evidence of fusion. After considerable liq. phase forms, stir sample occasionally as solid phase diminishes. Stir continuously during ca last 2 min of detn, *i.e.*, during inspection in anticipation of disappearance of last portion of cryst. matter. Push down any solids adhering to walls of tube above melt into melt with wire stirrer.

Using coordinate paper, plot av. mp (ordinate) of each specimen against composition (abscissa) expressed as % acetyl-*d*-amphetamine, and draw best smooth curve thru the 6 plotted points.

Det. mp of derivative obtained from sample and est. % *d*-isomer present from std curve.

**Gas-Liquid Chromatographic Method (37)**  
**Official Final Action****38.129****Apparatus**

(a) *Gas chromatograph*.—Equipped with flame ionization detector. Operate at sensitivity such that proline derivative from 10  $\mu\text{g}$  *d*-amphetamine sulfate gives peak 70–90% full scale. Adjust injection zone and detector temps to 230°.

(b) *Column*.—Glass, 2 m × 4 mm id, packed with 1% Carbowax 20M on 80–100 or 100–120 mesh Gas-Chrom Q (Applied Science Laboratories, Inc.). Condition column 24 hr at 210° before use. Operate at 185° and adjust N carrier gas flow rate so that proline derivative of *d*-amphetamine is eluted in ca 15 min (ca 60 mL/min).

(c) *Chromatographic tube*.—22 × 300 mm, without stopcock.

**38.130****Reagents**

(a) *Diatomaceous earth*.—See **36.002**.

(b) *Proline reagent*.—(Prep. reagent at  $< 30^\circ$ .) To 1.0 g *l*-proline (Sigma Chemical Co.) in 125 mL g-s conical flask, add 5 g trifluoroacetic anhydride (Eastman Kodak Co.) and swirl until proline is dissolved. Evap. excess trifluoroacetic anhydride under stream of dry N. Add 5 mL thionyl chloride, let stand 15 min, and evap. excess under stream of dry N. Dissolve residue in 100 mL  $\text{CH}_2\text{Cl}_2$  and refrigerate when not in use. Properly prepd reagent will give *l*-amphetamine ratio, **38.132**,  $\leq 0.02$  with *d*-amphetamine sulfate. (Caution: Trifluoroacetic anhydride and

★ Surplus method—see inside front cover.

thionyl chloride are toxic. Wear rubber gloves and eye protection and use effective fume removal device for evapn.)

(c) *Std soln I*.—0.5 mg USP Ref. Std Dextroamphetamine Sulfate/mL H<sub>2</sub>O.

(d) *Std soln II*.—0.5 mg *dl*-amphetamine sulfate (ICN-K&K Laboratories, Inc.)/mL H<sub>2</sub>O. Recrystallize *dl*-amphetamine sulfate from alcohol and dry under vac. at 100° before use.

### 38.131

#### Preparation of Wash Column

Mix 3.0 mL 1*N* NaOH with 5.0 g diat. earth and transfer to chromatgc tube contg small glass wool plug. Place glass wool pad on top of diat. earth and tamp firmly.

### 38.132

#### Preparation of Standard Curve

Prep. series of *l*-amphetamine sulfate stds contg total of ca 10 mg amphetamine sulfate in 20 mL H<sub>2</sub>O in 125 mL separators as follows: 0% *l*-amphetamine sulfate from 20 mL std soln *I* and 0 mL std soln *II*; 12.5%, 15 mL *I* and 5 mL *II*; 25%, 10 mL *I* and 10 mL *II*; 37.5%, 5 mL *I* and 15 mL *II*; and 50%, 0 mL *I* and 20 mL *II*. Treat each soln as follows: Add 5 mL 1*N* NaOH and ext with two 25 mL portions CHCl<sub>3</sub>. Filter CHCl<sub>3</sub> exts thru absorbent cotton into dry 150 mL beaker. Add 3 mL proline reagent, (b), and let stand 30 min; then transfer to wash column. Collect eluate in 150 mL beaker. Pass addnl 25 mL CHCl<sub>3</sub> thru column. Evap. on steam bath with aid of N stream, dissolve residue in 5 mL CHCl<sub>3</sub>, and transfer to g-s flask. Inject 5  $\mu$ L and calc.

$$l\text{-amphetamine ratio} = H_i \times R_{ii} / [(H_d \times R_d) + (H_i \times R_i)],$$

where *H* and *R* = peak ht and retention time, resp., of *d*- and *l*-amphetamine derivatives. Plot *l*-amphetamine ratio against % *l*-amphetamine.

### 38.133

#### Determination

Transfer finely powd sample contg ca 10 mg amphetamine sulfate to 100 mL beaker, add 2 g diat. earth, and mix. Add 3.0 mL 1*N* NaOH and mix to uniform slurry. Add 3.0 g diat. earth, mix well, and pack into chromatgc tube contg small glass wool plug. Place 150 mL beaker under column and elute with 100 mL CHCl<sub>3</sub>. Proceed as in 38.132, beginning "Add 3 mL proline reagent, (b), . . ." Calc. *l*-amphetamine ratio and det. *l*-amphetamine from std curve.

### 38.134 Amphetamine in Presence of Antihistamines and Barbiturates and Other Drugs

#### Official Final Action

See 38.111–38.117.

### Antihistamines in Presence of Acetophenetidin, Acetylsalicylic Acid, and Caffeine (APC) (38)

#### Official Final Action

(Applicable to thonzylamine.HCl, pheniramine maleate, and chlorpheniramine maleate in combination with APC)

### 38.135

#### Preparation of Standard Solutions

Prep. sep. std solns of thonzylamine.HCl, pheniramine maleate, and chlorpheniramine maleate by dissolving 250 mg antihistamine salt, accurately weighed, in 50.0 mL H<sub>2</sub>O. Pipet 5 mL of each soln into sep. 100 mL vol. flasks and dil. to vol. with ca 0.1*N* H<sub>2</sub>SO<sub>4</sub>. Transfer 10 mL of each acid soln to sep. 100 mL vol. flasks and dil. to vol. with ca 0.1*N* H<sub>2</sub>SO<sub>4</sub>. (Concn = 2.5 mg/100 mL.) Det. *A'* of thonzylamine.HCl at 314 nm, pheniramine maleate at 265 nm, and chlorpheniramine maleate at 264 nm.

### 38.136

#### Determination

Place accurately weighed powd sample contg ca 10 mg antihistamine in 125 mL separator. Add 15 mL H<sub>2</sub>O and ca 0.5 mL H<sub>2</sub>SO<sub>4</sub> (1+1). Ext with CHCl<sub>3</sub>, using 30, 20, 20, and 20 mL portions. Re-ext by passing CHCl<sub>3</sub> exts successively thru 2 separators, each contg 10 mL ca 0.1*N* H<sub>2</sub>SO<sub>4</sub>, shaking vigorously each time. Discard CHCl<sub>3</sub> and combine aq. solns.

Make combined solns alk. with 10% NaOH and ext with 30, 20, 20, and 20 mL portions CHCl<sub>3</sub>. Again pass CHCl<sub>3</sub> exts successively thru 2 separators, each contg 20 mL ca 0.1*N* H<sub>2</sub>SO<sub>4</sub>, shaking vigorously each time. Discard CHCl<sub>3</sub>, combine acid aq. solns, and dil. to vol. with ca 0.1*N* H<sub>2</sub>SO<sub>4</sub> in 100 mL vol. flask. Transfer 25 mL aliquot to 100 mL vol. flask and dil. to vol. with ca 0.1*N* H<sub>2</sub>SO<sub>4</sub>. Det. *A* at wavelength of max. absorption against ca 0.1*N* acid as ref.

$$\% \text{ Thonzylamine.HCl} = (A \times 2.5 \times 4 \times 100) / (A' \times \text{mg sample}).$$

$$\% \text{ Pheniramine or chlorpheniramine maleate}$$

$$= 1.018 \times (A \times 2.5 \times 4 \times 100) / (A' \times \text{mg sample}),$$

where 1.018 corrects for absorbance of maleate moiety of std.

### 38.137 Antipyrine and Benzocaine—Official Final Action

See 38.144–38.148.

### Benzocaine (Ethyl *p*-Aminobenzoate)—Official Final Action

#### Colorimetric Method (39)

### 38.138

#### Principle

Benzocaine is diazotized with NaNO<sub>2</sub>, excess nitrite is removed with NH<sub>4</sub> sulfamate, and product is coupled with *N*-1-naphthylethylenediamine.2HCl. Colored soln has max. at 540 nm. Method is not applicable in presence of sulfonamides. Benzocaine must be sepd from inorg. I to avoid interference. Antipyrine in 10-fold excess does not interfere.

### 38.139

#### Reagents

*Benzocaine std solns.*—(1) *Stock soln.*—0.25 mg/mL. Dissolve 25.0 mg benzocaine USP in 25–50 mL H<sub>2</sub>O in 100 mL vol. flask. Add 3 mL HCl, shake gently, and dil. to vol. with H<sub>2</sub>O. (2) *Working soln.*—5  $\mu$ g/mL. Pipet 10 mL stock soln into 100 mL vol. flask and dil. to vol. with H<sub>2</sub>O. Pipet 20 mL of this soln into 100 mL vol. flask and dil. to vol. with H<sub>2</sub>O.

### 38.140

#### Preparation of Standard Curve

Pipet 0.0, 2.0, 6.0, and 10.0 mL working std soln into sep. 25 mL vol. flasks. To each flask add 1 mL HCl (1+1). Dil. to 15 mL with H<sub>2</sub>O, add 1 mL 0.1% NaNO<sub>2</sub> soln, 37.153(c), mix, and let stand 5 min, swirling several times during standing. Add 1 mL 0.5% NH<sub>4</sub> sulfamate soln, 37.153(d), and let stand 5 min, swirling several times during standing. Add 1 mL colorless 0.1% *N*-1-naphthylethylenediamine.2HCl soln, 42.017(d), let stand 15 min, swirling several times during standing, and dil. to 25.0 mL with H<sub>2</sub>O.

Det. *A* of each soln in matched 1 cm cells in spectrophtr at 540 nm against H<sub>2</sub>O as ref. (Avoid collection of N bubbles on cell walls.) To obtain  $\Delta A$ , subtract reading of soln contg *no* std from each of other std readings. Plot  $\Delta A$  against benzocaine concn.

### 38.141

#### Preparation of Samples

(a) *Liquid preparation in water-soluble bases.*—Weigh sample contg 100 mg benzocaine, transfer to 250 mL vol. flask, and add 75 mL alcohol. Add 3 mL HCl, dil. to vol. with H<sub>2</sub>O, and mix well. Pipet 10 mL into 100 mL vol. flask, dil. to vol. with H<sub>2</sub>O, and mix

well. Pipet 10 mL of diln into 100 mL vol. flask, dil. to vol. with H<sub>2</sub>O, and mix well.

(b) *Tablets or troches*.—Weigh powd sample contg 7.5–10 mg benzocaine. Transfer to 100 mL beaker, wet with 2–3 mL alcohol, stir with glass rod to slurry, add 5 mL H<sub>2</sub>O and 2 mL HCl, stir, and let stand at room temp. 5 min. Dil. with 25 mL H<sub>2</sub>O, transfer quant. to 100 mL vol. flask, and dil. to vol. If soln is cloudy, filter thru dry paper, discarding first 10 mL filtrate. Pipet 10 mL clear filtrate into 100 mL vol. flask, dil. to vol. with H<sub>2</sub>O, and mix well.

(c) *Suppositories in water-soluble bases*.—Weigh sample contg 50–100 mg benzocaine into 100 mL beaker, add 15 mL H<sub>2</sub>O and 3 mL HCl, and let stand at room temp. 15 min, stirring occasionally with rod. Transfer quant. to 250 mL vol. flask, dil. to vol., and mix well. Pipet 10 mL into 100 mL vol. flask, dil. to vol., and mix well. Pipet 10 mL of diln into 100 mL vol. flask, dil. to vol., and mix well.

**38.142****Determination**

Pipet 2 aliquots of final diln specified in **38.141** contg 20–30 µg benzocaine into sep 25 mL vol. flasks. Label one flask "sample" and the other "sample blank." Proceed as in **38.140**, beginning "To each flask add 1 mL HCl (1+1)." except do not add NaNO<sub>2</sub> to "sample blank."

Det. A at 540 nm for each soln against H<sub>2</sub>O as ref. Subtract A of "sample blank" from "sample" reading. Det. µg benzocaine in aliquot from std curve.

$$\% \text{ Benzocaine} = (B \times F) / (W \times 10),$$

where *B* = µg benzocaine from std curve, *F* = diln factor, and *W* = mg sample.

**38.143 ★ Bromination Method (40) ★**

See **38.139**, 12th ed.

**Benzocaine and Antipyrine (41)—Official Final Action**

(Applicable in presence of glycerol and propylene glycol bases)

**38.144****Principle**

Benzocaine and antipyrine are extd by column partition chromatgy. Antipyrine is retained on FeCl<sub>3</sub> column and benzocaine on HCl column. Max. A are detd in CHCl<sub>3</sub> eluates at 272 nm for antipyrine and 283 nm for benzocaine. To identify compds, IR spectra of KBr dispersions are compared to stds.

**38.145****Apparatus and Reagents**

(a) *Chromatographic column and tamping rod*.—See **37.002**.

(b) *Syringe*.—10 mL syringe with 14 gage 4" laboratory cannula.

(c) *Ferric chloride*.—9%. Dissolve 9 g anhyd. FeCl<sub>3</sub> in H<sub>2</sub>O and dil. to 100 mL.

(d) *Diatomaceous earth*.—See **36.002**.

(e) *Chloroform, washed*.—Shake 4 vols CHCl<sub>3</sub> with 1 vol. H<sub>2</sub>O.

(f) *Mixed solvent*.—H<sub>2</sub>O-satd CHCl<sub>3</sub>-ether-isooctane (10+25+65).

(g) *Antipyrine std soln*.—1 mg/100 mL. Accurately weigh antipyrine std, previously dried 2 hr at 60°, and dil. with CHCl<sub>3</sub> to give concn of 0.1 mg/mL. Pipet 10 mL into 100 mL vol. flask contg 10 mL MeOH and 1.0 mL mixed solv., and dil. to vol. with washed CHCl<sub>3</sub>.

(h) *Benzocaine std soln*.—0.4 mg/100 mL. Accurately weigh USP Benzocaine Ref. Std, previously dried 3 hr over P<sub>2</sub>O<sub>5</sub>, and dil. with CHCl<sub>3</sub> to concn of 0.04 mg/mL. Pipet 10 mL into 100 mL

vol. flask contg 10 mL MeOH and 1.0 mL mixed solv., and dil. to vol. with washed CHCl<sub>3</sub>.

(i) *Photometric blank*.—Pipet 10 mL MeOH and 1 mL mixed solv. into 100 mL vol. flask, dil. to vol. with washed CHCl<sub>3</sub>, and mix.

(j) *Potassium bromide*.—Anhyd. spectrophtric grade.

**38.146****Sample Density**

(Altho sample is weighed because of viscosity of preps, report results on wt/vol. basis.)

Slowly withdraw 10 mL sample with syringe, keeping air bubbles to min., and transfer to previously weighed 10 mL vol. flask without touching sides of flask above mark. Let any air bubbles present rise before filling to final vol. Weigh flask and contents, and calc. sample density.

**38.147****Preparation of Chromatographic Columns**

Loosely pack small amt glass wool uniformly in base of 3 chromatgc tubes to support diat. earth.

*Bottom column*.—Mix 3 g diat. earth with 2 mL 2*N* HCl to form uniform fluffy mixt. Transfer mixt. to column and tamp firmly to uniform mass.

*Middle column*.—Mix 5 g diat. earth with 3 mL FeCl<sub>3</sub> soln and transfer to column as above.

*Top column*.—Accurately weigh sample contg 20 mg antipyrine into 100 mL beaker. Add 2 mL H<sub>2</sub>O and then 3 g diat. earth. Mix thoroly, transfer to column, and tamp firmly to uniform mass. Dry-wash beaker with 1 g diat. earth and tamp as above.

Top each column with small loose pad of glass wool.

**38.148****Determination**

(Caution: See **51.011**, **51.040**, and **51.056**.)

(a) *Separation of antipyrine and benzocaine*.—Arrange 3 columns in series. Rinse beaker that contained sample with 50 mL mixed solv. and transfer to top column. Elute columns with 3 addnl 25 mL portions mixed solv. Discard eluate. (Middle column contains antipyrine and bottom column contains benzocaine.) Sep. columns, and elute middle and bottom columns sep. with four 25 mL portions washed CHCl<sub>3</sub>, collecting eluates in 100 mL vol. flasks. Dil. to vol. with washed CHCl<sub>3</sub>.

(b) *Determination of antipyrine*.—Pipet 5 mL from antipyrine flask into 100 mL vol. flask contg 10 mL MeOH and dil. to vol. with washed CHCl<sub>3</sub>. Det. A of final diln against photometric blank, (i), at 272 nm, using 1 cm cells. Similarly, det. A' of std antipyrine soln and calc. amt of antipyrine in sample.

(c) *Determination of benzocaine*.—Pipet aliquot of eluate contg 0.4 mg benzocaine into 100 mL vol. flask contg 10.0 mL MeOH and dil. to vol. with washed CHCl<sub>3</sub>. Det. A of final diln against photometric blank, (i), at 283 nm. Similarly, det. A' of std benzocaine soln and calc. amt of benzocaine in sample.

(d) *Identification of antipyrine and benzocaine*.—Transfer remaining CHCl<sub>3</sub> eluates from antipyrine and benzocaine sepn to sep. 150 mL beakers. Place beakers in 30–40° H<sub>2</sub>O bath and evap. to dryness with gentle air current. (Caution: Benzocaine is volatile.)

Prep. KBr disk of each residue, using 0.8 mg residue and 200 mg KBr. Record IR spectrum of each between 2 and 16 µm and qual. compare these spectra with IR spectra of antipyrine and benzocaine stds.

**Benztropine Mesylate (42)—Official Final Action**

(Not applicable in presence of compds reacting with bromophenol blue, e.g., quaternary ammonium compds)

★ Surplus method—see inside front cover.

**38.149****Principle**

Benztropine is extd from acid soln by bromophenol blue-CHCl<sub>3</sub> soln, forming dye complex with max. A at ca 410 nm.

**38.150****Reagents and Apparatus**

(a) *Dye soln.*—Weigh 100 mg reagent bromophenol blue into 1 L vol. flask, add ca 750 mL CHCl<sub>3</sub>, stir mech. 10 min to dissolve, and dil. to vol. with CHCl<sub>3</sub>. Filter thru small pad of glass wool. Dil. 50 mL to 500 mL with CHCl<sub>3</sub>. Prep. fresh daily.

(b) *Benztropine mesylate std soln.*—1 mg/100 mL. Weigh 100 mg USP Ref. Std into 100 mL vol. flask and dissolve and dil. to 100 mL with 0.2N H<sub>2</sub>SO<sub>4</sub>. Dil. 10 mL aliquot to 100 mL with 0.2N H<sub>2</sub>SO<sub>4</sub> and further dil. 10 mL dild soln to 100 mL with 0.2N H<sub>2</sub>SO<sub>4</sub>. Prep. fresh daily.

(c) *Spectrophotometer.*—Recording, with 5 cm matched cells.

**38.151****Preparation of Sample**

(a) *Tablets.*—Transfer accurately weighed ground portion contg ca 1 mg benztropine mesylate to 100 mL vol. flask, using ca 70 mL 0.2N H<sub>2</sub>SO<sub>4</sub>. Shake mech. 15 min and filter thru Whatman No. 541 paper wetted with 0.2N H<sub>2</sub>SO<sub>4</sub> into 100 mL vol. flask. Rinse flask and filter with three 5 mL portions 0.2N H<sub>2</sub>SO<sub>4</sub>, rinse filter with several small portions 0.2N H<sub>2</sub>SO<sub>4</sub>, adding rinses to soln, and dil. to vol. with 0.2N H<sub>2</sub>SO<sub>4</sub>.

(b) *Injections.*—Transfer aliquot contg ca 1 mg benztropine mesylate to 100 mL vol. flask and dil. to vol. with 0.2N H<sub>2</sub>SO<sub>4</sub>.

**38.152****Determination**

Perform detn on same day sample and std solns are prepd. Place 25 mL each sample soln and std soln and 0.2N H<sub>2</sub>SO<sub>4</sub> for blank into sep. 250 mL separators and treat similarly. Add 50 mL dye soln and shake vigorously 1 min. Let sep. and drain lower layer into 125 mL separator contg 25 mL 0.2N H<sub>2</sub>SO<sub>4</sub>. Wash by inverting 5 times and let stand ca 20 min. Filter lower CHCl<sub>3</sub> layer thru glass wool wetted with CHCl<sub>3</sub> into 100 mL vol. flask, covering funnel with watch glass. Re-ext aq. soln in 250 mL separator with 50 mL dye soln, shake vigorously 1 min, drain into same 125 mL separator, and wash and filter as before, rewetting glass wool with CHCl<sub>3</sub> if necessary. Dil. to vol. with CHCl<sub>3</sub>, mix, and place in dark 40 min.

Record spectra of std and sample solns against blank in matched 5 cm cells, and det. A at max., ca 410 nm.

$$\text{mg Benztropine mesylate/100 mL} = (A/A') \times C,$$

where A and A' refer to sample and std solns, resp; and C = concn std soln in mg/100 mL.

**Butacaine Sulfate (43)—Official Final Action****38.153****Reagents**

(a) *Potassium iodide soln.*—20%. Prep. fresh.

(b) *Starch indicator.*—Make 1.5 g sol. starch into paste with few mL H<sub>2</sub>O, and add slowly, with stirring, to 300 mL boiling H<sub>2</sub>O.

(c) *Picrolonic acid soln.*—2.5% in alcohol.

**38.154****Determination**

(Caution: See 51.011, 51.040, and 51.056.)

(a) *Ointments containing butacaine sulfate in petrolatum or other greasy base.*—Into 125 mL separator accurately weigh sample contg ca 50 mg butacaine sulfate. Add 25 mL benzene and swirl until ointment base dissolves; then add 10 mL HCl (1+7) and shake separator gently ca 1 min. Let layers sep., drain aq. phase into second separator, and repeat extn 4 times with

10 mL portions H<sub>2</sub>O. Wash combined aq. exts with 5 mL CCl<sub>4</sub> and discard washing. Neutze soln with NH<sub>4</sub>OH, add 2 mL excess, and ext butacaine base by shaking with five 15 mL portions CHCl<sub>3</sub>. Filter each ext thru cotton pledget into 100 mL beaker, and evap. combined exts on steam bath under air current until no CHCl<sub>3</sub> odor remains.

Rinse down beaker wall with 2 mL alcohol delivered from pipet, warm until oily base dissolves completely, and add 1 drop HCl. Tilt and rotate beaker to wet with acidic soln any liq. on wall of beaker, and add 1 drop Me red. If soln does not react strongly acid, add addnl HCl dropwise. Dil. with few mL H<sub>2</sub>O, and wash quant. into 500 mL I flask with more H<sub>2</sub>O.

To soln add, from pipet, 10 mL KBr-KBrO<sub>3</sub> soln, **4.002(g)**, dil. to 200 mL with H<sub>2</sub>O, and add 10 mL HCl. Immediately stopper flask and swirl 5 min or until ppt coagulates. After 5 min, add 5 mL KI soln to flask, stopper, and shake vigorously. Rinse stopper and neck of flask with little H<sub>2</sub>O, and titr. soln with 0.1N Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>, **50.037**, until color is discharged. Add 15 mL starch indicator and 20 mL CHCl<sub>3</sub>, stopper flask, and shake vigorously. Continue titrn, vigorously shaking stoppered flask after each addn of Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> soln. Add Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> soln dropwise as end point approaches. (During titrn, mixt. passes thru series of color changes; at end point aq. phase is colorless and emulsified CHCl<sub>3</sub> layer is nearly so.) 1 mL 0.1N KBr-KBrO<sub>3</sub> = 0.00889 g (C<sub>18</sub>H<sub>30</sub>N<sub>2</sub>O<sub>2</sub>)<sub>2</sub>·H<sub>2</sub>SO<sub>4</sub>.

To isolate bromination product for identification, transfer titrd mixt. to separator, make alk. with NH<sub>4</sub>OH, and shake vigorously. Drain emulsified CHCl<sub>3</sub> layer, and to break emulsion, filter with suction thru 0.5 cm layer Hyflo Super-Cel (or similar filter-aid) supported on paper in buchner. Shake aq. phase remaining in separator with 25 mL CHCl<sub>3</sub>, and pass CHCl<sub>3</sub> ext thru filter. Transfer combined filtrates to separator, filter CHCl<sub>3</sub> layer thru cotton pledget into beaker, and evap. on steam bath under air current.

To oily residue of dibromobutacaine add 2 mL picrolonic acid soln and stir. Filter ppt on Hirsch funnel, wash with 2–3 mL alcohol, dry at 105°, and det. capillary mp, alone and in admixt. with authentic dibromobutacaine picrolonate (mp 158–160° with decomposition). If ppt does not form on adding picrolonic acid soln to bromination product, seed with small crystal of dibromobutacaine picrolonate; if ppt still does not form, butacaine is absent.

(b) *Tablets.*—Det. av. wt/tablet. To 125 mL separator add accurately weighed, finely powd tablet mixt. contg ca 200 mg butacaine sulfate, add 25 mL H<sub>2</sub>O, and swirl separator until sample dissolves. Add 2 mL NH<sub>4</sub>OH and ext with six 15 mL portions CHCl<sub>3</sub>. Shake each ext with 5 mL H<sub>2</sub>O in second separator, and then filter thru cotton pledget into beaker. (If emulsion forms in aq. phase in first separator, more than 6 extns may be required. Test for complete extn by evapg seventh ext on steam bath; if appreciable residue is obtained, dissolve it in CHCl<sub>3</sub>, combine with previous exts, and continue extns until complete. If aq. phase in first separator tends to emulsify, break emulsion by addn of Na<sub>2</sub>SO<sub>4</sub> or by other means.) Evap. filtrate to small vol. on steam bath and complete detn by one of following methods:

(1) Quant. transfer concd soln of butacaine base to tared 50 mL beaker with CHCl<sub>3</sub>, remove solv. on steam bath in air current, dry 30 min at 105°, cool in desiccator, and weigh. Wt residue × 1.160 = wt butacaine sulfate, (C<sub>18</sub>H<sub>30</sub>N<sub>2</sub>O<sub>2</sub>)<sub>2</sub>·H<sub>2</sub>SO<sub>4</sub>.

Gravimetric detn may be checked acidimetrically as follows: Rinse down wall of beaker with 2 mL neut. alcohol delivered from pipet, warm beaker on steam bath until butacaine base dissolves completely, add 1 drop Me red, and rinse down beaker wall with another 2 mL alcohol. Titr. soln with 0.1 N H<sub>2</sub>SO<sub>4</sub>, **50.040** or **50.041**, almost to point of color change; rinse down

wall of beaker with H<sub>2</sub>O, dil. to ca 45 mL, and complete titrn. 1 mL 0.1*N* H<sub>2</sub>SO<sub>4</sub> = 0.0355 g (C<sub>18</sub>H<sub>30</sub>N<sub>2</sub>O<sub>2</sub>)<sub>2</sub>·H<sub>2</sub>SO<sub>4</sub>.

(2) Det. gravimetrically as in (1); then proceed as in (a), beginning "Rinse down beaker wall with 2 mL alcohol . . ." except use 50 mL instead of 10 mL KBr-KBrO<sub>3</sub> soln.

(3) Completely remove solv. on steam bath, and proceed as in (1), second par. Then wash titrd soln into 500 mL I flask, pipet in 50 mL KBr-KBrO<sub>3</sub> soln, 4.002(g), dil. to 200 mL with H<sub>2</sub>O, add 10 mL HCl, and proceed as in (a), beginning "Immediately stopper flask . . ."

(c) *Crystals*.—Accurately weigh ca 200 mg sample into 125 mL separator, add 25 mL H<sub>2</sub>O, and swirl separator until sample dissolves. Continue as in (b), beginning "Add 2 mL NH<sub>4</sub>OH . . ."

(d) *Solns*.—Transfer to 125 mL separator aliquot contg ca 200 mg butacaine sulfate, and if necessary, dil. to 25 mL with H<sub>2</sub>O. Proceed as in (b), completing detn by (b)(1), (2), or (3) if chlorobutanol is absent, and only by (b)(3) if chlorobutanol is present.

★ Cinchophen—Official Final Action ★

**38.155 In Presence of Salicylates (44)**

Quant. iodination. See 38.151–38.152, 12th ed.

**38.156 In Presence of Sodium Bicarbonate (45)**

Extn from acid soln and titrn. See 38.153–38.154, 12th ed.

**Meperidine (Demerol®, Pethidine) (46)—Official Final Action**

**38.157 ★ Distillation Method ★**

See 36.093–36.095, 11th ed.

**38.158 Extraction Method**

Accurately weigh portion of powd sample contg ca 0.1 g meperidine, and macerate 2 hr with 10 mL H<sub>2</sub>O and 1 mL 1*N* H<sub>2</sub>SO<sub>4</sub>. Decant liq. thru small filter into separator. Macerate residue 20 min with 5 mL H<sub>2</sub>O, filter thru same filter, and wash residue and filter with small portions of H<sub>2</sub>O.

Sat. soln with NaCl; then add 5 mL 1*N* NaOH and ext with 25 mL and six 20 mL portions ether as in 36.001. Wash combined ether exts with two 5 mL portions H<sub>2</sub>O; ext this H<sub>2</sub>O with 10 mL ether and add this ether to main ether ext. Ext ether soln first with 20.0 mL 0.02*N* H<sub>2</sub>SO<sub>4</sub>, and then successively with 10 and 5 mL H<sub>2</sub>O. Combine H<sub>2</sub>SO<sub>4</sub> and H<sub>2</sub>O exts in beaker and warm on H<sub>2</sub>O bath until no ether odor is detected. Cool soln, and titr. excess acid with 0.02*N* NaOH, using Me red. 1 mL 0.02*N* H<sub>2</sub>SO<sub>4</sub> = 0.005676 g meperidine·HCl, C<sub>15</sub>H<sub>21</sub>O<sub>2</sub>N·HCl.

**Mephentermine Sulfate (N,α,α-Trimethylphenethylamine Sulfate) (47)—Official First Action**

**38.159**

**Principle**

Mephentermine sulfate is sepd on ion exchange column, eluted with alcoholic HCl, and measured by UV spectrophotometry.

**38.160**

**Apparatus**

(a) *Chromatographic tube*.—Glass, 150 × 12 (id) mm, fitted with replaceable coarse fritted glass disk, Teflon stopcock, and Buna-N "O" ring seal (Kontes Glass Co., No. K-422280, or equiv.).

(b) *Ion exchange resin*.—See 38.113(d).

**38.161**

**Reagents**

(a) *Alcoholic hydrochloric acid*.—(1) 1.5*N*.—Mix 1 part HCl with 7 parts alcohol-H<sub>2</sub>O (1+1). (2) 6*N*.—Mix 1 part HCl with 1 part alcohol-H<sub>2</sub>O (1+1).

(b) *Mephentermine sulfate std soln*.—0.5 mg/mL. Accurately weigh ca 25 mg mephentermine sulfate, previously dried 1 hr at 105°, into 50 mL vol. flask. Dissolve and dil. to vol. with 1.5*N* alcoholic HCl, (a)(1), and mix.

**38.162**

**Preparation of Column**

Prep. slurry of 2 g resin, (b), with 20–25 mL alcohol-H<sub>2</sub>O (1+1), and transfer to tube, (a), with stopcock closed and plug of glass wool under fritted disk. Let resin settle by gravity; then top with small pledget of glass wool. (Column need not be tamped.) Drain solv., wash column with three 10–20 mL portions alcohol-H<sub>2</sub>O (1+1) followed by 20 mL H<sub>2</sub>O, and discard all washings. Prevent column from drying out before use by maintaining head of 2–3 mL alcohol-H<sub>2</sub>O (1+1) or H<sub>2</sub>O.

When using column for first time and upon completion of seps, wash thoroly with 15–20 mL 6*N* alcoholic HCl, (a)(2), to recondition resin. With stopcock closed, stir resin to obtain slurry, let settle, and drain. Repeat twice. Finally, wash resin with alcohol-H<sub>2</sub>O (1+1) until excess acid is removed and then with three 10–20 mL portions H<sub>2</sub>O. Store under H<sub>2</sub>O when not in use.

Perform blank detn on new column, beginning in 38.163 with "Elute mephentermine with three 5 mL portions . . ." If UV spectrum has *A* > 0.05 at 258 nm, recondition column again or prep. new column, using different bottle of resin.

**38.163**

**Preparation of Sample**

(a) *Tablets*.—Grind tablets to pass No. 80 sieve. Accurately weigh amt powder contg ca 25 mg mephentermine sulfate into 50 mL beaker. Add 10 mL H<sub>2</sub>O, heat on steam bath 2–3 min, cool, and filter thru 9 cm Whatman No. 541 paper into prepd column, 38.162. Column flow rate should be ca 2–3 drops/sec. Thoroly wash filter paper with three 5–10 mL portions H<sub>2</sub>O, letting each portion pass into column before addn of next. Wash column with 25 mL alcohol-H<sub>2</sub>O (1+1). Discard all washings. Elute mephentermine with three 5 mL portions 1.5*N* alcoholic HCl, then with 30 mL 1.5*N* alcoholic HCl. Let each portion just enter column before adding next, introducing eluant down sides of column so as not to disturb resin. Collect eluate in 50 mL vol. flask, rinse liq. from tip of column into flask, and dil. to vol.

(b) *Elixir*.—Add sample vol. contg ca 25 mg mephentermine sulfate to prepd column, 38.162, and proceed as in (a), beginning "Elute mephentermine with three 5 mL portions . . ." If sample contains parabens, wash column with 25 mL alcohol before eluting.

**38.164**

**Determination**

Scan sample and std solns from 220–300 nm against 1.5*N* alcohol-HCl as ref. blank. Draw baseline connecting min. *A* at ca 254 and 262 nm, and use max. *A* at 258 nm to calc. potency of mephentermine sulfate:

$$\text{mg Mephentermine sulfate/tablet} = (A/A') \times (X/\text{g sample}) \times W,$$

where *A* and *A'* refer to sample and std, resp.; *X* = av. g/tablet; and *W* = mg std in 50.0 mL 1.5*N* alcoholic HCl; or

$$\text{mg Mephentermine sulfate/mL} = (A/A') \times (F/\text{mL sample}) \times W,$$

where *F* = diln factor.

★ Surplus method—see inside front cover.

**Methapyrilene in Expectorants (48)—Official Final Action**

(See also 38.111–38.117.)

**38.165****Reagent**

*Methapyrilene hydrochloride std soln.*—0.015 mg methapyrilene.HCl/mL. Transfer 60 mg methapyrilene.HCl, accurately weighed, to 200 mL vol. flask. Dissolve in ca 0.1N H<sub>2</sub>SO<sub>4</sub> and dil. to vol. with ca 0.1N H<sub>2</sub>SO<sub>4</sub>. Transfer 5 mL aliquot to 100 mL vol. flask and dil. to vol. with ca 0.1N H<sub>2</sub>SO<sub>4</sub>.

**38.166****Determination**

Pipet 10 mL sample into separator, make alk. with NH<sub>4</sub>OH, and ext with four 20 mL portions CHCl<sub>3</sub>. Combine CHCl<sub>3</sub> exts in 100 mL vol. flask and dil. to vol. with CHCl<sub>3</sub>. Transfer aliquot contg 1–3 mg methapyrilene to small beaker and evap. just to dryness on steam bath with air current. Dissolve residue in ca 0.1N H<sub>2</sub>SO<sub>4</sub>, transfer to 100 mL vol. flask, and dil. to vol. with ca 0.1N H<sub>2</sub>SO<sub>4</sub>. Det. A of this soln and A' of std against ca 0.1N H<sub>2</sub>SO<sub>4</sub> blank at 315 nm.

$$\text{mg Methapyrilene.HCl/100 mL sample} = (A \times 1.5 \times 100 \times 10)/(A' \times \text{vol. aliquot}).$$

**Neostigmine (Prostigmine®)****38.167 ★ Distillation Method (49) ★**  
**Official Final Action**

See 38.159, 12th ed.

**Chromatographic Method (50)—Official Final Action****38.168****Apparatus**

(a) *Spectrophotometer.*—Suitable for measurement in range 265–400 nm.

(b) *Chromatographic tube and tamping rod.*—See 37.002.

**38.169****Reagents**

(a) *Phosphate buffer.*—pH 5.8. Mix 1 vol. 1M K<sub>2</sub>HPO<sub>4</sub> (17.4 g/100 mL) with 4 vols. 1M KH<sub>2</sub>PO<sub>4</sub> (13.6 g/100 mL). Adjust pH, using pH meter, to 5.80±0.05 with either component.

(b) *Washed chloroform.*—Shake equal vols CHCl<sub>3</sub> and H<sub>2</sub>O in separator. Let layers sep. 5 min and discard upper layer.

(c) *Washed ether.*—Shake equal vols ether and H<sub>2</sub>O in separator. Let layers sep. 5 min and discard lower layer.

(d) *Bis(2-ethylhexyl) hydrogen phosphate (DEHP) soln.*—2.5% Mix. 2.5 mL DEHP with 97.5 mL H<sub>2</sub>O-washed CHCl<sub>3</sub>.

(e) *Diatomaceous earth.*—See 36.002.

(f) *Neostigmine std soln.*—Dry neostigmine bromide 3 hr in 105° oven. Accurately weigh ca 5 mg dry std, using microbalance, and transfer to 150 mL beaker. Add 2.0 mL pH 5.8 phosphate buffer, mix by swirling gently, and proceed as in 38.171.

**38.170****Preparation of Sample**

(a) *Tablets.*—Accurately weigh portion powd tablets contg 5 mg neostigmine bromide into 150 mL beaker, add 2.0 mL pH 5.8 phosphate buffer, mix by swirling gently, and proceed as in 38.171.

(b) *Individual tablets.*—Transfer tablet to 50 mL centr. tube, powder if coated, and add 6.0 mL pH 5.8 phosphate buffer by pipet. Stopper, shake mech. 30 min, and centr. 5 min at high speed. Pipet 2.0 mL clear supernate into 150 mL beaker and proceed as in 38.171.

(c) *Ophthalmic soln.*—Dil. accurately measured vol. sample

soln to 2.5 mg neostigmine bromide/mL with pH 5.8 phosphate buffer soln. Pipet 2.0 mL dild sample soln into 150 mL beaker and proceed as in 38.171.

**38.171****Determination**

(Caution: See 51.011, 51.054, 51.056, and 51.062. Use H<sub>2</sub>O-washed solvs thruout.)

Treat std and sample solns similarly. Add 3.0 g diat. earth, mix with metal spatula until fluffy, and transfer quant. in 3 portions to chromatgc tube contg 1 g diat. earth mixed with 0.5 mL pH 5.8 phosphate buffer. Pack uniformly. Dry-wash beaker with 0.2 g diat earth, transfer wash to tube, and pack uniformly. Wipe beaker and all app. used in column prepn with glass wool and add to column. Proceed without delay.

Wash column with 75 mL ether and then with 75 mL CHCl<sub>3</sub>. Discard washings. Elute neostigmine bromide with 75 mL 2.5% DEHP soln into 500 mL separator contg 20 mL 0.1N H<sub>2</sub>SO<sub>4</sub>. Complete elution with 25 mL CHCl<sub>3</sub>. Add 175 mL isooctane to eluate and shake vigorously 2 min. Let stand ≥5 min to completely sep. layers. Transfer lower aq. layer to 250 mL beaker. Repeat extn with two 20 mL portions 0.1N H<sub>2</sub>SO<sub>4</sub>, and combine aq. layers in the 250 mL beaker.

Add 10 mL 10% NaOH soln to beaker, mix by swirling gently, cover with watch glass, and heat 45 min on vigorous steam bath. Cool, transfer quant. to 100 mL vol. flask, dil. to vol. with H<sub>2</sub>O, and mix. Centr. portions of std and sample solns. Record spectra of clear sample and std solns between 400 and 255 nm against 1% NaOH soln in 1 cm cells. Det. ΔA of each soln by subtracting A at 340 nm from A at max., ca 293.5 nm.

mg Neostigmine bromide in final soln =  $(\Delta A/\Delta A') \times C \times 100$ , where C = mg neostigmine bromide std/mL, and ΔA and ΔA' refer to sample and std, resp.

**Neostigmine Methylsulfate (57)—Official Final Action**

(Applicable only to injections)

**38.172****Apparatus and Reagents**

(a) *Recording spectrophotometer.*—Suitable for measurement in range 230–350 nm.

(b) *Neostigmine methylsulfate std soln.*—0.5 mg/mL. Accurately weigh 50 mg neostigmine methylsulfate of known purity, transfer to 100 mL vol. flask, add 1 mL 1N H<sub>2</sub>SO<sub>4</sub>, and dil. to vol. with H<sub>2</sub>O.

**38.173****Preparation of Sample**

(a) *Interfering UV-absorbing preservatives absent.*—Transfer aliquot contg 5.0 mg neostigmine methylsulfate to 150 mL beaker and hydrolyze as in 38.175.

(b) *Injection solns containing phenol or parabens.*—Proceed as in 38.174.

**38.174****Extraction of Interferences**

Transfer sample aliquot (or sample dild if necessary) contg 5.0 mg neostigmine methylsulfate to 125 mL separator, add 1 mL 1N H<sub>2</sub>SO<sub>4</sub>, and add H<sub>2</sub>O to total vol. of 21 mL. Add 35 mL CHCl<sub>3</sub> and shake vigorously 2 min. Transfer CHCl<sub>3</sub> layer into second 125 mL separator contg wash soln of 10 mL H<sub>2</sub>O and 1 mL 1N H<sub>2</sub>SO<sub>4</sub>; shake, let layers sep. completely, and discard CHCl<sub>3</sub> phase. Repeat extn with 5 addnl 35 mL portions CHCl<sub>3</sub>. Rinse stem of each separator with CHCl<sub>3</sub> after last extn and discard CHCl<sub>3</sub>. Combine aq. layers in 150 mL beaker. Rinse each separator in succession with two 5 mL portions H<sub>2</sub>O, rinse stem

★ Surplus method—see inside front cover.

of each separator with H<sub>2</sub>O, transfer rinsings to beaker, and proceed as in 38.175.

**38.175****Hydrolysis**

Add 25 mL 10% NaOH soln and H<sub>2</sub>O to ca 80 mL. Cover with watch glass and heat 30 min on vigorous steam bath. Cool, quant. transfer soln thru loose glass wool plug, prewashed with 1% NaOH soln, to 250 mL vol. flask, and dil. to vol. with H<sub>2</sub>O. In sep. beaker, similarly treat 10 mL aliquot std neostigmine methylsulfate soln. Perform blank detn, omitting neostigmine methylsulfate. Proceed as in 38.176.

**38.176****Determination**

Record spectra of sample and std solns, relative to blank, in 1 cm cells, from 350 to 230 nm. Det.  $\Delta A$  of each soln by subtracting  $A$  at 350 nm from  $A$  at max., ca 239 nm.

$$\text{mg/mL Neostigmine methylsulfate in sample} = (\Delta A / \Delta A') \times 0.5 \times (10/\text{mL sample aliquot}),$$

where  $\Delta A$  and  $\Delta A'$  refer to sample and std, resp.

**38.177 ★ Pamaquine (Plasmochin®) (52) ★ Official Final Action**

Extn from alk. soln and titrn. See 38.169–38.170, 12th ed.

**Phenazopyridine Hydrochloride (Pyridium®, Mallophone®) (53)—Official Final Action****38.178****Reagents**

(a) *Titanium trichloride std soln.*—Prep. as in 50.042 and stdze as in 50.043.

(b) *Light green SF yellowish soln.*—Dissolve 1 g FD&C Green No. 2 in H<sub>2</sub>O and dil. to 1 L.

**38.179****Preparation of Solution**

(Caution: See 51.011, 51.040, and 51.056.)

(a) *Solns.*—To vol. contg ca 0.1 g phenazopyridine.HCl, add 10 mL 0.1*N* HCl and dil. to 100 mL.

(b) *Tablets and jelly.*—Accurately weigh sample (powd in case of tablets) contg ca 0.1 g phenazopyridine.HCl, add 10 mL 0.1*N* HCl, and dil. to 100 mL.

(c) *Ointments.*—Accurately weigh, in 100 mL beaker, sample contg ca 0.1 g phenazopyridine.HCl, stir with ether until ointment base dissolves, and wash into separator with ether and H<sub>2</sub>O. Shake thoroly, and drain aq. layer into second separator contg 25 mL ether. Shake, and drain aq. layer into third separator contg 25 mL ether. Shake, and transfer aq. layer to 250 mL beaker. Wash ether layers with alternate 10 mL portions HCl (1+1) and H<sub>2</sub>O until no more color is removed, successively passing each portion of the HCl or H<sub>2</sub>O thru the 3 separators and finally into beaker. Nearly neutze combined acid exts with NH<sub>4</sub>OH, cool, wash into separator, make ammoniacal, and ext with 25 mL portions CHCl<sub>3</sub> until no more color is removed, filtering CHCl<sub>3</sub> thru cotton pledget in stem of separator. Evap. combined CHCl<sub>3</sub> exts just to dryness, take up in 10 mL 0.1*N* HCl, and dil. to 100 mL.

**38.180****Determination**

Heat soln to bp, add 15 g *Na acid tartrate*, and boil 2 min. Add 10 mL light green SF yellowish soln and titr. hot with std TiCl<sub>3</sub> soln in current of CO<sub>2</sub>. End point is change from green to pale yellow. Perform blank titrn with 10 mL 0.1*N* HCl, 90 mL H<sub>2</sub>O, 15

g *Na acid tartrate*, and 10 mL light green SF yellowish soln, and subtract from vol. TiCl<sub>3</sub> previously found. 1 mL 0.1*N* TiCl<sub>3</sub> = 0.00624 g phenazopyridine.HCl, C<sub>11</sub>H<sub>11</sub>N<sub>5</sub>.HCl.

**Phenethylamines (54)—Official Final Action**

(Applicable to amphetamine, methamphetamine, mephentermine, phenylpropylmethylamine (Vonedrine®), and ephedrine)

**38.181****Apparatus**

*Spectrophotometer.*—Suitable for measurement in region 250–270 nm; with 1 cm cells of quartz or fused Si (preferably matched pair); or recording spectrophtr.

**38.182****Preparation of Standard Solution**

Accurately weigh 500–700 mg phenethylamine salt of known purity, transfer to 100 mL vol. flask, and dissolve in 0.1*N* H<sub>2</sub>SO<sub>4</sub>. Dil. to vol. with the H<sub>2</sub>SO<sub>4</sub> and mix well.

**38.183****Determination**

Accurately weigh powd sample contg 25–50 mg amine base and transfer to 40–50 mL g-s centrfr. tube contg 3–3.5 g NaCl and 6–7 glass beads. Dissolve sample by adding 5 mL 1*N* H<sub>2</sub>SO<sub>4</sub>, and swirl gently to aid escape of any liberated CO<sub>2</sub>. Test for acidity with litmus paper, adding more acid if necessary. Pipet in 25 mL CHCl<sub>3</sub> and 4 mL 2*N* NaOH, stopper securely, and shake 3–5 min. To second 40–50 mL centrfr. tube contg 3–3.5 g NaCl and 6–7 glass beads, add 10 mL std soln, 38.182. Swirl to dissolve salt, pipet in 25 mL CHCl<sub>3</sub> and 1 mL 2*N* NaOH, stopper securely, and shake 3–5 min.

Centrfr. tubes 3–5 min at 1500–1800 rpm. Withdraw 10 mL clear CHCl<sub>3</sub> layer by closing upper end of 10 mL pipet with index finger while lowering tip thru aq. layer. Wipe off outer portion of pipet, and transfer 10 mL CHCl<sub>3</sub> layer to second 40–50 mL centrfr. tube contg 25 mL 0.1*N* H<sub>2</sub>SO<sub>4</sub> and 6–7 glass beads. Stopper securely, shake, and centrfr. as above.

Prep. acid blank soln by shaking 25 mL 0.1*N* H<sub>2</sub>SO<sub>4</sub> with 3–5 mL CHCl<sub>3</sub> and centrfrg to obtain clear acid soln. Read  $A$  of portions of clear acid soln obtained from aliquots of std and of sample solns against acid blank prep'd as above in ref. cell, using 1 cm cells in range 252–255 for first min., 256–258 for max., and 260–262 for second min.

**38.184****Calculations**

Calc.  $A$  difference ( $\Delta A$ ) between  $A$  at maximum and  $A$  of 2 minima:  $\Delta A = A_{\max} - 0.5(A_{\min 1} + A_{\min 2})$ .

Calc. absorptivity differential ( $\Delta a$ ) produced by 1 g/L (1 mg/mL) of std amine base or salt:

$$\Delta a_{\text{std}} = \Delta A_{\text{std}} \times 100/\text{wt std},$$

where  $\Delta A_{\text{std}} = A$  difference for std soln; 100 = mL std soln measured; and wt = mg std in aliquot measured.

mg Amine/unit of sample

$$= (\Delta A_{\text{sample}} \times 25 \times 25 \times \text{av. wt of unit in mg}) / (\Delta a_{\text{std}} \times 10 \times \text{wt sample in mg}).$$

**Phenothiazine (55)—Official First Action****38.185****Reagents and Apparatus**

(All CHCl<sub>3</sub> solns must be protected from light and assay must be completed within 8 hr.)

(a) *Phenothiazine std soln.*—Dissolve phenothiazine in 10 parts toluene with heat. Add 0.1 g activated charcoal for each 4 g phenothiazine. Boil 10 min under reflux and filter while hot thru heated filter. Cool soln, and collect phenothiazine crystals on buchner or fritted glass filter. Dry crystals at 100° and then

★ Surplus method—see inside front cover.

in vac. desiccator contg paraffin chips. Repeat recrystn, if necessary, until mp is 184–185°. Dissolve 100.0 mg purified phenothiazine in  $\text{CHCl}_3$  in 50 mL vol. flask and dil. to vol. with  $\text{CHCl}_3$ .

(b) *Internal std soln.*—Dissolve 125 mg promethazine.HCl in  $\text{CHCl}_3$  in 25 mL vol. flask and dil. to vol. with  $\text{CHCl}_3$ .

(c) *Chromatographic column.*—Slurry 20 g Gas-Chrom Q, 100–120 mesh, with 100 mL  $\text{CHCl}_3$  in 500 mL r-b flask. Add, with stirring, 1.0 g Apiezon L dissolved in 50 mL  $\text{CHCl}_3$ . Evap. to dryness in 70°  $\text{H}_2\text{O}$  bath, using rotary vac. evaporator. Apply vac. (ca 50 cm Hg) to one end of 1.2 m (4') glass column (4 mm id) and, with gentle tapping only, fill tube with coated support. Condition column by heating 48 hr at 240° with N flow of ca 10 mL/min.

(d) *Gas chromatograph.*—Any gas chromatograph with H flame ionization detector capable of using specified column.

**38.186****Determination**

Grind representative sample portion to pass No. 60 sieve. Accurately weigh sample contg ca 200 mg phenothiazine and transfer to 100 mL vol. flask. Add 80 mL  $\text{CHCl}_3$  and shake vigorously until phenothiazine is completely dissolved (ca 20 min). Dil. to vol. with  $\text{CHCl}_3$ , mix thoroly, and let stand 15 min. Pipet 5 mL aliquots of clear supernate and phenothiazine std soln into sep. 25 mL g-s erlenmeyers. Pipet 4 mL aliquots of promethazine.HCl internal std soln into each flask.

About 1 hr before initial injection, adjust app. to following temps: column 215°, detector 230°, injector 230°. Set N carrier gas flow rate to give phenothiazine retention time of ca 8 min (ca 20 psig regulator outlet pressure). Retention time of internal std will be ca 17 min. Inject similar vol. of sample and std soln contg ca 10  $\mu\text{g}$  phenothiazine, using sensitivity setting that gives 70–90% of full-scale deflection.

% Phenothiazine in original sample

$$= (M/W)(P_u/P_a) \times (P_b/P_p) \times 200,$$

where  $M$  = mg phenothiazine used to prep. std soln,  $W$  = mg sample,  $P_u$  = phenothiazine sample soln peak area,  $P_a$  = promethazine.HCl sample soln peak area,  $P_b$  = promethazine.HCl std soln peak area, and  $P_p$  = phenothiazine std soln peak area.

**Phenylephrine Hydrochloride****38.187 ★ Acetylation Method (56)—Official First Action ★**

Acetylation on diat. earth column and detn by UV spectro-photometry in eluate. See 36.108–36.111, 11th ed.

**Colorimetric Method (57)—Official Final Action**

(Not applicable in presence of tetracycline, acetaminophen, salicylamide, phenolic compds, and Zn salts)

**38.188****Reagents**

Prep. (a), (b), and (d)(2) fresh on day of use.

(a) *4-Aminoantipyrine hydrochloride soln.*—(Eastman) 3% in  $\text{H}_2\text{O}$ .

(b) *Potassium ferricyanide soln.*—4%  $\text{K}_3\text{Fe}(\text{CN})_6$  in  $\text{H}_2\text{O}$ .

(c) *Sodium borate soln.*—2%  $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$ .

(d) *Phenylephrine hydrochloride std solns.*—(1) *Stock soln.*—Approx. 2.5 mg/mL. Weigh ca 125 mg phenylephrine.HCl to nearest 0.1 mg into 50 mL vol. flask and dil. to vol. with  $\text{H}_2\text{O}$ . Soln is stable several months under refrigeration. (2) *Working std soln.*—Approx. 0.25 mg/mL. Dil. 5 mL stock soln to 50 mL with  $\text{H}_2\text{O}$ .

★ Surplus method—see inside front cover.

**38.189****Preparation of Samples**

(a) *Tablets and capsules.*—Det. av. wt/unit. Grind tablets to powder and mix, or mix contents of capsules. Weigh portion contg ca 12.5 mg phenylephrine.HCl into 50 mL vol. flask, add ca 30 mL  $\text{H}_2\text{O}$ , and shake vigorously. Dil. to vol., shake again, and filter if soln is not clear.

(b) *Powders for oral suspensions, oral suspensions, sirups, solns, etc.*—Reconstitute powders for oral suspension as directed on label or use solns, sirups, and oral suspensions as is. Transfer aliquot contg ca 12.5 mg phenylephrine.HCl into 50 mL vol. flask and proceed as in (a).

**38.190****Determination**

(Reaction is time dependent; assay samples one at a time.)

Transfer 2 mL aliquot sample soln to 50 mL vol. flask (omit sample for reagent blank), add 1.0 mL 4%  $\text{K}_3\text{Fe}(\text{CN})_6$  soln, and swirl. Dil. to ca 48 mL with  $\text{Na}_2\text{B}_4\text{O}_7$  soln and add 1.0 mL aminoantipyrine soln. Immediately dil. to vol. with  $\text{Na}_2\text{B}_4\text{O}_7$  soln and shake vigorously. Immediately det.  $A$  of soln at 490 nm against reagent blank, in matched 1 cm cells.

Calc. sample concn,  $S = CFA/A'$ , where  $C$  = mg std/mL,  $F$  = diln factor, and  $A$  and  $A'$  refer to sample and std. resp.

Report mg phenylephrine.HCl/tablet, capsule, or vol. liq. dose.

**Automated Method (58)—Official Final Action****38.191****Principle**

Oxidn products of phenylephrine with  $\text{K}_3\text{Fe}(\text{CN})_6$  form colored complex with 4-aminoantipyrine in borate soln. Method is automated version of 38.188–38.190 and is not applicable in presence of tetracycline, acetaminophen, salicylamide, phenolic compds, and Zn salts.

**38.192****Apparatus**

*Automatic analyzer.*—AutoAnalyzer with following modules (available from Technicon Corp.): (1) *Sampler II.*—With 50/hr (2:1) cam. (2) *Proportioning pump.* (3) *Colorimeter.*—With 15 mm tubular flowcell and matched 490 nm filters. (4) *Recorder.* (5) *Manifold.*

Assemble app. as shown in Fig. 38:02. Make sample and resample pump tubes as short as possible by cutting each end 6 mm from color-coded shoulders. Sample line is 20 cm. Reduce vol. at point of debubbling and flowcell by constricting lower arm of C-5 debubbler with Tygon tubing to give push fit with  $0.015 \times 2.5$ " polyethylene tubing leading to flowcell as shown in Fig. 38:03.

Prewash system with  $\text{H}_2\text{O}$  before placing reagent lines in their appropriate reagent container. When tubes are pumping satisfactorily and system is equilibrated (ca 15 min), adjust colorimeter and recorder to produce steady baseline.

**38.193****Reagents**

See 38.188(a), (b), (c), (d)(1) (2.5 mg/mL), and in addn:

(a) *Wetting agent.*—Add 0.5 mL polyoxyethylene lauryl ether (Brij 35) to 1 L  $\text{H}_2\text{O}$ .

**38.194****Preparation of Sample**

Proceed as in 38.189, except weigh portion contg ca 125 mg in (a) and transfer aliquot (dild if necessary) contg 125 mg in (b).

**38.195****Stream Flow**

See Fig. 38:02. Sample solns are withdrawn from sample cups, segmented with air, and dild in manifold. Stream is

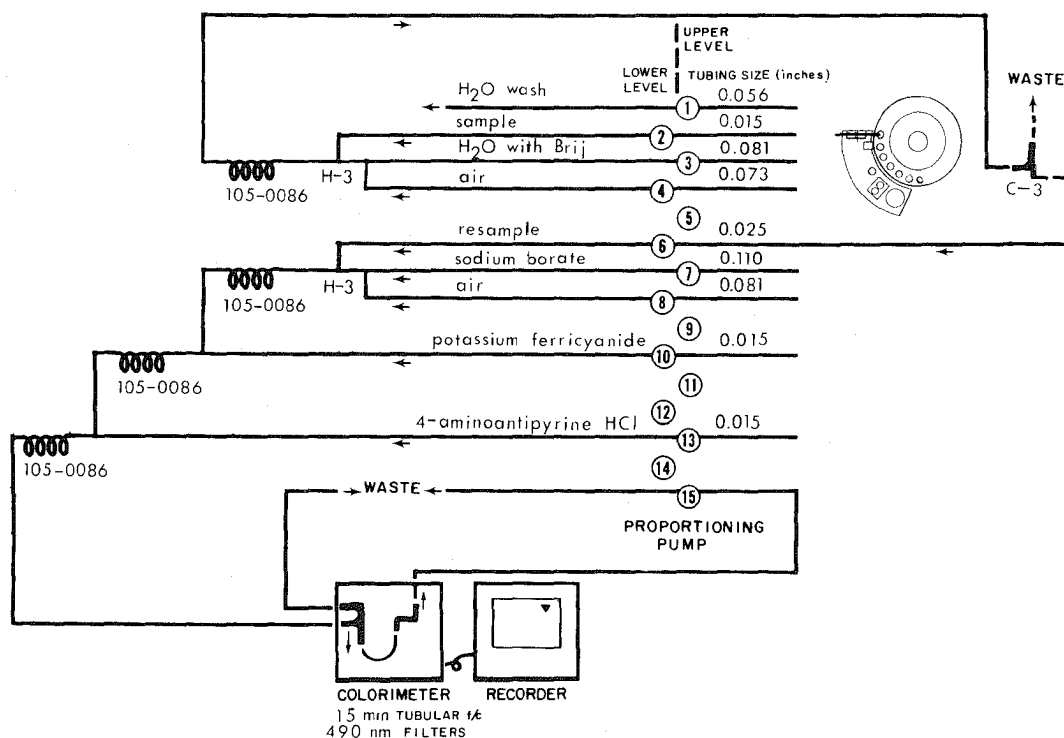

FIG. 38:02—Flow diagram for phenylephrine hydrochloride

debubbled and resampled. Resultant stream is buffered with air-segmented stream of borate soln.  $K_3Fe(CN)_6$  is added and mixed, and color reagent is added and mixed. Stream is debubbled and  $A$  is measured at 490 nm.

**38.196****Determination**

Fill 2 mL sample cups with prepd solns and aspirate at 2:1 sample-to-wash ratio, picking up sample with 0.016" stainless steel probe. Include 2 std solns (2.5 mg/mL) at beginning and end of each run of 5 samples in duplicate (10 detns). Draw line between baseline at beginning and end of run, if necessary. Subtract baseline  $A$  from max.  $A$  to obtain net  $A$  ( $\Delta A$ ) for each peak. Calc. mg phenylephrine.HCl/unit dose as in 38.190 from  $\Delta A$ , using av. of duplicate detns.

**Ion-Pair Column Partition Method (59)****Official Final Action**

(Not applicable in presence of phenolic nitrogenous bases)

**38.197****Apparatus and Reagents**

- Recording spectrophotometer.**—With matched 1 cm cells.
- Chromatographic tubes.**—See 37.002.
- Phosphate buffer.**—pH  $5.80 \pm 0.05$ . Mix 1 vol. 1M  $K_2HPO_4$  (174 g/L) and 4 vols 1M  $KH_2PO_4$  (136 g/L) and adjust pH with either component.
- Phosphate-citrate buffer.**—pH  $5.10 \pm 0.05$ . Mix 2 vols 1M  $K_2HPO_4$  and 1 vol. 1M citric acid (192 g  $C_6H_8O_7$  or 210 g  $C_6H_8O_7 \cdot H_2O$ /L) and adjust pH with either component.
- Diatomaceous earth.**—See 36.002.
- Bis-(2-ethylhexyl) hydrogen phosphate (DEHP) soln.**—Reagent grade. 2.4% v/v in  $H_2O$ -satd ether. Prep. fresh daily.
- Sulfuric acid.**—0.1N, ether-satd. Prep. fresh daily.
- Chloroform and ether.**— $H_2O$ -satd. Prep. fresh daily and use thruout detn.
- Phenylephrine hydrochloride std solns.**—(1) Stock soln.—

1 mg/mL. Accurately weigh ca 100 mg USP Phenylephrine.HCl Ref. Std in 100 mL vol. flask and dil. to vol. with  $H_2O$ . (2) Working soln.—0.04 mg/mL. Dil. 2 mL stock soln to 50 mL with 0.1N NaOH and use to obtain spectrum between 400 and 200 nm (or as far as instrument permits) along with sample detn.

**38.198****Preparation of Samples**

- Samples containing about 1 mg phenylephrine.HCl/mL sirup.**—Pipet 4.0 mL pH 5.8 buffer into 10 mL vol. flask. Carefully add sirup to vol. Do not wet flask above mark.
- Samples containing more than 1 mg phenylephrine.HCl/mL sirup.**—Dil. to 1 mg/mL and proceed as in (a).
- Tablets.**—Weigh ground sample contg ca 2 mg phenylephrine into 50 mL beaker. If components of tablets are  $H_2O$ -sol., add 2 mL  $H_2O$ , warm slightly to dissolve, and add 1 mL pH 5.8 buffer. If some components are not  $H_2O$ -sol. (e.g., acetaminophen), add 1 mL dimethylsulfoxide, warm to dissolve, and then add 2 mL pH 5.8 buffer. For tablets contg antacids (e.g.,  $Mg(OH)_2$  and  $Al(OH)_3$ ), heat powd sample contg ca 2 mg phenylephrine with 5 mL alcohol and 1 mL HCl to dissolve alk. material; add 10 mL  $n$ -BuOH and evap. to dryness. Dissolve residue in 1 mL dimethylsulfoxide and add 2 mL pH 5.8 buffer.
- Capsules.**—Take portion of contents contg ca 2 mg phenylephrine and proceed as in (c). Grind sample if necessary.

**38.199****Determination**

Pack small glass wool plug in base of chromatgc tube as support. Transfer mixt. of 1 g diat. earth with 0.8 mL pH 5.1 buffer to tube and tamp to uniform mass. Mix 4 g diat. earth with 3.0 mL aliquot prepd sample and carefully transfer directly above pH 5.1 layer, tamping gently. Dry-wash beaker with 1 g diat. earth, add to column, and tamp. Cover with small glass wool pad. Pass 75 mL  $CHCl_3$  thru column followed by 125 mL ether, and discard eluates. Place 125 mL separator contg ca 20

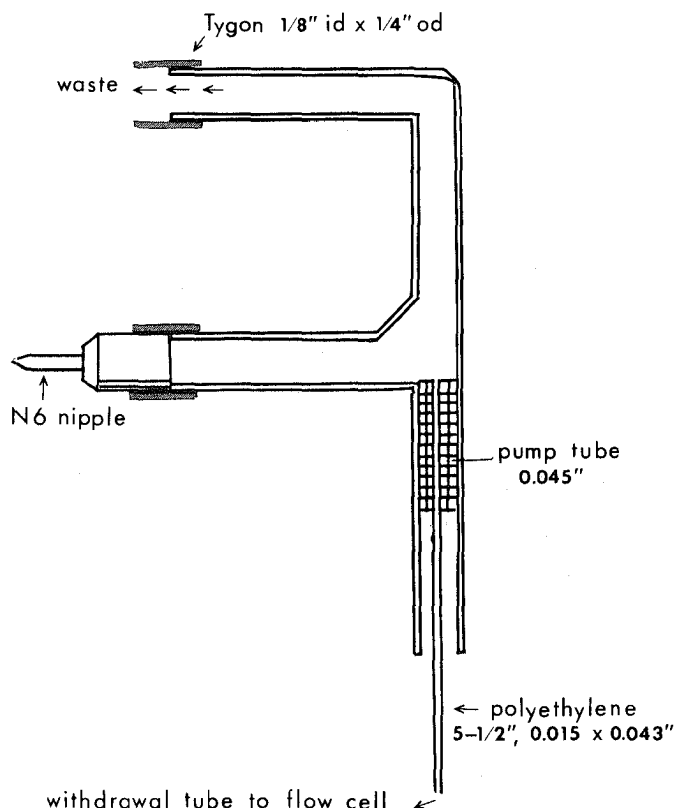

FIG. 38.03—Assembly of debubbler

mL 0.1N  $\text{H}_2\text{SO}_4$  as receiver under column. Elute column with 50 mL DEHP-ether soln and then with 25 mL ether, collecting in same separator. Shake separator and transfer aq. phase to 50 mL vol. flask contg 6 mL 1N NaOH. Re-ext ether with 15 mL 0.1N  $\text{H}_2\text{SO}_4$ . Combine exts and dil. to vol. with  $\text{H}_2\text{O}$ . Obtain spectrum between 200 and 400 nm on same day as elution.

**38.200****Calculations**

Det. corrected  $A$  ( $\Delta A$ ) of both std and sample as follows: Construct baseline representing background  $A$  extension obtained from 400 to ca 250 nm. (Constructed baseline  $A$  value at wavelength of max.  $A$ , ca 290 nm, is designated as  $A_B$ .) Subtract  $A_B$  from total  $A_{\text{max}}$  observed at wavelength peak.

For std, calc.  $a = \Delta A' / bc$ , where  $b$  = cell pathlength (1 cm), and  $c$  = concn in g/L.

For samples, calc.  $c = (\Delta A \times F) / ab$ , where  $F$  = diln factor.

Report mg phenylephrine.HCl/tablet, capsule, or vol. liq. dose.

**Phenylpropanolamine Hydrochloride—Official Final Action****Chromatographic Method (60)****38.201****Apparatus**

See 37.002.

**38.202****Reagents**

(a) *Chloroform*.— $A$  at 258.5 nm, measured against  $\text{H}_2\text{O}$  blank, <0.200.

(b) *Diatomaceous earth*.—See 36.002.

**38.203****Preparation of Column**

Fix pledget of glass wool in stem of chromatgc tube above constriction. Clamp tube vertically. In small beaker mix 3 g diat.

earth and 2 mL  $\text{H}_2\text{O}$ . Transfer to tube with metal spatula and press down evenly with packing rod.

**38.204****Determination**

(a) *Capsules and tablets*.—To 150 mL beaker transfer accurately weighed amt of powd sample contg ca 50 mg phenylpropanolamine.HCl. Add 5 mL  $\text{NH}_4\text{OH}$  (1+4) and mix by gentle swirling. Add 5 g diat. earth and mix with metal spatula. Transfer to tube without loss thru powder funnel, in 4 or more portions, pressing down each portion evenly with packing rod. When removing funnel from tube each time, tap it lightly in tube to remove loosely adhering particles; then hang it in beaker of such size that it does not touch bottom. After using packing rod, scrape off most of adhering material into tube with spatula, and tap rod and spatula over mouth of tube. When laying down implements, place them in position such that their ends do not touch anything. Finally use smooth, intact rubber policeman to sweep material from beaker and funnel into tube. Rub beaker, spatula, and packing rod with three ca 1 g portions diat. earth, sweeping each portion thru funnel into tube, using rubber policeman. Press down each portion with packing rod.

Place 100 mL vol. flask in receiving position. Wash down inside of tube with  $\text{CHCl}_3$ , adding enough (ca 20 mL) to moisten column and produce only few drops of eluate. Elute with 95 mL  $\text{CHCl}_3$ , wash tip of tube with little  $\text{CHCl}_3$ , and dil. to vol. with  $\text{CHCl}_3$ . Measure  $A$  at 258.5 nm, 2–5 min after pouring into silica cell, against portion of same  $\text{CHCl}_3$  used for elution.

To 150 mL beaker transfer ca 50 mg pure phenylpropanolamine.HCl, accurately weighed. Proceed as with sample, beginning "Add 5 mL  $\text{NH}_4\text{OH}$  (1+4) . . ." Det.  $A$  of sample and std eluates at ca same time, on same setting of wavelength dial. Use same cell for both eluates, and same cell for both blanks. Calc. phenylpropanolamine.HCl content.

(b) *Aqueous solns.*—Prep. column as in 38.203. Into 150 mL beaker pipet vol. sample contg ca 50 mg phenylpropanolamine.HCl, or pipet 10 mL, whichever is less. Add 1 mL  $\text{NH}_4\text{OH}$  and mix by gentle swirling. Add number of g diat. earth equal to total number mL of liq. and mix with metal spatula. Proceed as in (a), beginning "Transfer to tube without loss . . ."

**Extraction Method (61)****38.205****Determination**

Proceed as in 38.183–38.184.

**Phenylalkanolamine Salts Including Phenylpropanolamine Hydrochloride and Ephedrine Sulfate in Elixirs and Sirups (62)—Official Final Action**

(Applicable to individual phenylalkanolamines when only one is present, except for phenylephrine, which does not interfere and which is not detd by this method.)

**38.206****Principle**

Phenylalkanolamine is eluted with  $\text{CH}_2\text{Cl}_2$  from weakly basic diat. earth column, retained on weakly acidic column, and converted to benzaldehyde by on-column periodate reaction. Benzaldehyde is detd by UV spectrometry and is proportional to amt alkanolamine salt in sample.

**38.207****Reagents and Apparatus**

(a) *Phosphate-chloride soln.*—Dissolve 5 g  $\text{KH}_2\text{PO}_4$  and 7.5 g KCl in 100 mL  $\text{H}_2\text{O}$ .

(b) *Sodium metaperiodate soln.*—Dissolve 2 g  $\text{NaIO}_4$  in 20 mL  $\text{H}_2\text{O}$ . Store in dark.

(c) *Water-saturated methylene chloride.*—Sat. ca 400 mL spectral grade  $\text{CH}_2\text{Cl}_2$  by shaking 1 min with equal vol.  $\text{H}_2\text{O}$ . Use thruout.

(d) *Diatomaceous earth.*—See 36.002.

(e) *Phenylalkanolamine salt std soln.*—0.4 mg/mL. Accurately weigh ca 100 mg phenylalkanolamine salt and dissolve and dil. to 250 mL with  $\text{H}_2\text{O}$ .

(f) *Recording spectrophotometer.*—With matched 1 cm cells.

(g) *Chromatographic tubes and tamping rod.*—See 37.002.

## 38.208

**Preparation of Sample and Chromatographic Columns**

*Sample.*—Accurately dil. sample with  $\text{H}_2\text{O}$  to final concn of ca 0.4 mg/mL.

*Column I.*—Add 2.0 mL dild sample to 300 mg  $\text{K}_2\text{HPO}_4$  in 150 mL beaker. Swirl to dissolve. Add 3 g diat. earth, mix, transfer quant. to column, and tamp. Dry-wash beaker with 1 g diat. earth, add wash to column, and tamp. Cover with small glass wool plug. If acidic compds such as acetaminophen or theophylline are present, underlay sample-diat. earth mixt. with mixt. of 3 g diat. earth and 2 mL 10%  $\text{NaOH}$ .

*Column II.*—Mix 3 g diat. earth and 2 mL phosphate-chloride soln, and transfer to column. Tamp and cover with small glass wool pad.

*Column III.*—Mix 0.5 mL  $\text{H}_2\text{O}$  and 1 g diat. earth, transfer to column, and tamp. Mix 3 g diat. earth and 2 mL  $\text{NaIO}_4$  soln, transfer to column, tamp, and cover with glass wool pad.

## 38.209

**Preparation of Standard**

Prep. sep. column III as above. Mix 2.0 mL phenylalkanolamine salt std soln and 3 g diat. earth, transfer quant. to column, and tamp. Dry-wash beaker with 1 g diat. earth, transfer wash to column, tamp, and cover with glass wool pad. Place 100 mL vol. flask under column. Wet column with 10 mL  $\text{CH}_2\text{Cl}_2$ . With pipet, evenly distribute 1.0 mL  $\text{NH}_4\text{OH}$  onto surface of column packing. Elute column with four 25 mL portions  $\text{CH}_2\text{Cl}_2$ ; let each portion sink entirely into surface. Rinse tip of column into flask and dil. eluate to vol. with  $\text{CH}_2\text{Cl}_2$ . Elute with addnl 25 mL  $\text{CH}_2\text{Cl}_2$  and collect eluate for use as blank.

## 38.210

**Determination**

Mount columns so that eluate from I flows onto II. Elute combined columns with four 25 mL portions  $\text{CH}_2\text{Cl}_2$ ; let each portion sink entirely into surface of both columns. Rinse tip of Column I into II with  $\text{CH}_2\text{Cl}_2$  and discard I. Elute Column II with addnl 25 mL  $\text{CH}_2\text{Cl}_2$ . Discard all eluates.

Mount Column II above III and place 100 mL vol. flask under III. With pipet, evenly distribute 1.0 mL  $\text{NH}_4\text{OH}$  onto surface of Column II packing. Elute combined columns with four 25 mL portions  $\text{CH}_2\text{Cl}_2$ ; let each portion sink entirely into surface of each column. Rinse tip of Column II into III with ca 1 mL  $\text{CH}_2\text{Cl}_2$ . Discard Column II and continue to elute Column III until 100 mL eluate is collected.

Scan spectra of sample and std eluates from 350 to 230 nm, against column blank eluate. If liq. is cloudy, let soln clear (ca 1 min) before detg A. Calc. net A for sample and std solns,  $\Delta A$  and  $\Delta A'$ , resp., at min. A, ca 267 nm, and max. A, ca 246 nm.

$$\text{mg Phenylalkanolamine salt/mL} = (\Delta A / \Delta A') \times C \times F,$$

where C = mg std/mL and F = diln factor.

**Piperazine—Official Final Action****Chromatographic Method (63)**

(Applicable to aq. solns)

## 38.211

**Apparatus**

*Chromatographic tube.*—40 × 300 mm, with stopcock and fritted glass disk or plug of glass wool as support.

## 38.212

**Determination**

(Caution: See 51.011, 51.040, and 51.056.)

Prep. layered column with tamped layer of 5 g diat. earth, 36.002, on bottom; add layer of 5 g diat. earth thoroly mixed with 5 mL  $\text{H}_2\text{O}$ , and tamp. Thoroly mix 25 g diat. earth and 5 g  $\text{NaHCO}_3$  in 600 mL beaker, add 25 mL aliquot of piperazine soln contg ca 100 mg piperazine, and again mix thoroly. Add 2 mL  $\text{Ac}_2\text{O}$  and mix 5 min, transferring to another beaker to ensure thoro mixing. Add mixt. to column, using large funnel to prevent loss, and tamp. Dry-wash the 2 beakers with 5 g diat. earth, add to column, and tamp. Place pad of glass wool on top.

Pass 200 mL  $\text{CHCl}_3$  thru column, adjusting flow to ca 7 mL/min, and collect eluate in 250 mL beaker, previously dried at 80°, cooled in desiccator, and weighed. Evap.  $\text{CHCl}_3$  on steam bath with air current, and dry to const wt in convection oven at 80° (ca 3 hr). Piperazine = diacetylpiperazine × 0.5061.

Check for complete extn by passing another 100 mL portion  $\text{CHCl}_3$  thru column, evapg to dryness, and noting if residue is present.

Det. mp of diacetylpiperazine, which should be ca 140°.

**Near-Infrared Method (64)**

## 38.213

**Apparatus and Reagents**

(a) *Near-infrared spectrophotometer.*—With 5 cm Si cells.

(b) *Drying tube.*—Approx. 3.5 cm diam. × 9 cm long. Pack with glass wool and ca 6 cm granular anhyd.  $\text{Na}_2\text{SO}_4$  prewetted with ca 30 mL reagent grade  $\text{CHCl}_3$ .

(c) *Piperazine dihydrochloride.*—Anal. std. (Available from Pfaltz & Bauer Inc, 375 Fairfield Ave, Stamford CT 06902.) Store above Si gel.

## 38.214

**Preparation of Standard**

Accurately weigh std piperazine equiv. to ca 3.5–3.8 g anhyd. base, transfer to 100 mL vol. flask with  $\text{H}_2\text{O}$ , dil. to vol., and mix. Transfer 10.0 mL of this soln and exactly 5 mL  $\text{H}_2\text{O}$  to separator. Add 25 mL *NaOH soln* (1+1) and swirl. *Final concn of NaOH must be >30%*. Cool separator under tap, add 30 mL  $\text{CHCl}_3$ , and shake carefully ca 2 min. Drain  $\text{CHCl}_3$  layer thru drying tube, (b), into 100 mL vol. flask. Ext with three 20 mL portions  $\text{CHCl}_3$ , draining thru drying tube into vol. flask. Rinse tube with  $\text{CHCl}_3$  and dil. to vol. Prep. blank as above, using 15 mL  $\text{H}_2\text{O}$ .

## 38.215

**Preparation of Sample**

(a) *Powders.*—Transfer sample contg ca 250–300 mg piperazine base thru small funnel to separator contg exactly 5 mL  $\text{H}_2\text{O}$ . Rinse funnel with exactly 10 mL  $\text{H}_2\text{O}$  from pipet. Mix, and proceed as in 38.214, beginning, "Add 25 mL *NaOH soln* . . ." Dil.  $\text{CHCl}_3$  exts to 100 mL.

(b) *Sirups.*—Transfer sample contg ca 500 mg piperazine base to separator. Add  $\text{H}_2\text{O}$  to total vol. of exactly 15 mL. Proceed as in 38.214, beginning "Add 25 mL *NaOH soln* . . ." except use 200 mL vol. flask to collect  $\text{CHCl}_3$  exts, and ext with three 50 mL portions  $\text{CHCl}_3$ , finally rinsing inside of separator with several 10–15 mL portions  $\text{CHCl}_3$  before dilg to 200 mL.

**38.216****Determination**

Using 5 cm cells, scan from 1600 to 1450 nm against blank. (Max. is ca 1520 nm.) Draw baseline between min. at ca 1460 and 1565 nm and det. net  $A$ .

$$(A/A') \times (\text{mg base in std/mL CHCl}_3)$$

$$= (\text{mg base in sample})/(\text{mL final CHCl}_3 \text{ soln})$$

where  $A$  and  $A'$  refer to sample and std, resp. Convert sample from base to known salt formula, if desired.

**Procaine—Official Final Action****38.217****Qualitative Tests**

See Microchemical Tests, **36.095–36.097**.

**Quantitative Methods****Method I—with or without Propoxycaine (65)**

(Applicable in presence of parabens and phenolic vasoconstrictors)

**38.218****Apparatus and Reagents**

(a) *Chromatographic tubes and tamping rod*.—See **37.002**.

(b) *Bromide-citrate buffer*.—Mix equal vols 0.5M Na citrate (147 g 2H<sub>2</sub>O/L) and 0.5M citric acid (105 g 1H<sub>2</sub>O/L). Adjust to pH 4.0±0.2, using pH meter, by addn of appropriate citrate soln. Add 10.3 g NaBr/100 mL soln (1.0M Br) and mix.

(c) *Chloroform-isooctane solvent*.—65% CHCl<sub>3</sub> in isooctane. Do not sat. with H<sub>2</sub>O before use. Dil. 65 parts CHCl<sub>3</sub> in graduate to 100 parts with isooctane and mix.

(d) *Phosphate buffer*.—pH 7.0±0.2. Mix equal vols 0.5M KH<sub>2</sub>PO<sub>4</sub> (68.0 g/L) and 0.5M K<sub>2</sub>HPO<sub>4</sub> (87.1 g/L).

(e) *Procaine hydrochloride and propoxycaine hydrochloride std solns*.—Pep. sep. aq. solns contg 10 µg/mL.

**38.219****Preparation of Sample and Column**

Pipet 1 mL sample soln contg 20 mg procaine.HCl or 4 mg propoxycaine.HCl into beaker, add 1.0 mL phosphate buffer, and mix. Add 3 g diat. earth, **36.002**, and mix.

Place small glass wool plug in base of chromatgc tube. Mix 4 g diat. earth and 3 mL bromide-citrate buffer in small beaker, transfer to column, and tamp with gentle pressure. Mix 2 g diat. earth and 1 mL 0.1N NaOH, add to column, and tamp. Quant. transfer sample mixt. to column and tamp. Scrub beaker with 1 g diat. earth and 2–3 drops phosphate buffer, add to column, and tamp. Cover with pad of glass wool.

**38.220****Determination**

(Perform elution for propoxycaine even in its absence.)

(a) *Propoxycaine*.—Place 200 mL vol. flask under column and elute with 150 mL 65% CHCl<sub>3</sub> in isooctane. Dil. to vol. with CHCl<sub>3</sub> and mix. Pipet 10 mL aliquot into 100 mL beaker, add 4 drops HOAc, and evap. nearly to dryness on steam bath under gentle air current, then to dryness with reduced heat. Pipet 20 mL H<sub>2</sub>O into beaker and dissolve residue.

(b) *Procaine*.—Place 200 mL vol. flask under column and elute with 125 mL CHCl<sub>3</sub>. Dil. to vol. with CHCl<sub>3</sub> and mix. Pipet 10 mL aliquot into 100 mL beaker and evap. to dryness as in (a), but without addn of HOAc. Dissolve residue in H<sub>2</sub>O and transfer quant. to 100 mL vol. flask, dil. to vol. with H<sub>2</sub>O, and mix.

(c) *Spectrophotometry*.—Record spectra of sample and std solns from 350 to 250 nm and det.  $A$  of samples and  $A'$  of stds

at max., ca 302 and 290 nm, for propoxycaine and procaine, resp.

$$C = C' (A/A') D,$$

where  $C$  and  $C'$  = concns (µg/mL) of sample and std, resp., and  $D$  = appropriate diln factor.

**38.221 ★ Method II (66) ★**

(Dets as procaine any *p*-aminobenzoic acid formed by decomposition)

Bromination method. See **38.211**, 12th ed.

**38.222 Method III**

(Dets only undecomposed procaine)

See **38.002**.

**38.223 ★ Method IV (67) ★**

(Applicable in presence of chlorobutanol, cocaine, codeine, heroin, lactose, and morphine)

Distn into excess std acid and back-titrn. See **32.096**, 10th ed.

**Procainamide Hydrochloride****Spectrophotometric Method (68)—Official First Action****38.224****Principle**

Procainamide is extd from acid soln with CHCl<sub>3</sub>. After evapn of solv., residue is dissolved in alk. soln and max.  $A$  detd at ca 272 nm.

**38.225****Reagent**

*Procainamide hydrochloride std solns*.—Stock soln.—1 mg/mL. Assay std as in USP XX. Accurately weigh ca 100 mg procainamide.HCl (ICN-K&K Laboratories, Inc., No. 17158) into 100 mL vol. flask, and dissolve and dil. to vol. with 0.01N NaOH. *Working soln*.—1 mg/100 mL. Pipet 1 mL stock soln into 100 mL vol. flask and dil. to vol. with 0.01N NaOH. Prep. fresh daily.

**38.226****Preparation of Sample**

(a) *Capsules*.—Proceed as in **36.004**. Mix, and transfer accurately weighed portion contg ca 100 mg procainamide.HCl to 125 mL separator. Add 10 mL HCl (1+9) and shake to disperse. Add 15 mL H<sub>2</sub>O.

(b) *Tablets*.—Det. av. wt. Reduce tablets to fine powder. (For tablets with coatings that do not reduce to powder, carefully peel off and discard coatings, and reduce tablets to fine powder.) Mix, and transfer accurately weighed portion contg ca 100 mg procainamide.HCl to 125 mL separator. Add 10 mL HCl (1+9) and shake to disperse. Add 15 mL H<sub>2</sub>O.

(c) *Injections*.—Dil. soln, if necessary, with HCl (1+9) to give ca 100 mg procainamide.HCl/mL. Pipet 1 mL into 125 mL separator, add 10 mL HCl (1+9), and shake. Add 15 mL H<sub>2</sub>O.

**38.227****Determination**

(Caution: See **51.011** and **51.056**.)

Ext sample soln with three 25 mL portions CHCl<sub>3</sub> and discard CHCl<sub>3</sub>. To aq. soln add 5 mL NH<sub>2</sub>OH and ext with five 25 mL portions CHCl<sub>3</sub>, collecting exts in 250 mL beaker and rinsing tip of separator into beaker after each extn. Evap. CHCl<sub>3</sub> to dryness on steam bath with air current. Quant. transfer residue to 100 mL vol. flask with 0.01N NaOH, and dil. to vol. with same solv.

★ Surplus method—see inside front cover.

Pipet 1 mL dild soln into another 100 mL vol. flask and dil. to vol. with 0.01*N* NaOH. Record spectra of std and sample solns against 0.01*N* NaOH and det. *A* at max., ca 272 nm.

mg Procainamide.HCl/capsule or tablet

$$= (A/A') \times C \times D \times (W/W'),$$

where *A* and *A'* refer to sample and std solns, resp.; *C* = concn of std soln in mg/mL; *D* = sample diln factor in mL; *W* = av. mg/capsule or tablet; and *W'* = mg sample.

For injections, mg procainamide.HCl/mL

$$= (A/A') \times C \times D/V,$$

where *V* = mL sample aliquot.

#### **Pyrilamine in Cough Sirup (48)—Official Final Action**

(See also 38.111–38.117.)

#### **38.228**

#### **Reagent**

*Pyrilamine std soln.*—0.015 mg pyrilamine maleate/mL. Transfer 150 mg pyrilamine maleate to 500 mL vol. flask, dissolve in ca 0.1*N* H<sub>2</sub>SO<sub>4</sub>, and dil. to vol. with ca 0.1*N* H<sub>2</sub>SO<sub>4</sub>. Transfer 5 mL aliquot to 100 mL vol. flask and dil. to vol. with ca 0.1*N* H<sub>2</sub>SO<sub>4</sub>.

#### **38.229**

#### **Determination**

Proceed as for detn of methapyrilene, 38.166, but measure *A* at 314 nm.

mg Pyrilamine maleate/100 mL sample

$$= (A \times 100 \times 1.5 \times 10)/(A' \times \text{mL aliquot}),$$

where *A* and *A'* refer to sample and std, resp.

#### **Quinacrine Hydrochloride (Atabrine®)**

#### **38.230 ★ Volumetric Method (69)—Official Final Action ★**

Oxidn with K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> and titrn of excess. See 38.216–38.217, 12th ed.

#### **Fluorometric Method (70)—Official Final Action**

(Caution: See 51.008.)

#### **38.231**

#### **Apparatus**

*Spectrophotofluorometer.*—Scanning, with 1 cm cell path, Xe lamp, excitation wavelength 420 nm, and sensitivity to produce 80% fluorescence intensity (*F*) for std soln.

#### **38.232**

#### **Reagent**

*Quinacrine hydrochloride std soln.*—0.00050 mg/mL. Weigh 5.0 mg USP Quinacrine.HCl Ref. Std in 1 L vol. flask and dil. to vol. with H<sub>2</sub>O. Mix well and dil. 10.0 mL to 100 mL with 0.1*N* HCl. Alternatively, weigh 50.0 mg quinacrine.HCl into 1 L vol. flask and dil. to vol. with H<sub>2</sub>O. Mix well and dil. 10.0 mL to 1 L with 0.1*N* HCl. Prep. fresh daily.

#### **38.233**

#### **Preparation of Sample**

(a) *Tablets and powders.*—Weigh amt of well mixed or well ground sample contg 100 mg quinacrine.HCl into 200 mL vol. flask. Dil. to vol. with 0.1*N* HCl, mix 2 min, and filter if necessary. Dil. 10.0 mL clear sample soln to 1 L with H<sub>2</sub>O and mix. Finally dil. 10 mL to 100 mL with 0.1*N* HCl to obtain sample soln.

(b) *Liquids.*—Pipet accurate sample contg ca 100 mg quinacrine.HCl into 200 mL vol. flask. Proceed as in (a), beginning "Dil. to vol. with 0.1*N* HCl, . . ."

#### **38.234**

#### **Determination**

Adjust spectrophotofluorometer to ca 80% fluorescence intensity (*F*) at 500 nm with std soln. Transfer ca 3 mL sample soln to 10 × 10 mm clean cell and read % *F*, using 0.1*N* HCl as blank.

Calc. as follows:

$$\text{Liqs: mg quinacrine.HCl/mL} = 200,000 \times C \times (F/F') \times (1/V)$$

$$\text{Solids: \% by wt quinacrine.HCl} = 200,000 \times C \times (F/F') \times (100/W)$$

where *C* = mg/mL std soln; *F* and *F'*, resp., = fluorescence of sample and std solns at 500 nm, each corrected for blank; *W* = mg sample; and *V* = mL sample.

#### **38.235**

#### **Identification**

Set emission wavelength monochromator at wavelength of max. fluorescence, i.e., 500 nm. Scan std and sample solns used for quantitation with excitation wavelength monochromator from 200 to 750 nm.

Use same instrument parameters as for quantitation except set sensitivity at ca 40. Sample and std spectra exhibit identical max. and min.

## 39. Drugs: Neutral

### STEROIDS AND RELATED HORMONES Conjugated Estrogens (7)—Official Final Action

39.001

#### Reagents

(a) *Iron-Kober reagent*.—Dissolve 1.054 g  $\text{FeSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$  (Mohr salt) in ca 20 mL  $\text{H}_2\text{O}$ ; add 1 mL  $\text{H}_2\text{SO}_4$  and 1 mL 30%  $\text{H}_2\text{O}_2$ . Mix, heat until effervescence ceases, and dil. to exactly 50 mL. To 3 vols of the Fe soln in vol. flask, add  $\text{H}_2\text{SO}_4$ , with cooling, to make 100 vols.

Redistil phenol, discarding first 10% and last 5%. (*Caution:* Phenol may be harmful. Avoid contact with skin and eyes and breathing vapors.) Collect distillate with exclusion of moisture in dry, tared g-s flask of ca twice vol. of the phenol. Place stoppered flask in ice bath to solidify phenol, breaking top crust with glass rod to ensure complete crystn. Dry and weigh flask.

Add to phenol 1.13 times its wt of  $\text{Fe-H}_2\text{SO}_4$  soln, stopper flask, and let stand without cooling but with occasional mixing until phenol is liquefied ( $\leq 30$  min). Shake mixt. vigorously until homogeneous and let stand in dark 16–24 hr. Add to mixt. 23.5% its wt of  $\text{H}_2\text{SO}_4$  (10+11). Shake vigorously to homogeneity. Transfer to dry g-s bottles. Stored in dark and protected from absorption of moisture, this reagent is stable for months.

(b) *Dicyclohexylamine acetate*.—Dissolve 50 g dicyclohexylamine in 150 mL acetone, cool in ice bath, and add, with stirring, 18 mL HOAc dissolved in 150 mL acetone. Filter ppt on buchner, wash with small amt acetone, and air dry.

(c) *Girard reagent T (trimethylacetylhydrazide ammonium chloride)*.—Recrystallize com. samples twice from absolute alcohol and dry under vac. at room temp. Recrystd material should be white and practically odorless. Store in tightly stoppered bottle in desiccator.

(d) *Estrone std soln*.—50  $\mu\text{g/mL}$ . Dissolve ca 5.0 mg USP Estrone Ref. Std, accurately weighed, in benzene, and dil. to 100 mL with benzene.

(e) *Equilin std soln*.—20  $\mu\text{g/mL}$ . Dissolve ca 2.0 mg USP Equilin Ref. Std, accurately weighed, in benzene, and dil. to 100 mL with benzene.

39.002

#### Preparation of Sample

(*Caution:* See 51.011, 51.039, 51.040, 51.045, and 51.056.)

Reduce tablets to fine powder without loss. Weigh sample contg ca 7 mg Na estrone sulfate and transfer to 250 mL beaker. Add 6 g diat. earth, 36.002, and mix thoroly. Add 4 mL  $\text{H}_2\text{O}$  and mix until uniform. Transfer quant., with aid of small amt of dry diat. earth, 36.002, to 25  $\times$  150 mm chromatgc tube. Tamp moderately tight and wash column with 100 mL  $\text{H}_2\text{O}$ -satd ether, discarding ether wash. Add 100 mg dicyclohexylamine acetate, (b), dissolved in 5 mL  $\text{CHCl}_3$ , to column, and collect eluate in 250 mL g-s flask. Wash column with several 5 mL portions  $\text{CHCl}_3$  and finally with enough solv. to produce 150 mL total eluate. Evap. to dryness on steam bath with aid of air current.

Dissolve residue in 25 mL absolute MeOH, add 1 mL HCl and few boiling chips, stopper loosely, and boil 5 min. Cool, transfer to 125 mL separator with 70 mL  $\text{H}_2\text{O}$ , and ext with four 25 mL portions  $\text{CHCl}_3$ . Evap. combined  $\text{CHCl}_3$  exts just to dryness on steam bath with aid of air current.

Dissolve residue in 5 mL  $\text{CHCl}_3$  and transfer, using  $\leq 5$  mL  $\text{CHCl}_3$ , to 125 mL separator contg 50 mL isooctane. Add 10 mL 10% NaOH soln and shake 1 min. Transfer aq. layer to second 125 mL separator. Ext with two addnl 10 mL portions 10% NaOH

soln, adding each to second separator. Discard  $\text{CHCl}_3$ -isooctane soln. Acidify alk. ext with dil.  $\text{H}_2\text{SO}_4$ , cool, add 25 mL benzene, and shake 1 min. Transfer aq. layer to second separator contg 25 mL benzene, shake 1 min, and drain and discard aq. layer. Wash each benzene layer successively with 10 mL 10%  $\text{Na}_2\text{CO}_3$  soln and two 10 mL portions  $\text{H}_2\text{O}$ . Filter benzene layers thru cotton plug previously washed with benzene into 100 mL vol. flask. Wash separators and funnel with benzene, filter washings into vol. flask, dil. to vol., and mix (*Soln I*).

Evap. 50 mL aliquot *Soln I* to ca 5 mL and transfer to 25 mL g-s erlenmeyer with small vol.  $\text{CHCl}_3$ . Evap. to dryness on steam bath with air current. Reserve remainder of *Soln I* for detn of total estrogens. Add 100 mg Girard Reagent T and 0.5 mL HOAc to flask, stopper loosely, and heat on steam bath 5 min, swirling several times to ensure complete mixing. Cool, and transfer to 125 mL separator with ca 25 mL ice- $\text{H}_2\text{O}$ . Add 5 mL 5% NaOAc soln and ext immediately with three 10 mL portions  $\text{CHCl}_3$ . Combine  $\text{CHCl}_3$  exts in second separator, wash with 5 mL ice- $\text{H}_2\text{O}$ , and discard  $\text{CHCl}_3$ . Add  $\text{H}_2\text{O}$  wash to aq. soln in first separator. Add 3 mL  $\text{H}_2\text{SO}_4$  (1+2), mix well, and let stand 30 min. Ext aq. soln with three 25 mL portions  $\text{CHCl}_3$ , combine exts in second separator, wash with 5 mL  $\text{H}_2\text{O}$ , and filter thru cotton pad previously washed with  $\text{CHCl}_3$  into 150 mL beaker. Wash separator and filter with little  $\text{CHCl}_3$ , and add to main ext. Evap.  $\text{CHCl}_3$  soln to dryness on steam bath with air current. Dissolve residue in little benzene, transfer quant. to 50 mL vol. flask, and dil. to vol. with benzene (*Soln II*).

39.003

#### Determination of Total Estrogens as Sodium Estrone Sulfate

Transfer duplicate 1 mL aliquots *Soln I* and estrone std soln, using same pipet, to 16  $\times$  150 mm g-s test tubes. Add few boiling chips to each tube, evap. to dryness in steam bath, and cool in vac. desiccator. To each tube and to blank tube, add 1.0 mL Fe-Kober reagent, 39.001(a), stopper, and place in boiling  $\text{H}_2\text{O}$  bath. Heat ca 1 min, shake tubes to mix, and release pressure by removing stopper momentarily. Heat 90 min, cool in  $\text{H}_2\text{O}$  bath, add 10.0 mL  $\text{H}_2\text{SO}_4$  (1+2), and mix.

Det. *A* of std and sample solns against blank between 400 and 700 nm, and det. baseline *A* at 520 nm, drawing baseline between min. at ca 400 and 700 nm.

Total estrogens as Na estrone sulfate, mg/g

$$= (A_B/S_1) \times (C_1/w) \times 138 + d/2;$$

where  $A_B$  = baseline-corrected *A* of sample soln,  $S_1$  = baseline-corrected *A* of std soln,  $C_1$  = mg estrone in std aliquot,  $w$  = g sample, and  $d$  = Na equilin sulfate in mg/g from 39.004. Conversion factors are Na estrone sulfate:estrone = 1.38 and Na equilin sulfate:equilin = 1.38.

39.004

#### Determination of Equilin as Sodium Equilin Sulfate

Transfer duplicate 1 mL portions *Soln II* and equilin std soln (larger aliquots may be used for samples low in equilin; do not exceed 25–30  $\mu\text{g}$  equilin), using same pipet, to 16  $\times$  150 mm g-s test tubes. Add few boiling chips to each tube, evap. just to dryness in steam bath, and cool in vac. desiccator. To each tube and to blank tube add 0.10 mL alcohol and rotate tube to dissolve ketosteroids. Add 1.0 mL Fe-Kober reagent, 39.001(a), to each tube, mix thoroly, stopper, and heat 25 min in boiling

H<sub>2</sub>O bath. Cool, add 3.00 mL H<sub>2</sub>SO<sub>4</sub> (1+2) to each tube, and mix thoroly. Det. *A* against blank at 620 nm.

$$\text{Na equilin sulfate, mg/g} = (A_2/S_2) \times (C_2/w) \times 138;$$

where  $A_2$  = *A* of sample soln,  $S_2$  = *A* of std soln,  $C_2$  = mg equilin in std aliquot, and  $w$  = g sample.

### 39.005 *Determination of Estrone as Sodium Estrone Sulfate*

Transfer duplicate 1 mL aliquots *Soln II*, estrone std soln, and equilin std soln to 16 × 150 mm g-s test tubes. Proceed as in 39.003, beginning, "Add few boiling chips . . ." except heat 2 hr instead of 90 min. Det. *A* against blank at 520 nm. Correct *A* of sample soln for equilin *A* as follows:

$$A_3 (\text{corr.}) = A_3 - (S_4 \times A_2)/S_2;$$

$$\text{Na estrone sulfate, mg/g} = (A_3 (\text{corr.})/S_3) \times (C_1/w) \times 138;$$

where  $A_3$  = *A* of sample soln,  $S_3$  = *A* of estrone std soln,  $S_4$  = *A* of equilin std soln,  $C_1$  = mg estrone in std aliquot, and  $w$  = g sample.

### 39.006 ★ Ketosteroids (2)—Official First Action ★

Extn of oils from alk. soln followed by extn of ketosteroids from acid soln, and reaction with Girard reagent T. Product extd from neut. soln is used for β-estradiol detn. After acidification, ketosteroids are extd with CHCl<sub>3</sub>, evapd to dryness, and residue dissolved in alcohol. Aliquot reacted with BQC to det. equilenin, with benzenesulfonyl chloride to det. equilin, and with Fe-Kober reagent to det. estrone. See 39.006–39.012, 12th ed.

### 39.007 ★ Beta-Estradiol (2)—Official First Action ★

Colorimetric method. See 36.249–36.254, 11th ed.

### Estradiol Valerate (3)—Official Final Action

#### 39.008 *Principle*

Oils are eluted with heptane from CH<sub>3</sub>NO<sub>2</sub>-diat. earth column. Estradiol valerate is eluted with addnl heptane, and detd by fluorometry at max. intensity, ca 328 nm.

#### 39.009 *Apparatus*

(a) *Recording spectrophotofluorometer*.—With 1 cm cell path, excitation wavelength 285 nm, and sensitivity to produce 70% fluorescence for std soln at 328 nm.

(b) *Glass chromatographic tubes*.—250 × 25 mm id.

#### 39.010 *Reagents*

(a) *Heptane*.—Redistd.

(b) *Nitromethane*.—Spectral grade, or equiv.

(c) *Diatomaceous earth*.—See 36.002.

(d) *Estradiol valerate std solns*.—(1) *Stock soln*.—0.4 mg/mL. Accurately weigh ca 40 mg USP Estradiol Valerate Ref. Std in 100 mL vol. flask and dil. to vol. with absolute alcohol. (2) *Working soln*.—16 μg/mL. Dil. 2 mL stock soln to 50 mL with absolute alcohol.

#### 39.011 *Preparation of Sample*

Using "to contain" pipet (or hypodermic syringe fitted with 1½", 18 gage needle), transfer accurately measured vol. sample contg ca 40 mg estradiol valerate to 100 mL vol. flask. Wash pipet with heptane and add wash to vol. flask. Dil. to vol. with heptane and mix.

★ Surplus method—see inside front cover.

### 39.012

#### *Preparation of Column*

Place glass wool plug in base of chromatgc tube. To 10 g diat. earth in 250 mL beaker, add 11 mL CH<sub>3</sub>NO<sub>2</sub>. (*Caution*: CH<sub>3</sub>NO<sub>2</sub> is toxic and flammable. Wear resistant rubber gloves when using it. Use effective fume removal device.) Mix until fluffy and add to tube in portions, packing moderately after each addn. Top column with glass wool pad and prewash column with 50 mL heptane.

### 39.013

#### *Determination*

Transfer 2 mL sample soln to column. Wash with 5, 5, 10, 10, and 40 mL heptane (70 mL total), allowing each portion to pass thru column before adding next. Discard eluate. (*Caution*: See 51.011 and 51.039.) Change receiver to 250 mL beaker and continue eluting with heptane, collecting ca 150 mL. Evap. eluate to dryness and quant. transfer residue to 50 mL vol. flask, using absolute alcohol. Dil. to vol. with absolute alcohol.

Adjust spectrophotofluorometer to ca 70% fluorescence intensity at 328 nm with working std soln. Scan sample and std solns from ca 280 to 450 nm, reading % fluorescence at max., ca 328 nm. Use absolute alcohol as blank.

$$\text{mg Estradiol valerate/mL} = 100 \times C \times (F/F') \times (1/V),$$

where  $C$  = concn of std soln (mg/mL);  $F$  and  $F'$  = fluorescence of sample and std solns, resp., at 328 nm, each corrected for blank; and  $V$  = vol. of sample taken.

### Diethylstilbestrol (4)—Official Final Action

#### 39.014 *Reagent and Apparatus*

(a) *Diethylstilbestrol std soln*.—Accurately weigh suitable amt of USP Diethylstilbestrol Ref. Std, dissolve in alcohol, and prep. soln contg 20.0 μg/mL by accurate stepwise diln with alcohol. Prep. working std soln by mixing 25 mL of this soln with 25 mL 1.8% K<sub>2</sub>HPO<sub>4</sub> soln.

(b) *Irradiation containers*.—Quartz cells ≥4 mL capacity with clear sides, or 18 × 150 mm Vycor test tubes, held in rack that does not obstruct effective light beam of cylindrical 15 watt germicidal lamp, may be used conveniently.

#### 39.015 *Preparation of Assay Solution*

(a) *Oil solns containing 2 mg or less diethylstilbestrol/mL*.—Using accurately calibrated hypodermic syringe, transfer vol. sample contg 2 mg diethylstilbestrol to separator contg 50 mL isooctane. Shake mixt. with 10 mL 1*N* NaOH and transfer well defined aq. layer as completely as possible to second separator contg 50 mL isooctane. Shake vigorously and transfer clear aq. layer to third separator. Repeat extn of the 2 isooctane layers successively with two 10 mL portions 1*N* NaOH, collect aq. layers in third separator, and discard extd isooctane layers.

Acidify combined aq. exts with 3 mL H<sub>2</sub>SO<sub>4</sub> (1+1), cool, and ext diethylstilbestrol with three 30 mL portions CHCl<sub>3</sub>. Wash CHCl<sub>3</sub> exts successively in 2 separators, first contg 20 mL 1% NaHCO<sub>3</sub> soln and second, 20 mL H<sub>2</sub>O.

Filter washed CHCl<sub>3</sub> exts thru cotton pledget moistened with CHCl<sub>3</sub> into 100 mL vol. flask, dil. to vol. with CHCl<sub>3</sub>, and mix.

Transfer 10.0 mL CHCl<sub>3</sub> soln, contg 200 μg diethylstilbestrol, to small erlenmeyer and evap. just to dryness on steam bath with aid of air current. Cool in vac. desiccator 10 min. Add 10.0 mL alcohol, stopper, and dissolve residue by swirling. After 15 min, mix with 10.0 mL 1.8% K<sub>2</sub>HPO<sub>4</sub> to prep. assay soln.

(b) *Oil solns containing more than 2 mg diethylstilbestrol/mL*.—Dil. convenient accurately measured vol. oil soln with CHCl<sub>3</sub> to obtain soln contg 0.5 mg diethylstilbestrol/mL. Transfer

4 mL aliquot to separator contg 50 mL isooctane and proceed as in (a), beginning "Shake mixt. with 10 mL 1*N* NaOH . . ."

(c) *Tablets*.—Transfer accurately weighed portion powder material contg 2 mg diethylstilbestrol to separator contg 30 mL  $\text{CHCl}_3$ . Add 10 mL  $\text{H}_2\text{O}$  and 1 mL  $\text{H}_2\text{SO}_4$  (1+1) and shake vigorously. Drain  $\text{CHCl}_3$  layer into second separator, wash with 5 mL  $\text{H}_2\text{O}$ , and filter thru cotton pledget moistened with  $\text{CHCl}_3$  into 100 mL vol. flask. Repeat extn with three 20 mL portions  $\text{CHCl}_3$ , dil. combined exts to 100 mL, and mix.

Proceed as in (a), fourth par.

### 39.016

#### Irradiation

(Caution: Protect eyes from direct rays of UV light.)

Test transparency of several irradiation containers as follows: Transfer convenient vols of working std soln to tubes, place them ca 7 cm from 15 watt germicidal lamp, and irradiate soln transversely ca 10 min. Measure *A* of yellow solns at 418 nm in suitable spectrophtr in matched 1 cm cells, against  $\text{H}_2\text{O}$ . Re-irradiate for 1–3 min intervals, and note irradiation time required for max. *A*. Repeat irradiation process, varying distance of tubes from lamp, and det. most convenient conditions for developing stable, repeatable colors of max. *A* (ca 0.7 at 418 nm).

Transfer portions of working std soln and assay soln to clean, dry irradiation containers, and irradiate under optimum conditions previously detd. Calc. wt diethylstilbestrol in sample.

### 39.017

#### Total Phenols

Transfer 20 mL  $\text{CHCl}_3$  ext, **39.015**, contg 400  $\mu\text{g}$  diethylstilbestrol to beaker. Transfer alc. soln contg 400.0  $\mu\text{g}$  USP Diethylstilbestrol Ref. Std to similar beaker, and treat both solns as follows: Evap. to dryness on steam bath with aid of air current. Dissolve residues in 2.0 mL  $\text{HOAc}$  with gentle warming. Cool to room temp., add 10 drops  $\text{H}_2\text{SO}_4$  (1+1), and mix. Cool, add 5 drops 10%  $\text{NaNO}_2$  soln, and let stand 45 min with occasional mixing. Wash quant. into 25 mL vol. flask with ca 20 mL alc.  $\text{NH}_4\text{OH}$  soln, prepd by mixing equal vols alcohol and dil.  $\text{NH}_4\text{OH}$  (4+6). Cool in ice bath, and let stand at room temp. 1 hr. Dil. to vol. with the alc.  $\text{NH}_4\text{OH}$  soln, and mix. If ppt forms, filter thru dry paper, rejecting first few mL filtrate. Det. *A* of clear, yellow alk. solns at 420 nm in tightly stoppered 1 cm cells, in suitable spectrophtr, against alcohol (1+2). Calc. % total phenols, as diethylstilbestrol, in sample.

#### Dienestrol (5)—Official Final Action

(Caution: See **51.011**, **51.018**, **51.045**, **51.054**, **51.062**, and **51.066**.)

### 39.018

#### Reagents

(a) *Dienestrol std soln*.—Approx. 15  $\mu\text{g}/\text{mL}$ . Accurately weigh USP Dienestrol Ref. Std, dissolve in MeOH, and serially dil. to concn. Store in low-actinic vol. flask.

(b) *Methanolic sulfuric acid*.—Carefully add, with swirling, 50 mL  $\text{H}_2\text{SO}_4$  to 50 mL cold MeOH, while continuously chilling mixt. in ice- $\text{H}_2\text{O}$ . Use reagent at room temp. Reagent is stable 3–4 days in g-s flask.

(c) *Ethyl ether*.—Test as follows on day of use: Evap., with gentle heat and air stream, mixt. of 10.0 mL dienestrol std soln in ca 200 mL  $\text{H}_2\text{O}$ -washed ether. Dissolve residue in 10.0 mL MeOH. Proceed as in **39.021**, using this soln and 5.0 mL dienestrol std soln. Resulting solns should be clear and exhibit single max. at ca 303 nm, and corrected *A*, **39.022**, should differ  $\leq 3\%$ . If necessary, wash 750 mL ether with three 50 mL portions 10*N* KOH in 1 L separator. Percolate upper ether layer thru 300  $\times$  22 mm glass chromatgc tube contg glass wool plug and 20 g diat. earth thoroly mixed with 15 mL 10*N* KOH and tamped moderately

tight. Discard first 30 mL eluate and collect remainder for use. Column will only purify max. of 1 L ether.

(d) *Diatomaceous earth*.—See **36.002**.

### 39.019

#### Preparation of Columns

*Trap column*.—Mix 4 g diat. earth and 3 mL 0.25*M* KOH and transfer to 200  $\times$  22 mm glass chromatgc tube contg glass wool plug. Tamp mixt. tightly and top with glass wool pad. Prewash column with 25 mL  $\text{H}_2\text{O}$ -washed ether, followed by 25 mL benzene.

*Sample column*.—Accurately weigh freshly ground sample contg ca 400  $\mu\text{g}$  dienestrol into 150 mL beaker. Add 3 mL 0.3*M*  $\text{K}_3\text{PO}_4$  and wet sample completely. Add 5 g diat. earth and mix. thoroly with spatula. Transfer quant. in 2 equal portions to 200  $\times$  22 mm glass chromatgc tube contg glass wool pad, tamping each portion moderately tight. Dry-rinse beaker with 1–2 g diat. earth and add rinse to column. Wipe tamper, spatula, and beaker with glass wool pad and add pad to top of column.

### 39.020

#### Chromatography

Arrange columns so that eluate from sample column passes into trap column. Add 25 mL benzene to trap column; then add 175 mL benzene-isooctane (9+1) to sample column, using several portions to rinse sample beaker. Maintain layer of eluant over trap column. (To maintain this reservoir in trap column, connect the 2 columns with air-tight stopper, i.e., hollow No. 4 Nalgene stopper with hole drilled to accommodate stem of sample column.) Discard sample column when elution is complete. Wash trap column with addnl 25 mL benzene-isooctane (9+1) and discard eluates.

Elute dienestrol from trap column with 225 mL  $\text{H}_2\text{O}$ -washed ether into 250 mL g-s conical flask contg 10 mL absolute alcohol. Without delay, evap. to near dryness, using air stream and gentle heat. Rinse flask walls with small amt of absolute alcohol and evap. soln to dryness. Pipet 25 mL MeOH into flask, stopper tightly, and let stand several min with frequent vigorous swirling.

### 39.021

#### Isomerization

Into sep. 25 mL g-s conical flasks, pipet 5 mL dienestrol std soln, 5 mL sample prepn, and 5 mL MeOH as reagent blank. Add 5.0 mL methanolic  $\text{H}_2\text{SO}_4$  to each flask with swirling (solns will become warm). Stopper flasks tightly and shake vigorously; then let cool  $\geq 25$  min at room temp.

### 39.022

#### Determination

Det. *A* of sample and std solns between 400 and 240 nm in 1 cm cells against reagent blank. Correct *A* at ca 303 nm by subtracting *A* at 360 nm.

$$\text{mg Dienestrol/tablet} = [(A/A') \times C \times V \times W]/Q,$$

where *A* and *A'* refer to sample and std solns, resp.; *C* = exact concn of std in mg/mL; *V* = mL sample dildn (25 mL); *W* = av. tablet wt (g); and *Q* = sample wt (g).

#### Hexestrol (4,4'-(1,2-Diethylethylene Diphenol)) (6) Official Final Action

### 39.023

#### Determination

Grind tablets to fine powder. Weigh amt powder contg ca 5 mg hexestrol into 125 mL separator contg 25 mL  $\text{H}_2\text{O}$  and 1 mL HCl (1+9). Ext with 25, 15, 10, and 10 mL  $\text{CHCl}_3$ . Drain each ext thru  $\text{CHCl}_3$ -satd cotton pledget into 100 mL beaker. Evap. combined exts to ca 25 mL on steam bath in air current. Check for completeness of extn by evapng addnl 10 mL ext to dryness.

Quant. transfer concd  $\text{CHCl}_3$  exts to 125 mL separator contg 10 mL isooctane. Ext with 25, 15, 15, and 10 mL ca 0.1*N* NaOH, rolling or shaking separator gently 90 sec each time; emulsions may form. Drain lower org. layer into second 125 mL separator, each time including any small emulsion layer present. Continue alk. extn of org. phase, draining it alternately into two 125 mL separators and combining alk. exts by pouring each time into original separator. Discard org. phase.

Make combined alk. exts acid with HCl. Ext with 25, 15, 15, and 10 mL  $\text{CHCl}_3$ , collecting combined exts in 125 mL separator. Wash  $\text{CHCl}_3$  exts with two 15 mL portions  $\text{H}_2\text{O}$ . Discard  $\text{H}_2\text{O}$  washes.

Pass combined  $\text{CHCl}_3$  exts thru 1 cm column of granular anhyd.  $\text{Na}_2\text{SO}_4$  in coarse fritted glass funnel, ca 3.5 cm id, into 100 mL vol. flask. Rinse column and stem tip with small portions  $\text{CHCl}_3$ . Dil. to vol. with  $\text{CHCl}_3$ . Place 50.0 mL aliquot in g-s flask and evap. just to dryness on steam bath, with aid of air current. Remove last traces of  $\text{CHCl}_3$  with air current and without heat. Pipet 50 mL alcohol onto dry residue; shake 1 min to dissolve. This is sample soln.

Prep. std soln by dissolving pure hexestrol in enough alcohol to make concn ca 2.5 mg/50.0 mL. Use alcohol as ref. blank with sample and std solns.

Det. baseline *A* of sample and std solns at 280 nm with spectrophtr. If recording UV spectrophtr is used, record spectra between 320 and 240 nm. Adjust instrument to begin at 320 nm with zero *A*, and record spectra to 240 nm.

mg Hexestrol in assay sample =  $(A/A')$

$\times (\text{mg/mL std soln}) \times \text{total mL sample soln,}$

where *A* refers to sample and *A'* refers to std soln at 280 nm.

### 39.024

#### Qualitative Identification

(a) *Ultraviolet spectra*.—Dil. alc. soln of sample and std previously used for quant. assay to ca 20  $\mu\text{g/mL}$  with alcohol. Compare UV spectrum from 215 to 320 nm with similar spectrum from authentic hexestrol.

(b) *Infrared spectra*.—Prep. KBr disk contg 0.3–0.6% hexestrol from residue obtained by evapg portion of remaining  $\text{CHCl}_3$  sample soln from assay. Compare IR spectrum from 2 to 16  $\mu\text{m}$  with similar spectrum from authentic hexestrol. (Extraneous peak at 5.85  $\mu\text{m}$  appears in spectra of tablet preps that does not appear in std.)

#### Ethinyl Estradiol (7)—Official Final Action

### 39.025

#### Reagents

(a) *Methanol-sulfuric acid*.—In ice bath, cautiously add chilled  $\text{H}_2\text{SO}_4$  in small increments, with mixing, to 60 mL chilled anhyd. MeOH in 200 mL vol. flask. Cool to room temp., dil. to vol. with  $\text{H}_2\text{SO}_4$ , and mix. Reagent is stable at room temp. ca 1 month. (Caution: Wear face shield and heavy rubber gloves to protect against splashes.)

(b) *Washed chloroform*.—Vigorously shake ca 500 mL  $\text{CHCl}_3$  with 30 mL  $\text{H}_2\text{SO}_4$  in 1 L separator ca 2 min. Discard  $\text{H}_2\text{SO}_4$  (bottom) layer. Wash  $\text{CHCl}_3$  with 400 mL  $\text{H}_2\text{O}$  by shaking vigorously 1 min; discard  $\text{H}_2\text{O}$ . Repeat  $\text{H}_2\text{O}$  washing 3 times as above. Filter clear  $\text{CHCl}_3$  layer thru funnel contg pad of glass wool covered with ca 50 g granular anhyd.  $\text{Na}_2\text{SO}_4$ . Prep. fresh daily. Use same batch of washed  $\text{CHCl}_3$  for all samples and stds thruout series.

(c) *Ethinyl estradiol std solns*.—(1) *Stock soln*.—0.8 mg/mL. Accurately weigh ca 40 mg USP Ref. Std Ethinyl Estradiol, dissolve in anhyd. MeOH in 50 mL vol. flask, dil. to vol. with MeOH, and mix. (2) *Intermediate soln*.—20  $\mu\text{g/mL}$ . Pipet 5.0 mL stock soln into 200 mL vol. flask, dil. to vol. with isooctane, and

mix. (3) *Working soln*.—4  $\mu\text{g/mL}$ . Pipet 20 mL intermediate soln into 100 mL vol. flask, dil. to vol. with isooctane, and mix. (This soln is stable at room temp. ca 3 weeks.)

(d) *Diatomaceous earth*.—See 36.002.

### 39.026

#### Preparation of Column

*Trap layer*.—Transfer ca 5 g granular anhyd.  $\text{Na}_2\text{SO}_4$  to 25  $\times$  250 mm chromatgc tube contg pad of glass wool in base. Thoroily mix 3 mL 10% NaOH soln with 3 g diat. earth in 100 mL beaker. Transfer mixt. to tube in 1 portion and tamp moderately.

*Sample layer*.—Accurately weigh portion of ground tablet composite contg ca 40  $\mu\text{g}$  ethinyl estradiol into 100 mL beaker. Add 3 mL  $\text{CHCl}_3$  and 2 mL  $\text{H}_2\text{O}$ , and stir frequently 2 min to dissolve max. amt of sample. Mix with 4 g diat. earth 1 min, transfer quant. to tube in 1 portion, and tamp moderately. Dry-wash beaker with ca 0.5 g diat. earth and transfer wash to column. Wipe tamper, spatula, and beaker with glass wool and place glass wool on column.

### 39.027

#### Chromatography

Rinse tamper, spatula, and beaker with 25 mL isooctane and add rinse to column. Discard eluate. Using total of 55 mL  $\text{CHCl}_3$ -isooctane (1+9), repeat rinsing as above and discard eluate. Wash column with 15 mL isooctane and discard eluate. Finally, elute ethinyl estradiol with 50 mL washed  $\text{CHCl}_3$ , followed by 25 mL isooctane, collecting eluate in 250 mL separator.

### 39.028

#### Determination

Pipet 10 mL each of std soln and isooctane (reagent blank) into sep. dry 250 mL separators. To each add 50 mL washed  $\text{CHCl}_3$  and 15 mL isooctane, and mix gently. Pipet 10 mL MeOH- $\text{H}_2\text{SO}_4$  into sample, blank, and std separators, letting pipet drain completely. (Caution: See 51.018 and 51.030.) Shake vigorously 4 min, and let layers sep. ca 15 min; protect from strong light. Within 30 min, scan spectra between 700 and 500 nm of pink (lower) phases of std and sample in 1 cm cells against reagent blank as ref., set at 0 at 700 nm.

$\mu\text{g}$  Ethinyl estradiol in final soln =  $(A/A') \times C \times 10 (\text{mL})$ ,

where *A* and *A'* refer to sample and std solns, resp., at max., ca 537 nm; and *C* =  $\mu\text{g/mL}$  std soln.

#### Mestranol (8)—Official Final Action

(Applicable in presence of norethindrone and norethynodrel; not applicable in presence of ethynodiol diacetate or chlormadinone acetate)

### 39.029

#### Reagents

(a) *Diatomaceous earth*.—See 36.002.

(b) *Immobil solvent*.—Mix equal vols DMF and formamide (either redistd or stabilized formamide may be used).

(c) *n-Heptane*.—Redistd (may be prepd by fractionating thru all-glass column). *A* against alcohol in 1 cm cells should be  $<0.500$  in range 250–360 nm (limit of aromatic content). Residue from evapn of 25 mL distillate, dissolved in 10 mL alcohol, should have *A*  $\leq 0.01$  in range 230–360 nm (nonvolatile residue limit).

(d) *Spectrophotometric solvent*.—Transfer 10.0 mL  $\text{CHCl}_3$  to 100 mL vol. flask, add ca 80 mL *n*-heptane, warm to room temp., and dil. to vol. with *n*-heptane.

(e) *Mestranol std soln*.—0.06 mg/mL. Dissolve accurately weighed amt USP Mestranol Ref. Std in  $\text{CHCl}_3$  and dil. quant. to ca 0.6 mg mestranol/mL. Transfer 10.0 mL aliquot to 100 mL vol. flask, add ca 80 mL *n*-heptane, warm to room temp., and dil. to vol. with *n*-heptane.

**39.030****Preparation of Assay Mixture**

Finely powder tablets. Transfer accurately weighed portion contg ca 0.6 mg mestranol to 100 mL beaker. Add 2.0 mL immobile solv., mix, and warm 5 min on steam bath with occasional stirring with spatula to ensure that powder is thoroly wetted. Cool, add 4 g diat. earth, and mix with spatula until fluffy.

**39.031****Column Chromatography**

Pack pledget of fine glass wool in base of 25 × 250 mm chromatgc tube. Transfer 3.0 mL immobile solv. to 100 mL beaker, add 1 g anhyd. Na<sub>2</sub>SO<sub>4</sub>, and mix by swirling. Add 5 g diat. earth and mix until fluffy. Transfer to tube and tamp gently to compress to uniform mass. Quant. transfer prep'd sample to column, scrub beaker with 0.5 g diat. earth, and tamp as before. Wipe beaker, spatula, and funnel with pad of glass wool. Place pad on top of column and tamp lightly.

Add *n*-heptane to column. Discard first 20 mL eluate and then collect ca 99 mL eluate in 100 mL vol. flask. Wash tip of column with heptane, dil. eluate to vol. with heptane, and mix. Transfer 50.0 mL aliquot to 125 mL g-s conical flask and evap. on steam bath with aid of air current to ca 1 mL. (Caution: Use effective fume removal device when evapg heptane.) Remove last traces of solv. without heat. Wash sides of flask with ca 2 mL alcohol and evap. solv. on steam bath as before, removing last traces of solv. without heat. Add 5.0 mL spectrophtrc solv. to flask, stopper, let stand ca 5 min, and swirl to ensure soln of residue.

**39.032****Determination**

Record *A* of sample and std solns in 1 cm cells against spectrophtrc solv. Construct baseline by extending line passing between points on spectrum at 302 and 315 nm. Det. baseline-corrected *A* of sample ( $\Delta A$ ) and std ( $\Delta A'$ ) at max., ca 287 nm.

mg Mestranol in portion of tablets taken =  $10C \times (\Delta A/\Delta A')$ , where *C* = exact concn, mg/mL, of mestranol std.

**Mestranol in Combination with Ethynodiol Diacetate****Spectrophotometric Method (9)—Official Final Action****39.033****Principle**

Mestranol is sepd on partition column, eluted with *n*-heptane, and extd into MeOH-H<sub>2</sub>SO<sub>4</sub> reagent to form colored steroid complex with max. *A* at ca 540 nm.

**39.034****Apparatus and Reagents**

(Caution: Dimethyl sulfoxide (DMSO) and formamide can be harmful. Avoid skin contact by wearing heavy rubber gloves. Use effective fume removal device.)

(a) *Chromatographic tubes and tamping rod*.—Glass, 25 (od) × 300 mm. See 37.002.

(b) *Formamide*.—Reagent grade contg no stabilizing agent or H<sub>2</sub>O. Use recently opened bottle.

(c) *Washed n-heptane*.—Vigorously shake *n*-heptane (bp 98–99°) with ca 10% of its vol. of H<sub>2</sub>SO<sub>4</sub> in separator ≥5 min. Discard H<sub>2</sub>SO<sub>4</sub> (lower) layer and wash heptane with H<sub>2</sub>O until washings are neut. to pH test paper. Filter thru firm plug of absorbent cotton covered with ca 50 g anhyd. Na<sub>2</sub>SO<sub>4</sub>, discarding first 5 mL. Use same batch of washed heptane for all samples and stds thruout series.

(d) *Methanol-sulfuric acid reagent*.—Cautiously add in small increments, with mixing, chilled H<sub>2</sub>SO<sub>4</sub> (min. 95%) to 60 mL chilled anhyd. MeOH in 200 mL vol. flask in ice bath. Adjust to room temp., dil. to vol. with H<sub>2</sub>SO<sub>4</sub>, and mix. Reagent is stable

at room temp. ca 1 month. (Caution: See 51.030 and 51.066.)

(e) *Mestranol std solns*.—(1) *Stock soln*.—1 mg/mL. Dissolve ca 25 mg USP Ref. Std Mestranol, accurately weighed, with 3 mL CHCl<sub>3</sub> in 25 mL vol. flask, dil. to vol. with *n*-heptane, and mix well. (2) *Intermediate soln*.—30 µg/mL. Pipet 3 mL stock soln into 100 mL vol. flask, dil. to vol. with *n*-heptane, and mix. (3) *Working soln*.—0.75 µg/mL. Pipet 5 mL intermediate soln into 200 mL vol. flask, dil. to vol. with *n*-heptane, and mix. Prep. fresh daily.

**39.035****Preparation of Column**

Thoroly mix 3 g diat. earth, 36.002, and 1 mL H<sub>2</sub>O in 100 mL beaker, transfer to chromatgc tube contg pledget of glass wool at base, and tamp moderately tight.

Thoroly mix 7 g diat. earth and 3.5 mL DMSO (spectral grade)-formamide (10+9) in 150 mL beaker, transfer to tube in 2 portions, and tamp each moderately tight.

Accurately weigh portion of ground tablets contg ca 150 µg mestranol into 100 mL beaker. Add 2 mL formamide and stir continuously 2 min to wet and disperse sample completely. Mix thoroly with 4 g diat. earth, transfer quant. to column in 1 portion, and tamp moderately tight. Scrub beaker with ca 0.5 g diat. earth and transfer to column. Wipe tamper, spatula, and beaker with glass wool, and place as pad above column contents.

**39.036****Determination**

Rinse tamper, spatula, and beaker with 65 mL *n*-heptane, and pour rinse into column. Discard eluate contg ethynodiol diacetate. Elute mestranol with total of 135 mL *n*-heptane, collecting eluate in 200 mL vol. flask. Dil. to vol. with *n*-heptane and mix.

Pipet 50 mL each of mestranol working std soln and sample eluate in sep. dry 250 mL separators. Pipet 10 mL MeOH-H<sub>2</sub>SO<sub>4</sub> (Caution: See 51.018.) reagent into each, draining pipet completely. Shake vigorously 4 min and let stand 45 min, protected from light. Within ≤25 min, scan pink (lower) phase in each separator between 700 and 500 nm in 10 mm cells against MeOH-H<sub>2</sub>SO<sub>4</sub> reagent as ref., setting instrument to 0 *A* at 700 nm for each scan.

µg Mestranol in sample taken =  $200 \times C \times (A/A')$ ,

where 200 = mL sample diln, *C* = µg mestranol std/mL std soln, and *A* and *A'* refer to sample and std, resp., at max., ca 540 nm.

**Progestational Steroids (10)—Official Final Action****39.037****Principle**

CHCl<sub>3</sub> ext of norethindrone, norethindrone acetate, dimethisterone, or medroxyprogesterone acetate is treated directly with isonicotinic acid hydrazide to produce stable color measured at 380 nm. Norethynodrel in CHCl<sub>3</sub> ext is isomerized with HCl prior to same reaction.

**39.038****Reagents**

(a) *Isonicotinic acid hydrazide (INH) soln*.—Transfer 100 mg INH (mp 171–173°) to 200 mL vol. flask. Add ca 150 mL MeOH and 0.1 mL HCl. Shake to dissolve, and dil. to vol. with MeOH.

(b) *Washed cotton*.—Wash absorbent cotton with CHCl<sub>3</sub> and air dry.

(c) *Washed chloroform*.—Shake CHCl<sub>3</sub> with equal vol. H<sub>2</sub>O in separator. After CHCl<sub>3</sub> layer clears, filter thru pledget of washed cotton covered with bed of ca 50 g anhyd. Na<sub>2</sub>SO<sub>4</sub>. Use thruout method.

(d) *Methanolic HCl soln*.—Dil. 3.0 mL HCl to 50 mL with MeOH.

(e) *Std soln.*—Dissolve accurately weighed amt std drug in  $\text{CHCl}_3$  and dil., if necessary, with  $\text{CHCl}_3$  to ca 10 mg/100 mL.

**39.039****Preparation of Sample**

Finely powder tablets. Transfer accurately weighed portion of powder contg ca 10 mg steroid to 125 mL separator contg 10 mL  $\text{H}_2\text{O}$ . Add 25 mL  $\text{CHCl}_3$ , shake continuously 5 min, and filter ext thru pledget of cotton and ca 30 g anhyd.  $\text{Na}_2\text{SO}_4$  into 100 mL vol. flask. Repeat extn with two 25 mL portions  $\text{CHCl}_3$ , combine exts, rinse filter with  $\text{CHCl}_3$ , and dil. filtrate to vol. with  $\text{CHCl}_3$ .

**39.040****Determination**

(a) *Norethindrone, norethindrone acetate, dimethisterone, and medroxyprogesterone acetate.*—To sep. 50 mL g-s conical flasks, transfer 5.0 mL sample ext, 5.0 mL std soln, and 5.0 mL  $\text{CHCl}_3$  as blank. To each flask add 25.0 mL INH soln, stopper, mix, and let stand 30 min. Record spectra from 500 to 350 nm against reagent blank.

$$\text{mg Steroid/tablet} = (A/A') \times W' \times (T/W),$$

where  $A$  and  $A'$  refer to sample and std, resp., at max., ca 380 nm; and  $W$ ,  $W'$ , and  $T$  = mg sample, mg std/100 mL, and av. tablet wt in mg, resp.

(b) *Norethynodrel.*—Add 1.0 mL methanolic HCl to sep. flasks contg 100 mL sample ext, 100 mL norethynodrel std, and 100 mL  $\text{CHCl}_3$  as blank. Shake vigorously 3 min (mixts may be hazy) and let stand 70 min. Add 1.0 mL MeOH to each flask and mix thoroly (mixts become clear).

Transfer 5.0 mL each soln to sep. 50 mL g-s conical flasks and continue as in (a).

**Single Tablet Assay (11)—Official Final Action****39.041****Principle**

Principle is same as in 39.037, except that before colorimetric detn, sample is eluted from  $\text{H}_2\text{O}$ -diat. earth column with  $\text{CHCl}_3$ . Elution vols and vols of isonicotinic acid hydrazide used vary with individual tablet dosage levels ranging from 0.35 to 10 mg.

**39.042****Apparatus and Reagents**

(a) *Glass chromatographic tube and tamping rod.*—250 × 25 (od) mm. See 37.002.

(b) *Isonicotinic acid hydrazide (INH) soln.*—Prep. 500 mL as in 39.038(a), using 500 mL vol. flask and 2.5-fold amts of all reagents.

(c) *Washed chloroform.*—See 39.038(c).

(d) *Methanolic hydrochloric acid soln.*—10%. Dil. 5.0 mL HCl to 50 mL with MeOH.

(e) *Std solns.*—Dissolve in individual vol. flasks accurately weighed amt of each std material in  $\text{CHCl}_3$ , and dil. with  $\text{CHCl}_3$  to ca 0.035 mg norethindrone/mL, 0.025 mg norgestrel/mL, and 0.25 mg norethynodrel/mL. Prep. fresh daily.

**39.043****Preparation of Column**

Soak 1 accurately weighed tablet with 1 mL  $\text{H}_2\text{O}$  in 100 mL beaker. Thoroly mix 1 g diat. earth, 36.002, with 0.5 mL  $\text{H}_2\text{O}$  in another 100 mL beaker with small metal spatula, transfer to chromatgc tube contg small pledget of glass wool at base, and tamp tight. Carefully triturate tablet with spatula, add 3 mL  $\text{CHCl}_3$ , and mix gently to dissolve as much as possible of tablet. Mix sample thoroly with 3 g diat. earth, transfer to tube in 1 portion, and tamp tight. Scrub beaker with ca 0.5 g diat. earth

and transfer to tube. Wipe tamper, spatula, and beaker with small pledget of glass wool and add to column.

**39.044****Elution**

(a) *Norethindrone (0.35 mg/tablet).*—Pipet 15 mL INH soln into 25 mL vol. flask and place to collect eluate from column. Rinse tamper, spatula, and beaker with 10 mL  $\text{CHCl}_3$ , and pour rinse into column. When elution stops, continue elution by adding 1 mL portions  $\text{CHCl}_3$  until eluate fills flask to within ca 0.5 mL of mark. Gently swirl flask occasionally during elution without detaching it from column. Detach flask from column, add  $\text{CHCl}_3$  to vol., mix, and let stand 45 min before colorimetric detn.

For >0.35 mg norethindrone, increase elution vol. and/or dil. eluate.

(b) *Norgestrel (0.5 mg/tablet).*—Pipet 30 mL INH soln into 50 mL vol. flask and place it to collect eluate from column. Rinse tamper, spatula, and beaker with 10 mL  $\text{CHCl}_3$ , and pour rinse into column. When elution stops, continue elution by adding 2 mL portions  $\text{CHCl}_3$  until eluate fills flask to within ca 0.5 mL of mark. Continue as in (a).

(c) *Norethynodrel (2.5–5.0 mg/tablet).*—Place 100 mL vol. flask marked to indicate ca 75 mL vol. to collect eluate from column. Rinse tamper, spatula, and beaker with 10 mL  $\text{CHCl}_3$ , and pour rinse into column. When elution stops, continue elution by adding 5 mL portions  $\text{CHCl}_3$  until eluate fills flask to 75 mL mark. Pipet 10 mL norethynodrel std soln into another 100 mL vol. flask and mix with 65 mL  $\text{CHCl}_3$ . Add 75 mL  $\text{CHCl}_3$  into third 100 mL vol. flask as blank. Add ca 5 small boiling chips and 1.0 mL methanolic 10% HCl into each flask. Stopper, and shake vigorously 1–2 min. Remove stoppers and heat soln to bp on steam bath. Continue heating 15 min with occasional swirling. Remove flasks and cool to room temp. Dil. each to vol. with  $\text{CHCl}_3$  and mix. ( $\text{CHCl}_3$  solns should be completely clear.)

**39.045****Determination**

(a) *Norethindrone.*—Into 25 mL vol. flask, pipet 10 mL norethindrone std soln and 15.0 mL INH soln. Stopper, and shake ca 1 min. Into another 25 mL vol. flask, pipet 10 mL  $\text{CHCl}_3$  and 15 mL INH soln as blank for both norethindrone and norgestrel. Stopper flask and mix. Let all flasks stand 1 hr.

(b) *Norgestrel.*—Pipet 20 mL norgestrel std soln into 50 mL vol. flask and add 30.0 mL INH soln. Stopper, and shake ca 1 min. Let soln and blank, (a), stand 1 hr.

(c) *Norethynodrel.*—Into sep. 25 mL vol. flasks, pipet 10 mL each of isomerized sample, std, and blank. Add 15.0 mL INH soln to each. Stopper, shake ca 1 min, and let stand 1 hr.

Record spectra of samples and stds from 550 to 350 nm within next hr, against corresponding ref. blank, setting instrument to 0 A at 550 nm for each scan.

$$\mu\text{g Progesterone/tablet} = (A/A') \times C \times (\bar{W}/W),$$

where  $A$  and  $A'$  refer to sample and std, resp., at ca 380 nm;  $C$  =  $\mu\text{g}$  of corresponding std in 10.0 mL norethindrone or norgestrel std soln, or 20.0 mL norethynodrel std soln;  $\bar{W}$  = av. tablet wt; and  $W$  = individual tablet wt.

**39.046 ★ Ethisterone (17 $\alpha$ -Ethinyltestosterone) (12) ★ Official First Action****KBr Disk Method**

Column chromatgc sepn and IR spectrophtric detn. See 39.043–39.046, 12th ed.

★ Surplus method—see inside front cover.

**Dexamethasone Phosphate (13)—Official First Action****39.047****Reagents**

(a) *Borate buffer*.—pH 8.2. Dissolve 6.2 g boric acid in H<sub>2</sub>O, and dil. to ca 1 L. Adjust pH to 8.6 with 50% (w/w) NaOH soln. Add 10.2 g MgCl<sub>2</sub>·6H<sub>2</sub>O and dissolve. (pH will decrease to 8.2.)

(b) *Alkaline phosphatase soln*.—Dissolve 100 mg intestinal alk. phosphatase enzyme (Worthington Biochemical Corp., Rte 9, Freehold, NJ 07728),  $\geq 1.4$  units/mg, in 50 mL borate buffer.

(c) *Tetramethyl ammonium hydroxide soln*.—Dil. 10 mL 10% soln of (Me)<sub>4</sub>NOH to 100 mL with alcohol.

(d) *Blue tetrazolium soln*.—Dissolve 0.5 g blue tetrazolium in 100 mL alcohol and filter. Store protected from light.

(e) *Dexamethasone phosphate std soln*.—Accurately weigh ca 12 mg USP Dexamethasone Phosphate Ref. Std into 100 mL vol. flask. Add H<sub>2</sub>O, shake to dissolve, and dil. to vol. with H<sub>2</sub>O.

**39.048****Extraction**

(a) *Creams and ointments*.—Weigh portion contg ca 2.5 mg dexamethasone phosphate into 125 mL separator. Add 15 mL 5% NaCl soln and 25 mL CH<sub>2</sub>Cl<sub>2</sub>. Shake well to disperse sample. Continue shaking 2 min. Let phases sep., and transfer CH<sub>2</sub>Cl<sub>2</sub> layer to second separator contg 6 mL 5% NaCl soln. Shake well 1 min, let phases sep., and discard CH<sub>2</sub>Cl<sub>2</sub> layer. Repeat wash with addnl 25 mL CH<sub>2</sub>Cl<sub>2</sub>, washing each aq. phase in succession. Discard CH<sub>2</sub>Cl<sub>2</sub>. Transfer aq. phase in first separator to 25 mL vol. flask. Rinse first separator with contents of second and transfer rinse to vol. flask. Rinse both separators with same 2 mL 5% NaCl soln and add rinse to vol. flask. Dil. to vol. with 5% NaCl, if necessary.

(b) *Solutions*.—Accurately dil. soln to concn ca 0.1 mg dexamethasone phosphate/mL. Place 25 mL dild soln and 25 mL CH<sub>2</sub>Cl<sub>2</sub> in 125 mL separator, shake, let layers sep., and discard CH<sub>2</sub>Cl<sub>2</sub>.

**39.049****Enzymatic Reaction and Extraction**

Pipet 3 mL of each aq. sample and std soln into sep. 125 mL separators. Add 8 mL alk. phosphatase, mix, and let stand 2 hr at room temp. ( $\geq 25^\circ$ ). Ext with two 25 mL portions CH<sub>2</sub>Cl<sub>2</sub>. Filter CH<sub>2</sub>Cl<sub>2</sub> layers into 100 mL beaker thru small pledget of cotton. Evap. CH<sub>2</sub>Cl<sub>2</sub> at room temp. in current of air in hood. (Do not use air current strong enough to cool CH<sub>2</sub>Cl<sub>2</sub> and cause moisture to collect in beaker.) Dissolve residue in 10 mL alcohol. Transfer quant. to 25 mL vol. flask, rinsing beaker with three 5 mL portions alcohol. Prep. blank by evapg 50 mL CH<sub>2</sub>Cl<sub>2</sub> and dissolving residue in 25 mL alcohol.

**39.050****Determination**

Pipet 10 mL blank soln into 20 mL g-s test tube or flask. Add 1.0 mL (Me)<sub>4</sub>NOH soln and 1.0 mL blue tetrazolium soln. Stopper and set aside, protected from light, *exactly* 45 min. At 1–3 min intervals, repeat above operations with 10 mL each sample and std soln. (Series of samples can be analyzed using 1 blank and 1 std soln.) Det. A of each soln at 515 nm *exactly* 45 min after addn of blue tetrazolium, against alcohol as ref.

**39.051****Calculations**

(a) *Creams and ointments*.—

mg Dexamethasone phosphate/g =  $(A/A') \times C \times (25/W)$ .

(b) *Solns*.—

mg Dexamethasone phosphate/mL =  $(A/A') \times C \times D$ , where A and A' refer to sample and std solns, resp., corrected for blank; C = mg/mL std soln; W = g sample; and D = diln factor.

**Prednisolone or Prednisone****Semiautomated Method (14)—Official Final Action****39.052****Principle**

Alcoholic soln of drug is extd with CHCl<sub>3</sub> and reacted with tetramethylammonium hydroxide and blue tetrazolium. A of resulting complex is read in flowcell at 525 nm.

**39.053****Apparatus**

(a) *Automatic analyzer*.—AutoAnalyzer with following modules (Technicon Instruments Corp.): Sampler II with 30/hr (3:1) cam; proportioning pump I; colorimeter I, equipped with 15 mm tubular flowcell and matched 525 nm filters; recorder compatible with colorimeter I; manifold (see Fig. 39.01).

(b) *Shaker*.—Model BT, wrist-action (Burrell Corp.).

(c) *Ultrasonic generator*.—150 watt.

**39.054****Reagents**

(a) *Blue tetrazolium (BT) reagent*.—0.15%. Dissolve 1.5 g BT in 50 mL MeOH and dil to 1 L with alcohol. Store in light-resistant bottle.

(b) *Tetramethylammonium hydroxide (TMAH) reagent*.—0.15%. Dil. 15.0 mL 10% TMAH soln to 1 L with alcohol.

(c) *Prednisolone std soln*.—(1) *Stock soln*.—0.4 mg/mL. Accurately weigh ca 40 mg USP Prednisolone Ref. Std into 100 mL vol. flask, dissolve in 50% alcohol, and dil to vol. (2) *Working soln*.—0.10 mg/mL. Pipet 25 mL stock soln into 100 mL vol. flask and dil. to vol. with 50% alcohol.

(d) *Prednisone std soln*.—(1) *Stock soln*.—0.2 mg/mL. Accurately weigh ca 20 mg USP Prednisone Ref. Std into 100 mL vol. flask, dissolve in 50% alcohol, and dil. to vol. (2) *Working soln*.—0.05 mg/mL. Pipet 25 mL stock soln into 100 mL vol. flask and dil. to vol. with 50% alcohol.

**39.055****Preparation of Sample**

Disintegrate individual tablet or disperse weighed composite in accurately measured vol. 50% alcohol to give prednisolone concn of 0.1 mg/mL or prednisone concn of 0.05 mg/mL. Use ultrasonic generator until tablet is disintegrated and shake mech. 15 min. Let soln settle  $\geq 2$  hr.

**39.056****Analytical System**

Sample is withdrawn and extd with air-segmented stream of CHCl<sub>3</sub> in double mixer, and org. phase is sepd in BO fitting. BT and TMAH reagents are added to org. phase and mixed. Soln is passed thru delay coil and A is detd at 525 nm in 15 mm flowcell.

**39.057****Start-Up and Shut-Down Operations**

Pump alcohol thru CHCl<sub>3</sub> line 10 min; then pump CHCl<sub>3</sub> thru line 5 min. Place remaining tubes in their resp. solns and let system equilibrate 20–30 min or until steady baseline is obtained. To shut down system, place CHCl<sub>3</sub>, BT, and TMAH lines in alcohol and remove all other lines from their solns. After 15 min, remove remaining lines from alcohol soln and pump system dry.

**39.058****Determination**

Fill sample cups in following order: 3 cups std soln, 5 cups sample soln, 1 cup std soln, 5 cups sample soln, etc. Place 2 cups std soln at end of each series. (First 2 cups of std solns are used to equilibrate system, but are not included in calcs.) Start Sampler II. After last cup has been sampled, let system operate

until steady baseline is obtained. Draw tangent to initial and final baselines. Subtract baseline to det. net  $A$  and  $A'$  for each sample and std peak, resp. Discard values for first 2 and last std peaks and calc. av. std  $A'$ .

$$\text{mg Drug in portion taken} = (A/A') \times C \times D,$$

where  $C$  = concn of std in mg/mL and  $D$  = diln factor.

### NONALKALOIDAL VEGETABLE DRUGS AND THEIR DERIVATIVES

#### Digitoxin (15)—Official Final Action

##### 39.059

##### Reagents

(a) *Formamide*.—Shake 1 L  $\text{HCONH}_2$  (99% grade) with ca 30 g anhyd.  $\text{K}_2\text{CO}_3$  15 min and filter. Distil under vac. in all-glass app. Reject first portion of distillate contg  $\text{H}_2\text{O}$ , and collect fraction boiling at ca  $101^\circ/12$  mm Hg (1.6 kPa) ( $115^\circ/25$  mm Hg; 3.3 kPa). Store over  $\text{H}_2\text{SO}_4$  until odor of  $\text{NH}_3$  is no longer detected.

(b) *Alkaline picrate reagent*.—Mix 20 mL 1% aq. picric acid soln with 10 mL 5%  $\text{NaOH}$  soln, dil. to 100 mL with  $\text{H}_2\text{O}$ , and mix. Reagent is stable 2–3 days.

(c) *Digitoxin std soln*.—0.04 mg/mL. Dissolve 20.0 mg USP Digitoxin Ref. Std in alcohol, and dil. to 50 mL with alcohol. Dil. 10.0 mL of this stock soln to 100 mL with alcohol.

(d) *Diatomaceous earth*.—See 36.002.

##### 39.060

##### Preparation of Chromatographic Column

*Chromatographic tube*.—See 37.002.

*Wash layer*.—Add ca 2 g diat. earth to 1 mL  $\text{H}_2\text{O}$  in 100 mL beaker. Mix thoroly with stirring rod or scoop until the mixt. appears fluffy and uniform, and transfer to chromatgc tube. Press down lightly with packing rod. (Wash layer should be 15–20 mm thick.)

*Trap layer*.—Add 3 g diat. earth to 3 mL formamide- $\text{H}_2\text{O}$  soln (2+1) in 150 mL beaker, mix thoroly, and transfer to tube containing wash layer. Press trap layer down lightly and evenly.

##### 39.061

##### Preparation of Sample

(a) *Crystalline digitoxin*.—Dissolve 20 mg digitoxin, accurately weighed, in 20 mL  $\text{CHCl}_3$ . Transfer to 100 mL vol. flask with several portions of benzene, dil. to vol. with benzene, and mix. Transfer 10.0 mL to chromatgc column, 39.060. When liq. has passed into column, proceed as in 39.062.

(b) *Tablets*.—Thoroly mix accurately weighed powd sample contg 2 mg digitoxin with 2 mL  $\text{H}_2\text{O}$  in 250 mL beaker. Add 4 mL formamide, stir thoroly, and cover beaker with watch glass. Heat mixt. 20 min on steam bath, with frequent stirring. Cool; add 2 mL  $\text{H}_2\text{O}$  and ca 8 g diat. earth. Stir thoroly until mass appears uniform and does not stick to beaker. Quant. transfer mixt. to prepd chromatgc tube, 39.060, thru powder funnel in several portions, pressing it down with stirring rod. Use rubber policeman to sweep adhering particles from beaker and funnel into tube. Scrub beaker and stirring rod with ca 1 g diat. earth, and add dry washings to tube thru funnel. Repeat washing with 2 addnl portions diat. earth. Place cotton pad in tube and press it down on column with packing rod, sweeping diat. earth on sides of tube before it. (Over-all ht of column should be 120–150 mm.)

##### 39.062

##### Separation of Digitoxin

Elute digitoxin with ca 240 mL benzene- $\text{CHCl}_3$  (3+1), collecting eluate in 250 mL vol. flask at rate  $\leq 4$  mL/min. Wash stem with stream of  $\text{CHCl}_3$ , dil. to 250 mL with  $\text{CHCl}_3$ , and mix.

Continue elution as in 39.064.

##### 39.063

##### Colorimetric Determination

Transfer 25 mL aliquot eluate to small erlenmeyer and evap. to dryness on steam bath with aid of air current. Moisten residue with ca 0.5 mL alcohol, and again evap. to dryness. Add 5.0 mL alcohol to cooled flask, stopper, and let stand 15 min with occasional shaking.

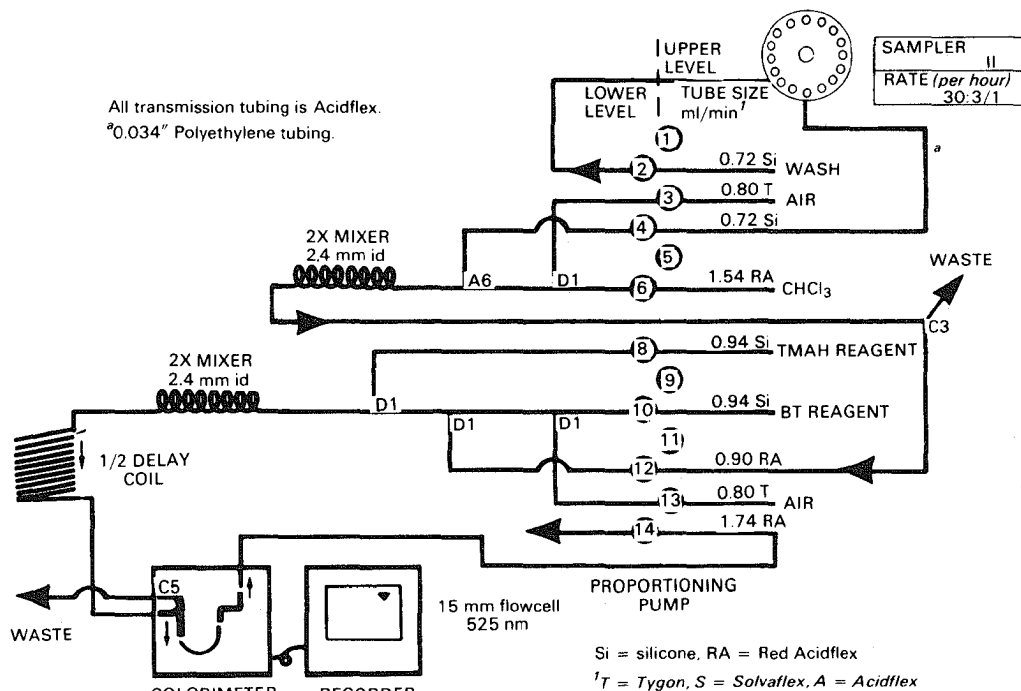

FIG. 39.01—Flow diagram for semiautomated analysis for prednisolone or prednisone

Transfer 5.0 mL aliquot dild std digitoxin soln to small flask and 5 mL alcohol to another flask as blank. Add 3.0 mL alk. picrate reagent to each flask, and mix by swirling. Protect soln from intense light. After 10 min, det. *A* of std and sample solns relative to blank at 495 nm, repeating measurements at 2 min intervals until max. values are attained. Calc. digitoxin content of sample.

**39.064****Tests for Other Digitoxosides**

(Caution: See 51.011, 51.040, and 51.056.)

After digitoxin seps, elute other digitoxosides with 200 mL  $\text{CHCl}_3$ , collecting eluate in separator. Shake with 100 mL  $\text{H}_2\text{O}$ . Transfer lower layer to beaker, ext  $\text{H}_2\text{O}$  with 30 mL  $\text{CHCl}_3$ , and add  $\text{CHCl}_3$  washings to beaker. Evap. to dryness. Pipet 5 mL dild digitoxin std soln into second beaker and evap. to dryness. Add 4 mL Keller-Kiliani reagent, 39.073(b), to each of the cooled residues and mix thoroly. After 15 min, filter thru glass wool if necessary, and det. *A* of clear sample and std relative to reagent blank, at 590 nm; repeat measurements at 5 min intervals until max. values are attained. Calc. content of other digitoxosides in sample as digitoxin.

**Digitoxin****Automated Method (16)—Official Final Action****39.065****Principle**

$\text{KIO}_4$  oxidizes *cis*-2-deoxy sugars to malonyldialdehydes which are condensed with 2-thiobarbituric acid to yield stable, intensely colored methine dyes. Glycoside moiety of digoxin consists of 3 molecules of digitoxose, 2,6-dideoxy-D-ribohexose, which yields colored compd with max. *A* at 530 nm.

**39.066****Apparatus**

(a) *Automatic analyzer*.—AutoAnalyzer with following modules (Technicon Instruments Corp.): Sampler II with 40/hr (2:1) cam; proportioning pump I; manifold; const temp. bath (75°) with two 40' × 1.6 mm id coils; Model 1 colorimeter, with 50 mm tubular flowcell, matched 530 nm filters; Bristol recorder linear in *T*, and paper printed in *A* units. (See Fig. 39:02.)

(b) *Shaker*.—Model BT, wrist-action (Burrell Corp.).

(c) *Ultrasonic generator*.—150 watt.

**39.067****Reagents**

(a) *Arsenic trioxide soln*.—Add 20.0 g  $\text{As}_2\text{O}_3$  and 7.0 g NaOH pellets to 100 mL  $\text{H}_2\text{O}$ , and heat to bp to dissolve. (Caution: See 51.078.) Add 800 mL  $\text{H}_2\text{O}$  and 60 mL HCl, and dil. to 1 L.

(b) *Potassium metaperiodate soln*.—Add 3.6 g  $\text{KIO}_4$  to 900 mL  $\text{H}_2\text{O}$ . Heat and stir to dissolve. Cool. Add 3.0 mL  $\text{H}_2\text{SO}_4$  and dil. to 1 L.

(c) *Thiobarbituric acid (TBA) soln*.—Add 15.0 g TBA and 4.5 g NaOH pellets to 900 mL  $\text{H}_2\text{O}$ , and stir to dissolve. Add HCl slowly to pH 3.5–4.0. Filter and dil. to 1 L.

(d) *Digoxin std solns*.—(1) *Stock soln*.—0.05 mg/mL. Accurately weigh ca 25 mg USP Digoxin Ref. Std into 500 mL vol. flask and dil. to vol. with 50% alcohol. (2) *Working soln*.—5  $\mu\text{g/mL}$ . Pipet 10 mL stock soln into 100 mL vol. flask and dil. to vol. with 50% alcohol. Prep. fresh daily.

**39.068****Preparation of Sample**

Disintegrate individual tablet or disperse weighed composite in accurately measured vol. 50% alcohol to give digoxin concn of 5  $\mu\text{g/mL}$ . Use ultrasonic generator  $\geq 5$  min to assure tablet disintegration. Shake mech. 1 hr. Let soln settle  $\geq 2$  hr.

**39.069****Analytical System**

Sample is withdrawn, segmented with air, and oxidized with  $\text{KIO}_4$  in mixing coil.  $\text{As}_2\text{O}_3$  is added to remove excess  $\text{KIO}_4$ ; then TBA is added. Color is developed in 75° heating bath, and *A* of soln at 530 nm is measured in 50 mm flowcell.

**39.070****Start-Up**

Place all lines in their resp. solns, and let system equilibrate 30 min.

**39.071****Shut-Down**

Place  $\text{KIO}_4$ ,  $\text{As}_2\text{O}_3$ , and TBA lines in  $\text{H}_2\text{O}$ . Remove all other lines from their solns. After 10 min, remove remaining lines from  $\text{H}_2\text{O}$  and pump system dry.

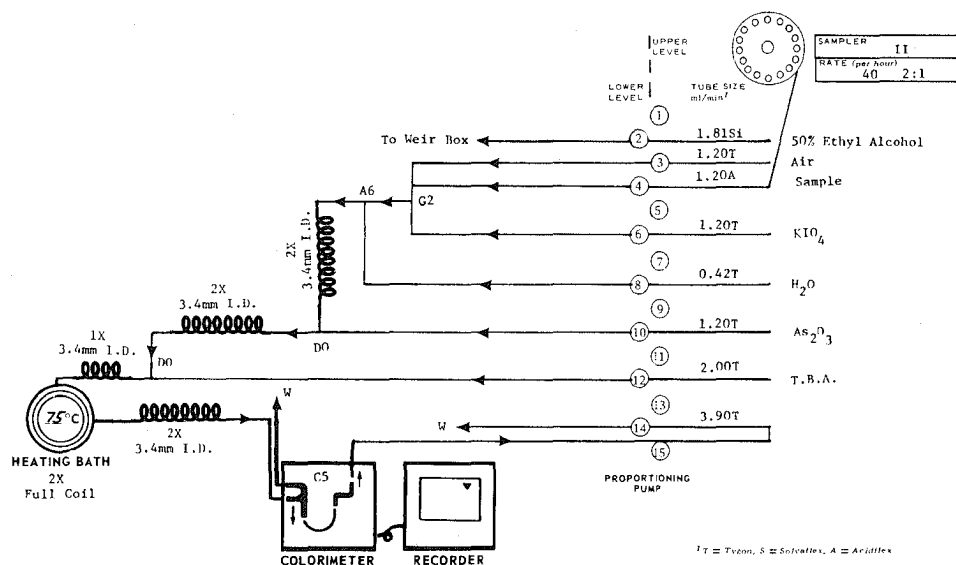

FIG. 39:02—Flow diagram for automated analysis for digoxin

## 39.072

**Determination**

Fill sample cups in following order: 4 cups std soln, 5 cups sample soln, 1 cup std soln, 5 cups sample soln, etc. Place 2 cups std soln at end of each run. (Extra cups of std solns at start and end of sampling pattern will eliminate carryover effect in transitions from wash soln to std soln and vice versa. Three extra cups at start and 1 extra cup at end should suffice, but det. number needed for equilibrium by experiment. System should give uniform response for at least final pair of extra std cups before sample pattern is started.) Start Sampler II. After last cup has been sampled, let system operate until steady baseline is obtained. Draw tangent to initial and final baselines. Subtract baseline to det.  $\Delta A$  and  $\Delta A'$  for each sample and std peak, resp. Discard values for first 3 and last std peaks and calc. av.  $\Delta A'$ .

$$\text{mg Digoxin in portion taken} = (\Delta A / \Delta A') \times C \times D,$$

where  $C$  = concn of std in mg/mL and  $D$  = diln factor.

**Digoxin and Total Digitoxosides (17)—Official Final Action**

## 39.073

**Reagents**

(a) *Alkaline dinitrobenzene soln.*—(1) Prep. 5% soln *m*-dinitrobenzene in benzene, and store in g-s brown glass bottle. (2) Mix 1 mL 10% tetramethyl ammonium hydroxide soln with 140 mL absolute alcohol, titr. with 0.01*N* HCl, using Me red, and adjust to 0.008*N* with absolute alcohol. Just before use, mix 60 mL (1) with 40 mL (2).

(b) *Keller-Kiliani reagent.*—Mix 60 mL HOAc with 1 mL 9% FeCl<sub>3</sub>·6H<sub>2</sub>O soln and 5 mL H<sub>2</sub>SO<sub>4</sub>, and cool.

(c) *Digoxin std soln.*—25.0 µg/mL. Dissolve 25.0 mg USP Digoxin Ref. Std, C<sub>41</sub>H<sub>64</sub>O<sub>14</sub>, in hot alcohol, cool, dil. to 100 mL, and mix. Dil. 10.0 mL of this soln to 100 mL with alcohol and mix.

## 39.074

**Preparation of Sample**

(a) *Crystalline digoxin.*—Prep. alc. soln contg 125 µg digoxin/mL. Transfer 10.0 mL to separator, add 50 mL H<sub>2</sub>O and 1 mL 2*N* H<sub>2</sub>SO<sub>4</sub>, and ext with three 30 mL portions CHCl<sub>3</sub>. Wash each CHCl<sub>3</sub> ext in second separator by shaking with 10 mL H<sub>2</sub>O and 1 g powd *anion-cation exchange resin* (Amberlite MB-1, anal. grade, indicator-free, has been found satisfactory; available as Mallinckrodt Cat. No. 3325), and filter thru pledget of cotton moistened with CHCl<sub>3</sub> into 100 mL vol. flask. Dil. to vol. with CHCl<sub>3</sub> and mix well. This soln is *Assay Soln.*

(b) *Elixirs and injections.*—Transfer aliquot contg 1.25 mg digoxin to separator, and proceed as in (a), beginning: "... add 50 mL H<sub>2</sub>O and 1 mL 2*N* H<sub>2</sub>SO<sub>4</sub>, ..."

(c) *Tablets.*—Accurately weigh, into 100 mL beaker, portion of powd tablets contg 1.25 mg digoxin. Add 10 mL alcohol, cover with watch glass, and heat to bp on steam bath. Let simmer 20 min with frequent stirring. Cool, wash quant. into separator with 30 mL CHCl<sub>3</sub> and 50 mL H<sub>2</sub>O, add 1 mL 2*N* H<sub>2</sub>SO<sub>4</sub>, and proceed as in (a), beginning: "... ext with three 30 mL portions CHCl<sub>3</sub>."

## 39.075

**Determination**

(a) *Digoxin.*—Pipet 5.0 mL digoxin std soln and 10.0 mL assay soln into similar erlenmeyers, and evap. to dryness on steam bath with aid of air current. Cool, and to each flask add 5.0 mL freshly prepd alk. dinitrobenzene reagent. Let stand 5 min at ≤30°, with frequent mixing. Det.  $A$  of developing blue colors relative to reagent blank at 620 nm at 1 min intervals, using matched 1 cm cells and spectrophtr. Record max.  $A$  of aliquot of assay soln and that of digoxin std soln,  $A'$ . Digoxin (mg in assay soln) = 1.25  $A/A'$ .

(b) *Other digitoxosides.*—Pipet 20 mL assay soln and 10 mL digoxin std soln into sep. beakers and evap. to dryness on steam bath with aid of air current. Cool, add 4.0 mL Keller-Kiliani reagent at ≤30° to each beaker, and mix thoroly. After 15 min, det.  $A$  of sample and std at 590 nm relative to reagent blank at 5 min intervals. Record max.  $A$  of sample and that of std,  $A'$ . Total digitoxosides calcd as digoxin (mg in sample soln) = 1.25  $A/A'$ . Difference between this value and that obtained in (a) is amt of other digitoxosides in sample soln.

39.076 ★ **Camphor (18)—Official Final Action ★**

(Not applicable to synthetic camphor)

Steam distn, benzene extn, and polarimetric detn. See 39.061, 12th ed.

39.077 ★ **Camphor in Spirits (19) ★****Official Final Action**

Gravimetric detn as 2,4-dinitrophenylhydrazones. See 39.062–39.063, 12th ed.

**Camphor (20)—Official Final Action**

## 39.078

**Apparatus**

(a) *Gas chromatograph.*—With H flame ionization detector and strip chart recorder. Operate instrument in accordance with manufacturer's instructions. Operating conditions: temps (°)—column 180, detector 220, flash heater 250; N flow rate ca 60 mL/min adjusted to elute phenol in ca 9 min. Approx. retention time of camphor is 2.5 min. Adjust electrometer sensitivity so that 2.5 µg phenol gives ca 50% deflection.

(b) *GLC column.*—(Material available from Applied Science Laboratories, Inc. has been found satisfactory.) Dissolve 1.2 g Carbowax 20M in ca 50 mL CH<sub>2</sub>Cl<sub>2</sub> on steam bath. (*Caution:* Use effective fume removal device when heating or evapg CH<sub>2</sub>Cl<sub>2</sub>.) Add 10 g 100–140 mesh Gas-Chrom P and stir as solv. evaps. Dry 1 hr at 105°. Pour dry, coated packing material into 1.8 m (6') × 4 mm glass tube, vibrating with hand vibrator. Place glass wool plugs at each end; then insert septums. Condition prepd column overnight at 200° with N flow.

## 39.079

**Reagents**

(a) *Camphor std soln.*—0.5 mg/mL. Dissolve and dil. 100 mg camphor to 200 mL with CHCl<sub>3</sub>.

(b) *Phenol internal std soln.*—1 mg/mL. Dissolve and dil. 100 mg phenol to 100 mL with CHCl<sub>3</sub>.

(c) *Menthol internal std soln.*—0.5 mg/mL. Dissolve and dil. 100 mg menthol to 200 mL with CHCl<sub>3</sub>.

(d) *Methyl salicylate internal std soln.*—1 mg/mL. Dissolve and dil. 100 mg Me salicylate to 100 mL with CHCl<sub>3</sub>.

(e) *Working std soln.*—Pipet equal vols of appropriate internal std soln, (b), (c), or (d), and camphor std soln, (a), into g-s flask. Phenol is preferred internal std but sample must not contain substance selected as internal std.

## 39.080

**Preparation of Sample**

(a) *Oily solns.*—Dil. aliquot of sample with CHCl<sub>3</sub> to ca 0.5 mg camphor/mL.

(b) *Ointments.*—Dissolve weighed sample in CHCl<sub>3</sub>, warming very slightly if necessary. Dil. with CHCl<sub>3</sub> to ca 0.5 mg camphor/mL.

★ Surplus method—see inside front cover.

**39.081****Determination**

Pipet equal vols sample soln and internal std into g-s flask. Inject 5  $\mu$ L into gas chromatograph and record chromatogram. Inject 5  $\mu$ L working std soln and record chromatogram. Measure ht of each peak above baseline.

Concn (mg/mL or mg/g) in sample

$$= (P \times I' \times C') / (P' \times I \times C),$$

where  $P'$  and  $P$  = hts std and sample peaks, resp.;  $I'$  and  $I$  = hts internal std peak in std and sample, resp.;  $C'$  = mg std/mL std soln used to prep. working std; and  $C$  = mL or g sample/mL sample soln.

**39.082 ★ Camphor, Monobromated, in Tablets (21) ★**  
**Official Final Action**

Liberation of inorg. Br with Na amalgam and gravimetric detn as AgBr. See 39.068–39.069, 12th ed.

**39.083 ★ Menthol (22)—Official Final Action ★**

Acetylation and quant. saponification of derivative. See 39.070, 12th ed.

**39.084 ★ Aloin (23)—Official Final Action ★**

Extn with dil.  $H_2SO_4$  and transfer of impurities into  $CHCl_3$ . Aloin is salted out into  $CHCl_3$ -alcohol and detd gravimetrically. See 39.071, 12th ed.

**39.085 ★ Podophyllum (24)—Official Final Action ★**

Extn with alcohol, pptn with cold dil. HCl, and gravimetric detn. See 39.072, 12th ed.

**39.086 ★ Chenopodium Oil (25)—Official Final Action ★**

Titrn with  $TiCl_3$ . See 39.073–39.074, 12th ed.

**Santonin in Mixtures—Official Final Action**

**39.087 ★ Langer Method (Modified) (26) ★**

See 36.515, 11th ed.

**Dinitrophenylhydrazine Method (27)**

**39.088****Reagent**

*Dinitrophenylhydrazine sulfate soln.*—Dissolve 1 g 2,4-dinitrophenylhydrazine in mixt. of 90 mL  $H_2O$  and 10 mL  $H_2SO_4$  by warming; cool, and filter.

**39.089****Determination**

(Caution: See 51.011, 51.039, 51.040, and 51.045.)

Weigh 2.5 g ground sample into gooch and wash with ca 100 mL pet ether satd with santonin. Discard washings. Ext with ca 100 mL benzene, collecting filtrate in beaker. Evap. to dryness, warm residue with alcohol until dissolved, transfer to 100 mL vol. flask, cool, dil. to vol. at 20° with alcohol, and filter if necessary. To 25 mL of this soln add 50 mL dinitrophenylhydrazine sulfate soln and let stand 48 hr in dark. Collect ppt in gooch and wash with ca 150 mL alcohol (1+2). Dry residue 1 hr at 100°, cool, and weigh. Wt ppt  $\times 0.5775$  = wt santonin.

**Ultraviolet Absorption Method (28)**

(Applicable in presence of starch and calomel)

**39.090****Reagent**

*Santonin std soln.*—10  $\mu$ g/mL. Weigh 50 mg santonin NF XI, transfer to 50 mL vol. flask, dissolve in alcohol, and dil. to vol.

with alcohol. Pipet 2 mL aliquot into 200 mL vol. flask and dil. to vol. with alcohol.

**39.091****Determination**

Accurately weigh portion powd sample contg ca 35 mg santonin, transfer to 100 mL vol. flask, dil. to vol. with alcohol, and shake frequently during 15 min. Let settle ca 15 min, transfer 5 mL aliquot supernate to 200 mL vol. flask, dil. to vol. with alcohol, and mix. Det.  $A$  of this soln and of std soln,  $A'$ , against alcohol at 240 nm.

Grains santonin/tablet = (wt std, mg)  $\times A \times 4000 \times$  tablet wt (mg)/ $A' \times$  mg sample  $\times 64.8$ .

**39.092****Identification**

Ext portion of powd tablets with alcohol or use alc. soln from detn and evap. to dryness. Santonin gives white tabular crystals, mp 170–173°.

**Infrared Method (29)—Official Final Action**

(Applicable to tablets in presence of calomel)

**39.093****Apparatus**

*Infrared spectrophotometer.*—For operation in 2–15  $\mu$ m region; equipped with 2 matched NaCl cells 1.0 mm thick, suitable for  $CS_2$  solns. (Cells of shorter path length are not suitable because of low solubility of santonin.)

**39.094****Determination**

(Caution: See 51.011, 51.018, 51.039, 51.040, 51.048, and 51.056.)

Transfer 25 mg Santonin NF XI, accurately weighed, to 125 mL separator contg ca 15 mL  $H_2O$ . Ext as for sample.

Transfer accurately weighed portion powd tablets, contg ca 25 mg santonin, to 125 mL separator contg ca 15 mL  $H_2O$ . Make just ammoniacal with  $NH_4OH$  (1+9) (ca 1 drop) and ext with four 25 mL portions  $CHCl_3$ . Filter each ext thru cotton plug, moistened with  $CHCl_3$ , in long-stem glass funnel into 250 mL beaker. Evap. combined  $CHCl_3$  exts to ca 5 mL on steam bath with aid of air current. Transfer quant. to 25 mL g-s erlenmeyer with ca 10 mL  $CHCl_3$  in 2 mL portions, and evap. to dryness. Wash down sides of flask with few mL anhyd. ether, repeating if necessary to form dry residue. Use caution to avoid loss of sample by spattering. Add 10 mL  $CS_2$  from pipet, stopper flask, and mix by swirling. Filter any insol. material thru cotton, and immediately det. baseline  $A$  of sample and std ( $A'$ ) solns relative to  $CS_2$  at max. of 9.75  $\mu$ m, drawing baseline between minima of 9.6 and 9.95  $\mu$ m.

$$\% \text{ Santonin} = A \times \text{mg std} \times 100 / A' \times \text{mg sample}.$$

Record spectra of sample and std solns from 2 to 15  $\mu$ m and compare for sample identity.

**39.095 ★ Santonin in Santonica (Levant Worm ★**  
**Seed) (30)—Official Final Action**

(Caution: See 51.011, 51.039, 51.040, and 51.045.)

Extn with benzene, cleanup with alcohol,  $Ba(OH)_2$ , acid, and  $CHCl_3$  extn. Detn by dinitrophenylhydrazine method. See 39.083, 12th ed.

★ Surplus method—see inside front cover.

**Rutin (37)—Official Final Action****39.096****Reagents**

(a) *Acid-alcohol reagent*.—Mix 550 mL alcohol with 50 mL HOAc and dil. to 1 L with H<sub>2</sub>O.

(b) *Rutin std soln.*—0.02 mg/mL. Accurately weigh 100 mg rutin (obtainable from ICN-K&K Laboratories, Inc.) and dissolve in 50 mL acid-alcohol. Transfer to 250 mL vol. flask with small portions acid-alcohol. Dil. to vol. with reagent and mix well. Pipet 5 mL aliquot into 100 mL vol. flask and dil. to vol. with H<sub>2</sub>O.

(c) *Quercetin std soln.*—0.01 mg/mL. Prep. as in (b), using 50 mg quercetin. Pure quercetin may be prepd as in J. Am. Pharm. Assoc., Sci. Ed. 42, 66(1953).

**39.097****Apparatus**

(a) *Spectrophotometer*.—Capable of isolating 338.5, 352.5, and 366.5 nm, with isolated spectrum  $\leq 5$  nm.

(b) *Absorption cells*.—Matched 1 cm.

(c) *Glass stirring rods*.—Of small enough diam. to dislodge material from tips of 50 mL conical centr. tubes.

**39.098****Preparation of Sample Solution**

Weigh directly into 50 mL centr. tube number of tablets required to give 0.05–0.50 g rutin ( $\geq 5$  tablets). Record number and wt. (If tablets are coated, dissolve coating with distd H<sub>2</sub>O after weighing, discard aq. washings, and transfer rutin-contg core to centr. tube.) Add 20 mL acid-alcohol reagent and break up tablets with stirring rod. After tablets are thoroly disintegrated, heat mixt. 10 min in H<sub>2</sub>O bath held at 70–80°, resuspending material occasionally by stirring. Remove stirring rod, rinse with acid-alcohol reagent, and centr. 15 min. at ca 2000 rpm.

Decant supernate into 250 mL vol. flask, using funnel and decanting with one smooth motion, and let tube drain ca 10 sec. While still inverted, rinse mouth of tube with acid-alcohol reagent. Ext twice more, starting with "Add 20 mL acid-alcohol reagent . . ." After third extn, dil. combined supernates to 250 mL with acid-alcohol reagent. Any insol. material may be removed by filtration after diln if first 15–20 mL filtrate is discarded. Depending on original wt rutin taken, make diln with H<sub>2</sub>O to give final concn of 0.01–0.03 g rutin/L. Ppts forming during aq. diln may be removed by filtration if first portion of filtrate is discarded to guard against concn changes due to adsorption.

**39.099****Determination**

Det. A of sample soln against H<sub>2</sub>O blank at 338.5, 352.5, and 366.5 nm. Also det. A of std rutin soln,  $A'_{R_1}$ , and std quercetin soln,  $A'_{Q_1}$ , against H<sub>2</sub>O blank at 352.5 and 366.5 nm. (In absence of std quercetin, values  $A'_{Q_1,352.5} = 0.553$  and  $A'_{Q_1,366.5} = 0.631$  may be used. Any error introduced by use of these predetd values should be of second order.) Calc. as follows:

$$R_1 = A_{338.5}/A_{352.5};$$

and

$$R_2 = A_{366.5}/A_{352.5}.$$

If  $R_1 = 0.914 \pm 0.009$  and  $R_2 = 0.842 \pm 0.013$ , extd material can be considered pure rutin and wt rutin/tablet can be calcd:

$$\text{mg Rutin/tablet} = A_{352.5} \times d \times W \times 0.02/A'_{R_1,352.5} \times w,$$

where  $d$  = sample diln factor;  $W$  = av. wt/tablet; and  $w$  = wt sample.

(Value of  $R_1$  beyond its upper limit while  $R_2$  remains within its range indicates interfering absorption which diminishes rapidly enough to be ineffective at 352.5 nm. Under this condition, A

observed at 352.5 nm is accepted as correct, and rutin content is calcd as for pure rutin. Increase in  $R_2$  while  $R_1$  remains within or below its limits usually indicates presence of quercetin. Simultaneous increase or decrease of both ratios beyond their respective limits indicates invalidating condition.) Amts of rutin and quercetin may be calcd by solution of following simultaneous equations:

$$A_{352.5} = (A'_{R_1,352.5} \times r/0.02) + (A'_{Q_1,352.5} \times q/0.01)$$

$$A_{366.5} = (A'_{R_1,366.5} \times r/0.02) + (A'_{Q_1,366.5} \times q/0.01)$$

where  $r$  = mg rutin/mL in sample soln, and  $q$  = mg quercetin/mL in sample soln.

**39.100 ★ Gums, Identification (32)—Official Final Action ★**

(See also 16.290–16.296.)

Spot tests. See 39.088–39.090, 12th ed.

**39.101 ★ Ipomea (33)—Official Final Action ★**

Proceed as in 39.102.

**39.102 Jalap (33)—Official Final Action**

Place 10 g sample, as "60-mesh" powder, in 250 mL erlenmeyer and add 50 mL alcohol. Fit flask with stopper thru which is inserted glass tube ca 1 m long to act as condenser, and heat gently on simmering steam bath 30 min, shaking occasionally. Transfer contents to small percolator and percolate slowly with warm alcohol until ca 95 mL collects.

To test for complete extn, collect 10 mL more percolate and pour few drops into cold H<sub>2</sub>O; if more than faint cloudiness appears, continue percolation with warm alcohol until test for resin fails. Conc. the addnl percolate by evapn and add to flask before dilg to vol. Cool percolate to room temp. and dil. to 100 mL with alcohol. Mix well.

Evap. 25 mL of the prepd tincture (representing 2.5 g drug) on H<sub>2</sub>O bath in beaker or flask and dry residue until alcohol-free. Add 15 mL H<sub>2</sub>O, bring mixt. to bp, let cool ca 3 min, and stir well with flat-end rod 2 min to ensure thoro washing of resin. Cool mixt. by placing container in jar of ice-cold H<sub>2</sub>O and decant wash H<sub>2</sub>O onto 9 cm filter. Repeat washing of resin with another 15 mL portion H<sub>2</sub>O, boiling and cooling mixt., kneading resin as before, and decanting washings into filter as before. Repeat washing and kneading process with hot H<sub>2</sub>O third time.

Dissolve residue in container in 10 mL warm alcohol and pour soln onto filter, collecting filtrate in weighed beaker or flask. Use enough hot alcohol in small portions to completely transfer soln of resin to filter and ensure thoro washing of filter. Evap. combined filtrate and washings to apparent dryness, add 1 mL absolute alcohol, and evap. solv., taking care to rotate container in inclined position as last portions of solv. are dissipated. Dry residue at 80° to const wt.

**39.103 ★ Volatile Acidity of Tragacanth (34) ★ Official Final Action**

Steam distn and titrn of distillate. See 39.093, 12th ed.

**MISCELLANEOUS****★ Nitroglycerin (Glyceryl Trinitrate)—Official Final Action ★****Reduction Method (35)****39.104****Apparatus**

(a) *Connecting bulb*.—Hopkins style, ca 7.6 cm diam. This style has long inlet tube with opening on side of tube.

★ Surplus method—see inside front cover.

(b) *Condenser*.—Water-cooled, 56 cm long, and preferably of Pyrex glass.

(c) *Adapter tube*.—Approx. 2.25 cm diam. at top and with narrow outlet.

(d) *Scrubber-trap*.—Any efficient trap in which all vapor is washed thoroly with H<sub>2</sub>O before it leaves distg flask (see Fig. 39:03.).

### 39.105

#### Extraction

(a) *Ether extraction*.—Place in 50 mL beaker weighed sample contg ca 0.0324 g (0.5 grain) nitroglycerin. If sample consists of tablets, count those taken; if of powd material, mix thoroly before weighing. Add 10 mL ether, and to facilitate extn, reduce tablets to fine powder, using flat-end stirring rod. Stir thoroly. Decant ether thru dry 7 cm quant. paper into 250 mL beaker contg 10 mL alcohol. Hold paper in place in funnel with the stirring rod and pour ether down rod. Make 4 addnl extns in same way. Dissolve ether-insol. residue in small amt of H<sub>2</sub>O, transfer soln to separator, and ext with two 10 mL portions ether. Filter these exts, add to first exts, and evap. combined ether soln to ca 10 mL with fan. Transfer soln to 800 mL Kjeldahl flask, rinsing beaker first with 10 mL alcohol and then with little H<sub>2</sub>O. Dil. to ca 300 mL with recently boiled and cooled NH<sub>3</sub>-free H<sub>2</sub>O.

(b) *Alcohol extraction*.—Weigh into g-s erlenmeyer sample contg ca 0.065 g (1 grain) nitroglycerin. If sample consists of tablets, count those taken; if of powd material, mix thoroly before weighing portion taken for analysis. Pipet in 50 mL alcohol. To facilitate extn, reduce tablets to fine powder with flat-end rod. Stopper flask and shake. Let mixt. settle, transfer 25 mL aliquot of clear soln to 800 mL Kjeldahl flask, and dil. to ca 300 mL with NH<sub>3</sub>-free H<sub>2</sub>O.

### 39.106

#### Determination.

Place flask on wire gauze with asbestos center. Add thru funnel 2 g *Devarda alloy*, ca 4 cm heavy (ca 16 gage) *Al wire*, and 10–15 mL alc. KOH soln (15 g KOH dild to 100 mL with

alcohol). Immediately after adding alkali, place little H<sub>2</sub>O in scrubber trap (A and B, Fig. 39:03), and insert rubber stopper carrying scrubber trap and connecting bulb into neck of flask. Connect outlet tube of connecting bulb with upright condenser fitted with adapter tube dipping to bottom of 500 mL erlenmeyer contg measured vol. (ca 25 mL) 0.02N HCl or H<sub>2</sub>SO<sub>4</sub> and 10–15 mL H<sub>2</sub>O, and so inclined that tip of adapter is submerged as far as practicable under surface of liq. in flask.

Heat distn flask ca 1 hr, using small flame and regulating heat so that rapid evolution of H, but no appreciable distn, takes place. Gradually increase heat until distn begins; when active foaming ceases, continue distn with large flame until ca 40 mL liq. remains in distg flask. Lower flame toward end of distn to avoid cracking flask. Remove receiver contg distillate, add enough Me red to make soln red, and titr. excess acid with 0.02N NaOH soln. From difference between this excess and amt added, after making correction shown by blank with same amt of reagents distd in same manner, calc. % nitroglycerin in sample. 1 mL 0.02N acid = 0.001514 g nitroglycerin.

#### Infrared Method (36)

### 39.107

#### Reagent

*Nitroglycerin std.*—Absorbate on lactose contg ca 10% nitroglycerin. Stdze by 39.104–39.106. This product is stable indefinitely in tightly stoppered bottle.

### 39.108

#### Determination

(Caution: See 51.011, 51.039, 51.040, and 51.048.)

Transfer number of tablets contg ca 5 mg nitroglycerin to small separator. Dissolve or suspend in 5 mL H<sub>2</sub>O, add 20 mL CS<sub>2</sub>, shake 1 min, and let sep. Filter CS<sub>2</sub> layer thru pledget of cotton previously washed with CS<sub>2</sub> and collect in 100 mL beaker. Repeat extn with three 10 mL portions CS<sub>2</sub>. Evap. combined exts to ca 3 mL, using gentle current of air, at temp. ≤50°. Transfer quant. to 5 mL vol. flask and dil. to vol. with CS<sub>2</sub>.

Accurately weigh amt std absorbate contg ca 5 mg nitroglycerin. Transfer to small separator and ext as above.

Det. baseline *A<sub>B</sub>* of sample and std solns relative to CS<sub>2</sub> at 7.89 μm, drawing baseline between min. at 7.5 and 8.3 μm. Calc. nitroglycerin content of sample. Record spectra of sample and std solns from 2 to 15 μm and compare for identity of sample.

#### Nitrate Esters—Official Final Action

#### Infrared Method (37)

(Applicable to mannitol hexanitrate, erythritol tetranitrate, or pentaerythritol tetranitrate)

### 39.109

#### Apparatus

(a) *Recording infrared spectrophotometer*.—With two 1.0 mm liq. absorption cells with NaCl windows, preferably matched or of known *A* difference, and KBr disk holder.

(b) *Chromatographic tube*.—25 × 200 mm with 5 × 40 mm stem.

(c) *Die and hydraulic press*.—Suitable for prep g KBr disks.

### 39.110

#### Preparation of Standard Solution

Ext ester from com. absorbate (usually 10% on lactose or other inert diluent) with ether, filter, and evap. to dryness with aid of air current at temp. ≤50°. Dry in vac. desiccator 1 hr. Prep. std soln contg 0.5 mg ester/mL CHCl<sub>3</sub>.

*Caution:* Pure crystalline nitrate esters are very explosive, especially pentaerythritol tetranitrate. Do not use sample contg >5 mg pure compd.

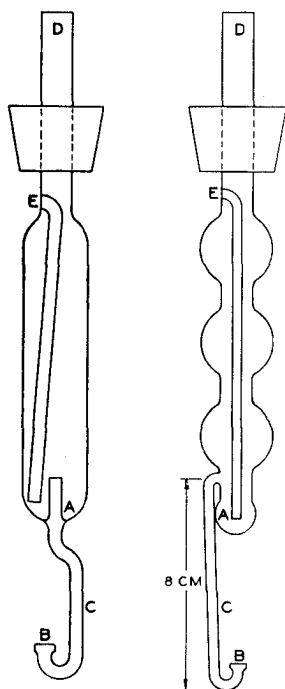

FIG. 39:03—Scrubber trap for ammonia distillation

## 39.111

**Preparation of Sample**

Reduce tablets to fine powder. Weigh sample contg ca 25 mg nitrate ester and transfer to 125 mL separator with ca 5 mL H<sub>2</sub>O. Make distinctly acid with H<sub>2</sub>SO<sub>4</sub> (1+9). Proceed as in (a) in absence of phenobarbital, or (b) in presence of phenobarbital.

(a) Add 10 mL CHCl<sub>3</sub> to separator, shake vigorously several min, and let sep. Transfer CHCl<sub>3</sub> layer to 50 mL vol. flask. Ext. aq. soln with three addnl 10 mL portions CHCl<sub>3</sub> and transfer each ext to vol. flask. Dil. to vol. with CHCl<sub>3</sub>, mix, and filter.

(b) Add 15 mL CHCl<sub>3</sub> to separator, shake vigorously several min, and let sep. Transfer CHCl<sub>3</sub> layer to chromatgc column contg 4 mL 1M K<sub>3</sub>PO<sub>4</sub> soln adsorbed on 5 g diat. earth, **36.002**, collecting eluate in 50 mL vol. flask. Ext. aq. soln with three addnl 10 mL portions CHCl<sub>3</sub>, and pass each ext thru column, collecting eluate in vol. flask. Dil. to vol. with CHCl<sub>3</sub>, mix, and filter.

## 39.112

**Determination**

(Store CHCl<sub>3</sub> to be used in IR measurements in stoppered flask.)

Transfer 5 mL aliquot CHCl<sub>3</sub> soln to 25 mL g-s erlenmeyer, evap. to dryness with aid of air current at temp. ≤50°, and complete drying in vac. desiccator. Add 5.00 mL CHCl<sub>3</sub> to residue, stopper flask tightly, and let stand 30 min with occasional shaking to ensure complete soln. Det. *A* of std and sample solns against CHCl<sub>3</sub> at max. (ca 6.0 μm) and calc. amt of ester per tablet.

Evap. another portion CHCl<sub>3</sub> soln to dryness as above. Prep. KBr disk by grinding together in agate mortar 1 mg residue with 200 mg IR spectral grade KBr and pressing in die and hydraulic press. Record spectrum from 2 to 15 μm and compare with spectrum of std nitrate ester to det. identity of sample.

**Mannitol Hexanitrate; Mannitol Hexanitrate and Phenobarbital (38)—Official Final Action**

(Ascorbic acid interferes. See also 39.109–39.112.)

## 39.113

**Reagents**

(a) *Phenoldisulfonic acid*.—Heat 5 g colorless phenol, 30 mL H<sub>2</sub>SO<sub>4</sub>, and 15 mL fuming H<sub>2</sub>SO<sub>4</sub> (ca 20% free SO<sub>3</sub>) on steam bath 2 hr. (Caution: See 51.030 and 51.031.)

(b) *Nitrate std soln*.—Dissolve 100 mg KNO<sub>3</sub> or NaNO<sub>3</sub> in ca 1 mL H<sub>2</sub>O and dil. to 100 mL with HOAc.

(c) *Phenobarbital std soln*.—In 100 mL vol. flask dissolve 100 mg phenobarbital and dil. to vol. with HOAc. Pipet 5 mL of this soln and 15 mL HOAc into 100 mL vol. flask, dil. to vol. with H<sub>2</sub>O, and filter, discarding first 5 mL filtrate.

## 39.114

**Preparation of Sample**

Transfer accurately weighed sample contg ca 30 mg mannitol hexanitrate to 50 mL vol. flask, and dil. to vol. with HOAc. Shake well and filter, discarding first 5 mL filtrate.

## 39.115

**Determination of Mannitol Hexanitrate**

Transfer 1.0 mL aliquots of sample, std, and HOAc (blank) to individual 100 mL vol. flasks, add 2.0 mL phenoldisulfonic acid to each, and let stand 15 min. Dil. with H<sub>2</sub>O to ca 60 mL, add NH<sub>4</sub>OH (ca 10 mL) until max. yellow color appears, cool to room temp., dil. to vol. with H<sub>2</sub>O, and mix. Det. *A* of sample and std, *A'*, relative to blank at 408 nm.

% Mannitol hexanitrate =  $(A \times R_2 \times k \times 50)/(A' \times R_1)$ ; where *R*<sub>1</sub> is mg sample, *R*<sub>2</sub> is mg std/mL, and *k* is 88.66 for NaNO<sub>3</sub> and 74.56 for KNO<sub>3</sub> std.

## 39.116

**Determination of Phenobarbital**

Pipet 10 mL aliquot sample soln into 50 mL vol. flask, dil. to vol. with H<sub>2</sub>O, shake, and filter, discarding first 5 mL filtrate. Prep. blank by dilg 10.0 mL HOAc to 50 mL with H<sub>2</sub>O and filtering. Dil. sep. 20 mL aliquots of std, sample, and blank solns to 100 mL with NH<sub>4</sub>OH (1+9), adjusting to room temp. before dilg. to vol. (Final pH of soln, 9.0–9.6.) Det. *A* of sample and std relative to blank at 240 nm, and calc. phenobarbital content.

39.117 **Pentaerythritol Tetranitrate (39)****Official Final Action**

(Applicable in presence of meprobamate)

Accurately weigh powd sample contg ca 40 mg pentaerythritol tetranitrate into 50 mL g-s vol. flask. Add ca 30 mL HOAc, shake ca 1 min, and dil. to vol. with HOAc. Filter, discarding first 5 mL filtrate. Proceed as in 39.115.

% Pentaerythritol tetranitrate =  $(A \times R' \times k \times 50)/(A' \times R)$ ; where *A* and *A'* refer to sample and std, resp.; *R* and *R'* are mg sample and mg std/mL, resp.; and *k* is 92.99 for NaNO<sub>3</sub> or 78.18 for KNO<sub>3</sub> std.

**Pentaerythritol Tetranitrate (PETN) and Meprobamate (40)—Official Final Action**

(Caution: PETN may explode when heated strongly, even when dissolved.)

## 39.118

**Apparatus**

See 39.109.

## 39.119

**Reagents**

(Caution: See 51.011, 51.040, and 51.056.)

(a) *Dilute phosphoric acid*.—3 + 1. Dil. 3 vols 85% H<sub>3</sub>PO<sub>4</sub> with 1 vol. H<sub>2</sub>O.

(b) *Water-washed benzene*.—Shake equal vols benzene and H<sub>2</sub>O 1 min in separator. Discard lower phase. Use within 2 days of prepn.

(c) *Water-washed chloroform*.—Shake equal vols. CHCl<sub>3</sub> and H<sub>2</sub>O 1 min in separator. Discard upper layer. Use within 2 days of prepn.

(d) *Anhydrous chloroform*.—Filter H<sub>2</sub>O-washed CHCl<sub>3</sub> thru anhyd. Na<sub>2</sub>SO<sub>4</sub>.

(e) *Pentaerythritol tetranitrate (PETN) std soln*.—10 mg/50 mL. Ext PETN from com. PETN (usually 10% on lactose or other inert diluent) with CHCl<sub>3</sub> to give ca 20 mg pure PETN. Filter and evap. to dryness under air current with little or no heat. Dry in vac. desiccator 2 hr. Accurately weigh ca 10 mg, using microbalance, dissolve in anhyd. CHCl<sub>3</sub>, and dil. to 50 mL with this solv. Destroy excess PETN by dissolving in acetone and burning in large vessel behind safety barrier, using effective fume removal device.

(f) *Meprobamate std soln*.—80 mg/100 mL. Dissolve 80 mg USP Meprobamate Ref. Std in anhyd. CHCl<sub>3</sub> and dil. to 100 mL with this solv.

(g) *Diatomaceous earth*.—See 36.002.

## 39.120

**Determination**

(Use H<sub>2</sub>O-washed solvs unless designated anhyd. Caution: See 51.011, 51.039, 51.040, 51.045, and 51.056.)

Loosely pack small amt of fine glass wool in base of chromatgc tube to support diat. earth. Weigh 3 g diat. earth into 100 mL beaker, add 2.0 mL 1N NaOH, mix with metal spatula until fluffy, and pack uniformly in tube. Weigh 5 g diat. earth into 250 mL beaker, add 7.0 mL dil. H<sub>3</sub>PO<sub>4</sub>, mix until fluffy, and pack uniformly

on column. (Do not pack too tightly as column will elute too slowly.) Accurately weigh portion powd sample contg ca 10 mg PETN into 150 mL beaker. Add 4 mL benzene and heat gently with swirling ca 1 min. Cool, add 4 g diat. earth, mix until fluffy, transfer quant. to column, and pack uniformly. Dry-wash beaker with 1 g diat. earth and 0.5 mL benzene, transfer to column, and pack uniformly. Wipe sample beaker and all app. used in column prepn with glass wool, and pack on column.

Pass 75 mL benzene thru column and collect eluate in 150 mL beaker until elution ceases. Rinse column tip with small portions benzene into beaker and set aside. This fraction contains PETN.

Place 250 mL beaker under column. Add 4.0 mL H<sub>2</sub>O to column and let it be absorbed. Pass 150 mL CHCl<sub>3</sub> thru column and collect eluate in 250 mL beaker. Rinse column tip with CHCl<sub>3</sub> into beaker. This fraction contains meprobamate.

Evap. each fraction on steam bath under gentle air current to ca 10 mL and take to dryness with little or no heat from steam bath. Place beakers in vac. oven 30 min at 30° and ≤380 mm (15") Hg. Remove from oven. Add ca 10 mL anhyd. CHCl<sub>3</sub> to PETN beaker and heat gently to dissolve residue. Quant. transfer with anhyd. CHCl<sub>3</sub> to 50 mL vol. flask and dil. to vol. with anhyd. CHCl<sub>3</sub>.

Dissolve meprobamate residue with ca 20–25 mL anhyd. CHCl<sub>3</sub>. If theoretical wt of meprobamate in sample wt taken is 100 mg, transfer quant. to 100 mL vol. flask with anhyd. CHCl<sub>3</sub> and dil. to vol. with this solv. If theoretical wt of meprobamate is ca 200 mg, use 250 mL vol. flask and proceed as above.

Scan sample and std solns in 1.0 mm cells from 5.0 to 6.5 μm (2000–1540 cm<sup>-1</sup>) on IR spectrophtr against anhyd. CHCl<sub>3</sub> as ref.

Calc. PETN by subtracting *A* at 5.5 μm (1818 cm<sup>-1</sup>) from *A* at ca 6.02 μm (1660 cm<sup>-1</sup>) and compare with std *A*. (Note: PETN sample solns may contain very small peak at ca 5.8 μm (1722 cm<sup>-1</sup>). This is contaminant of meprobamate and does not interfere with PETN detn. Also, a peak may appear at ca 6.25 μm (1600 cm<sup>-1</sup>). This is H<sub>2</sub>O peak. Disregard this peak in calcg PETN net *A*.)

Calc. meprobamate by subtracting *A* at 5.5 μm (1818 cm<sup>-1</sup>) from *A* at ca 5.82 μm (1718 cm<sup>-1</sup>) and compare with std *A*.

### 39.121

#### Identification

(a) *PETN*.—Prep. both std and sample KBr disks from respective assay solns. Evap. 4–5 mL of each soln in small mortar, add 200 mg KBr, mix thoroly, and press. Scan spectrum from 2 to 15 μm (5000–667 cm<sup>-1</sup>). Compare sample and std curves. (Note: Sample IR curve may deviate from std curve. This deviation is caused by meprobamate contaminant. However, all major peaks in std and sample should be evident.)

(b) *Meprobamate*.—Prepare KBr disks as above from 1 mL sample and std assay solns. Scan and compare as in (a).

### Menadione Sodium Bisulfite (41)—Official Final Action

(Applicable to injections)

### 39.122

#### Principle

Aq. menadione.NaHSO<sub>3</sub> soln is mixed with diat. earth and placed in chromatgc column over lower layer of HCl-diat. earth. Excipients are eluted with CHCl<sub>3</sub> and menadione with NH<sub>3</sub>-CHCl<sub>3</sub>. Excess NH<sub>3</sub> which could decompose menadione is neutzd by acidic lower layer. Menadione is detd by UV spectrophotometry.

### 39.123

#### Reagents

(a) *Chloroform*.—Use H<sub>2</sub>O-washed CHCl<sub>3</sub> thruout.

(b) *Ammoniacal chloroform*.—Mix 1 part NH<sub>4</sub>OH with 25 parts CHCl<sub>3</sub> as needed.

(c) *Menadione std soln*.—50 μg/mL. Dissolve 50 mg USP Menadione Ref. Std in CHCl<sub>3</sub> and dil. to 100 mL with CHCl<sub>3</sub>. Dil. 10 mL aliquot to 100 mL with CHCl<sub>3</sub>.

### 39.124

#### Determination

Mix 1 mL HCl (1+3) with 1.5 g diat. earth, **36.002**, and pack into chromatgc tube, **37.002**. Dil. aq. sample soln to contain ca 5 mg menadione.NaHSO<sub>3</sub>.3H<sub>2</sub>O/mL, mix 2.0 mL this soln with 3 g diat. earth in beaker, and pack into tube. Dry-wash beaker with 1 g diat. earth, add to tube, tamp until compressed, and overlay with piece of glass wool used to wipe beaker.

Wash column with 100 mL CHCl<sub>3</sub> and discard CHCl<sub>3</sub>. Wash tip of column with few mL CHCl<sub>3</sub>. With 100 mL vol. flask as receiver, add 5 mL NH<sub>4</sub>OH-CHCl<sub>3</sub>, let sink into diat. earth, and elute menadione with 90 mL CHCl<sub>3</sub>. Rinse tip of column with CHCl<sub>3</sub> and dil. to vol. with CHCl<sub>3</sub>. Scan soln and std soln from 280 to 400 nm against CHCl<sub>3</sub> and det. *A* at max., ca 334 nm.

mg Menadione.NaHSO<sub>3</sub>.3H<sub>2</sub>O/mL dild assay soln

$$= 0.05 \times 1.918 \times C \times (A/A')$$

where 1.918 is factor to convert menadione to menadione .NaHSO<sub>3</sub>.3H<sub>2</sub>O; *C* = μg menadione/mL std soln; and *A* and *A'* refer to sample and std solns, resp.

### Meprobamate (42)—Official Final Action

### 39.125

#### Apparatus

(a) *Spectrophotometer*.—Recording IR spectrophtr, effective over 0.75–3.5 μm range, with 1 cm matching near-IR silica cells. Peak at ca 2.91 μm for meprobamate must be resolved.

(b) *Chromatographic tubes*.—Glass, 20 × 300 mm.

### 39.126

#### Reagents

(a) *Alcohol-free chloroform*.—Thruout detn use only CHCl<sub>3</sub> prepd daily as follows: Ext alcohol by passing CHCl<sub>3</sub> successively thru three 500 mL separators, each contg 50–75 mL H<sub>2</sub>O. Pack 2 chromatgc tubes half-full with alumina (80–200 mesh, Fisher No. A-540, or equiv.) activated by heating 2 hr at 300°. Mount one column above other and pass CHCl<sub>3</sub> thru both columns. Pass ≤500 mL CHCl<sub>3</sub> at one time. If more CHCl<sub>3</sub> is needed, repeat purification with fresh alumina.

(b) *Meprobamate std soln*.—0.5 mg/mL. Accurately weigh ca 25 mg USP Meprobamate Ref. Std and transfer to 50 mL vol. flask. Dissolve in and dil. to vol. with CHCl<sub>3</sub>. Absorptivity should be ca 1.0 if 2.91 μm peak is properly resolved.

### 39.127

#### Preparation of Sample

Finely pulverize tablets, accurately weigh portion contg ca 50 mg meprobamate, and transfer to dry 100 mL vol. flask. Add 50 mL CHCl<sub>3</sub>, shake 15–20 min, and dil. to vol. with CHCl<sub>3</sub>. Filter soln thru dry Whatman No. 1 paper, or equiv. Discard first 20–25 mL and collect remainder in dry g-s erlenmeyer.

### 39.128

#### Determination

Zero instrument at 2.914 μm with CHCl<sub>3</sub> in both cells. Scan sample and std solns against CHCl<sub>3</sub> between 3.000 and 2.790 μm. Measure baseline *A* values at max., ca 2.91 μm, from straight line drawn between minima at ca 2.980 and 2.875.

$$\text{mg Meprobamate/tablet} = A_{\text{sample}} \times (C/A_{\text{std}}) \times 100 \times (T/W);$$

where *A* refers to baseline values; *C* = mg meprobamate/mL std soln; *T* and *W* = av. wt/tablet and sample wt, resp., in mg.

### 39.129 Meprobamate and Pentaerythritol Tetranitrate

See 39.118–39.121.

**Dichlorophene (43)—Official Final Action****39.130****Principle**

Dichlorophene is extd from acid soln with  $\text{CHCl}_3$  and detd by measuring *A* in alc. NaOH soln at 305 nm.

**39.131****Reagent**

*Dichlorophene std solns.*—(1) *Stock soln.*—600  $\mu\text{g/mL}$ . Dissolve 60 mg dichlorophene (ICN-K&K Laboratories, Inc.) in alcohol and dil. to 100 mL. (2) *Working soln.*—15  $\mu\text{g/mL}$ . Dil. 5.0 mL stock soln to 200 mL with 0.1*N* NaOH. Prep. fresh daily.

**39.132****Preparation of Sample**

(a) *Soft gelatin capsules.*—Select representative number (5–20) of capsules. Treat each capsule, one at a time, as follows: Using sharp scalpel, cut capsule lengthwise and transfer to funnel placed in neck of 500 mL vol. flask. Thoroughly rinse capsule contents, scalpel, and funnel with alcohol. Remove funnel and carefully transfer opened capsule to vol. flask. Dil. to vol. with alcohol and mix. Prep. soln contg ca 0.3 mg dichlorophene/mL by stepwise diln with alcohol.

(b) *Suspension.*—Mix thoroly. Using 10 mL “to contain” pipet with wide orifice (Duopette pipet, Scientific Products, Inc., No. P4615-1X, or equiv.), withdraw suspension to TC mark. Drain pipet into 250 mL vol. flask, using pressure applied from rubber bulb. Thoroughly rinse pipet into flask with alcohol, dil. to vol., and mix. Prep. soln contg ca 0.3 mg dichlorophene/mL by stepwise diln with alcohol.

**39.133****Determination**

Transfer 10 mL aliquot prepd sample soln to 125 mL separator contg 10 mL  $\text{H}_2\text{O}$ . Add 3 mL 1*N* NaOH, mix well, and ext with 10 mL *n*-hexane. Let sep. and transfer lower aq. layer to second separator. Ext with another 10 mL portion *n*-hexane. Transfer aq. layer to third separator. Combine *n*-hexane exts in first separator and ext with 10 mL 50% alcohol. Discard hexane. Add alc. wash to aq. layer in third separator. Add 7 mL 1*N* HCl and mix well. (Soln should be distinctly acid to litmus paper.) Ext acid soln with four 25 mL portions  $\text{CHCl}_3$ . Filter each ext thru  $\text{CHCl}_3$ -washed cotton into 250 mL beaker. Rinse funnel and cotton with ca 5 mL  $\text{CHCl}_3$  and carefully evap. just to dryness on steam bath, using gentle air jet. Let beaker and contents cool. Dissolve residue of dichlorophene in 5.0 mL alcohol and transfer to 200 mL vol. flask, using 0.1*N* NaOH. Dil. to vol. with 0.1*N* NaOH and mix.

Record spectra of sample and std solns from 370 to 225 nm, using 1 cm cells and 5 mL alcohol dild to 200 mL with 0.1*N* NaOH as ref.

Det. *A* of std and sample solns at peak wavelength ca 305 nm and calc. dichlorophene content of sample.

**39.134****Identification**

Dil. aliquots of sample assay soln, working std soln, and ref. soln with equal vols 0.1*N* NaOH. Obtain *A* between 370 and 225 nm.

Spectra should be similar and exhibit maxima at 245 and 305 nm. Ratio ( $A_{245}/A_{305}$ ) of sample does not differ appreciably from that of std.

**Methenamine (Hexamethylenetetramine) in  
Tablets (44)—Official Final Action**

**39.135****Reagent**

*Modified Nessler reagent.*—(1) Dissolve 10 g  $\text{HgCl}_2$ , 30 g KI, and 5 g acacia in 200 mL  $\text{H}_2\text{O}$ , and filter thru cotton; (2) dissolve

15 g NaOH in 100 mL  $\text{H}_2\text{O}$ . Mix 20 mL soln (1) with 10 mL soln (2).

**39.136****Determination**

Weigh 0.5 g powder, prepd as in 36.003, into r-b flask, and add 100 mL  $\text{H}_2\text{O}$  and 25 mL HCl (1+2.5). Connect with reflux condenser (preferably of worm type) and boil gently 15 min. Cool, wash condenser tube with little  $\text{H}_2\text{O}$ , transfer contents of flask to 250 mL vol. flask, and dil. to vol.

Chill 30 mL Nessler reagent and add 10 mL aliquot of hydrolyzed sample soln. Wash neck of container with jet of  $\text{H}_2\text{O}$  and let stand  $\geq 1$  min. Add 10 mL HOAc (1+1.5) so that inside of neck is completely washed by reagent, mix quickly and thoroly by rotating and tilting flask, and immediately add 20 mL 0.1*N* I from buret or pipet. Tit. excess I with 0.1*N*  $\text{Na}_2\text{S}_2\text{O}_3$ , adding 5–10 drops starch indicator, 6.005(f), toward end of titrn, until blue disappears. Final color of soln is pale straw-green. If preferred, end point may be detd by reappearance of faint blue when drop of the I soln is added. 1 mL 0.1*N* I = 0.00117 g methenamine.

**Methenamine and Methenamine Mandelate  
Automated Method (45)—Official Final Action**

**39.137****Principle**

Methenamine is hydrolyzed to HCHO and  $\text{NH}_4^+$  in acid soln. Free HCHO condenses with chromotropic acid in strong acid soln to form colorless hydroxydiphenylmethane derivative which is further oxidized to colored *p*-quinoidal compd with max. *A* at 570 nm. Method is applicable to methenamine, methenamine mandelate, and methenamine with  $\text{NaH}_2\text{PO}_4$ .

**39.138****Reagents and Apparatus**

(Use deionized  $\text{H}_2\text{O}$  or equiv. thruout.)

(a) *Dilute ammonia.*—Dil. 5 mL  $\text{NH}_4\text{OH}$  to 1 L with  $\text{H}_2\text{O}$ .

(b) *Dilute sulfuric acid.*—72%. Slowly add  $\text{H}_2\text{SO}_4$  to 600 mL  $\text{H}_2\text{O}$  to total vol. of 1.5 L (when cool).

(c) *Chromotropic acid (CTA) color reagent.*—Suspend 500 mg CTA, di-Na salt (ICN-K&K Laboratories, Inc., Eastman Kodak Co., or equiv.), in 20 mL  $\text{H}_2\text{O}$  and slowly add 30 mL  $\text{H}_2\text{SO}_4$  in small portions (overheating produces deep violet color and inactivates reagent). Cool, and mix into 1.5 L 72%  $\text{H}_2\text{SO}_4$ .

(d) *Methenamine std soln.*—Dissolve enough methenamine, previously dried over  $\text{P}_2\text{O}_5$  and stdzd (USP), in dil.  $\text{NH}_4\text{OH}$  to give concn of std appropriate for dosage level analyzed (Table 39.01).

(e) *Automatic analyzer.*—AutoAnalyzer with following modules (Technicon Instruments Corp.): Sampler II with 20/hr (2:1) cam; proportioning pump I; heating bath set at 90° with two 40' coils, 1.6 mm id; colorimeter with 15 mm tubular flowcell and matched 570 nm filters; recorder with semilog paper; manifold (Fig. 39.04). Wire down all tube connections carrying  $\text{H}_2\text{SO}_4$ .

**Table 39.01 Sample Pump Tube Sizes and Methenamine Std Concns for Various Tablet Dosage Levels**

Product	Dosage, mg/ tablet	Pump Tube Size, mL/min	Std, mg/100 mL
Methenamine mandelate	250	1.00	2.50
Methenamine mandelate	500	0.60	5.00
Methenamine	300, 325	0.60	6.00, 6.50
Methenamine	500	0.23	5.00
Methenamine mandelate	1000	0.23	10.00

completely by heating 30 min on steam bath with frequent shaking.

**39.144****Determination**

Conduct blank as in detn, including filtration. Cool soln, **39.143(a)** or **(c)**, add 50 mL HOAc, shake thoroly, and let stand  $\geq 25$  min. Add 30 mL 0.2*N* I, **50.018**, from buret, adding first 10 mL by fast drops with const rotating of flask and remaining 20 mL at full speed, and continue shaking. Stopper flask and let stand 50 min, shaking thoroly 5 or 6 times during interval. Dil. to vol. with H<sub>2</sub>O, shake, and let stand 10 min longer. Filter rapidly thru dry, folded, 12 cm paper. Titr. 100 mL aliquot with 0.1*N* Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>, with or without starch indicator as desired. Correct for blank titrn. 1 mL 0.2*N* I = 0.01496 g methylene blue, C<sub>16</sub>H<sub>18</sub>N<sub>3</sub>ClS·3H<sub>2</sub>O; or 0.01279 g anhyd. methylene blue, C<sub>16</sub>H<sub>18</sub>N<sub>3</sub>ClS.

**Sodium Fluorescein (47)—Official Final Action**

(Applicable to solns. *Caution:* See **51.008** and **51.016**.)

**39.145****Apparatus**

(a) *Fluorometric apparatus*.—Spectrophotofluorometer or fluorocolorimeter. With cell path  $\geq 1$  cm, excitation wavelength 460 nm, emission wavelength 515 nm, and sensitivity to yield  $\geq 85\%$  *T* for most concd std soln. Warm lamp  $\geq 20$  min before making measurements.

(b) *Thin layer sheets*.—Silica gel (100  $\mu$ m) with fluorescent indicator (Eastman Kodak Co. Chromagram sheets for TLC, No. 6060, or equiv.).

**39.146****Reagents**

(a) *Acriflavine hydrochloride soln*.—Dissolve 5 mg salt (J. T. Baker Chemical Co., or equiv.) in 0.5 mL H<sub>2</sub>O and dil. to 5 mL with alcohol.

(b) *Fluorescein diacetate*.—Mp 206–208° (Eastman Kodak Co. No. 1688, or equiv.). If material is impure, indicated by low mp or other evidence, recrystallize from alcohol.

(c) *Sodium fluorescein std solns*.—(1) *Stock soln*.—903.6  $\mu$ g Na fluorescein/mL. Accurately weigh 100 mg fluorescein diacetate (equiv. to 90.36 mg Na fluorescein), dried 1 hr at 100°, and transfer to 100 mL vol. flask with ca 10 mL alcohol. Add 2 mL 10% NaOH and heat on steam bath at ca boiling temp. 20 min. Swirl frequently. After hydrolysis, cool flask, dil. to vol. with H<sub>2</sub>O, and mix. (2) *Intermediate soln*.—0.9036  $\mu$ g Na fluorescein/mL. Dil. 1 mL clear stock soln to 1 L with H<sub>2</sub>O and mix. (3) *Working solns*.—0.000, 0.009, 0.018, 0.027, 0.036, and 0.045  $\mu$ g Na fluorescein/mL. Transfer 0.0, 1.0, 2.0, 3.0, 4.0, and 5.0 mL intermediate soln to sep. 100 mL vol. flasks, add 20 mL pH 9 buffer to each, and dil. to vol. with H<sub>2</sub>O.

(d) *Boric acid buffer*.—pH 9. Prep. ca 200 mL soln 0.05*M* in boric acid and 0.05*M* in KCl. Adjust to pH 9 with 0.2*M* NaOH.

**39.147****Preparation of Sample**

Quant. dil. sample with H<sub>2</sub>O to obtain ca 1  $\mu$ g Na fluorescein/mL and transfer 3.0 mL aliquot to 100 mL vol. flask contg 20 mL pH 9 buffer. Dil. to vol. with H<sub>2</sub>O and mix.

**39.148****Determination**

Measure fluorescent intensity (*I*) of all working std solns and plot std curve ( $\mu$ g Na fluorescein against *I*). Det. *I* of sample soln and calc. concn of sample.

**39.149****Purity and Identification**

Dil. concd sample and hydrolyzed stock solns with alcohol to contain ca 1 mg Na fluorescein/mL.

Spot 10  $\mu$ L each of above solns and acriflavine.HCl soln on

fluorescent silica gel sheets and develop with *n*-BuOH-alcohol-H<sub>2</sub>O (2+1+1). Dry sheet and view under longwave UV light. Sample and std should exhibit only one spot, which has similar but different *R<sub>f</sub>* from spot obtained with acriflavine.HCl.

**39.150 ★ Cod Liver Oil in Emulsions (48) ★ Official Final Action**

See **32.299**. 10th ed.

## 40. Drugs: Illicit

### 40.001 Microchemical Tests—Official Final Action

See 36.095–36.108 (Diacetylmorphine (heroin), diacetylmorphine.HCl, lysergic acid diethylamide tartrate, 4-methyl-2,5-dimethoxyamphetamine.HCl (STP.HCl, DOM), and psilocybin).

#### Cocaine Hydrochloride

##### Gas Chromatographic Method (1)—Official First Action

#### 40.002

##### Principle

Cocaine is extd from weakly basic, aq. soln with  $\text{CHCl}_3$  contg internal std, and then sepd by GLC from other amines, org.-sol. neutrals, and internal std.

#### 40.003

##### Apparatus and Reagents

(a) *Gas chromatograph*.—With H flame detector and 1.8 m (6')  $\times$  4 (id) mm glass column packed with 3% OV-1 on 100–120 mesh Chromosorb W(HP) (Applied Science Laboratories, Inc.). Typical operating conditions: temps ( $^{\circ}$ ): column 225, detector and injector 240; N carrier gas flow rate, 60 mL/min. Adjust column temp. to elute cocaine in  $3 \pm 0.5$  min. Adjust H and air flow rates and electrometer sensitivity so that 4  $\mu\text{L}$  cocaine std soln gives 40–60% full scale deflection. Retention time of cocaine relative to internal std is ca 0.65.

(b) *Dibasic potassium phosphate*.—10%. Dissolve 5 g  $\text{K}_2\text{HPO}_4$  in 50 mL  $\text{H}_2\text{O}$ , and mix well.

(c) *Dilute hydrochloric acid*.—0.1N. Dil. 7.0 mL HCl to 1 L with  $\text{H}_2\text{O}$ , and mix well.

(d) *Internal std soln*.—0.8 mg/mL. Dissolve 80 mg tetracosane in 100 mL  $\text{CHCl}_3$ , and mix well.

(e) *Cocaine hydrochloride std soln*.—1 mg/mL. Accurately weigh ca 10 mg cocaine.HCl into 10 mL vol. flask, and dil. to vol. with internal std soln. Prep. fresh every 3 months. Store in refrigerator.

#### 40.004

##### Preparation of GLC Column

Plug column exit with silanized glass wool. Apply vac. to exit end, and slowly add packing material thru column inlet while gently tapping column. Fill to within 1 cm of column inlet, and plug with silanized glass wool. Condition column overnight at  $260^{\circ}$  with slow stream of N. Sat. column with cocaine by making successive 4  $\mu\text{L}$  injections of cocaine std soln until cocaine: internal std ratio differs by <3% from preceding std injection.

#### 40.005

##### Determination

Accurately weigh ca 250 mg finely ground sample and dil. quant. with 0.1N HCl to estd cocaine.HCl concn of 1 mg/mL. Mix well and let any insol. material settle. Pipet 2 mL sample prepn, 2 mL internal std soln, and 1 mL 10%  $\text{K}_2\text{HPO}_4$  into test tube; stopper, and shake vigorously. Let layers sep. Pipet 2 mL cocaine std soln, 2 mL 0.1N HCl, and 1 mL 10%  $\text{K}_2\text{HPO}_4$  soln into another test tube, stopper, and shake vigorously. Let layers sep. Inject 4  $\mu\text{L}$   $\text{CHCl}_3$  (bottom) layer of sample and std solns, each in duplicate, using 10  $\mu\text{L}$  syringe.

$$\% \text{ Cocaine.HCl} = (P/P') \times (B'/B) \times (C/W) \times D \times 100,$$

where  $P$  and  $P'$  = av. areas or peak hts of sample and std cocaine.HCl, resp.;  $B$  and  $B'$  = av. areas or peak hts of internal

std in sample and std, resp.;  $C$  = mg cocaine.HCl/mL in std soln;  $W$  = mg sample; and  $D$  = diln factor for sample.

$$\begin{aligned} \text{mg Cocaine.HCl/tablet} = \\ \% \text{ cocaine.HCl} \times \text{av. tablet wt in mg/100} \end{aligned}$$

### 40.006 ★ Diacetylmorphine (Heroin) in Tablets (2) ★ Official Final Action

Extn and titrn. See 36.022, 11th ed.

### 40.007 ★ Diacetylmorphine and Quinine (3) ★ Official Final Action

UV spectrophtric detn in NaOH-MeOH soln. See 40.003–40.005, 12th ed.

### ★ Lysergic Acid Diethylamide (LSD) (4) ★ Official First Action

(Caution: LSD is strong psychotomimetic agent. Use rubber gloves and effective fume removal device to avoid skin contact and breathing dusts of materials suspected or known to contain LSD.)

#### 40.008

##### Reagents and Apparatus

(a) *Indicator paper*.—Sat. filter paper (Whatman No. 1, or equiv.) with 2%  $p$ -dimethylaminobenzaldehyde in alcohol, air dry, and cut into strips 4–5 cm wide. Store in tightly capped amber glass bottles.

(b) *Chromatographic paper saturated with immobile solvent*.—Sat.  $8 \times 8$ " (20  $\times$  20 cm) Whatman No. 1 chromatgc paper with MeOH soln of 25% formamide (stabilized reagent grade or recently distd) and 1% benzoic acid. Place wet paper between 2 Whatman No. 1 sheets and remove excess solv. by blotting lightly; then suspend paper from glass rod ca 15 min to let MeOH evap. (paper remains slightly moist with formamide).

(c) *Chromatographic mobile solvent*.—Sat. ether with formamide by shaking in separator. Let reagents sep. and discard lower formamide layer.

(d) *Reference stds*.—LSD tartrate (USP authentic substance  $d$ -lysergic acid diethylamide tartrate) and USP Ergonovine Maleate Ref. Std.

(e) *Spectrophotometer*.—Preferably capable of recording spectrum continuously from 400 to ca 200 nm.

#### 40.009

##### Presumptive Test

Ext LSD (ca 40  $\mu\text{g}$ ) from ground powder with enough MeOH to provide ca 5 drops liq. ext. Decant clear liq. into beaker. Transfer 1 or 2 drops liq. (contg ca 5–10  $\mu\text{g}$  LSD) to prepd indicator paper with eye dropper and let MeOH evap. Add 1 drop HCl and let paper stand, supported so that HCl does not touch any surface. If LSD is present, violet-red or violet-blue spot develops and slowly diffuses to edge of ring to form colored ring. Compare test with MeOH blank and LSD ref. soln in MeOH.

Test can detect 1  $\mu\text{g}$  LSD. Larger amt LSD gives faster reaction and more pronounced, more stable color ring.

★ Surplus method—see inside front cover.

## 40.010

**Paper Chromatography**

(Spot solns from (a) and (b) and chromatograph simultaneously on same chromatgc paper.)

Arrange chromatgc chamber for ascending chromatgy. To mobile solv. trough in chamber, add enough mobile solv. to develop chromatogram and equilibrate chamber with solv. vapor. Cover chamber and let equilibrate ca 15 min.

(a) *Paper chromatography of LSD*.—Prep. sample soln by extg ca 60 µg LSD from ground sample with 5 mL MeOH and filtering. Evap. ca ½ filtrate to dryness in 10–15 mL centr. tube by warming on steam bath under gentle air stream. Wash sides of tube with 10 µL MeOH. Sep. spot 3 µL (10 µg LSD) concd sample soln and equiv. (10 µg) LSD ref. std MeOH soln on prepd chromatgc paper. Apply soln in portions (ca 0.5 µL) and let dry before reapplication; spot size should be <10 mm diam. Altho method is applicable to as much as 100 µg LSD, vol. ext spotted must be minimal.

After spotting is complete and spot is dry, apply enough immobile solv. (ca 5–10 µL) to cover spot. Spotting removes immobile solv.; it must be replenished to prevent streaking. Check adequacy of sample spot by comparing intensity of fluorescence with that of std under UV light. If sample spot fluoresces weakly, indicating insufficient LSD, overspot more sample ext from centr. tube as above.

Place spotted paper in equilibrated chromatgc chamber and seal with tape. Develop chromatogram until mobile solv. reaches within ca 5 cm of top of paper (ca 0.5 hr). Withdraw paper and let air dry. Observe under UV light (long and short wavelength).

(b) *Paper chromatography of products of partial racemization of LSD by base*.—In 25 mL erlenmeyer, add remaining filtered sample soln from (a) and adjust vol. to ca 5 mL. Treat equiv. LSD ref. std soln similarly. Add equal vol. 1*N* NaOH, cover, and heat on steam bath 5 min. Remove from steam bath, cool, transfer to separator, and dil. with ca 20 mL H<sub>2</sub>O. Ext LSD with 15 mL CHCl<sub>3</sub>, wash CHCl<sub>3</sub> with 15 mL H<sub>2</sub>O, and discard H<sub>2</sub>O wash. Evap. CHCl<sub>3</sub> to dryness and dissolve residue in 10 µL MeOH as in (a). Spot and develop MeOH soln and degraded LSD ref. std soln as in (a).

Racemization, which produces iso-LSD, causes 2 spots to appear on paper. Iso-LSD has lower *R<sub>f</sub>* value than LSD.

## 40.011

**Determination**

(Perform assay as rapidly as possible and away from direct sunlight. Use freshly prepd std soln.)

Place accurately weighed portion powd sample in 50.0 mL alcohol and shake. Filter to remove insol. material, discarding first few mL filtrate. Take aliquot of filtrate contg ca 0.2 mg LSD and evap. almost to dryness under air current on steam bath with min. heat. Dissolve residue in several mL 0.1*N* HCl and transfer to separator with several portions 0.1*N* HCl to make total vol. ca 25 mL. Make soln alk. with NH<sub>4</sub>OH. Ext LSD with four 15 mL portions CHCl<sub>3</sub>. Evap. combined CHCl<sub>3</sub> ext to dryness with min. heat in air current. Dissolve residue in 10 mL 1% HOAc in alcohol.

Prep. std soln by accurately weighing LSD tartrate std and dilg to 20 µg/mL with 1% alc. HOAc.

Scan sample and std solns from 400 to 200 nm and compare *A* at max., ca 312 nm, using 1% alc. HOAc as blank. Calc. as follows:

$$\text{LSD (free base, anhyd.) } (\mu\text{g/g}) \\ = (A/A') \times (C/W) \times 10 \text{ (mL)} \times 0.811;$$

where *A* and *A'* refer to sample and std solns, resp.; *C* is concn of std in µg/mL; and *W* is g sample in aliquot filtrate taken.

Accurately weigh ≥5 mg (microbalance) USP Ergonovine Maleate Ref. Std, dissolve in 1% alc. HOAc, and dil. with 1% alc. HOAc to ca 20 µg/mL. Measure *A* between 400 and 200 nm. Calc. LSD concn, using *A* at max., ca 312 nm:

$$\text{LSD (free base, anhyd.) } (\mu\text{g/g}) \\ = (A/A') \times (C/W) \times 10 \text{ (mL)} \times 0.733.$$

**Marihuana (Cannabis)****Duquenois-Levine Qualitative Test (5)  
Official Final Action**

## 40.012

**Reagent**

*Duquenois reagent*.—Dissolve 12 drops acetaldehyde (fresh) and 1 g vanillin in 50 mL alcohol.

## 40.013

**Test**

Ext ca 100 mg sample with 25 mL pet ether, filter into white porcelain dish, and evap. to dryness on steam bath. Add 2 mL Duquenois reagent and stir to dissolve residue. Add 2 mL HCl, stir, and let stand 10 min. Note color, transfer soln to test tube, add 2 mL CHCl<sub>3</sub>, and shake. Let sep. and note color in CHCl<sub>3</sub> layer; purple color is pos. test.

**Methaqualone (2-Methyl-3-*o*-tolyl-4(3*H*)-quinazolinone)  
in Pharmaceutical and Clandestine Preparations****Gas Chromatographic Method (6)—Official First Action**

## 40.014

**Apparatus and Reagents**

(a) *Gas chromatograph*.—With flame ionization detector and 1.8 m × 4 (id) mm glass column packed with 3% OV-1 on 100–120 mesh Chromosorb W(HP). Typical operating conditions: temps (°): column 235, detector and injector 260; flow rates (mL/min): N carrier gas 60, H 30, air 300; set column temp. and flow rate to give methaqualone retention time of 2.5±0.5 min.

(b) *Sodium bicarbonate soln*.—1*M*. Dissolve 7 g NaHCO<sub>3</sub> in 100 mL H<sub>2</sub>O.

(c) *Internal std soln*.—Dissolve tetraphenylethylene (Eastman Kodak Co.) in CHCl<sub>3</sub> to give concn of 4 mg/mL. Each analysis requires 25 mL.

(d) *Methaqualone hydrochloride std soln*.—4 mg/mL. Accurately weigh methaqualone.HCl and dil. with internal std soln to give concn of 4 mg/mL.

## 40.015

**Determination**

Condition new column overnight at 270° with slow stream of N. Sat. column immediately before analysis by making three 3 µL injections of methaqualone.HCl std soln.

Accurately weigh sample contg ca 100 mg methaqualone.HCl and transfer quant. to 50 mL erlenmeyer. Pipet in 25 mL internal std soln and add ca 10 mL 1*M* NaHCO<sub>3</sub> soln. Heat on steam bath 5–8 min, cool to room temp., stopper, and shake. Let sep. and inject 1–2 µL of CHCl<sub>3</sub> (bottom) layer into gas chromatograph.

$$\% \text{ Methaqualone.HCl} = (P/P') \times (B'/B) \times (C/W) \times 2500,$$

where *P* and *P'* = areas or peak hts of sample and std methaqualone.HCl, resp.; *B* and *B'* = areas or peak hts of sample and std internal std, resp.; *C* = mg methaqualone.HCl/mL in std soln; and *W* = mg sample.

**Phencyclidine (7)—Official First Action**

(Applicable to powders only)

**40.016****Principle**

Phencyclidine is extd from weakly basic, aq. soln with  $\text{CHCl}_3$ , contg internal std. Phencyclidine is sepd by GLC from other amines, org. sol. neutral compds, and internal std.

**40.017****Reagents and Apparatus**

(a) *Internal std soln.*—Dissolve 80 mg eicosane ( $\text{C}_{20}\text{H}_{42}$ ) in 100 mL  $\text{CHCl}_3$ .

(b) *Phencyclidine hydrochloride std soln.*—Weigh 10.0 mg phencyclidine.HCl (USP Authentic Substance) and dissolve in 10.0 mL internal std soln. Store in refrigerator and replace every 3 months.

(c) *Gas chromatograph.*—With 1.8 m (6')  $\times$  4 mm (id) glass column, packed with 3% OV-1 on 100–120 mesh Chromosorb W HP (Applied Science Laboratories, Inc.), and H flame detector. Typical operating conditions: temps ( $^{\circ}$ ): column 190, detector 240, injection port 240; N carrier gas flow rate 60 mL/min. Adjust column temp. to elute phencyclidine in  $3 \pm 0.5$  min. Adjust H and air flow rates and electrometer sensitivity so that 4  $\mu\text{L}$  phencyclidine std soln gives 40–60% full scale deflection. Retention time of phencyclidine relative to internal std is ca 0.75.

(d) *Column.*—Plug column exit with plug of silanized glass wool. Apply vac. to exit end and slowly add packing thru inlet end while tapping gently. Fill to within 1 cm of inlet and plug with silanized glass wool. Condition column overnight at  $260^{\circ}$  with slow flow of N while disconnected from detector. Sat. column by making successive phencyclidine injections until

phencyclidine/internal std ratio differs by  $<3\%$  from that of preceding injection.

**40.018****Determination**

Accurately weigh ca 250 mg finely ground sample, dissolve in 0.1N HCl, and quant. dil. to estimated phencyclidine.HCl concn of 1 mg/mL. Let any insol. material settle. Pipet 2 mL aliquots sample soln and 2 mL std soln into sep. test tubes. Add 2.0 mL internal std soln and 1.0 mL 10%  $\text{K}_2\text{HPO}_4$  soln to sample tube, stopper, and shake vigorously. Add 2.0 mL 0.1N HCl and 1.0 mL 10%  $\text{K}_2\text{HPO}_4$  to std tube, stopper, and shake vigorously. Let sep. Inject duplicate 4  $\mu\text{L}$  aliquots of lower  $\text{CHCl}_3$  layers into gas chromatograph from 10  $\mu\text{L}$  syringe.

% Phencyclidine.HCl =  $(H/H') (C'/W) (B'/B) \times DF \times 100$ ,  
where  $H$  and  $H'$  = av. peak ht or area of sample and std, resp.;  
 $C'$  = mg std phencyclidine.HCl/mL in std soln;  $W$  = mg sample;  
 $B$  and  $B'$  = av. peak ht or area of internal std in sample and std, resp.; and  $DF$  = diln factor for sample.

mg Phencyclidine.HCl/tablet

= % Phencyclidine.HCl  $\times$  av. tablet wt (mg)/100.

# 41. Drugs and Feed Additives in Animal Tissues

## ANOT (3-Amino-5-nitro-*o*-toluamide) (1) Official Final Action

41.001

### Principle

ANOT, metabolite of zoalene, is liberated from ground tissue by enzymatic digestion with ficin. Digest is treated with  $\text{NaHCO}_3$  and extd with acetone.  $\text{CHCl}_3$  is added to sep. soln into 2 layers. Org. layer is concd and passed thru alumina column. Adsorbed ANOT is washed with  $\text{CHCl}_3$  and eluted with 80% alcohol. Alcohol soln is passed thru cation exchange resin and ANOT is eluted with 4*N* HCl. Colored compd formed by diazotization and coupling with *N*-1-naphthylethylenediamine is measured at 540 nm.

41.002

### Apparatus

- (a) *Chromatographic tube*.—600 × 16 mm id.
- (b) *Ion exchange columns for Dowex resin*.—180 × 11 mm id.
- (c) *Mixer*.—High speed, high shear mixer with explosion-proof motor, and ca 1 L container.
- (d) *Spectrophotometer*.—Beckman Model DU (replaced by Models 24/25), or equiv.

41.003

### Reagents

- (a) *Alumina*.—Activated, Alcoa grade F-20, 80–200 mesh.
- (b) *3-Amino-5-nitro-*o*-toluamide*.—ANOT, anal. std. Available from Ag-Organics Dept., Dow Chemical Co.
- (c) *Ammonium sulfamate soln*.—1.0%. Prep. fresh weekly.
- (d) *Coupling reagent*.—0.25% aq. soln. of *N*-1-naphthylethylenediamine·2HCl. Prep. fresh weekly and store in dark bottle.
- (e) *Dowex 50W-X8 cation exchange resin*.—Hydrogen form, 200–400 mesh. Bio-Rad Laboratories, 32nd and Griffin Ave, Richmond, CA 94804.
- (f) *Ficin*.—ICN Pharmaceuticals, Inc., Life Sciences Group. (*Caution*: Ficin is potent proteolytic enzyme which attacks living tissues. Avoid contact with skin and eyes and breathing dust.)
- (g) *Sodium nitrite soln*.—0.25%. Prep. fresh daily.

41.004

### Preparation of Alumina Column

Insert small plug of glass wool into chromatgc tube and compress in lower end of tube. Add 60 g alumina and pack by gently tapping tube on rubber stopper to ht of ca 30 cm. Add 100 mL  $\text{CHCl}_3$  and drain to just above level of alumina. Do not drain  $\text{CHCl}_3$  below level of alumina.

41.005

### Preparation of Ion Exchange Column

Heat 100 g Dowex 50W-X8 on steam bath with 400 mL 6*N* HCl 2–3 hr. Filter on buchner and wash with  $\text{H}_2\text{O}$  until washings are acid-free. Wash resin with 100 mL 80% alcohol. Then mix resin with 250 mL 80% alcohol. Pour enough resin slurry into ion exchange column to give bed ht of ca 5 cm after settling. Wash resin with 25 mL 80% alcohol. Slight air pressure can be used to increase flow of liq. thru resin. Do not let liq. level drain below top of resin bed.

41.006

### Preparation of Standard Curve

Accurately weigh 100 mg ANOT into 1 L vol. flask, dissolve in 50 mL acetone, and dil. to vol. with  $\text{H}_2\text{O}$ . Dil. 10 mL of this stock soln to 100 mL with  $\text{H}_2\text{O}$  to give working soln of 10  $\mu\text{g}/\text{mL}$ .

Pipet 0, 2, 4, 6, 8, and 10 mL aliquots of this soln into sep. 50 mL vol. flasks. Dil. each to ca 40 mL with 4*N* HCl. Proceed as in 41.007, beginning "Add 1 mL 0.25%  $\text{NaNO}_2$  . . ." Plot *A* at 540 nm against  $\mu\text{g}$  ANOT.

41.007

### Determination

(*Caution*: See 51.011, 51.040, and 51.056.)

Collect tissue, freeze with solid  $\text{CO}_2$ , and keep frozen until analyzed. Grind tissue while at least partially frozen and weigh 50 g into 1 qt (1 L) Mason jar. Add 125 mL  $\text{H}_2\text{O}$ , 15 mL 1*N* HCl, and 5 g ficin, and mix with mixer ca 5 min. Cover jar loosely and keep 24 hr at 30°. Then keep 30 min in bath at 70–80°, remove, and cool.

Weigh ca 10 g  $\text{NaHCO}_3$  and slowly add to jar with stirring, taking care that sample does not foam over top of jar. When foaming has subsided, add 500 mL acetone and mix 5 min with mixer.

Filter on buchner into 1 L filter flask, using 11 cm paper and ca 5 g Super-Cel as filter pad. Wash residue with 200 mL acetone, collecting washings in same flask. Transfer filtrate to 2 L separator and add 1 L  $\text{CHCl}_3$ . Shake ext in separator vigorously and let stand until layers sep. Drain  $\text{CHCl}_3$  layer into 2 L beaker. Ext aq. layer with 200 mL  $\text{CHCl}_3$  and combine  $\text{CHCl}_3$  washing with original ext. Evap.  $\text{CHCl}_3$  ext to ca 50 mL under heat lamp with air current. Add 100 mL  $\text{CHCl}_3$  and again evap. to 50 mL. If soln is not clear, repeat addn and evapn of  $\text{CHCl}_3$  to remove  $\text{H}_2\text{O}$ .

Add clear  $\text{CHCl}_3$  soln to alumina column and drain to level of alumina. Wash with four 50 mL portions  $\text{CHCl}_3$ . Discard washings. Add 90 mL 80% alcohol to column to elute ANOT. Discard first 30 mL effluent and collect 60 mL in 100 mL beaker. Transfer this soln to ion exchange column. Slight air pressure may be used to increase flow of soln. After soln has drained to top of resin bed, wash with 50 mL 80% alcohol followed by 50 mL  $\text{H}_2\text{O}$ . Discard washings. Add 45 mL 4*N* HCl and collect effluent in 50 mL vol. flask.

Add 1 mL 0.25%  $\text{NaNO}_2$ , mix, and let stand 5 min. Add 1 mL 1%  $\text{NH}_4$  sulfamate soln, mix, and let stand 5 min. Add 1 mL coupling reagent, mix, dil. to vol. with 4*N* HCl, and mix thoroly. Let stand 15 min and read *A* at 540 nm, using 1 cm cells, against  $\text{H}_2\text{O}$  as ref.

41.008

### Calculations

Obtain  $\mu\text{g}$  of ANOT corresponding to *A* from std curve.

$\text{ppm ANOT in sample} = \mu\text{g ANOT/g sample.}$

### Total Arsenic (2)—Official Final Action

(Complete analysis in 1 day; otherwise stop after ashing step.)

41.009

### Reagents and Apparatus

(a) *Silver diethyldithiocarbamate (AgDDC)*.—See 25.006(m). Reagent is stable several months at room temp.

(b) *Arsenic std solns*.—(1) *Stock soln*.—500  $\mu\text{g}/\text{mL}$ . Accurately weigh 0.660 NBS  $\text{As}_2\text{O}_3$  SRM, or equiv., dissolve in 25 mL 2*N* NaOH, and dil. to 1 L with  $\text{H}_2\text{O}$ . (2) *Working solns*.—0–2 ppm. Just before use, prep. by dilg stock soln with  $\text{H}_2\text{O}$ .

(c) *Zinc*.—Shot, contg  $\leq 0.00001\%$  As (Fisher Scientific Co., No. Z-12, or granules of equiv. purity).

(d) *Cellulose powder*.—Whatman CF-11 fibrous (H. Reeve Angel & Co., Inc.).

(e) *Distillation apparatus*.—(1) *Flask*.—250 mL erlenmeyer. (2) *Connecting tube*.—L-shaped 8 mm od glass tube with 11 and 7 cm sides. Plug shorter end with 2 pieces of glass wool satd with 10% Pb(OAc)<sub>2</sub> soln and dried (replace plugs when discolored). (3) *Delivery tube*.—L-shaped 6 mm od glass tube with 22 and 5 cm sides. Constrict end of longer side to 1 mm opening. (4) *Receiver*.—8 cm length of 15 mm glass tube sealed to open end of 100 × 10 mm od test tube.

Connect flask thru 1-hole rubber stopper with 11 cm side of connecting tube. Attach connecting tube to 5 cm side of delivery tube with rubber tube sleeve. Fit constricted end of delivery tube into bottom of receiver.

**41.010****Dry Ashing**

Blend liver and kidney in high-speed blender. Pass fibrous tissues such as muscle and skin thru meat grinder, and divide and quarter. Weigh 10 g tissue into 100 mL Coors crucible. Add 3 g MgO and 20 mL cellulose powder (10 mL beaker is convenient measure) to liver, kidney, and skin samples and 10 mL cellulose powder to muscle samples. Mix thoroly and char cautiously over open flame until evolution of smoke ceases. (*Caution*: Rapid rise in temp. will cause crucibles to crack; avoid overheating samples to prevent loss of As.)

Cool, add 3 g Mg(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O, and place in cold furnace preset at 555°. After furnace reaches operating temp., ash 2 hr. Cool, moisten ash with 10 mL H<sub>2</sub>O, and transfer quant. to 250 mL erlenmeyer with 90 mL 6*N* HCl. Dil. to 175 mL with H<sub>2</sub>O. (Presence of black carbonaceous particles does not interfere.)

**41.011****Distillation**

Add 2 mL 15% KI soln, and swirl. Add 1 mL SnCl<sub>2</sub> soln, 25.006(g), and swirl. Cool in freezer or ice bath 45 min or until sample reaches 4°. Prep. blank contg 90 mL 6*N* HCl and 85 mL H<sub>2</sub>O, and treat similarly.

Prep. trapping soln by pipetting 3 mL AgDDC reagent into receiving tube and place in ice bath. Attach delivery tube to connecting tube and insert delivery tube into AgDDC soln. Add 10 g Zn shot or granules to cooled erlenmeyer, immediately connect flask to connecting tube, and let distn proceed 1 hr at room temp. Det. A against reagent blank in 1 cm cell at 540 nm; det. As content from std curve.

Calc. As concn in sample by multiplying A at 540 nm by reciprocal slope of std curve, disregarding y intercept term.

**41.012****Preparation of Standard Curve**

Add As working std solns (but <2 mL soln) to 10 g tissue to provide curve over desired range (usually 0–2 ppm As). Carry these samples thru ashing and distn. Det. best fitting straight line from ≥4 sets of detns for each tissue by method of least sqs, *Definitions of Terms and Explanatory Notes*, Item (24).

**Clopidol (3,5-Dichloro-2,6-dimethyl-4-pyridinol) (3)****Official Final Action****Gas Chromatographic Method**

(Diazomethane is toxic, can cause specific sensitivity, and is potentially explosive. Prep. diazomethane reagent, methylate, and evap. in hood. Avoid ground glass joints, etched or scratched glassware, and sharp edges. Store diazomethane solns in freezer; do not expose to direct sunlight or strong artificial light.)

**41.013****Principle**

Tissues and eggs are extd with MeOH; ext is filtered and cleaned up on alumina and anion exchange columns. Eluate is methylated with diazomethane, producing Me ether of clopidol (3,5-dichloro-4-methoxy-2,6-lutidine), which is detd by electron

capture GLC. Applicable to ≥0.1 ppm in chicken tissues and ≥0.05 ppm in eggs.

**41.014****Apparatus**

(a) *Centrifuge*.—Clinical (Model CL, International Equipment Co., Needham Heights, MA 02194), or equiv., with head and cups to accommodate 13 × 100 mm tubes.

(b) *Flask*.—500 mL r-b # 29/42 neck. Make 6 irregularly spaced 6 mm projections into flask by heating spot ca 2 cm diam. with torch and pushing spot in with blunt instrument.

(c) *Gas chromatograph*.—With electron capture detector. Operating conditions: temps (°)—column 155, injection port 220, detector 220; flow rates—N carrier gas 120 mL/min; sensitivity 3 × 10<sup>-10</sup> amp; and chart speed 20"/hr.

(d) *Gas chromatographic column*.—25% DC-200 silicone oil (Dow Corning Corp.) on 80–100 mesh Chromosorb W (AW) (Applied Science Laboratories, Inc.). Prep'd column available from Applied Science Laboratories, or prep. as follows: Weigh 12 g Chromosorb W (AW), from which fines have been removed on No. 100 sieve, into specially modified r-b flask, (b), contg 100 mL CHCl<sub>3</sub> and 3 g DC-200 fluid. Dry on rotary evaporator under vac. Use heat lamp or hot H<sub>2</sub>O to aid evapn. Sieve and discard fines passing No. 100 sieve. Pack 1.9 m (74") × 3 mm id U-shaped borosilicate glass column and condition ≥18 hr at 200° with N flow of 75–100 mL/min before use. Add packing to column, tapping on floor to settle. Insert glass wool plug at effluent end. Level of packing in injection arm should be few mm below depth of needle point at inlet.

(e) *Liquid chromatographic columns*.—(1) *Alumina column*.—Add 6 g (1 heaping 5 mL beaker) alumina, 41.015(a), to 300 × 18 mm id column, with coarse fritted disk and 30 × 5 mm id stem. (2) *Anion exchange column*.—Place 1 cm (after settling) AG1-X8 resin, 41.015(b), in 170 × 10 mm id column, with coarse fritted disk and 30 × 5 mm id stem, using MeOH to transfer resin. Rinse column with 2 mL MeOH, applying air pressure from squeeze bulb.

(f) *Homogenizer*.—See 41.002(c), or equiv., for use with Brockway 4 oz (125 mL) sq powder jar (No. 72 G1333, with 38 mm Polyseal caps, Brockway Glass Co., Inc., McCullough Ave, Brockway, PA 15824) and pt (500 mL) or qt (1 L) Mason jars.

(g) *Meat grinder*.—With stainless steel attachment.

(h) *Shaker*.—Wrist-action (Model BT, Burrell Corp., or equiv.).

(i) *Culture tubes*.—13 × 100 mm (Corning Glass Co., No. 9825), with 13 mm foil-lined plastic screw caps.

**41.015****Reagents**

(a) *Alumina*.—Alcoa F-20, 80–200 mesh (Fisher Scientific Co.).

(b) *Anion exchange resin*.—Bio-Rad AG1-X8, 100–200 mesh, acetate form (Bio-Rad Laboratories, 32nd and Griffin Aves, Richmond, CA 94804).

(c) *Diazomethane reagent*.—Approx. 18 mg/mL in Et ether. Add 35 mL 2-(2-ethoxy-ethoxy) ethanol (Aldrich Chemical Co., Inc.) and 10 mL ether to soln of 6 g KOH in 10 mL H<sub>2</sub>O in 125 mL long-neck distg flask. Place mag. stirring bar in flask and mount above H<sub>2</sub>O bath on top of hot plate mag. stirrer. Attach dropping funnel and efficient condenser connected in series to 250 and 50 mL erlenmeyers. Place 25 mL ether in second flask and place inlet tubing below surface of ether. Cool both receiving flasks in ice. Place soln of 21.5 g *N*-methyl-*N*-nitroso-*p*-toluenesulfonamide (Diazald; Aldrich Chemical Co., Inc.) dissolved in 140 mL ether in dropping funnel. Heat H<sub>2</sub>O bath to 55° and raise it to heat distn flask. Stir contents of flask while adding Diazald soln over 20 min. Interrupt distn when distillate is nearly colorless. Combine contents of the 2 receivers and store at 0° in culture tubes with foil-lined screw caps. Reagent is stable several weeks

if kept in freezer in full, closed tubes. Alternatively, diazomethane reagent may be prepd as in Anal Chem. **32**, 1412–1414(1960).

(d) *Methanolic hydrochloric acid*.—5%. Add 25 mL HCl to 475 mL MeOH.

#### 41.016

#### Standard Solutions

(a) *Clopidol std solns.*—(1) *Stock soln.*—100 µg/mL. Accurately weigh ca 100 mg Clopidol Anal. Std (available from Sampling Coordinator, Ag-Organics Dept, Dow Chemical USA) in weighing bottle, transfer to 1 L vol. flask with MeOH, to total vol. of ca 950 mL. Stir mag. to dissolve clopidol (may take 2–3 hr). Dil. to vol. at room temp., and mix well. (2) *Intermediate soln.*—10 µg/mL. Pipet 10 mL stock soln into 100 mL vol. flask, dil. to vol. with MeOH, and mix. (3) *Working soln.*—1 µg/mL. Pipet 10 mL intermediate soln into 100 mL vol. flask, dil. to vol. with MeOH, and mix.

(b) *3,5-Dichloro-4-methoxy-2,6-lutidine (clopidol methyl ether) std solns.*—(1) *Stock soln.*—1 mg clopidol equiv./mL. Weigh 107.3 mg 3,5-dichloro-4-methoxy-2,6-lutidine anal. std (available from Sampling Coordinator, Ag-Organics Dept., Dow Chemical USA) in weighing bottle. Transfer to 100 mL vol. flask with benzene, dil. to vol. with benzene, and mix well. (2) *Intermediate soln I.*—10 µg clopidol equiv./mL. Pipet 1 mL stock soln into 100 mL vol. flask, dil. to vol. with benzene, and mix. (3) *Intermediate soln II.*—1.0 µg clopidol equiv./mL. Pipet 10 mL intermediate soln I into 100 mL vol. flask, dil. to vol. with benzene, and mix. (4) *Working solns.*—Prep. series of std solns contg 0.01 to 0.20 µg clopidol equiv./mL by dilg portions of intermediate soln II with benzene.

#### 41.017

#### Chromatography of Standards

Fill syringe needle with benzene, avoiding entrapped air, draw 3 µL sample aliquots of clopidol methyl ether working soln into syringe, and inject onto column. Measure peak hts (*PH*) in terms of % full-scale deflection, and plot *PH* against µg/mL. Prep. std curve daily and check by injecting std soln after every 1 or 2 samples.

#### 41.018

#### Determination

(a) *Muscle, liver, and kidney.*—Homogenize by grinding thru meat grinder. Accurately weigh ca 20 g tissue into 4 oz (125 mL) jar. Add 50 mL MeOH and 3 g HyFlo Super-Cel filter aid for muscle; use 12 g filter aid for liver and kidney. Attach jar to homogenizer and blend 3 min at max. speed. Filter thru 2 g pad of filter aid in 60 mL coarse fritted glass buchner mounted on filter assembly. Collect filtrate in 100 mL graduate, and wash jar and filter cake with MeOH to nearly 100 mL. If filter cake goes dry, break up with spatula during addn of more MeOH to prevent channeling. Dil. to 100 mL at room temp., stopper, and mix well.

Place anion exchange column under alumina column. Pipet 20 mL ext onto alumina column and let elute thru both columns into beaker. Wash columns with 10 mL MeOH added to alumina column, rinsing sides. Remove alumina column and beaker. Place 25 mL vol. flask under anion exchange column and elute clopidol with two 10 mL portions 5% HCl in MeOH. Dil. eluate to vol. with MeOH, and mix well. Pipet 1 mL aliquot into 13 × 100 mm tube and evap. to dryness (4–5 min) by mounting tube in 70° H<sub>2</sub>O bath so H<sub>2</sub>O level is at same ht as soln in tube. Direct very small jet of air down tube using rubber tubing and medicine dropper tip, or equiv. Remove tube, add 0.2 mL 80% MeOH, and heat briefly to redissolve residue. Add 1 mL diazomethane reagent, seal with screw cap, and heat gently 2 min by mounting tube as before in 70° H<sub>2</sub>O bath. Remove tube, and let cool 5 min before removing cap. Add small SiC boiling chip and evap. reagents gently by mounting tube with only extreme rounded

bottom portion touching H<sub>2</sub>O of 70° bath. Continue heating 2–3 min until ether is evapd. Add 0.1 mL 1*N* NaOH, 5 mL H<sub>2</sub>O, and 1.0 mL benzene, cap tube, and vigorously shake mixt. 1 min. Centrf. 3 min. Dil. further by adding more benzene, if necessary. Inject 3 µL of benzene layer as in **41.017**. Det. *PH* and interpolate µg/mL clopidol in benzene ext from std curve.

(b) *Eggs.*—Accurately weigh ca 20.0 g sample into 4 oz. (125 mL) jar, and add ca 12 g Hyflo Super-Cel. Shake mech. 15 min. Proceed as in (a), beginning "Filter thru 2 g pad . . ." Elute with 9.5 mL 5% HCl in MeOH and collect eluate in 10 mL vol. flask.

(c) *Recovery factor.*—Accurately weigh 20.0 g samples of homogenized clopidol-free tissue, and add equiv. of 0.0, 0.1, and 0.5 ppm clopidol working std soln (0.0, 2.0, and 10.0 mL, resp.). Proceed as in (a) and calc. av. recovery factor,  $R = (\text{ppm found from std curve})/(\text{ppm added})$ . For eggs, use 20 g samples, add equiv. of 0.00, 0.05, and 0.2 ppm (0.0, 1.0, and 4.0 mL working std soln, resp.), proceed as in (b), and calc. av. recovery factor,  $R$ .

$$\text{ppm Clopidol in tissues} = 6.25 (G - G')/R$$

$$\text{ppm Clopidol in eggs} = 2.5 (G - G')/R$$

where  $G = \mu\text{g/mL}$  from std curve of sample, and  $G' = \mu\text{g/mL}$  from std curve of blank.

#### Decoquinat (Ethyl 6-*n*-decyloxy-7-ethoxy-4-hydroxy-3-quinoline carboxylate) (4)—Official Final Action

(Applicable to chicken tissues at ≤2.5 ppm level)

#### 41.019

#### Principle

Tissue is homogenized in MeOH-CHCl<sub>3</sub>. After addn of metaphosphoric acid, decoquinat is extd into CHCl<sub>3</sub> and sepd from interfering materials by chromatgy on Florisil. Decoquinat is eluted from column with CaCl<sub>2</sub>-MeOH and detd by fluorometry against std treated similarly. Range 0.1–2.2 ppm; sensitivity 0.1 ppm.

#### 41.020

#### Apparatus

(a) *Fluorometer.*—Aminco-Bowman SPF, or equiv.

(b) *Chromatographic columns.*—Prep. as in **42.053(a)**, except use 0.4±0.02 g Florisil.

#### 41.021

#### Reagents

(a) *Methanol-chloroform soln.*—Mix 4 parts MeOH, redistd in all-glass app., and 1 part CHCl<sub>3</sub>, spectral grade.

(b) *Decoquinat std solns.*—(1) *Stock soln.*—200 µg/mL. Weigh 20 mg Decoquinat Ref. Std (available from Hess & Clark Laboratories). Dissolve and dil. to 100 mL with CHCl<sub>3</sub>. (2) *Working soln.*—10 µg/mL. Pipet 5 mL stock soln into 100 mL vol. flask and dil. to vol. with CHCl<sub>3</sub>. (3) *Fluorescence reference soln.*—0.2 µg/mL. Pipet 2 mL working soln into 100 mL vol. flask and dil. to vol. with elution solv., (c). Solns are stable ≥1 month.

(c) *Elution solvent.*—Dissolve 10 g anhyd. CaCl<sub>2</sub> in 1 L redistd MeOH. Let stand 24 hr. Decant from any insol. residue.

(d) *Metaphosphoric acid soln.*—5%. Dissolve 50 g metaphosphoric acid pellets (J. T. Baker Chemical Co., No. 0252) in 1 L H<sub>2</sub>O. Refrigerate at 5° and use cold.

(e) *Florisil.*—100–200 mesh (Fisher Scientific Co., No. F-101).

#### 41.022

#### Preparation of Standard Curve

Add 55 mL (50 g) MeOH-CHCl<sub>3</sub> (4+1) soln to each of four 250 mL separators. Add 0.0, 0.1, 0.3, and 0.5 mL working soln contg 0, 1, 3, and 5 µg decoquinat, resp. Proceed with *Determination*, beginning "Add 100 mL 5% metaphosphoric acid, . . .", adding entire CHCl<sub>3</sub> ext to column. Construct std curve by plotting fluorescence against µg decoquinat/mL.

## 41.023

**Determination**

Weigh 20 g tissue into high-speed blender. Add  $80 \pm 1$  g MeOH-CHCl<sub>3</sub> (4+1) (weigh on top-loading balance). Blend 1 min. Transfer to centrif. bottle and centrif. 5 min at ca 2000 rpm. Decant and weigh 50 g supernate (equiv. to 10 g tissue) into 250 mL separator. Add 100 mL 5% metaphosphoric acid, invert 50 times, let phases sep. 10 min, and drain and retain CHCl<sub>3</sub> layer. Add 10 mL addnl CHCl<sub>3</sub> to separator, shake, and let sep. as before. Combine CHCl<sub>3</sub> exts, add 2 mL MeOH, and dil. to 25 mL with CHCl<sub>3</sub>.

Depending on expected decoquinat content, add 5, 10, or 25 mL ext (2, 4, or 10 g tissue, resp.) to chromatgc column. Normally use 10 mL for liver, kidney, skin, and fat, and 25 mL for muscle samples. Wash column with 10 mL MeOH. Elute with 15 mL elution solv., (c), collecting in tube marked at 15 mL. Mix and transfer to fluorometer cell. Set activation wavelength at 270 nm and emission wavelength at 390 nm. With fluorescence ref. std in cell, adjust microphotometer controls to give reading of 80 on rel. intensity scale. Det. fluorescence of samples, and calc.  $\mu$ g decoquinat from std curve.

**Ethoxyquin (1,2-Dihydro-6-ethoxy-2,2,4-trimethylquinoline) (5)—Official First Action**

(Applicable to chicken tissues and eggs)

## 41.024

**Apparatus**

(a) *Photofluorometer*.—(Caution: See 51.008.) Instrument with primary filter passing only 365 nm Hg line and secondary filter passing light between 410 and 580 nm (but not below 410 nm). Photovolt Corp., 1115 Broadway, New York, NY 10010, Model 540 with BHgl primary filter and B470 secondary filter is suitable.

(b) *Separators*.—250 mL with Teflon stopcocks.

## 41.025

**Reagents**

(a) *Isooctane*.—Fluorescence <2% that of soln contg 0.020  $\mu$ g quinine sulfate/mL 0.1N H<sub>2</sub>SO<sub>4</sub>. If necessary, purify isooctane by passing thru 30  $\times$  2 cm activated alumina column.

(b) *Sulfuric acid-sodium sulfate soln*.—0.3N H<sub>2</sub>SO<sub>4</sub> contg 2% Na<sub>2</sub>SO<sub>4</sub>.

(c) *Ethoxyquin std solns*.—(1) *Stock soln*.—10  $\mu$ g/mL. Place 10 mg com. grade ethoxyquin in 1 L vol. flask; dissolve and dil. to vol. with isooctane. Store in refrigerator. (2) *Working solns*.—0.010, 0.020, 0.030, and 0.050  $\mu$ g/mL. Transfer 1, 2, 3, and 5 mL aliquots stock soln to 1 L vol. flasks and dil. to vol. with isooctane. Prep. fresh on day of use.

## 41.026

**Preparation of Standard Curve**

Prep. std curve at time of analysis of final ethoxyquin exts. Read ethoxyquin stds with photofluorometer set at 0 with shutters closed and at 100 with most concd std. Plot instrument reading against  $\mu$ g ethoxyquin on linear graph paper.

## 41.027

**Preparation of Sample and Extraction**

(All glassware must be free of stopcock grease.)

(a) *Egg yolk*.—Carefully break egg to avoid rupturing yolk and sep. as much of egg white from yolk as possible. Wash yolk in running H<sub>2</sub>O to remove most of remaining egg white. Dry yolk on absorbent paper, break yolk sac, pour yolk into bottle, and stopper.

Weigh bottle contg yolk and pour ca 5 g yolk into mortar contg 25 g anhyd. granular Na<sub>2</sub>SO<sub>4</sub> and 3 g anhyd. powd Na<sub>2</sub>CO<sub>3</sub>. Reweigh bottle and record wt yolk added. (Several samples may

be prepd from same yolk.) Grind mixt. in mortar until uniform and dry 1 hr in desiccator contg Drierite.

Transfer dried mixt. to 4 oz (125 mL) screw-cap bottle and shake 30 min with 50 mL isooctane. Centrf. and filter supernate thru Whatman No. 1 paper into 250 mL separator. Repeat extn with second 50 mL isooctane and add ext to separator.

Gently shake isooctane ext 1 min each with two 50 mL portions 0.3N H<sub>2</sub>SO<sub>4</sub>-Na<sub>2</sub>SO<sub>4</sub> soln. Combine acid exts and add 10 mL 6N NaOH. Ext alk. soln with two 50 mL portions isooctane. Combine isooctane exts and dry 15 min over anhyd. Na<sub>2</sub>SO<sub>4</sub>; decant, and dil. to 100 mL with isooctane.

(b) *Tissue (muscle and liver)*.—Accurately weigh ca 5 g muscle or 1 g liver and add to 15 g anhyd. Na<sub>2</sub>SO<sub>4</sub> and 2 g anhyd. Na<sub>2</sub>CO<sub>3</sub> in mortar. Grind until uniform and place in desiccator 1 hr.

Shake dried mixt. 30 min in 4 oz (125 mL) screw-cap bottle with 100 mL isooctane. Centrf., and filter into 250 mL separator. Continue as in (a), 4th par., beginning "Gently shake isooctane ext . . ."

(c) *Fat*.—Accurately weigh ca 1 g frozen fat and add to 10 g granular, anhyd. Na<sub>2</sub>SO<sub>4</sub> and 1 g anhyd. Na<sub>2</sub>CO<sub>3</sub> in glass mortar. Grind mixt. thoroly. Add 20 mL isooctane and continue grinding several min. Decant isooctane into 4 oz (125 mL) screw-cap bottle. Repeat grinding with isooctane 3 times. Transfer isooctane ext to bottle, shake, and centrf.

Decant supernate isooctane layer into 250 mL separator and continue as in (a), 4th par., beginning "Gently shake isooctane ext . . ."

## 41.028

**Determination**

Det. fluorescence of isooctane soln and calc. ethoxyquin content from std curve.

ppm Ethoxyquin = ( $\mu$ g/mL ethoxyquin)  $\times$  (mL ext/g sample).

**Melengestrol Acetate (MGA)****Gas Chromatographic Method (6)—Official Final Action**

## 41.029

**Principle**

MGA is extd from lean tissue with CH<sub>3</sub>CN and ext is partitioned with hexane. MGA in fatty tissues is extd with hexane and then transferred into CH<sub>3</sub>CN. Residue from either ext, after evapn of solv., is chromatgd on Florisil to remove interfering lipid materials with hexane and hexane-acetone (95+5). MGA is eluted with hexane-acetone (80+20). Residue is dissolved in hexane-acetone, and detd by GLC.

For those liver samples where MGA is poorly resolved on chromatogram, hexane-acetone is evapd, partitioned with aq. 70% MeOH-hexane, transferred into CHCl<sub>3</sub>, and evapd. Dry residue is dissolved in hexane-acetone and reinjected onto GLC column.

## 41.030

**Apparatus**

(a) *Adapters*.— $\text{F}$  24/40, Nos. 5225-10 and 5205 (Ace Glass, Inc., or equiv.).

(b) *High-speed blender*.—Waring Blendor Model 702-B with 1 L glass bowl having polyethylene gaskets (see (i)), or equiv.

(c) *Chromatographic tubes*.—Glass, 400  $\times$  19 mm id, fitted with medium porosity fritted glass disks, Teflon stopcocks, and  $\text{F}$  24/40 tops.

(d) *Containers*.—Plastic, Romac No. AP06C with No. LA-16P lids (Romac Container, Inc., 33625 Pen Oak Pkwy, Avon Lake, OH 44012), or equiv. For storage of frozen tissues.

(e) *Flasks*.—R-b, 50, 500, and 1000 mL.

(f) *Funnels*.—Medium porosity fritted glass funnels, 350 mL.

(g) *Gas chromatograph*.—F&M Model 402, replaced by

HP 5700 series, (available from Hewlett-Packard Co., Rt 41, Avondale, PA 19311), or equiv., with all-glass on-column injection system,  $^{63}\text{Ni}$  electron capture detector, and 1 mv strip chart recorder. Operating conditions: temps ( $^{\circ}$ )—column 240–250, injection port 240–250, detector 270–275; flow rates—He carrier gas 60–80 mL/min (40 psi, 3.0–3.5 rotameter setting), Ar-CH<sub>4</sub> purge gas (95+5) 135–150 mL/min (40 psi); attenuation 16 $\times$  or 32 $\times$ ; pulse interval 150; electrometer sensitivity  $1 \times 10^{-12}$  amp full scale deflection with 1 mv recorder. Approx. retention time of MGA under these conditions is 5–6 min.

(h) *Gas chromatographic column*.—Use borosilicate glass tubing,  $0.2362 \pm 0.013$ " ( $6.00 \pm 0.33$  mm) od and  $0.118 \pm 0.01$ " ( $3.00 \pm 0.25$  mm) id (Wilkens-Anderson Co., 4525 W Division St, Chicago, IL 60651, or equiv.). Bend 0.9 m (3') piece of tubing into proper design for instrument. Pack column with 1% OV-17 on 100–120 mesh Gas Chrom Q (max. operating temp., 350 $^{\circ}$ , Applied Science Laboratories, Inc., or equiv.), and plug both ends with 0.5 cm loosely packed silanized glass wool. Pack far enough from ends so that no part of column packing or glass wool is inside injection port or detector inlet fittings. Connect column to injection port and cap detector inlet. Condition column 1 hr at 240 $^{\circ}$  with He carrier gas at 40 mL/min, and then 16 hr at 275 $^{\circ}$  with He carrier gas at 80 mL/min. Remove cap and connect column to detector.

(i) *Gaskets*.—Polyethylene, cut from 1 qt (1 L) freezer containers.

(j) *Nitrogen pressure manifold for columns*.—(Optional). Adapters No. 5205 (Ace Glass, Inc., or equiv.) connected thru manifold regulated at 3 psi (20.7 kPa), with individual control valve.

(k) *Pipets*.—Transfer pipets, 9" Dispo-pipettes (Scientific Products, Inc., or equiv.).

(l) *Reservoirs*.—250 mL  $\frac{3}{4}$  24/40 r-b flasks with  $\frac{3}{4}$  24/40 male joint in bottom, or equiv.

(m) *Rotary evaporator*.—4–6 small size Rinco evaporators (Rinco Instrument Co., 503 S Prairie St, Greenville, IL 62246), or equiv., controlled with 4 mm bore stopcocks connected to manifold that leads to 2 condensation traps connected in series to vac. pump with free air capacity of 140 L/min. Cool traps with solid CO<sub>2</sub>-alcohol mixt. Connect each sample in r-b flask with 2 adapters in series to evaporator, and heat in thermostatically controlled H<sub>2</sub>O bath at 45 $^{\circ}$ .

(n) *Separators*.—With Teflon stopcocks, 500 and 1000 mL.

(o) *Silanized glass wool*.—Applied Science Laboratories, Inc., or equiv.

(p) *Syringe*.—10  $\mu\text{L}$ , Hamilton No. 701N, or equiv.

#### 41.031

#### Reagents

(All solvs must show no impurities when processed thru entire detn in absence of tissues.)

(a) *Argon-methane, 95+5*.—Purge gas (Matheson Gas Products, PO Box 85, 932 Paterson Plank Rd, Lyndhurst, NJ 07071, or equiv.).

(b) *Diatomaceous earth*.—Celite 545 (Johns-Manville Products Corp., or equiv.).

(c) *Florisil*.—60–100 mesh (available from Floridin Co.). Activated by manufacturer at 650 $^{\circ}$  (1225–1250 $^{\circ}\text{F}$ ). Heat in oven at 130 $^{\circ}$   $\geq$  48 hr before use.

(d) *Glassware cleaner*.—Haemo Sol (Scientific Products, Inc., or equiv.).

(e) *Helium*.—99.5% min. purity (Matheson Gas Products, or equiv.).

(f) *Solid carbon dioxide*.

(g) *Solvents*.—Acetone, CH<sub>3</sub>CN, benzene, CHCl<sub>3</sub>, hexane, and MeOH. Distd-in-glass grade (Burdick & Jackson Laboratories, Inc., or equiv.).

(h) *Solvent mixtures*.—(v/v). (1) *Hexane-acetone*.—(8+2). (2) *Hexane-acetone*.—(95+5). (3) *70% Methanol*.

(i) *Anhydrous sodium sulfate*.—Mallinckrodt Chemical Works, or equiv. Wash with CHCl<sub>3</sub>, dry in 110 $^{\circ}$  oven, and store in g-s bottle until used.

#### 41.032

#### MGA Standard Solutions

(a) *Stock solns*.—(1) *A*.—1 mg/mL; 1000 ppm. Dissolve 100.0 mg melengestrol acetate (99.5% purity, Upjohn Co.) in 100 mL acetone. Soln is stable 2–3 months. (2) *B*.—100 ppm. Dil. 10.0 mL soln A to 100 mL with MeOH. Prep. soln fresh daily. (3) *C*.—10 ppm. Dil. 10.0 mL soln B to 100 mL with MeOH. Prep. soln fresh daily.

(b) *Intermediate solns*.—(1) *D*.—0.5 ppm. Dil. 5.0 mL soln C to 100 mL with MeOH. (2) *E*.—1.0 ppm. Dil. 10.0 mL soln C to 100 mL with MeOH. (3) *F*.—1.5 ppm. Dil. 15.0 mL soln C to 100 mL with MeOH.

(c) *Working solns*.—0.25, 0.50, 0.75 ppm. Transfer 5.0 mL solns D, E, and F into sep. 50 mL r-b flasks and evap. on rotary evaporator. Dissolve residues in 10.0 mL portions hexane-acetone (8+2).

#### 41.033

#### Extraction

(Wash all glassware in detergent and rinse in H<sub>2</sub>O to remove traces of cleaning agent. Then rinse with MeOH, acetone, or CHCl<sub>3</sub>. *Caution*: See 51.004, 51.043, 51.046, and 51.061. Store samples in freezer.)

(a) *From fat*.—Transfer 25.0 g sample to 250 mL beaker. Add 150 mL hexane and warm on steam bath without boiling. Stir with spatula until fat dissolves. Place 20 g diat. earth (2 heaping tablespoons) in fritted funnel and wash with 100 mL CH<sub>3</sub>CN. Discard wash. Filter warmed fat soln thru cake on funnel with vac. into 1 L filter flask. Rinse beaker with <50 mL hexane to remove solids, and transfer to funnel. Remove top 3 mm diat. earth cake and transfer to blender bowl. (Some diat. earth is left in funnel for next filtration.)

Add 150 mL hexane and homogenize 3 min at low speed. Filter soln thru diat. earth cake into filter flask. Rinse blender bowl with enough hexane to remove solids, and transfer to funnel. Adjust combined filtrates to ca 400 mL with hexane in filter flask. Rinse beaker and blender bowl with two 50 mL portions CH<sub>3</sub>CN, and transfer to funnel. (Rinse cake thoroly, since MGA may adsorb onto diat. earth from hexane.) Warm filter flask on steam bath in hood and transfer filtrate to 1 L separator. Rinse flask with 5–15 mL CH<sub>3</sub>CN, and transfer to separator. Shake vigorously 1 min. Let layers sep. 30 min. Drain lower layer into 1 L r-b flask. Add 100 mL CH<sub>3</sub>CN to separator. Repeat extn and sepn twice. Add 50 mL benzene to r-b flask and evap. on rotary evaporator.

(b) *From muscle, liver, and kidney*.—Transfer 25.0 g frozen tissue to blender bowl. Let thaw 5–10 min at room temp. Add 150 mL CH<sub>3</sub>CN, 20 g diat. earth (2 heaping tablespoons), and 50 g anhyd. Na<sub>2</sub>SO<sub>4</sub> (2 tablespoons). Homogenize at low speed 3 min. Place 20 g diat. earth into fritted funnel and wash with 100 mL CH<sub>3</sub>CN. Discard wash. Filter soln thru cake with vac. into 1 L filter flask. Rinse blender bowl with <50 mL CH<sub>3</sub>CN to remove remaining solids. Sep. tissue cake from filter pad and transfer to blender. (Do not disturb diat. earth below tissue cake. Household fork is good transfer tool.)

Add 10 g diat. earth, 25 g anhyd. Na<sub>2</sub>SO<sub>4</sub>, and 150 mL CH<sub>3</sub>CN to blender bowl. Homogenize 3 min at low speed, filter, and rinse. Transfer combined filtrate to 1 L r-b flask and add 50 mL benzene. Evap. to dryness in rotary evaporator. (*Caution*: Bumping may occur.) To dry residue, add 200 mL hexane and 100 mL CH<sub>3</sub>CN thru adapter. Remove adapter, and transfer solv. mixt.

to 1 L separator. Add another 200 mL portion hexane to r-b flask and transfer to separator. Shake vigorously 1 min. Let layers sep. 30 min. Drain lower layer into 1 L r-b flask. Add 100 mL  $\text{CH}_3\text{CN}$  to separator. Repeat extn and sepn twice. Add 50 mL benzene and evap. on rotary evaporator.

**41.034****Column Chromatography**

Before analysis of samples, confirm, using MGA std soln, that hexane-acetone (8+2) elutes MGA completely, as follows: Pipet 1 mL 1 ppm MGA std soln into 50 mL r-b flask and evap. solv. on rotary evaporator. Chromatograph on Florisil column as indicated below. Det. recovery of MGA. If recovery is <95%, det. new elution vol. or obtain new batch of Florisil.

To 19 mm id glass tube, add cooled Florisil to ht of 10 cm with tapping. Push small wad of glass wool into tube until it touches Florisil. Place reservoir on top of column. Consecutively prewash column with 100 mL hexane, 100 mL acetone, and 100 mL hexane. (N pressure may be used to speed up this washing.) Remove reservoir.

Dissolve sample residue in 20 mL hexane and transfer to top of column. Replace reservoir and consecutively wash flask with 20 mL hexane, 200 mL hexane, and 300 mL hexane-acetone (95+5), and add each washing to column; if N pressure is used, add adapter. When last of solv. has reached top of column, place 500 mL r-b flask under column, wash r-b flask with 150–170 mL hexane-acetone (8+2), and transfer to column for MGA elution. Elute sample until column goes dry, using N pressure to blow out last of solv. Evap. to dryness on rotary evaporator. Quant. transfer dried residue with five 2 mL portions acetone to 50 mL r-b flask and evap. on rotary evaporator. Dil. sample to 1.0 mL with hexane-acetone (8+2).

MGA gives poorly resolved chromatogram with some liver samples. Following addnl cleanup is necessary to remove interferences: Evap. remainder of 1 mL hexane-acetone soln on rotary evaporator. To dried residue, add three 20 mL portions hexane and transfer to 500 mL separator. Add 50 mL 70% MeOH, shake vigorously 1 min, let sep. 15 min, and drain lower layer into second 500 mL separator. Add 50 mL 70% MeOH to first separator. Repeat extn and sepn twice. To MeOH layer in second separator, add 1.0 mL satd  $\text{Na}_2\text{SO}_4$  soln, 100 mL deionized  $\text{H}_2\text{O}$ , and 50 mL  $\text{CHCl}_3$ . Shake vigorously 1 min. (Caution: Vent frequently.) Let layers sep. 15 min and drain lower layer into 500 mL r-b flask. Add 50 mL  $\text{CHCl}_3$  to separator and repeat extn and sepn twice. Evap.  $\text{CHCl}_3$  on rotary evaporator. Quant. transfer dried residue with five 2 mL portions acetone to 50 mL r-b flask and evap. on rotary evaporator. Add 1.0 mL hexane-acetone (8+2) and reinject on column.

**41.035****Gas Chromatography**

Alternately inject 2–4  $\mu\text{L}$  aliquots sample blank and 0.25 ppm MGA std soln until reproducible peak hts are obtained for std. Inject 1–4  $\mu\text{L}$  0.25 ppm MGA std soln. Adjust gas flow and attenuation until 20–25 mm peak ht is obtained. Use this std soln for measurement and calcn of samples at ca 10 ppb (ng/g) level, 0.5 ppm std soln for samples at ca 20 ppb, and 0.75 ppm std soln for samples at 30 ppb.

Inject same sample vol. as used for std soln to obtain 20–25 mm response. Measure peak ht of std,  $H'$ , and sample,  $H$ , at retention time of MGA by baseline technic.

$$\text{ppb MGA} = (H/H') \times C \times (V/l)/g \text{ sample,}$$

where  $C$  = ng MGA std injected on column;  $V$  = total mL soln (sample + solv.) in r-b flask (1.0 mL); and  $l$  = mL sample soln injected onto column.

**Nalidixic Acid (7)—Official Final Action**

(Applicable to chicken liver and muscle contg  $\geq 100$  ppb nalidixic acid)

**41.036****Principle**

Nalidixic acid is extd from aq. tissue homogenate with EtOAc. EtOAc is collected, concd, and passed thru alumina column which retains nalidixic acid. Nalidixic acid is removed from column with borate buffer, acidified, and re-extd with  $\text{CHCl}_3$ . After  $\text{CHCl}_3$  removal, residual nalidixic acid is made to fluoresce with  $\text{H}_2\text{SO}_4$  and resultant fluorescence is measured with spectrofluorometer.

**41.037****Apparatus**

(a) *Spectrofluorometer*.—(Caution: See 51.008.) Aminco-Bowman 4-8202, or equiv., with Xe lamp, IP 28 photomultiplier tube, and operated with manufacturer's slit arrangement No. 3. Precise wavelength settings for excitation and emission may vary slightly between instruments. Det. optimal wavelengths (ca 325 and 408 nm) after evapn of 2 mL working std soln (1  $\mu\text{g}$  nalidixic acid) and soln of residue in 10 mL 21.5N  $\text{H}_2\text{SO}_4$ , 41.038(c)(1).

(b) *Chromatographic tubes*.—160  $\times$  11.5 (id) mm (Kontes Glass Co., No. K-420000, or equiv.).

(c) *Shaker*.—Reciprocating (Sargent-Welch Scientific Co., No. S-74060, or equiv.).

**41.038****Reagents**

(a) *Phosphate buffer soln*.—pH 6.0. Weigh 28 g  $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$  into 1 L beaker, add ca 600 mL  $\text{H}_2\text{O}$ , and adjust pH potentiometrically with aq. NaOH. Dil. to 1 L.

(b) *Borate buffer soln*.—pH 10.0. Dissolve 30 g  $\text{H}_3\text{BO}_3$  in ca 600 mL  $\text{H}_2\text{O}$  and adjust pH potentiometrically with aq. NaOH. Dil. to 1 L.

(c) *Dilute sulfuric acid*.—(Caution: See 51.030.) (1) 21.5N.—Measure 200 mL  $\text{H}_2\text{O}$  into 1 L flask and gradually add, with cooling, 300 mL  $\text{H}_2\text{SO}_4$ . Use soln at room temp. (2) 7N.—Dil. 1 vol. (1) with 2 vols.  $\text{H}_2\text{O}$ .

(d) *Alumina*.—Neut. (Fisher Scientific Co., No. A-950, or equiv.).

(e) *Nalidixic acid std solns*.—(1) *Stock soln*.—500  $\mu\text{g}/\text{mL}$ . Dissolve 50.0 mg nalidixic acid anal. std (available from Sterling Winthrop Research Institute, Rensselaer, NY 12144) in 100 mL MeOH. (2) *Intermediate soln*.—5.0  $\mu\text{g}/\text{mL}$ . Dil. 2.0 mL stock soln to 200 mL with MeOH. (3) *Working soln*.—0.5  $\mu\text{g}/\text{mL}$ . Dil. 10.0 mL intermediate soln to 100 mL with MeOH.

**41.039****Determination**

(Caution: See 51.005, 51.039, 51.056, and 51.057.)

Transfer 10 g chicken liver or muscle to high-speed blender. Add 100 mL phosphate buffer and blend 2–3 min. Transfer homogenate to 500 mL g-s extn bottle and add 300 mL EtOAc.

Add 100 mL phosphate buffer to each of five 500 mL g-s extn bottles. Transfer 0, 1.0, 2.0, 3.0, and 4.0 mL working soln contg 0.0, 0.50, 1.0, 1.5, and 2.0  $\mu\text{g}$  nalidixic acid, resp. Add 300 mL EtOAc to each. Mech. shake all bottles contg sample and std 10–15 min and centr. ca 5 min at 2500 rpm. Withdraw 250 mL EtOAc supernate from each and transfer to sep. 600 mL beakers. Evap. each under air current on steam bath to ca 60 mL.

Prep. adsorption column for sample and each std as follows: Place glass wool plug at bottom of chromatgc tube and add alumina to depth of 3 cm (ca 3 g). Place another glass wool pad at top of column. Wash each column with 25 mL EtOAc. Transfer tissue and std exts from beakers to respective columns. Rinse

each beaker with 25 mL EtOAc followed by two 25 mL portions ether and two 25 mL portions MeOH. Transfer each solv. rinse to corresponding column and discard all eluates.

Add two 25 mL portions borate buffer and collect eluate in 50 mL graduate. Transfer eluate from graduate to 125 mL separator with Teflon stopcock. Ext with 25 mL ether and discard ether. Acidify aq. soln with 10 mL 7*N* H<sub>2</sub>SO<sub>4</sub>. Thoroughly ext with 25 mL and 10 mL CHCl<sub>3</sub>. Withdraw each CHCl<sub>3</sub> ext and combine in 100 mL beaker. (Do not introduce any aq. phase.) Evap. solv. just to dryness on steam bath.

Add 10.0 mL 21.5*N* H<sub>2</sub>SO<sub>4</sub> to each beaker. Mix thoroughly  $\geq$  10 min. Det. relative fluorescence (product of linear scale meter reading and meter multiplier setting) of processed blank, stds, and tissue sample in 1 cm cell at excitation 325 nm and emission, 408 nm. Subtract relative fluorescence of reagent blank from relative fluorescence of all std and sample preps.

Prep. std curve with reagent blank-corrected relative fluorescence values of processed stds as ordinate and corresponding  $\mu$ g nalidixic acid as abscissa. From std curve, det. amt nalidixic acid (*x*) which corresponds to reagent blank-corrected relative fluorescence of processed tissue sample.

ppb (ng/g) Nalidixic acid = (*x*  $\times$  1000)/10 g (tissue wt).

#### Zoalene (3,5-Dinitro-*o*-toluamide) (7) Official Final Action

##### 41.040

##### Principle

Ground tissue is extd with acetone, and benzene is added to sep. soln into 2 layers. Org. layer is concd, and passed thru alumina column. Absorbed zoalene is washed with CHCl<sub>3</sub> and eluted with 80% alcohol. Alc. soln is evapd just to dryness and residue dissolved in alc. DMF soln. Colored complex formed by addn of 1,3-diaminopropane is measured at 560 nm.

##### 41.041

##### Apparatus

See 41.002(a), (b), and (d).

##### 41.042

##### Reagents

(a) *Acetone-benzene soln.*—Mix 35 parts acetone with 65 parts benzene.

(b) *Alumina.*—See 41.003(a).

(c) *1,3-Diaminopropane.*—Aldrich Chemical Co.

(d) *Dimethylformamide-alcohol soln.*—Mix 4 parts DMF with 1 part absolute ethanol.

(e) *Zoalene.*—Anal. std. (Available from Agricultural Dept., Dow Chemical Co.)

##### 41.043

##### Preparation of Alumina Column

See 41.004.

##### 41.044

##### Preparation of Standard Curve

Accurately weigh 100 mg zoalene into 1 L vol. flask, dissolve in 50 mL acetone, and dil. to vol. with H<sub>2</sub>O. Dil. 10 mL of this

stock soln to 100 mL with H<sub>2</sub>O to give working soln of 10  $\mu$ g/mL. Pipet 0, 2, 4, 6, 8, and 10 mL aliquots working soln into sep. 100 mL beakers and evap. just to dryness under heat lamp. Add 5 mL alc. DMF soln to each beaker and stir 1–2 min. Add 5 mL 1,3-diaminopropane. After 10 min, measure *A* of soln at 560 nm, using 1 cm cells against H<sub>2</sub>O as ref. Prep. std curve by plotting *A* against  $\mu$ g zoalene.

##### 41.045

##### Determination

(Caution: See 51.004, 51.011, 51.039, 51.040, 51.045, and 51.046.)

Collect tissue, freeze with solid CO<sub>2</sub>, and keep frozen until analyzed. Grind tissue while at least partially frozen and weigh 50 g into 1 qt (1 L) Mason jar. Add 250 mL acetone and mix with high-speed mixer ca 5 min. Filter on buchner into 1 L filter flask, using 11 cm paper and ca 5 g Super-Cel as filter pad. Wash residue with 100 mL acetone, collecting washings in same flask. Transfer filtrate to 1 L separator and add 500 mL benzene.

Vigorously shake ext in separator and let stand until layers sep. Swirl funnel and let stand again until layers sep. Drain aq. layer into 250 mL centrf. bottle. Transfer org. layer to 1 L beaker. Rinse separator with 100 mL acetone-benzene soln and add to centrf. bottle. Stopper, shake vigorously, and centrf. 20 min at ca 1700 rpm. Remove lower layer with suction tube and transfer org. layer to 1 L beaker.

Evap. to 10 mL under heat lamp with air current. Add 100 mL CHCl<sub>3</sub> and evap. to 50 mL. If soln is not clear, repeat addn and evapn of CHCl<sub>3</sub> to remove H<sub>2</sub>O.

Add clear CHCl<sub>3</sub> soln to alumina column and drain to level of alumina. Wash with four 50 mL portions CHCl<sub>3</sub>. Discard washings. Add 90 mL 80% alcohol to column to elute zoalene. Discard first 30 mL effluent and collect 60 mL in 100 mL beaker. Evap. soln under heat lamp with air current until residue no longer flows. Do not heat residue after beaker is dry.

Add 5 mL alc. DMF soln to beaker and warm with stirring to ca 45° to dissolve residue. When completely in soln, add 5 mL 1,3-diaminopropane to develop color. Filter thru small fluted paper. After 10 min, measure *A* of soln at 560 nm, using 1 cm cells against H<sub>2</sub>O as ref.

##### 41.046

##### Calculations

Obtain  $\mu$ g zoalene corresponding to *A* from std curve.

ppm Zoalene in sample =  $\mu$ g zoalene/g sample.

## 42. Drugs in Feeds

(Medicated feeds may deteriorate under improper storage conditions. When possible, use reasonably fresh samples, store them in the cold, and grind just before analysis.)

### Qualitative Tests for Furazolidone and Zoalene (7) Official First Action

42.001

#### Apparatus

See 7.124.

42.002

#### Reagents

- (a) *Dimethylformamide (DMF)*.—Reagent grade.
- (b) *Alcoholic potassium hydroxide soln.*—4%. Dissolve 4 g KOH in 100 mL alcohol. If premixed with DMF (1+9), prep. fresh daily.
- (c) *Ethylenediamine*.—Use in hood.

42.003

#### Preparation of Sample

Gently grind pellet, cube, or crumble forms with mortar and pestle. Sieve thru nest of Nos. 10, 20, and 30 sieves with pan. Drugs usually are concd in portion in pan.

42.004

#### Identification

(a) *DMF test*.—Place 9 drops DMF and 1 drop alc. KOH soln in each of 3 depressions of white spot plate. Sprinkle ca 0.01 g fine feed material into each soln from tip of spatula while observing reaction under microscope. Furazolidone produces intense blue color, easily detected at  $\geq 0.0025\%$ . Zoalene gives bright green, easily detected at  $\geq 0.0025\%$ . Color of minute particles of zoalene fades rapidly; color of larger particles persists 3–5 min.

(b) *Ethylenediamine test*.—Place dry filter paper at bottom of petri dish and sprinkle ca 0.5 g fine feed evenly over paper. Dispense 2–4 mL ethylenediamine under edge of paper so as to wet entire paper and sample. Examine under stereoscopic microscope at 10 $\times$  for particles developing bright purple, indicating zoalene, or deep red, indicating furazolidone. (Blood meal, frequently used in livestock feed, also gives deep red color with reagent.)

### Total Arsenic (2)—Official Final Action

42.005

#### Reagents

- (a) *Arsenic trioxide*.—NBS As<sub>2</sub>O<sub>3</sub> SRM 83, or equiv.
- (b) *Magnesium oxide-magnesium nitrate slurry*.—Suspend 75 g MgO and 105 g Mg(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O in enough H<sub>2</sub>O to make 1 L. Agitate vigorously before addn to sample. (Freshly prepd slurry gives ash which is easily disturbed by air currents.)
- (c) *Stannous chloride soln.*—**25.006(g)**. Effective as long as it discharges yellow color in sample ext.
- (d) *Absorbing soln.*—Transfer with graduate 25 mL 1.5% HgCl<sub>2</sub> soln, and with pipet 3.75 mL 6N H<sub>2</sub>SO<sub>4</sub> and 3.75 mL 0.03N KMnO<sub>4</sub>, into 250 mL graduate. Dil. to 250 mL with H<sub>2</sub>O and mix. Prep. fresh daily.
- (e) *Ammonium molybdate reagent*.—Dissolve 1 g (NH<sub>4</sub>)<sub>2</sub>MoO<sub>4</sub> in 100 mL 5.4N H<sub>2</sub>SO<sub>4</sub>. Soln keeps several weeks. (Prep. 5.4N H<sub>2</sub>SO<sub>4</sub> by dilg 6N (9+1).)
- (f) *Hydrazine sulfate reagent*.—0.15%. Dissolve 0.15 g N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>SO<sub>4</sub> in 100 mL H<sub>2</sub>O. Soln keeps several weeks.

42.006

#### Apparatus

(Do not clean app. and glassware with detergents, as they interfere with color development. Haemo-Sol, available from Scientific Products, Inc., or equiv., is satisfactory.)

(a) *Evaporating dishes*.—70 mL; Coors No. 430, size 00A, or equiv.

(b) *Arsine evolution apparatus*.—Bend 6 mm id glass tubing at 120° angle ca 10 cm from one end and at 60° angle ca 15 cm from other end. Plug shorter end with glass wool impregnated with satd Pb(OAc)<sub>2</sub> soln and insert in rubber stopper, placed in top of 125 mL erlenmeyer, so that end of tube projects just below stopper. Plug other end with unimpregnated glass wool and connect thru rubber tubing to glass tube, constricted at lower end, that reaches to bottom of 50 mL large neck vol. flask, or if preferred, 50 mL centrf. tube, marked exactly at 50 mL and approx. at 20 mL.

42.007

#### Preparation of Sample Solution

Weigh ground sample contg  $\leq 50$   $\mu$ g As (unless aliquot is to be taken from digested soln) into 70 mL ashing dish. If  $>2.5$  g sample is used, increase amt of slurry and size of ashing dish. Add ca 10 mL well mixed slurry, (b), and enough H<sub>2</sub>O to permit thoro mixing with stirring rod. Rinse stirring rod, and dry sample at 100°. Ash 2–4 hr at 550–600°. (Slight C residue does not interfere. Use care to avoid loss of ash.)

Cool, and moisten residue with H<sub>2</sub>O. Cover dish with watch glass and add ca 15 mL HCl (1+1). Let stand overnight, or heat on H<sub>2</sub>O bath with agitation until ash dissolves. Filter thru Whatman No. 30 paper into 125 mL erlenmeyer. Rinse filter with enough hot H<sub>2</sub>O, in several portions, to obtain ca 60 mL filtrate.

42.008

#### Preparation of Standard Curve

Dissolve 0.660 g As<sub>2</sub>O<sub>3</sub> in 25 mL 10% NaOH soln, dil. to 1 L with H<sub>2</sub>O, and mix. Dil. 10 mL aliquot to 1 L with H<sub>2</sub>O (1 mL = 5  $\mu$ g As). Transfer 0, 2, 4, 6, 8, 10, 12, and 14 mL aliquots from buret into 125 mL erlenmeyers. Dil. each to ca 60 mL with H<sub>2</sub>O and proceed as in **42.009**. Plot A against  $\mu$ g As.

42.009

#### Arsine Evolution

Add ca 10 mL HCl, 2 mL KI soln, **25.006(f)**, and 0.5 mL SnCl<sub>2</sub> soln, (c). Swirl, heat in H<sub>2</sub>O bath 5 min, and cool. Have all parts of evolution app. ready for immediate assembly, with ca 20 mL absorbing soln, (d), in 50 mL vol. flask or centrf. tube marked at 50 mL. Add 5–6 g Zn, **25.006(j)**, to digested soln; quickly insert stopper contg glass tubing into erlenmeyer and place delivery tube against bottom of vol. flask or centrf. tube so that bubbles will be small. Use few drops of H<sub>2</sub>O to test for leaks between rubber stopper and erlenmeyer. Connecting glass tube must be large enough so bubbles will not carry over Pb compds from impregnated glass wool plug into absorption flask.

42.010

#### Color Development

After 30 min, disconnect rubber tubing, leaving delivery tube in receiving vessel so that any Hg arsenide on tube will be exposed to color-developing reagents. Add 1.0 mL NH<sub>4</sub> molybdate reagent, (e), and mix by forcing air thru delivery tube. Add 1.0 mL hydrazine sulfate reagent, (f), and again mix. Heat in boiling H<sub>2</sub>O bath 20 min. Rinse delivery tube with H<sub>2</sub>O and

remove. Cool to room temp., dil. to 50 mL, and mix. Filter thru tight glass wool plug in funnel or centr. (Do not use filter paper, as color will be adsorbed.) Read *A* against H<sub>2</sub>O at  $\geq 750$  nm. Max. *A* is at 840 nm. Det. As content from std curve.

As  $\times 2.90$  = arsanilic acid; As  $\times 2.24$  = arsenosobenzene; As  $\times 3.51$  = 3-nitro-4-hydroxyphenylarsonic acid; As  $\times 3.3$  = 4-nitrophenylarsonic acid; As  $\times 3.47$  = *p*-ureidobenzeneearsonic acid.

★ **2-Acetylamino-5-nitrothiazole (Cyzine®) (3)** ★  
Official Final Action

## 42.011

**Principle**

2-Acetylamino-5-nitrothiazole is extd from finished feeds by hot dimethylformamide (DMF). Aliquot of filtered ext is passed thru alumina column. Impurities are removed by washing with DMF, and 2-acetylamino-5-nitrothiazole is eluted with acidified MeOH. *A* of yellow soln, developed by action of NaOH on compd, is detd spectrophtrically at 410 nm.

## 42.012

**Apparatus**

- (a) *Spectrophotometer*.—For use at 410 nm with 1 cm cells.
- (b) *Chromatographic tubes*.—10 (id)  $\times$  300 mm; Corning Glass Works No. 38450.
- (c) *Filter grip*.—New York Laboratory Supply Co. No. 35050.
- (d) *Filter disks*.—Glass fiber, 5.5 cm; Reeve Angel No. 934AH.

## 42.013

**Reagents**

- (a) *Acidified methanol*.—Add 2 mL 5*N* HCl to 100 mL MeOH.
- (b) *Alcoholic sodium hydroxide soln*.—Add 2.5 mL 10*N* NaOH to 100 mL alcohol. Let stand 2 days for carbonates to settle.
- (c) *Aluminum oxide*.—Alcoa F-20, for chromatgc adsorption. (Available from Fisher Scientific Co., as "Alumina, Adsorption, Fisher.") It is unsuitable for use as received and must be prepd as in 42.014(a).

## 42.014

**Preparation of Chromatographic Column**

(a) *Preparation of alumina*.—To 250 g alumina in 2 L beaker add 1.5 L H<sub>2</sub>O, stir, let settle 10 min, and decant as much H<sub>2</sub>O as possible. Add 1.5 L 1*N* HCl, stir well, and let stand  $\geq 1$  hr, stirring at 10–15 min intervals. Decant, including fines, and add 1.5 L H<sub>2</sub>O. Stir, let settle, and decant H<sub>2</sub>O, including fines. Continue washing and decanting to include fines with 1.5 L portions of H<sub>2</sub>O until pH of wash H<sub>2</sub>O is same as that of H<sub>2</sub>O being used for wash. (Universal indicator paper is satisfactory for pH detn. When taking pH, H<sub>2</sub>O should be essentially free from suspended fines.) Transfer alumina to buchner and air dry ca 1 min, using gentle vac. Transfer alumina to wide, shallow dish and dry at 100–150°  $\geq 16$  hr, stirring several times during drying. Alumina should be free of lumps and should pour freely; if not, dry further. During drying, other materials must not be present in oven.

(b) *Preparation of column*.—Fit 0.6 cm section of 0.25" natural rubber tubing 1–2 cm from end of stem of 75 mm glass funnel with ca 3 mm stem bore thruout length. Fit funnel into top of 10  $\times$  300 mm chromatgc tube, forming tight seal. Fit 5 cm piece of rubber tubing to end of tube and 8 cm piece of tapered glass tubing or 3 mm bore glass stopcock to tubing. Control flow of liq. to ca 1 drop/sec by stopcock or pinch clamp.

Remove funnel and fill tube with DMF to ca 0.6 cm above end of funnel stem after funnel is replaced. Make slurry of previously prepd alumina, using 3 vols DMF to 1 vol. alumina. Heat slurry on hot plate (do not boil) to expel adsorbed gases and cool to room temp. Prep. fresh before using; do not use slurry which has stood overnight. Swirl beaker to suspend alumina and add portions thru affixed funnel to tube until alumina is 275 mm high. After each addn, gently tap side of tube to disperse alumina evenly. Keep ca 1 cm DMF over alumina until ready for use.

## 42.015

**Determination**

(Caution: See 51.018, 51.040, and 51.053.)

Weigh 20.0 g well mixed, freshly ground feed and transfer to 250 mL beaker. To second 250 mL beaker, add 60 mL DMF from graduate, and bring to bp on hot plate under hood. Add boiling DMF to sample, boil 2 min, stirring constantly, and cool to room temp. Filter, using gentle suction, into 200 mL Kohlrusch flask by decanting thru 5.5 cm buchner fitted with glass fiber filter disk. (Adapt buchner to flask by means of filter grip.)

Repeat extn with 60 mL boiling DMF as above, transferring entire cooled contents of beaker to buchner. Rinse beaker with two 30 mL portions cold DMF, adding each to buchner. Cool flask to room temp. and dil. to vol. with DMF. Stopper and mix well.

Pipet 10 mL aliquot DMF ext thru funnel onto column and let it elute at ca 1 drop/sec. Just before ext reaches top of column, add 10 mL DMF and let it run thru. Repeat wash with two 10 mL portions DMF and discard all DMF eluates.

Pass four 10 mL portions acidified MeOH thru column to elute 2-acetylamino-5-nitrothiazole. Make each addn, including first, just before preceding one reaches top of column. Do not let column go dry at any time. Collect eluate in 50 mL g-s vol. flask until ca 2 mL of last acidified MeOH portion remains on top of column. To ca 40 mL eluate in vol. flask, add exactly 0.5 mL 5*N* HCl and mix. Soln should become distinctly lighter. Add MeOH to vol. and mix thoroly.

Pipet 20 mL aliquots into each of two 25 mL g-s vol. flasks. Dil. first to vol. with MeOH, stopper, and mix well (blank). To second flask add 5 mL alc. NaOH soln (sample soln). Prep. reagent blank by adding 5 mL alc. NaOH to third 25 mL vol. flask and dilg to vol. with MeOH. Det. *A* of blank (*A*<sub>0</sub>) and sample (*A*) soln at 410 nm in 1 cm cell against reagent blank. Altho developed color is stable ca 0.5 hr, do not prep. sample solns until just before reading.

## 42.016

**Calculations**

% 2-Acetylamino-5-nitrothiazole

$$= [(A - A_0) \times 25 \times 50 \times 200 \times 100] /$$

$$(a \times 100 \times 20 \times 10 \times \text{g sample})$$

$$= 1.25 \times (A - A_0) / \text{g sample},$$

for *a* (1%, 1 cm) = 1000.

Det. *a* as follows: Accurately weigh ca 100 mg purified 2-acetylamino-5-nitrothiazole and transfer to 100 mL vol. flask with small portions DMF. Add total of ca 20 mL DMF and dissolve by warming on steam bath. After soln is complete, cool to room temp., dil. to vol. with DMF, stopper, and mix well. Dil. 5 mL aliquot to 200 mL with DMF, add 10 mL aliquot to prepd alumina column, 42.014(b), and proceed as in detn to det. *A*'.

$$a = (A' \times 25 \times 50 \times 200 \times 1000) / (20 \times 10 \times 5 \times \text{mg sample})$$

$$= A' \times 250,000 / \text{mg sample}.$$

★ Surplus method—see inside front cover.

**Aklomide (2-Chloro-4-nitrobenzamide)  
(2,4-CNBA) (4)—Official Final Action**

(Applicable in presence of sulfanitran or roxarsone)

**42.017****Reagents**

(a) *Titanous chloride soln.*—4% aq. Prep. fresh on day of use from 20% soln or solid  $\text{TiCl}_3$ .

(b) *Sodium nitrite soln.*—0.1% aq. Prep. fresh on day of use.

(c) *Ammonium sulfamate soln.*—0.5%. Dissolve 500 mg  $\text{NH}_4\text{SO}_3\text{NH}_2$  in  $\text{H}_2\text{O}$  and dil. to 100 mL. Prep. fresh weekly.

(d) *Coupling reagent.*—0.1% aq. *N*-naphthylethylenediamine·2HCl. Prep. fresh weekly and store in dark glass bottle in refrigerator.

(e) *Aklomide std solns.*—2-Chloro-4-nitrobenzamide, purified for std use, available from Salsbury Laboratories. (1) *Stock soln.*—1 mg/mL. Transfer 100 mg aklomide to 100 mL vol. flask, dissolve in ca 75 mL MeOH, dil. to vol. with MeOH, and mix well. (2) *Intermediate soln.*—10  $\mu\text{g/mL}$ . Pipet 10 mL stock soln into 100 mL vol. flask, dil. to vol. with MeOH, and mix. Pipet 5 mL into 50 mL vol. flask. Evap. to dryness on  $\text{H}_2\text{O}$  bath with aid of gentle air stream and cool to room temp. Add ca 30 mL 0.15*N* HCl, shake 10 min intermittently, dil. to vol. with 0.15*N* HCl, and mix well. (3) *Working solns.*—0, 0.4, 0.8, 1.2, 1.6, and 2.0  $\mu\text{g/mL}$ . Transfer 0, 1, 2, 3, 4, and 5 mL intermediate soln to sep. 25 mL vol. flasks and dil. to vol. with 0.15*N* HCl.

**42.018****Preparation of Standard Curve**

Transfer 4 mL aliquot from each working std soln to sep. colorimetric tubes and proceed with reduction, color development, and measurement as in 42.019. Tubes contain 0, 1.6, 3.2, 4.8, 6.4, and 8.0  $\mu\text{g}$  aklomide/tube, equiv. to 0, 0.008, 0.016, 0.024, 0.032, and 0.040% aklomide in feed when 5 g sample is taken. Plot *A* against % aklomide.

**42.019****Determination**

Weigh 5 g sample contg ca 0.025% aklomide into 100 mL vol. flask, add 75 mL MeOH, and heat 30 min in 60°  $\text{H}_2\text{O}$  bath, shaking occasionally. Remove flask, cool to room temp., and dil. to vol. with MeOH. Mix thoroly and let stand 40 min to settle feed particles.

Pipet 5 mL clear supernate into 50 mL vol. flask and dil. to vol. with 0.15*N* HCl. Mix well and filter thru Whatman No. 4 paper into 125 mL erlenmeyer. (If filtrate is cloudy, refilter.) Pipet 4 mL filtrate into each of 2 tubes, add 2 drops 4%  $\text{TiCl}_3$  from dropper, mix, and let stand 2 min. Add 2 drops 10*N* NaOH from dropper, mix until white ppt persists, and acidify with 2.0 mL HCl. Mix and let stand until soln clears. Add 0.5 mL  $\text{NaNO}_2$  to one tube and 0.5 mL  $\text{H}_2\text{O}$  to second tube as blank; mix. After 3 min, add 0.5 mL 0.5%  $\text{NH}_4$  sulfamate to each tube and mix. After 2 min, add 0.5 mL coupling reagent to each, mix, and let color develop 15 min. Read *A* of soln at 545 nm in colorimeter or spectrophtr. Subtract reading of feed blank. Det. % aklomide in feed directly from std curve.

**Thin Layer Chromatographic Qualitative Test****42.020****Reagents**

(a) *Spray reagent.*—Dissolve and dil. 0.1 g *p*-(dimethyl-amino)cinnamaldehyde (DMC) (available from J. T. Baker Chemical Co.) to 100 mL with 1.0*N* HCl. (Soln is stable  $\geq 1$  month.) Just before use, add 1 mL 20%  $\text{TiCl}_3$  to 25 mL DMC soln and mix. Discard after 1 hr.

(b) *Aklomide reference std.*—1 mg/mL. See 42.017(e)(1).

**42.021****Test**

Ext 10 g sample with 25 mL MeOH, shaking occasionally during 15 min. Filter thru Whatman No. 4 paper into 50 mL beaker. Conc. filtrate to ca 2 mL on steam bath. Spot ca 10  $\mu\text{L}$  on 250  $\mu\text{m}$  silica gel G TLC plate along with ref. std and develop ca 30 min, in ether. Remove from tank and air dry ca 15 min. Spray plate with DMC- $\text{TiCl}_3$  reagent. (Caution: See 51.017.) Aklomide forms reddish pink spot. Compare  $R_f$  value to that of ref. std.

***p*-Aminobenzoic Acid (5)—Official Final Action****42.022****Preparation of Standard Solution**

Transfer 0.100 g *p*-aminobenzoic acid (99+% purity, available from ICN Pharmaceuticals Inc., Life Sciences Group) to 100 mL vol. flask, dissolve in 5 mL 1*N* NaOH, and dil. to vol. with  $\text{H}_2\text{O}$ . Dil. 5 mL aliquot to 200 mL with  $\text{H}_2\text{O}$  (1 mL = 25  $\mu\text{g}$ ). Place 2, 4, and 6 mL aliquots dild soln (50, 100, 150  $\mu\text{g}$ ) in 100 mL vol. flasks, add 3 mL HCl to each, dil. to vol. with  $\text{H}_2\text{O}$ , and mix.

**42.023****Determination**

Transfer 5 g freshly ground feed to 250 mL vol. flask, add 135 mL  $\text{H}_2\text{O}$ , making slurry of first 10 mL to wet sample completely, and then add 15 mL HCl. Mix, and place on steam bath 25 min, swirling occasionally until soln darkens. Cool, dil. to 250 mL with  $\text{H}_2\text{O}$ , and let feed particles settle. Pipet 50 mL into 100 mL vol. flask, dil. to vol. with  $\text{H}_2\text{O}$ , and mix thoroly. Pour soln into 250 mL beaker, add filter-aid, and filter thru 18.5 cm Whatman No. 2 paper, or equiv., discarding first 10–15 mL, if turbid.

Pipet two 10 mL aliquots into 50 mL beakers, add 5 mL  $\text{H}_2\text{O}$  and 2 mL fresh 0.10%  $\text{NaNO}_2$  soln, mix, and let stand 3 min. Add 2 mL 0.50%  $\text{NH}_4$  sulfamate soln, mix, and let stand 2 min. Then add, to one beaker only, 1 mL coupling reagent, 42.017(d), and to other 1 mL  $\text{H}_2\text{O}$ . Mix solns and wait 10 min. Det. *A* against  $\text{H}_2\text{O}$  at 545 nm in spectrophtr. (Avoid false readings due to N bubbles on cell walls.) Subtract blank *A* from sample *A* and calc.  $\mu\text{g}$  found by ref. to std curve.

% *p*-aminobenzoic acid in feed =  $\mu\text{g}$  found/1000.

K *p*-aminobenzoate = *p*-aminobenzoic acid  $\times 1.278$ .

Prep. stds by treating 10 mL aliquots of 3 final std solns, representing 5, 10, and 15  $\mu\text{g}$ , as in detn, beginning "... add 5 mL  $\text{H}_2\text{O}$  ..." Plot *A* at 5, 10, and 15  $\mu\text{g}$  and draw straight line.

**42.024****Qualitative Tests**

(To differentiate *p*-aminobenzoic acid, arsanilic acid, and sulfaquinoxaline)

Place 10 mL prepd sample filtrate in separator. Ext with 10 mL peroxide-free ether by vigorous shaking 30 sec. Let layers sep., and drain aq. layer into another separator. Re-ext with 10 mL ether and drain aq. layer into third separator for third extn with same vol. ether. After final extn, drain aq. layer into fourth separator, add 5 mL  $\text{H}_2\text{O}$ , mix, and couple soln as in 42.023, second par. Wait 10 min, add 5 drops HCl and 10 mL isoamyl alcohol, and ext gently ca 30 sec. Let stand until layers sep. Red color in solv. is due to *p*-aminobenzoic acid; that in lower layer, to arsanilic acid. Drain as much aq. layer as possible and again ext with 10 mL solv. Arsanilic acid remains as distinct color in aq. layer, not as mere trace due to incomplete removal of *p*-aminobenzoic acid. Combine ether exts, wash with 5 mL  $\text{H}_2\text{O}$ , discard, and ext with 10 mL 1%  $\text{Na}_2\text{CO}_3$  soln; acidify, and couple again to prove presence of sulfaquinoxaline.

★ **2-Amino-5-nitrothiazole (Enheptin®) (6) ★**  
**Official Final Action**

**42.025****Reagents**

(a) *Borate buffer*.—pH 9.0. Dil. 50.0 mL  $\text{H}_3\text{BO}_3$ -KCl soln, **50.009(c)**, and 21.40 mL 0.2M NaOH, **50.009 (d)**, to 200 mL with  $\text{H}_2\text{O}$ .

(b) *Sodium hydrosulfite soln*.—Prep. 1% soln of Na hydrosulfite in borate buffer, (a), and use within 5 min of prepn.

**42.026****Determination**

Transfer 2 g ground feed to 50 mL wide-mouth vol. flask, add 10 mL acetone, and let stand 2 min, swirling occasionally. Dil. to vol. with  $\text{H}_2\text{O}$ , mix, and filter immediately thru coarse paper. Transfer 25 mL aliquot to 50 mL vol. flask, add 15 mL 5%  $\text{NH}_4\text{Cl}$  soln, and mix. Dil. to vol. with  $\text{H}_2\text{O}$ , mix, and filter thru Whatman No. 42 paper, or equiv., discarding first 10 mL filtrate.

Place 4 mL aliquot in each of 2 small beakers. To first, add 0.5 mL freshly prepd Na hydrosulfite soln. Dil. contents of both beakers to 10 mL and immediately read both solns in spectrophtr against  $\text{H}_2\text{O}$  at 388.5 nm. Subtract *A* of reduced soln from that of unreduced soln. From std curve read  $\mu\text{g}$  Enheptin corresponding to this difference.

$\mu\text{g Enheptin} \times 0.00125 = \% \text{ Enheptin in sample.}$

**42.027****Preparation of Standard Curve**

Dissolve 100 mg 2-amino-5-nitrothiazole std in 100 mL acetone and dil. to 1 L with  $\text{H}_2\text{O}$ . Transfer aliquots of 4, 8, 12, 16, and 20 mL to 100 mL vol. flasks and dil. to vol. with  $\text{H}_2\text{O}$ . Treat 5 mL aliquots of each diln as above, and read *A* of unreduced soln against reduced soln as blank, obtaining readings corresponding to 20, 40, 60, 80, and 100  $\mu\text{g}$ .

**Amprolium (1-(4-Amino-2-*n*-propyl-5-pyrimidinylmethyl)-2-picolinium chloride hydrochloride) (7)—Official Final Action**

**42.028****Principle**

Amprolium is extd from feed with aq. MeOH. Ext is purified by chromatgy on alumina, and amprolium reacts with 2,7-naphthalenediol,  $\text{K}_3\text{Fe}(\text{CN})_6$ , KCN, and NaOH in MeOH to form colored compd with absorption max. at 530 nm. There is no interference from usual components of com. feeds, vitamins, antibiotics, picolines, or pyrimidines. Nithiazide, Enheptin A, and nitrofurazone show some interference.

**42.029****Reagents**

(Caution: See **51.050**.)

(a) *Alcoholic sodium hydroxide soln*.—Dil. 15.0 mL aq. NaOH soln, (i), with anhyd. MeOH to 200 mL. Stopper, and mix well.

(b) *Alumina*.—Reagent grade suitable for chromatgy. Should pass following test: Vigorously shake 10 g alumina with 100 mL  $\text{H}_2\text{O}$  in 250 mL g-s flask  $\geq 2$  min. Let settle, decant, and det. pH potentiometrically. pH should be 9.5–10.5.

(c) *Amprolium std soln*.—25  $\mu\text{g/mL}$ . Weigh 25.0 mg Amprolium Ref. Std (available from Merck & Co.) into 50 mL vol. flask, dissolve in dil. MeOH, (e), dil. to vol., and mix. Dil. 5 mL to 100 mL in vol. flask with dil. MeOH. Soln is stable 1 week.

(d) *Color developing reagent*.—Add 5 mL  $\text{K}_3\text{Fe}(\text{CN})_6$  soln to 90 mL naphthalenediol soln, (f), in 250 mL g-s flask, and mix well. Add 5 mL KCN soln, (g), stopper, mix well, and let stand 30–35 min. Add 100 mL alc. NaOH soln, (a), and mix. Use within

75 min, filtering thru medium porosity fritted glass filter just before use.

(e) *Dilute methyl alcohol*.—Mix 2 vols anhyd. MeOH with 1 vol.  $\text{H}_2\text{O}$ . Cool to room temp. before use.

(f) *Naphthalenediol soln*.—Dissolve 25 mg 2,7-naphthalenediol (Eastman Kodak Co.) in 1 L anhyd. MeOH.

(g) *Potassium cyanide soln*.—Dissolve 1.0 g KCN in 100 mL  $\text{H}_2\text{O}$ . Kept tightly stoppered, soln is stable 2 weeks.

(h) *Potassium ferricyanide soln*.—Dissolve 200 mg  $\text{K}_3\text{Fe}(\text{CN})_6$  in 100 mL  $\text{H}_2\text{O}$ . Kept tightly stoppered, soln is stable 2 weeks.

(i) *Sodium hydroxide soln*.—Dissolve 2.25 g NaOH in 200 mL  $\text{H}_2\text{O}$ .

**42.030****Extraction**

Accurately weigh amt ground feed ( $\leq 15$  g) contg 1.5–2.5 mg amprolium and transfer to 250 mL g-s flask. Add 100.0 mL dil. MeOH, stopper, and stir mag. or shake mech. 60 min. Filter thru Whatman No. 42, or equiv., paper and collect 25–40 mL clear filtrate, rejecting first 10–15 mL. Filtrate should be clear. Refilter, if necessary, thru fresh paper or centrf. until clear.

**42.031****Chromatography**

(a) *Preparation of alumina*.—To 200 g  $\text{Al}_2\text{O}_3$ , (b), add 1 L  $\text{H}_2\text{O}$ . Stir mixt. 30 min. Filter slurry thru fast paper on buchner funnel. Wash  $\text{Al}_2\text{O}_3$  on filter with three 100 mL portions of anhyd. MeOH. Air-dry under vac. until  $\text{Al}_2\text{O}_3$  reaches room temp. Prepd  $\text{Al}_2\text{O}_3$  should be free-flowing. Store in g-s bottle.

(b) *Preparation of column*.—Constrict end of 40 cm length of 9–10 mm id glass tubing by rotating in hot flame until opening is 4–5 mm. Insert small plug of Pyrex glass wool in lower end of tube and compress with glass rod to thickness ca 2–3 mm. Transfer 5.0 g prepd alumina to dry tube and pack by gentle tapping of tube. Prep. sep. column for each sample.

(c) *Chromatography of feed extract*.—Pipet 25 mL clear ext onto column and let pass thru column by gravity. Reject first 3 mL eluate and collect next 5 mL for color development.

**42.032****Determination**

Mark 3 sep. 15 mL centrf. tubes as *X*, *S*, and *B*. To *X* add 4.00 mL clear eluate from column; to *S* add 4.00 mL amprolium std soln, and to *B* add 4.00 mL dil. MeOH as blank. Add 10.0 mL color developing reagent to each tube, stopper, mix, and let stand 20 min. Centrf. 2–3 min, decant into 1 cm cells, and cover. (If solns are not clear and free from suspended particles, decant into cells thru small plug of Pyrex glass wool.) Det. *A* of solns *X* and *S* in spectrophtr or colorimeter at 530 nm against soln *B* as ref. within 20–25 min after adding color developing reagent.

$\% \text{ Amprolium in feed} = (2.54 \times C)/(A' \times W);$

where *A* and *A'* refer to sample and std, resp., *C* = mg amprolium in final aliquot of std soln (0.100 mg), and *W* = g original sample.

**Fluorometric Method (8)—Official Final Action**

(Applicable in absence of antibiotics except procaine penicillin and chlortetracycline)

**42.033****Reagents**

(a) *Amprolium std solns*.—(1) *Stock soln*.—0.20 mg/mL. Weigh 20.0 mg Amprolium Ref. Std (available from Merck & Co.) and dissolve in enough TCA soln, (d), to make 100.0 mL. (2) *Working soln*.—1  $\mu\text{g/mL}$ . Dil. 5.00 mL stock soln to 100 mL with TCA soln and mix well. Further dil. 10 mL of this soln to 100 mL with  $\text{H}_2\text{O}$ , and mix well.

★ Surplus method—see inside front cover.

(b) *Potassium ferricyanide soln.*—Dissolve 2 g  $K_3Fe(CN)_6$  in 100 mL  $H_2O$ .

(c) *Silver nitrate soln.*—Dissolve 5 g  $AgNO_3$  in 100 mL  $H_2O$ .

(d) *Trichloroacetic acid (TCA) soln.*—Dissolve 5 g  $CCl_3COOH$  in 100 mL  $H_2O$ .

**42.034****Extraction**

Grind feed sample to pass No. 20 sieve and mix thoroly. (High-speed blender grinds most feeds to desired fineness in ca 3 min.) Weigh sample contg ca 750  $\mu g$  amprolium and transfer to 250 mL g-s flask. Add 100.0 mL TCA soln, stopper, and agitate 30 min on mag. stirrer or mech. shaker.

Filter by gravity thru Whatman No. 42 paper, rejecting first 5 mL. Collect  $\geq 10$  mL clear filtrate. Transfer 5.00 mL clear ext to 50 mL vol. flask, dil. to vol. with  $H_2O$ , and mix well. This is dild sample ext.

**42.035****Development of Fluorophor**

Mark three 50 mL centr. tubes X, Y, and Z. To tube X add 15.00 mL dild sample ext; to tube Y add 1.50 mL TCA soln and 13.50 mL  $H_2O$  as blank soln; and to tube Z add 15.00 mL amprolium working std soln. To all tubes add 5.00 mL  $NaOH$  soln (3+10), stopper with polyethylene stoppers, and mix well. Immediately add 0.50 mL  $AgNO_3$  soln to all tubes, stopper, and mix well. Let all tubes stand 2 min. Then to all tubes add 3.0 mL  $K_3Fe(CN)_6$  soln, stopper, mix, and let stand 3.0 min.

During this 3 min wait, add 15 mL  $n$ -BuOH to all tubes, as overlay, and stopper. After 3 min, vigorously shake all tubes 1.0 min, and centr. 1 min. Transfer 10.0 mL aliquots of upper BuOH layer from all tubes to test tubes. Add 1.00 mL absolute alcohol to each tube and mix well.

**42.036****Measurement of Fluorescence**

(Caution: See 51.008.)

(a) *For instruments designed to accommodate  $10 \times 10$  mm cells and using monochromatic light for excitation.*—Set activation wavelength at 400 nm (uncorrected) and emission wavelength at 455 nm (uncorrected). Transfer ca 2.0 mL fluorophor BuOH ext to cell and read.

(b) *For instruments designed to accommodate  $10 \times 40$  mm cells and using filters to adjust wavelengths for excitation and emission.*—Use Corning Glass Works 5840 (CS-7-60) filter placed after light source to adjust excitation wavelength and Corning Glass Works 3385 (CS-3-71) filter placed behind cell to adjust emission wavelength. Transfer entire contents of test tube contg extd fluorophor to cell and read.

**42.037****Calculations**

% Amprolium in feed =  $(X - Y) \times C / [150 \times (Z - Y) \times W]$ , where X, Y, and Z are fluorescence readings of sample, reagent blank, and std, resp.; C =  $\mu g$  in 15 mL std soln (15.0); and W = g sample.

**Arsanilic Acid (*p*-Aminobenzenearsonic Acid) (9)**  
**Official Final Action**

(Applicable in absence of sulfonamides)

**42.038****Determination**

Transfer 4.0 g freshly ground sample to 200 mL vol. flask, and add ca 80 mL  $H_2O$  and 4 mL 0.5N  $NaOH$ . Place flask on steam bath ca 5 min, swirling occasionally. Carefully add 20 mL  $HCl$ , mix, and cool to room temp. Dil. to vol. with  $H_2O$ , mix, pour into

250 mL beaker, add some Filter-Cel, or equiv., and filter thru Whatman No. 42, or equiv., paper, discarding first 5 mL.

Pipet 5 mL aliquots of clear filtrate into each of two  $20 \times 175$  mm test tubes. To each tube add 2 mL 0.1%  $NaNO_2$  soln, mix, and let stand 5 min. Add 2 mL 0.5%  $NH_4$  sulfamate soln and let stand 2 min. Then add, to 1 tube only, 1 mL coupling reagent, 42.017(d), mix, and let stand 10 min before dilg both solns to vol. of 15 mL. Mix well (if bubbles appear, filter thru glass wool), and det. A against  $H_2O$  at 538 nm in spectrophtr or with 540 nm filter in photometer. Subtract A of blank from sample A. Det.  $\mu g$  arsanilic acid in aliquot (equiv. to 100 mg sample) from std curve.

**42.039****Preparation of Standard Curve**

Transfer 0.100 g pure arsanilic acid to 100 mL vol. flask, add ca 20 mL  $H_2O$  and 2 mL 0.5N  $NaOH$ , and dissolve. Dil. to vol. with  $H_2O$  and mix well. Transfer 10 mL to 100 mL vol. flask, dil. to vol. with  $H_2O$ , and mix well. Dil. 5 mL of this soln to 250 mL with  $H_2O$  in vol. flask, and mix well (1 mL = 2  $\mu g$  arsanilic acid). Pipet aliquots of 0, 2, 3, 5, and 8 mL of this std soln into  $20 \times 175$  mm test tubes, add 1 mL  $HCl$  (1+1) to each tube, and continue as in 42.038, beginning "To each tube add 2 mL 0.1%  $NaNO_2$  . . ." Subtract blank A from A of stds and plot differences against 4, 6, 10, and 16  $\mu g$  arsanilic acid in aliquots.

**42.040****Bifuran—Official Final Action**

See 42.075–42.076.

**42.041 ★ Bithionol (2,2'-Thiobis(4,6-dichlorophenol)) ★**  
**(10)—Official Final Action**

Bithionol is extd from acid soln with hexane, re-extd into alk. soln, and reacted with 4-aminoantipyrine and  $K_3Fe(CN)_6$ . Colored product is extd into BuOH and detd spectrophtrically at 500 nm. See 38.035–38.037, 11th ed.

**Buquinolate (Ethyl 4-hydroxy-6,7-diisobutoxy-3-quinolinecarboxylate) (11)—Official Final Action**

**42.042****Principle**

Buquinolate is extd from feed with  $CHCl_3$ , concd to small vol., and sepd from interfering substances by TLC utilizing 2 solv. systems. Buquinolate is eluted from substrate and detd fluorometrically.

**42.043****Reagents**

(a) *Alcohol, 80%.*—Dil. 84.3 mL alcohol to 100 mL with  $H_2O$ .

(b) *Developing solvent.*—Mix  $CHCl_3$  with alcohol (10+1). Prep. fresh daily.

(c) *Buquinolate std solns.*—(1) *Stock soln.*—0.5 mg/mL. Dissolve 50.0 mg Buquinolate Ref. Std (available from Norwich Pharmacal Co., Norwich, NY 13815) in  $CHCl_3$  to make 100 mL. Warm mixt. on steam bath as necessary. Soln is stable 1 month if protected from evapn. (2) *Working soln.*—100  $\mu g$ /mL. Pipet 5 mL stock soln into 25 mL vol. flask, dil. to vol. with  $CHCl_3$ , and mix well. Prep. fresh daily.

**42.044****Apparatus**

(a) *Developing tanks.*—Line developing tanks (Brinkmann Instruments, Inc. No. 25-10-200-2, or equiv., for plates  $\leq 20 \times 20$  cm) with Whatman 3 MM paper. Add 100 mL  $CHCl_3$  to one tank; add 100 mL developing solv., (b), to second tank. Prep. each tank fresh daily.

★ Surplus method—see inside front cover.

(b) *Plates for TLC.*—Clean plates thoroly with alkyl benzene sulfonate-type detergent (Ajax, or equiv.) and brush; rinse plates with H<sub>2</sub>O and then with acetone. Let plates air dry. Slurry 60 g silica gel G (Brinkmann No. 68-00-261-3) with 120 mL H<sub>2</sub>O. Pour into suitable applicator and spread 0.500 mm layer on 20 × 20 cm plates. Air dry 15–30 min; then dry 2 hr at 110°. Cool and store plates in desiccator until used.

(c) *Fluorometer.*—Either spectrophotofluorometer or filter fluorometer may be used. (Suitable filters are: excitation, Baird Atomic, Inc. type UV-7E (UV Spectrum Filters, Nos. 59-07-9); emission, Corning Glass Works 0-52 + 7-60.) (Caution: See 51.008.)

## 42.045

## Determination

(Caution: See 51.016.)

Grind ca 100 g sample to pass No. 30 sieve and mix thoroly. Accurately weigh sample contg 1.25 mg buquinolate into 250 mL g-s erlenmeyer. Pipet 100 mL CHCl<sub>3</sub> into sample flask. Shake mech. 1 hr. Filter ext thru Whatman No. 54 paper on buchner with mild vac. (Take care to prevent solv. loss by evapn.) Transfer exactly 80 mL ext to 150 mL beaker and evap. almost to dryness on steam bath. Take up residue in small portion CHCl<sub>3</sub> and transfer to 10 mL vol. flask with small portions CHCl<sub>3</sub>. Dil. to vol. with CHCl<sub>3</sub> and mix well.

Apply 250 µL sample ext and 250 µL working std soln to TLC plate. Place spots ca 25 mm from bottom of plate and 40 mm apart. (Do not touch pipet to plate.) Develop plate in CHCl<sub>3</sub> developing tank, (a), until solv. front nearly reaches top of plate (ca 1 hr). Observe plate under short wavelength UV light: Buquinolate remains at origin; feed background migrates. Transfer air-dried (5–10 min) plate to tank contg developing solv., (b). Let plate develop until solv. front advances 12 cm. Air dry 5–10 min. Examine plates under short wavelength UV light. Buquinolate migrates from origin (*R<sub>f</sub>*, 0.4–0.6). With spatula, outline each buquinolate spot plus blank spot of equiv. area and *R<sub>f</sub>*. Remove adsorbent from around buquinolate spots and discard. Quant. transfer each spot to sep. g-s 25 mL erlenmeyers. Pipet 10 mL 80% alcohol, (a), into each flask, shake mech. 20 min, and centr.

Det. intensity of fluorescent radiation (*I*) of sample, std, and blank in 10 × 10 mm silica cells, at excitation and emission wavelengths of 265 and 375 nm, resp.

$$\% \text{ Buquinolate} = [(I_{\text{sample}} - I_{\text{blank}}) / (I_{\text{std}} - I_{\text{blank}})] \times (0.125/\text{g sample}).$$

42.046 ★ Cadmium Anthranilate (12) ★  
Official Final Action

Spectrophtric detn of dithizone complex. See 42.046–42.047, 12th ed.

Carbadox (Methyl 3-(2-Quinoxalinylmethylene) Carbazate-*N'*, *N'*-dioxide, Mecadox) (73)—Official First Action

(Applicable to levels ≥0.0055%. Carbadox solns are light sensitive. Exts must be protected from direct sunlight or artificial light.)

## 42.047

## Apparatus

(a) *Filter aid.*—Celite 545 or Millipore prefilter pad (No. AP2504700, Millipore Corp., Ashby Rd, Bedford, MA 01730), or equiv.

(b) *Spectrophotometer.*—For use at 520 nm.

★ Surplus method—see inside front cover.

## 42.048

## Reagents

(a) *Carbadox std solns.*—(1) *Stock soln.*—1.10 mg/mL. Weigh 110.0 mg Carbadox Ref. Std (available from Pfizer, Inc., Quality Control, Agricultural Div., 1107 S Rt 291, Lee's Summit, MO 64063) into 100 mL vol. flask, dissolve in CHCl<sub>3</sub>-MeOH (3+1), and dil. to vol. with same solv. Ultrasonic bath speeds dissoln. Prep. fresh daily. (2) *Working soln.*—0.110 mg/mL. Pipet 10 mL stock soln into 100 mL vol. flask, dil. to vol. with CHCl<sub>3</sub>-MeOH (3+1), and mix well. Prep. fresh daily.

(b) *Methanolic hydrochloric acid soln.*—1*N*. Dil. 85 mL HCl to 1 L with MeOH.

(c) *Methanolic sodium hydroxide soln.*—0.05*N*. Dissolve 2.0 g NaOH in MeOH and dil. to 1 L with MeOH. Prep. fresh weekly or sooner if ppt forms.

(d) *Potassium phosphate soln.*—1*M*. Dissolve 136 g KH<sub>2</sub>PO<sub>4</sub> in H<sub>2</sub>O and dil. to 1 L.

(e) *Sodium hydroxide-sodium chloride soln.*—Dissolve 100 g NaCl in 0.1*N* NaOH and dil. to 1 L with 0.1*N* NaOH.

(f) *Stannous chloride soln.*—Prep. immediately before use. Add 8.0 g SnCl<sub>2</sub>·2H<sub>2</sub>O to 100 mL methanolic 1*N* HCl. Place in 55–60° H<sub>2</sub>O bath and swirl intermittently until soln is clear (ca 20 min). Stopper and cool to room temp. Use within 2 hr.

## 42.049

## Preparation of Samples

(Caution: See 51.056 and 51.066)

Weigh duplicate portions ground feed into 250 mL erlenmeyers: 2.000 g for 0.0330–0.0606% carbadox; 5.000 g, 0.0110–0.0330%; and 20.00 g, 0.0055–0.0110%. Wet each portion with 10 mL H<sub>2</sub>O, let stand 5 min, and add 140 mL CHCl<sub>3</sub>-MeOH (3+1). Add 15.0 mL working std soln to 1 portion. Stopper both flasks loosely or with polyethylene stopper with pinhole, and boil gently 1 hr. Cool to room temp.

Using three 25 mL portions CHCl<sub>3</sub>-MeOH (3+1), quant. transfer mixt. to buchner precoated with Celite or contg prefilter pad, collecting filtrate under vac. in 250 mL vol. flask. Dil. to vol. with CHCl<sub>3</sub>-MeOH (3+1), and mix well. Pipet 100 mL aliquot into 250 mL separator contg 50 mL NaOH-NaCl soln. Shake 10 sec and discard lower CHCl<sub>3</sub> layer. Add 50 mL CHCl<sub>3</sub>, shake 10 sec, and discard CHCl<sub>3</sub> layer. Add 10 mL KH<sub>2</sub>PO<sub>4</sub> soln, and ext with three 50 mL portions CHCl<sub>3</sub>, combining exts in r-b flask. Do not let any solids at interface drain into flask. Evap. to dryness, using rotary evaporator and 60° H<sub>2</sub>O bath.

Conduct reagent blank of H<sub>2</sub>O and CHCl<sub>3</sub>-MeOH (3+1) thru boiling, filtration, extns, and evapn, omitting addn of feed and carbadox.

## 42.050

## Determination

Dissolve residue in flask from sample, sample plus std, and blank in 5.00 mL 0.05*N* methanolic NaOH. Add 20.0 mL SnCl<sub>2</sub> soln, swirl gently, and let stand 10 min for complete color development. If necessary, clarify soln by filtration thru small glass wool plug. Within 15 min after completion of color development, det. *A* of clear solns at 520 nm against MeOH as ref. solv. Subtract *A* of blank from *A* of sample and *A'* of sample plus std.

$$\% \text{ Carbadox} = (A/\text{g sample}) \times [1/(A' - A)] \\ \times (\text{mg carbadox/mL working std soln}) \\ \times (1 \text{ g}/1000 \text{ mg}) \times 15 \text{ mL aliquot} \times 100.$$

Decoquinat (Ethyl 6-*n*-decyloxy-7-ethoxy-4-hydroxy-3-quinolinecarboxylate) (74)—Official Final Action

## 42.051

## Principle

Decoquinat is extd from feed with 1% CaCl<sub>2</sub>-MeOH soln. After addn of H<sub>2</sub>O and acid, drug is extd into CHCl<sub>3</sub>, then sepd

from interfering materials by chromatgy on Florisil. Decoquinat is eluted from column with 1%  $\text{CaCl}_2$ -MeOH and detd by fluorometry against std treated similarly.

**42.052****Reagents**

(a) *Calcium chloride-methanol soln.*—1%. Dissolve 10 g anhyd.  $\text{CaCl}_2$ , reagent grade, in 1 L MeOH, spectral grade (MC/B Manufacturing Chemists) or equiv. redistd, reagent grade, anhyd. MeOH. Filter thru Whatman No. 2 paper.

(b) *Decoquinat std solns.*—(1) *Stock soln.*—300  $\mu\text{g}/\text{mL}$ . Weigh 30 mg Decoquinat Ref. Std (available from Hess & Clark Laboratories). Dissolve and dil. to 100 mL with 1%  $\text{CaCl}_2$ -MeOH soln. Prep. fresh monthly. (2) *Working soln.*—6  $\mu\text{g}/\text{mL}$ . Pipet 5 mL stock soln into 250 mL vol. flask and dil. to vol. with 1%  $\text{CaCl}_2$ -MeOH soln. Check *A* of this soln in 1 cm quartz cells at 265 nm against spectral grade MeOH (ca 0.660). Prep fresh std when *A* is outside range 0.620–0.700. Soln is stable  $\geq 1$  week. (3) *Fluorescence reference soln.*—1.5  $\mu\text{g}/\text{mL}$ . Pipet 25 mL working std soln into 100 mL vol. flask and dil. to vol. with spectral grade MeOH. Check *A* at 265 nm as above. Prep. fresh std when *A* is outside range 0.150–0.190.

(c) *Florisil.*—100–200 mesh (Fisher No. F-101).

**42.053****Apparatus**

(a) *Chromatographic columns.*—Draw 30 cm length of 9 mm tubing (7 mm id) to drip tip. Insert small glass wool plug to support adsorbent. Close drip end with short piece of tubing and pinch clamp. Add 5 mL  $\text{CHCl}_3$  to column, then  $0.5 \pm 0.01$  g Florisil. Add 2 mL addnl  $\text{CHCl}_3$  and stir with thin glass rod to settle adsorbent. Remove tubing and wash down sides of tube with  $\text{CHCl}_3$ . Prep. just before use.

(b) *Separators.*—125 or 250 mL with Teflon stopcocks.

(c) *Fluorometer.*—(Caution: See 51.008.) Either spectrofluorometer or filter fluorometer may be used. Excitation filter: Baird Atomic, Inc. UV-2 (UV Spectrum Filters No. 14-16-8, 325 nm); emission filter: Baird Atomic S/UV (UV Spectrum Filters No. 14-01-4, 390 nm).

**42.054****Determination**

Weigh 10 g sample into 125 mL erlenmeyer, add exactly 50 mL 1%  $\text{CaCl}_2$ -MeOH soln, stopper, and shake mech. 20 min. Decant soln into centr. tube and centr. 5 min at moderate speed. Pipet 10 mL clear supernate into 125 mL separator. Prep. std by pipetting 10 mL working std soln into another separator. Add exactly 10 mL  $\text{CHCl}_3$  to each funnel by pipet and swirl to mix. Add 100 mL dil. HCl (1+19) to each funnel. Shake gently by inverting 25 times; then allow 15 min for phases to sep. Drain  $\text{CHCl}_3$  layer into centr. tube and centr. 5 min. Remove by aspiration any droplets of floating  $\text{H}_2\text{O}$  phase that seps.

Pipet 5 mL  $\text{CHCl}_3$  sample soln onto Florisil column. Pipet 5 mL  $\text{CHCl}_3$  std soln onto another column. Pipet 5 mL  $\text{CHCl}_3$  onto third column (reagent blank). Pass two 10 mL portions anhyd. MeOH thru each column. Let MeOH drain to surface of Florisil and discard column effluent. Elute with 15 mL 1%  $\text{CaCl}_2$ -MeOH soln, collecting in tube marked at 15 mL. Mix well, centr. if not clear, and transfer to fluorometer cells. Set activation wavelength of fluorometer at 325 nm and emission wavelength at 390 nm. Set fluorometer sensitivity with fluorescence ref. std to give convenient scale reading (e.g., 100). Det. fluorescence of samples, std, and reagent blank. Subtract reagent blank correction, if any, from reading of std and samples.

% Decoquinat in feed =  $(0.003 \times \text{corrected fluorescence of sample}) / \text{corrected fluorescence of std.}$

**Dibutyltin Dilaurate (DBTD, Butynorate®)****Atomic Absorption Spectrophotometric Method (15)  
Official Final Action****42.055****Principle**

DBTD is extd from feed with  $\text{CHCl}_3$ , ext is filtered to remove feed particles, and aliquot is concd in presence of MeOH until  $\text{CHCl}_3$  is removed. MeOH soln is dild and filtered to remove feed interference, and Sn is detd by AA using air- $\text{C}_2\text{H}_2$  flame.

**42.056****Apparatus and Reagents**

(a) *Atomic absorption spectrophotometer.*—Double beam, operated at 286.3 nm with air- $\text{C}_2\text{H}_2$  flame and direct readout using 10 mv recorder. Optimize instrument according to manufacturer's instructions.

(b) *Hot plate.*—Regulated to  $\pm 3^\circ$ .

(c) *Mechanical shaker.*—Wrist-action type (Burrell Corp., or equiv.).

(d) *Tin std solns.*—(1) *Stock soln.*—500  $\mu\text{g}/\text{mL}$ . Accurately weigh ca 0.217 g dibutyltin bis(2-ethylhexanoate) (NBS SRM No. 1057 or Eastman Kodak No. 10427, % Sn certified) into 100 mL vol. flask, and dissolve and dil. to vol. with MeOH. (2) *Working soln.*—10  $\mu\text{g}/\text{mL}$ . Pipet 2 mL stock soln into 100 mL vol. flask, add 1.0 mL HCl, and dil. to vol. with MeOH.

**42.057****Preparation of Sample and Extraction**

Grind sample in high-speed blender to pass No. 20 sieve (ca 3 min), and mix thoroly. Accurately weigh aliquot contg ca 10  $\mu\text{g}$  Sn/mL in final soln (see Table 42.01), and transfer to 125 mL erlenmeyer. Add 50 mL  $\text{CHCl}_3$ , mix, and place flask in  $55\text{--}60^\circ$   $\text{H}_2\text{O}$  bath. Let sample reach bath temp.; then stopper tightly. Continue heating addnl 30 min, swirling occasionally. Remove from  $\text{H}_2\text{O}$  bath and shake mech. 20 min. Filter thru Whatman No. 4 paper, and collect  $\geq 30$  mL filtrate in 50 mL erlenmeyer.

Pipet 25 mL filtrate into 100 mL graduated beaker, add 2 boiling chips and 0.25 mL HCl, and conc. to ca 10 mL at gentle boil on hot plate. Add 20 mL MeOH and conc. sample to ca 10 mL again; then repeat with addnl 20 mL and 30 mL portions MeOH. (Raise temp. of hot plate to maintain gentle boiling as ratio of MeOH to  $\text{CHCl}_3$  increases.) Remove from heat and let cool to room temp. Transfer MeOH soln to 25 mL vol. flask, washing beaker and funnel with 2–3 five mL portions MeOH, dil. to vol. with MeOH, and mix thoroly. Filter thru Whatman No. 42 paper and collect filtrate in another 25 mL vol. flask.

Prep. blank by dilg 1 mL HCl to 100 mL with MeOH.

**42.058****Determination**

(Caution: See 51.006.)

Let spectrophtr warm up thoroly and equilibrate by aspirating MeOH 15 min, using air- $\text{C}_2\text{H}_2$  flame and triple slot burner head. Zero spectrophtr by aspirating blank; then aspirate sample and std solns, using conditions given in (a). Repeat sequence for each sample.

$$\begin{aligned} \% \text{DBTD} &= A \times C \times 50 \times 5.32 \times 10^{-6} \times (100/A') \times W \\ &= (A/A') \times (0.266/W), \end{aligned}$$

**Table 42.01 Sample Weights for DBTD-Containing Feeds**

%DBTD	Feed Sample, g
0.020 (Polystat)	13.00
0.0375 (Tinostat)	7.00
0.0700 (Wormal)	3.75
0.1400 (Wormal)	2.00

where  $A$  and  $A'$  refer to sample and std, resp.;  $C = \text{g std/mL}$ ; and  $W = \text{g sample}$ .

#### Diethylstilbestrol (DES) (16)—Official First Action

##### 42.059

##### Reagent

*Diethylstilbestrol std soln.*—55  $\mu\text{g/mL}$ . Prep. stock soln contg 0.55 mg USP Ref. Std Diethylstilbestrol/mL  $\text{CHCl}_3$ . Dil. 10 mL of this stock soln to 100 mL with  $\text{CHCl}_3$ .

##### 42.060

##### Apparatus

(a) *Lamp.*—UV or germicidal lamp. Wattage of lamp and distance from cell should be such that peak absorption results with min. rise in temp. of soln, preferably  $\leq 1^\circ$ . (*Caution:* See 51.016.)

(b) *Spectrophotometer.*—With  $W$  lamp and matched 1 cm absorption cells. Cells must be silica or quartz, if used for irradiation.

(c) *Cells.*—Matched 1 cm quartz absorption cells or transparent quartz tubes, 16  $\times$  150 mm for irradiation.

##### 42.061

##### Standardization

Place quartz cells or tubes in suitable holder, rigidly fixed, so that cells or tubes are irradiated transversely and at fixed distance from lamp. (Do not irradiate from top.) Distance may be 15 cm or whatever gives irradiation max. between ca 5–12 min. Cells or tubes must be clean and dry for each detn. Det. optimum irradiation time by irradiation in quartz cells of ca 3 mL HOAc contg DES at time intervals of 1 min increments to find approx. irradiation max. Depending on source of irradiation, more exact irradiation time for max.  $A$  may result with shorter time intervals.

Pipet 1 mL std soln into 100 mL beaker, evap. in air current, add 10 mL HOAc, stir, and transfer ca 3 mL portions to each of 2 or 3 cells for irradiation. Cool, if necessary, and det.  $A$  at 415 nm as in 42.062. Alternatively, use mixt. of alcohol and 0.1M  $\text{K}_2\text{HPO}_4$  (1+1) as solv.

*Irradiation is critical and conditions must be carefully observed.* Check frequently against std soln, and use exact same conditions for samples. Time of exposure may be longer with feed ext than with pure DES soln.

##### 42.062

##### Determination

Accurately weigh 20 g "40-mesh" sample, add 2–3 g Dicalite or other diat. earth, mix well, transfer to extn thimble (33  $\times$  94 mm), and place piece of absorbent cotton in top of thimble. To extn flask add 140 mL solv. mixt. contg 7% v/v EtOH in  $\text{CHCl}_3$ , and ext 16 hr or overnight at rate of  $\geq 100$  drops/min in Soxhlet extractor. After extn, leave part of  $\text{CHCl}_3$  in upper part of app. and transfer it to another flask. If insol. material is present in main ext, filter into 100 mL vol. flask (glass wool in funnel is suitable), rinse with rest of  $\text{CHCl}_3$  from other flask, cool, dil. to vol. with  $\text{CHCl}_3$ , and mix.

Pipet 25 mL into 125 mL separator (aliquot 1). Transfer another 25 mL into second 125 mL separator (aliquot 2). Into second separator pipet 1.0 mL DES std soln, contg 55  $\mu\text{g}$ . Add 25 mL  $\text{CHCl}_3$  and 25 mL 1N  $\text{H}_2\text{SO}_4$  to each separator and wash by inverting funnel with rotary motion 6 times rather vigorously. Transfer lower  $\text{CHCl}_3$  layer to another 125 mL separator, add 10 mL  $\text{CHCl}_3$  to acid soln, and wash again as before. Combine  $\text{CHCl}_3$  solns, discarding aq. soln.

Add 10 mL 1N NaOH and invert separator with rotary motion rather vigorously ca 12 times but not hard enough to cause serious emulsions. Drain  $\text{CHCl}_3$  layer into another 125 mL separator. Again ext this  $\text{CHCl}_3$  with 10 mL 1N NaOH in same

way. Discard  $\text{CHCl}_3$  layer and combine alk. exts in separator.

To combined alk. exts add 5 mL  $\text{CHCl}_3$ , shake few sec, discard lower  $\text{CHCl}_3$  layer, and repeat 3 or 4 times in same way until  $\text{CHCl}_3$  exts are colorless. Transfer washed alk. ext to 100 mL beaker. To this separator add 5 mL  $\text{H}_2\text{O}$ , shake, and add to combined alk. ext. Add 10 mL 2N  $\text{H}_3\text{PO}_4$ , cool to room temp., and adjust to pH  $9.0 \pm 0.1$  with 2N  $\text{H}_3\text{PO}_4$ . (*Caution:* Rinse separators that contained combined NaOH exts at least twice with  $\text{H}_2\text{O}$  to remove all alk.)

Return pH-adjusted soln to original separator (alk.-free) from which it was taken, rinsing beakers with two 2 mL portions  $\text{H}_2\text{O}$ . Rinse beakers with 15 mL  $\text{CHCl}_3$ , shake 30–60 sec carefully to avoid emulsions, transfer lower  $\text{CHCl}_3$  layer to clean, dry separator, and ext pH-adjusted soln twice more in same way with 15 mL portions  $\text{CHCl}_3$ . Combine all  $\text{CHCl}_3$  exts, add 25 mL  $\text{H}_2\text{O}$ , and shake briefly. Filter  $\text{CHCl}_3$  ext thru 30 mL fritted glass funnel (ca 20  $\times$  100 mm), medium porosity, contg 2 cm anhyd.  $\text{Na}_2\text{SO}_4$ , into 50 mL vol. flask. Wash the  $\text{H}_2\text{O}$  with small portions  $\text{CHCl}_3$  and use to rinse  $\text{Na}_2\text{SO}_4$  and funnel. Continue to rinse funnel with  $\text{CHCl}_3$  to 50 mL vol. Mix, and pipet 25 mL aliquot into 150 mL beaker previously rinsed with  $\text{CHCl}_3$ . Evap. just to dryness on steam bath with aid of air current (manifold arrangement works well on series of samples). Evap. last of  $\text{CHCl}_3$  with air current only.

Pipet 10 mL HOAc, or alcohol-0.1M  $\text{K}_2\text{HPO}_4$  (1+1), into the beaker. Stir with glass rod to ensure soln of DES. Transfer ca 3 mL into each of 2 or 3 matched quartz cells (1 cm thickness). Read  $A$  at 415 nm before irradiation. Immediately place cells in front of lamp, as in 42.061, and irradiate under same conditions. Read  $A$ . If quartz tubes are used, readings before irradiation can be made on remaining 4 mL of soln for blank correction.

Calc. by increment method for each solv., where  $A$  refers to sample after irradiation;  $A_0$ , before;  $B = A$  of sample plus added DES after irradiation;  $B_0$ , before.

$$\text{mg DES/lb feed} = (A - A_0) \times 4.99 / [(B - B_0) - (A - A_0)]$$

*Alternative calculations.*—Prep. std curve from 27.5, 41.25, 55.0, 82.5, and 110  $\mu\text{g}$  DES. After correcting for blank, det.  $\mu\text{g}$  DES from  $A$  reading.

$$\text{mg DES/lb feed} = \mu\text{g} \times 0.1815$$

#### 1,2-Dimethyl-5-nitroimidazole (Dimetridazole) (17) Official First Action

##### 42.063

##### Principle

Dimetridazole is extd from feeds with MeOH, sepd from interfering substances by two alumina chromatgc steps, and detd spectrophtrically at its UV wavelength max. Nihydrazone, furazolidone, zoalene, 2-chloro-4-nitrobenzamide, tylosin, and large amts procaine (from procaine penicillin) interfere.

##### 42.064

##### Apparatus and Reagents

(a) *Spectrophotometer.*—For use in UV.

(b) *Chromatographic tubes.*—13  $\times$  150 mm and 15  $\times$  250 mm, constricted at bottom to hold glass wool plug and 6 mm od delivery tube.

(c) *Aluminum oxide.*—Suitable for chromatgy, 42.029(b). To det. suitability of alumina, perform detn on feed that does not contain dimetridazole or other imidazole drugs. If feed appears to contain  $>0.004\%$  dimetridazole, use another batch of alumina.

(d) *1,2-Dimethyl-5-nitroimidazole (dimetridazole) std solns.*—(1) *Stock soln.*—0.1 mg/mL. Weigh 100 mg dimetridazole std (available from Salsbury Laboratories) into 100 mL vol. flask. Dissolve in  $\text{H}_2\text{O}$  by shaking frequently ca 20 min. Dil. to vol. with  $\text{H}_2\text{O}$  and mix. Pipet 20 mL into 200 mL vol. flask, dil. to vol. with  $\text{H}_2\text{O}$ , and mix. (2) *Working solns.*—Pipet 5, 10, 20, 30, and 40 mL

stock soln into sep. 100 mL vol. flasks. Add 5.0 mL 3*N* HCl to each, immediately dil. to vol. with H<sub>2</sub>O, and mix. Pipet 5 mL each soln and 5 mL 0.10*N* NaOH into sep. 50 mL erlenmeyers. Stopper and mix. These solns contain 2.5, 5, 10, 15, and 20 µg dimetridazole/mL.

**42.065****Preparation of Standard Curve**

Proceed as in 42.068, using working std solns and blank prep'd by mixing 5 mL 0.15*N* HCl with 5 mL 0.10*N* NaOH.

Read *A* against blank for recording or manual spectrophotrs. Construct std curve by plotting *A* against µg dimetridazole/mL.

**42.066****Preparation of Sample**

Weigh portion finely ground feed contg 0.5–2.0 mg dimetridazole (usually 5 g) into 100 mL vol. flask. Add 70–75 mL MeOH and place in 60° const temp. bath 30 min. Make certain that H<sub>2</sub>O level covers flask to ca 3 mm below MeOH level. Swirl flask 2 or 3 times during first 5 min to heat evenly. Cool to room temp., dil. to vol. with MeOH, and mix. Let stand 5–10 min to let coarse feed particles settle.

**42.067****Chromatography**

Place small glass wool plug in bottom of 250 × 15 mm chromatgc tube and add 8 cm layer alumina; pack column tightly to prevent streaking. (If streaks enter effluent, pos. bias is introduced.) Decant methanolic ext onto column so that settled feed particles are not disturbed. Collect ca 30 mL eluate in 50 mL vol. flask. Stopper until ready for use.

(*Note:* Dimetridazole sublimes at temps >70°; manner of solv. removal is critical.) For feed contg 0.015% dimetridazole, pipet 15 mL effluent (4 mL if feed contains 0.06%; 3 mL if feed contains 0.10%) into 125 mL suction or r-b flask and evap. under reduced pressure from H<sub>2</sub>O aspirator. If 15 mL is taken, use hot plate (low heat) or H<sub>2</sub>O-bath to reduce to 3–4 mL. Shake to prevent bumping. When vol. approaches 3–4 mL remove flask from heat and remove last 3–4 mL only with heat from palm of hand. Continue shaking to prevent bumping. Do not attempt to attain complete dryness because part of the 2–3 drops of oily residue is dimetridazole.

Wash down walls of flask, beginning at base of neck, with 5.0 mL 0.10*N* NaOH. Swirl to wash walls. Let stand 5 min and add 5.0 mL 0.15*N* HCl. Swirl to mix and wash flask walls. Stopper until ready for chromatgc.

**42.068****Determination**

Prep. second alumina column by inserting small glass wool plug into bottom of 150 × 13 mm chromatgc tube, add 4 cm layer alumina, and tap gently to pack column lightly. Pour entire 10 mL soln onto column and let pass thru by gravity. Collect effluent in 50 mL erlenmeyer. Force out liq. adhering to column by applying air pressure with rubber bulb. Swirl flask to mix. Stopper until ready to read. Pass blank soln of 5 mL 0.15*N* HCl and 5 mL 0.10*N* NaOH thru sep. 4 cm alumina column as above.

(a) *Using recording spectrophotometer.*—Fill matched pair silica cells with reagent blank and with sample soln (always use same cell for blank) and scan from 330 to 310 nm. Read *A* at peak and obtain concn of soln in µg/mL from std curve.

$$\% \text{ Dimetridazole} = \frac{(\mu\text{g/mL from std curve}) \times \text{diln factor}}{\times 100} / (\text{g sample} \times 10^6),$$

where diln factor =  $1.335 \times 10^{-3}$  for feeds contg 0.015%;  $5 \times 10^{-3}$ , 0.06%; and  $6.66 \times 10^{-3}$ , 0.1%.

(b) *Using manual spectrophotometer.*—Locate peak *A* of sample soln (ca 318 nm), using matched pair silica cells, and set wavelength at peak. Read *A* of sample and blank solns and

correct sample for blank. Obtain concn of soln in µg/mL from std curve, and calc. % in feed as above.

**Ethopabate (Methyl 4-acetamido-2-ethoxy-benzoate) (18)****Official Final Action****42.069****Principle**

Ethopabate is extd from feed by 50% MeOH at room temp. Clear filtrate is acidified with dil. HCl and extd with CHCl<sub>3</sub>. Most interfering substances (amines, *p*-aminobenzoic acid, procaine) are sepd. CHCl<sub>3</sub> ext is washed with Na<sub>2</sub>CO<sub>3</sub> soln to remove sulfaquinoxaline, acetyl-(*p*-nitrophenyl) sulfanilamide, and chlortetracycline. Ethopabate is converted to free amine by controlled acid hydrolysis. Free amine is diazotized and coupled; colored complex is extd with *n*-BuOH and read at 550 nm.

**42.070****Reagents**

(a) *Dilute hydrochloric acid.*—0.3*N*. Dil. 25 mL HCl with H<sub>2</sub>O to 1 L.

(b) *Sodium carbonate soln.*—Dissolve 40 g anhyd. Na<sub>2</sub>CO<sub>3</sub> in H<sub>2</sub>O and dil. to 1 L.

(c) *Coupling reagent (NED).*—Dissolve 50 mg *N*-(1-naphthyl)ethylenediamine.2HCl in 25 mL H<sub>2</sub>O. Prep. fresh as needed.

(d) *Ethopabate std solns.*—(1) *Stock soln.*—0.400 mg/mL. Weigh 40.0 mg Ethopabate Ref. Std (available from Merck & Co.) into 100 mL vol. flask, dissolve in MeOH, and dil. to vol. (2) *Intermediate soln.*—40 µg/mL. Pipet 10 mL stock soln into 100 mL vol. flask, dil. to vol. with aq. MeOH (1+1), and mix well. Stored in tightly stoppered flasks, solns are stable ≥1 month. (3) *Working soln.*—16.0 µg/20.0 mL. Pipet 5 mL intermediate soln into 250 mL vol. flask, dil. to vol. with aq. MeOH (1+1), and mix well.

**42.071****Extraction**

Grind feed sample to pass No. 20 sieve and mix thoroly. (High-speed blender grinds most feeds to desired fineness in ca 3 min.) Accurately weigh sample contg ca 80 µg ethopabate (do not exceed 20 g). Transfer to 250 mL g-s flask. Add 100.0 mL aq. MeOH (1+1) and mag. stirrer bar, stopper tightly, and stir 1 hr. (Mech. shaker that provides vigorous agitation may be used.) Centrf., or filter portion of ext thru fast paper. Collect only enough filtrate to supply aliquot for test. If necessary, store exts overnight at room temp. in tightly stoppered flasks.

**42.072****Removal of Interferences**

Pipet 20 mL clear ext into 50 mL centrf. tube. Add 5.0 mL dil. HCl (1+9) and 10 mL CHCl<sub>3</sub>, stopper with polyethylene stopper, and shake vigorously 3 min on mech. shaker. Centrf., and carefully transfer bottom CHCl<sub>3</sub> layer into clean 50 mL centrf. tube, using syringe with long needle. Repeat extn with two more 10 mL portions CHCl<sub>3</sub>. Add 10 mL Na<sub>2</sub>CO<sub>3</sub> soln to combined CHCl<sub>3</sub> exts, stopper, and shake 3 min. Centrf., and without disturbing interface, draw off most of top aq. layer, using syringe, and discard. Repeat washing with another 10 mL Na<sub>2</sub>CO<sub>3</sub> soln, discarding washing. Add 10 mL H<sub>2</sub>O to CHCl<sub>3</sub> ext, stopper, shake vigorously ca 1 min, and centrf. Draw off aq. layer and discard. Repeat with another 10 mL H<sub>2</sub>O. (To avoid loss of drug and low results, do not disturb interface on CHCl<sub>3</sub>, and complete extn and washings in shortest time possible. Prolonged contact with HCl and Na<sub>2</sub>CO<sub>3</sub> may cause partial hydrolysis of ethopabate.)

Pipet 20 mL aq. MeOH (1+1) into 50 mL centrf. tube, add 5.0 mL dil. HCl (1+9), and proceed as for sample (reagent blank).

Pipet 20 mL ethopabate working std soln (16.0  $\mu$ g) into 50 mL centr. tube, add 5.0 mL dil. HCl (1+9), and proceed as for sample (std).

#### 42.073 *Conversion of Ethopabate to Free Amine*

Quant. transfer washed  $\text{CHCl}_3$  exts to sep. 100 mL beakers. Rinse each centr. tube with two 3 mL portions aq. MeOH (1+1), adding rinsings to beaker. Place beaker on steam bath and evap.  $\text{CHCl}_3$  to vol. of ca 2 mL. Add 5.0 mL aq. MeOH (1+1) and swirl beaker to dissolve completely.

Quant. transfer soln to r-b centr. tube. Rinse beaker with 10, 10, and 5 mL portions 0.3N HCl. Immerse tube in boiling  $\text{H}_2\text{O}$  bath so that level of liq. in tube is just below level of  $\text{H}_2\text{O}$  bath. Heat 45 min. Remove tube from hot  $\text{H}_2\text{O}$  bath and cool to 10–15° in cold  $\text{H}_2\text{O}$  bath.

#### 42.074 *Development and Measurement of Color*

Remove tubes from cold  $\text{H}_2\text{O}$  bath. Add 1.0 mL freshly prep'd 0.2%  $\text{NaNO}_2$  soln to each tube, mix, and let stand 2 min. Add 1.0 mL 1.0%  $\text{NH}_4$  sulfamate soln, mix, and let stand 2 min. Add 1.0 mL NED soln, mix, and let stand 10 min. Add 5.0 g NaCl and 5.00 mL *n*-BuOH, stopper, and shake vigorously until NaCl dissolves. Centr., carefully transfer portion of clear, colored alc. layer to 1 cm cell, and read *A* at 555 nm against *n*-BuOH. Correct for reagent blank.

% Ethopabate in feed =  $0.008 \times (A - A_B) / [(A' - A_B) \times W]$ , where *A*, *A<sub>B</sub>*, and *A'* refer to sample, reagent blank, and std, resp., and *W* = g original sample.

**Furazolidone (*N*-[5-Nitro-2-furfurylidene]-3-amino-2-oxazolidone), Bifuran (Mixture of Furazolidone and Nitrofurazone), or Nitrofurazone (5-Nitro-2-furaldehyde semicarbazone) (19)—Official Final Action**

#### 42.075 *Reagents*

(a) *Phenylhydrazine hydrochloride soln.*—Dissolve 0.5 g phenylhydrazine.HCl in 50 mL  $\text{H}_2\text{O}$ . Prep. fresh daily. Mix equal vol. of this soln with HCl.

(b) *Furazolidone std solns.*—(1) *Stock soln.*—0.55 mg/mL. Weigh 55 mg furazolidone std (available from Hess & Clark) into 100 mL vol. flask, dil. to vol. with dimethylformamide (DMF), and mix. Soln is stable several months when protected from light. (2) *Working soln.*—Prep. working std corresponding to label declaration. For feeds contg 0.011% furazolidone, pipet 2 mL stock soln into 100 mL vol. flask, add 48 mL DMF, and dil. to vol. with  $\text{H}_2\text{O}$ . For feeds contg 0.00275% furazolidone, pipet 0.5 mL stock soln into 100 mL vol. flask, add 49.5 mL DMF, and dil. to vol. with  $\text{H}_2\text{O}$ .

(c) *Nitrofurazone std solns.*—(1) *Stock soln.*—0.56 mg/mL. Weigh 56 mg nitrofurazone std (available from Hess & Clark) into 100 mL vol. flask, dil. to vol. with DMF, and mix. Soln is stable several months when protected from light. (2) *Working soln.*—Prep. working std corresponding to label declaration. For feeds contg 0.0056% nitrofurazone, pipet 1 mL stock soln into 100 mL vol. flask, add 49 mL DMF, and dil. to vol. with  $\text{H}_2\text{O}$ . For feeds contg 0.0112% nitrofurazone, pipet 2 mL stock soln into 100 mL vol. flask, add 48 mL DMF, and dil. to vol. with  $\text{H}_2\text{O}$ .

(d) *Bifuran std solns.*—(1) *Stock soln.*—0.1285 mg/mL. Pipet 20 mL nitrofurazone stock soln and 3 mL furazolidone stock soln into 100 mL vol. flask and dil. to vol. with DMF. (2) *Working soln.*—For feeds contg 0.0064% total nitrofurans, prep. working std by pipetting 5 mL bifuran stock soln into 100 mL vol. flask, adding 45 mL DMF, and dilg to vol. with  $\text{H}_2\text{O}$ .

(e) *Adsorbent.*—To 100 parts alumina, 42.029(b), in screw cap bottle, add 4 parts  $\text{Mg}(\text{OH})_2$ , shake until thoroly mixed, then add

5 parts  $\text{H}_2\text{O}$ , and mix until all lumps disappear. Store in tightly sealed container.

#### 42.076

#### Determination

(Caution: See 51.018, 51.040, and 51.053.)

Grind coarse or pelleted feeds to "20 mesh" thru cutting-type mill such as Wiley Intermediate. Finer feeds need not be ground. Weigh 10 g sample into 125 mL erlenmeyer, add exactly 50 mL DMF, stopper loosely, and place in boiling  $\text{H}_2\text{O}$  bath 5 min. Mech. shake 10 min and filter thru rapid paper. To 25 mL filtrate add 25 mL  $\text{H}_2\text{O}$  and mix.

Prep. ca 20 mm diam. adsorption column, contg adsorbent, to ht of 5 cm. Pass the 50% DMF sample soln thru column, discarding first 3 mL eluate. (If column flow stops, break up gummy film at top of adsorbent, using long thin glass rod.) Pipet 5 mL aliquots of eluate into each of 2 numbered test tubes. Protect one tube from light. To other tube, add 3 drops freshly prep'd 2% soln of Na hydrosulfite and let stand 20 min, shaking at ca 5 min intervals. Treat 5 mL aliquots of working std soln in exactly same manner.

Pipet 5 mL phenylhydrazine.HCl soln into each of the numbered test tubes contg samples and stds. Mix and place tubes in 70°  $\text{H}_2\text{O}$  bath 25 min; cool in 15°  $\text{H}_2\text{O}$  bath 5 min. Add exactly 10 mL toluene to each tube, stopper, and shake vigorously 40 times. Centr. or filter toluene soln directly into absorption cell thru cotton wad inserted in stem of small funnel. Read *A* of solns at 440 nm.

$$\% \text{ Furazolidone} = [(A_{\text{samp.}} - A_{\text{red. samp.}}) \times 0.011 \text{ (or } 0.00275)] / (A_{\text{std}} - A_{\text{red. std}})$$

$$\% \text{ Total nitrofurans (bifuran)} = [(A_{\text{samp.}} - A_{\text{red. samp.}}) \times 0.0064] / (A_{\text{std}} - A_{\text{red. std}})$$

$$\% \text{ Nitrofurazone} = [(A_{\text{samp.}} - A_{\text{red. samp.}}) \times 0.0056 \text{ (or } 0.011)] / (A_{\text{std}} - A_{\text{red. std}})$$

#### 42.077 ★ *Glycarbylamide (4,5-Imidazoledicarboxamide) (20)—Official Final Action*

Glycarbylamide is extd from feed with dimethylformamide. Ext is purified by chromatgy on alumina and anion exchange resin, and traces of residual impurities are oxidized with Br. *A* of glycarbylamide is measured at 283 nm in alk. soln against portion of same soln from which glycarbylamide has been removed by adsorption on  $\text{HgO}$ . See 38.066–38.071, 11th ed.

#### Ipironidazole (1-Methyl-2-isopropyl-5-nitroimidazole) (21) Official First Action

#### 42.078

#### Principle

Ipironidazole is extd from feed with warm 0.2N HCl, transferred to benzene after alkalization, and measured by GLC with electron capture detector.

#### 42.079

#### Apparatus

(a) *Gas chromatograph.*—With electron capture detector. Conditions: temps (°)—column 180±2 (isothermal), injection 240±2, detector 210±2; N flow 60 mL/min (install 3' (0.9 m) × ¼" molecular sieve 5A trap in N line).

(b) *Recorder.*—Texas Instruments (PO Box 1444, Houston, TX 77001) 0–1 mv input and 1.0 sec full scale deflection, chart speed 0.75"/min, or equiv.

(c) *Gas chromatographic column.*—0.9 m (3') × ⅛" od stainless steel tubing packed with 5% Carbowax 20M-terephthalic acid (TPA) on 100–120 mesh Chromosorb G, acid-washed and

★ Surplus method—see inside front cover.

dichlorodimethylsilane-treated (Applied Science Laboratories, Inc.).

(d) *Column preparation*.—Dissolve 1.0 g Carbowax 20M-TPA in 30 mL  $\text{CHCl}_3$  and let stand over 19.0 g Chromosorb G 3 days with occasional swirling. After standing, evap.  $\text{CHCl}_3$  under N and dry 1 hr in 70° oven. After packing, condition column 2 days at 200° in slow stream of N before use.

**42.080****Reagents**

(a) *Benzene*.—Redistil from all-glass app., discarding first and last 10%. (Caution: See 51.011, 51.039, 51.040, and 51.045.)

(b) *Ipronidazole*.—Available from Hoffmann-La Roche, Inc.; prep. std soln contg 0.3  $\mu\text{g}$  ipronidazole/mL benzene.

**42.081****Chromatography of Standard**

Inject 5  $\mu\text{L}$  std ipronidazole soln into gas chromatograph and adjust conditions to obtain ca 5 min retention time. Det. area under ipronidazole peak as product of peak ht (cm) and width (cm) at half ht, using slope baseline technic. After satisfactory performance of column is established, inject at least duplicate 5  $\mu\text{L}$  aliquots of std soln (1.5 ng/5  $\mu\text{L}$ ) at beginning of work day and periodically thereafter (e.g., after each 5–6 sample injections). Measure ipronidazole peak area in each case.

**42.082****Preparation of Sample**

(Caution: See 51.018 and 51.045.)

Ext mash-type feeds without prior grinding. Grind pelleted feeds to pass No. 30 sieve before extrn. (Method for feeds is described for 0.0060% level of ipronidazole with modifications indicated for 0.0030 and 0.0090% levels.)

Transfer 10 g sample into 500 mL vol. flask (for 0.0030% level, use 20 g sample) and add exactly 200 mL 0.2N HCl previously warmed to 40±3°. Stopper flask and shake mech. 20 min. Let settle few min. Centrf. portion of supernate and pipet 10 mL (for 0.0090% level, transfer 5.0 mL and add 5 mL 0.2N HCl) to g-s centrf. tube. Place tube in cold  $\text{H}_2\text{O}$  bath and add 0.5 mL 5N NaOH to make alk. (pH = 10–12.5; check with Accutint pH paper; do not hold eluate at high pH for prolonged time). Pipet 20 mL benzene into tube, stopper, shake mech. 5 min, and centrf. 10 min at 2500 rpm. Pipet 5 mL clear benzene ext into 25 mL vol. flask, dil. to vol. with benzene, and mix. This is sample soln.

**42.083****Determination**

Inject 5  $\mu\text{L}$  sample soln into chromatograph. Measure area of ipronidazole peak obtained from chromatogram.

% Ipronidazole =  $(B \times C \times D)/(B' \times 10,000)$ ,

where  $B$  and  $B'$  = areas under ipronidazole peak for sample and std solns, resp.;  $C$  =  $\mu\text{g}$  ipronidazole/mL in std soln (0.3); and  $D$  = diln factor (0.0030% level,  $D$  = 100; 0.0060%, 200; and 0.0090%, 400).

★ Nequinate (Methyl 7-benzoyloxy-6-butyl-  
1,4-dihydro-4-oxo-3-quinolinecarboxylate) (22)  
Official Final Action

**42.084****Principle**

Coccidiostat nequinate is used in feed at 20  $\mu\text{g}/\text{g}$ . Drug is extd from feed with 1%  $\text{HCOOH}$  in  $\text{CHCl}_3$  and filtered; ext is dild with  $\text{CHCl}_3$ . Methanesulfonic acid (MSA) is added and fluorescence is measured against std treated in same manner.

★ Surplus method—see inside front cover.

**42.085****Apparatus**

(a) *Spectrophotofluorometer*.—With sufficient energy at 270 nm.

(b) *Automatic dilutor*.—0.1 mL dild to 20 mL with  $\text{CHCl}_3$ ; reproducibility ±0.1% (Labindustries, 620 Hearst Ave, Berkeley, CA 94710, No. 82001).

**42.086****Reagents**

(a) *Chloroform*.—Check each bottle before use to det. that it has fluorescence background ≤10% fluorescence of ref. std soln after addn of MSA.

(b) *Methanesulfonic acid (MSA) soln*.—Contg 50 mg MSA (Eastman Kodak Co. No. 6320)/mL  $\text{CHCl}_3$ ; prep. fresh daily.

(c) *Formic acid*.—97–100% (MC/B Manufacturing Chemists, FX 440, or equiv.).

(d) *Diethylamine (DEA) soln*.—Contg 50 mg DEA (bp 55–56°)/mL  $\text{CHCl}_3$ ; prep. fresh daily.

(e) *Nequinate std solns*.—(1) *Stock soln*.—1 mg/mL. Weigh 100 mg nequinate into 100 mL vol. flask. Dissolve and dil. to vol. with 1%  $\text{HCOOH}$  in  $\text{CHCl}_3$ . (2) *Working soln*.—4.0  $\mu\text{g}/\text{mL}$ . Dil. 10 mL stock soln to 100 mL with 1%  $\text{HCOOH}$  in  $\text{CHCl}_3$ . Further dil. 4.0 mL of this soln to 100 mL with same solv.

**42.087****Determination**

Grind pelleted or coarse feed to pass No. 30 sieve. Weigh 5 g sample into 40 mL centrf. tube with Teflon-lined screw cap. Add exactly 25 mL 1%  $\text{HCOOH}$  in  $\text{CHCl}_3$  (25 mL automatic pipet is convenient). Stopper tube and shake mech. 15 min. Filter small portion ext thru medium porosity fritted glass filter with aid of pressure. (Since <1.0 mL filtrate is required for next step, it is not necessary for all of ext to pass thru filter. Feed ext theoretically contains 4  $\mu\text{g}/\text{mL}$ .)

Dil. 2 fractions filtered ext to calcd concn of 0.02  $\mu\text{g}/\text{mL}$   $\text{CHCl}_3$ . Use either automatic dilutor (0.1 mL to 20 mL) or perform diln by transferring 0.5 mL filtered feed ext to 100 mL vol. flask, using Hamilton or tuberculin syringe, and dilg to vol. with  $\text{CHCl}_3$ . To one fraction,  $S^+$ , add 0.02 mL MSA soln/10 mL. To second fraction,  $S^-$ , add 0.02 mL DEA soln/10 mL. Dil. 2 fractions working std soln (4.0  $\mu\text{g}/\text{mL}$ ) to 0.02  $\mu\text{g}/\text{mL}$  in same manner. To one fraction,  $R^+$ , add 0.02 mL MSA soln/10 mL. To second fraction,  $R^-$ , add 0.02 mL DEA soln/10 mL. (MSA and DEA solns can be added most easily by use of micrometer buret.)

Using ref. std,  $R^+$ , adjust monochromators for max. fluorescence, excitation wavelength near 270 nm, and emission wavelength near 372 nm. Adjust gain to read ca 70% full scale and det. fluorescence of ref. stds ( $R^+$  and  $R^-$ ) and samples ( $S^+$  and  $S^-$ ).

$\mu\text{g}$  Nequinate/g sample =  $[(F_{S^+} - F_{S^-})/(F_{R^+} - F_{R^-})] \times (100/W_s)$ , where  $F_{S^+}$ ,  $F_{S^-}$ ,  $F_{R^+}$ , and  $F_{R^-}$  = fluorescence of  $S^+$  (sample with MSA),  $S^-$  (sample with DEA),  $R^+$  (ref. std with MSA), and  $R^-$  (ref. std with DEA), resp.; and  $W_s$  = g sample.

Nicarbazin (4,4'-Dinitrocarbanilide.2-hydroxy-  
4,6-dimethylpyrimidine) (23)—Official Final Action

(Presence of furazolidone, nitrofurazone, or nihydrazone may cause high results. Confirm presence of nicarbazin by Identification Test, 42.093.)

**42.088****Reagents**

(a) *Dimethylformamide (DMF)*.—Reagent grade.

(b) *Alumina*.—See 42.029(b).

(c) *Alcohol*.—Formulas SDA Nos. 2B, 3A, or 30 may be used.

(d) *Alcoholic sodium hydroxide soln*.—Dil. 2.0 mL clear 50%

NaOH soln, 50.033(b), to 100 mL with alcohol. Centrf. in stoppered tube. Prep. fresh daily.

(e) *Nicarbazin std solns.*—(1) *Stock soln.*—Weigh 25.0 mg Nicarbazin Ref. Std (available from Merck & Co.) into 500 mL vol. flask, and dissolve in ca 150 mL DMF with aid of gentle heat. Cool, dil. to vol. with DMF, and mix well. Store protected from light. (2) *Working soln.*—12.5 µg/mL. Transfer 25.0 mL stock soln to 100 mL vol. flask and dil. to vol. with DMF. Mix well.

**42.089****Preparation of Column**

Use glass tube 22 mm id, ca 50 cm long, constricted at lower end. Place plug of glass wool in constricted end and add 30 g alumina in 3 portions. Tamp each portion with glass rod while applying gentle suction. Wash column with 25 mL DMF, draining to point 1–2 cm above bed level before adding sample to column. Prep. column for each sample and std.

Never let column run dry; keep head of liq. at all times.

**42.090****Preparation of Sample**

(Caution: See 51.011, 51.040, and 51.053.)

Weigh 10.0 g sample into 250 mL erlenmeyer and add 100.0 mL DMF. Heat *just to bp* on hot plate in hood with intermittent stirring. Cool to room temp. by immersing in H<sub>2</sub>O bath. Decant supernate into centrf. tubes and centrf. 3 min.

**42.091****Determination**

(Caution: See 51.018, 51.040, and 51.053.)

Pipet 25.0 mL clear ext onto column and let pass thru column with aid of gentle suction. Wash column with three 10 mL portions DMF and reject washings. Elute with nine 5 mL portions alcohol, discarding first 15 mL eluate and collecting next 25 mL eluate in 25 × 200 mm tube. Quant. transfer eluate into 50 mL vol. flask and dil. to vol. with alcohol. Mix well.

Pipet 25.0 mL working std soln onto another column and proceed as for sample.

Pipet two 15.0 mL portions sample soln into sep. 25 mL vol. flasks. To one add 5.0 mL alc. NaOH soln and adjust vol. of both solns to 25 mL with alcohol. Read *A* of yellow soln formed in first flask within 5 min in spectrophtr or colorimeter at 430 nm against second soln as blank. Calc. wt nicarbazin from std curve.

**42.092****Preparation of Standard Curve**

Pipet 10, 15, and 20 mL aliquots of chromatgd working std soln into sep. 25 mL vol. flasks, add 5 mL alc. NaOH, and dil. to vol. with alcohol. Mix well. Measure *A* within 5 min at 430 nm against alcohol.

Prep. std curve by plotting *A* against µg nicarbazin.

**42.093****Identification Test**

Place alcohol in 1 cm quartz cell and clear chromatgd sample soln in matched cell. Det. *A* at 2 nm intervals from 340 to 349 nm with Beckman Model DU spectrophtr, or equiv., at min. slit width. Absorption max. at 344±4 nm confirms presence of nicarbazin.

**Nicotine (24)—Official Final Action**

(Applicable in the presence of phenothiazine, dibutyltin dilaurate, and 2,2'-dihydroxy-5,5'-dichlorodiphenylmethane)

**42.094****Principle**

Nicotine is extd with alkali, steam distd, extd with CHCl<sub>3</sub>, and detd spectrophtr in acidic soln.

**42.095****Reagents**

(a) *Dilute hydrochloric acid.*—0.05*N*. Dil. 4.1 mL HCl to 1 L with H<sub>2</sub>O.

(b) *Nicotine std soln.*—0.012 mg/mL. Accurately weigh ca 100 mg nicotine and dil. to 100 mL in vol. flask with 0.05*N* HCl. Transfer 3.0 mL aliquot to 250 mL vol. flask and dil. to vol. with 0.05*N* HCl. (Caution: Nicotine is very toxic.)

(c) *Antifoam.*—Antifoam A (Dow Corning Corp.), or equiv.

**42.096****Apparatus**

(a) *Distillation flask.*—250 mL r-b flask and Claisen distg head or 250 mL Claisen flask.

(b) *Condenser.*—Graham coil type with 300 mm jacket (Corning No. 2500, or equiv.). Must be used in vertical position.

(c) *Ultraviolet recording spectrophotometer.*—Double beam, capable of scanning UV spectrum from 220 to 300 nm, with 1 cm cells.

**42.097****Determination**

(Detn can be interrupted at any step where soln is acidic.)

Accurately weigh representative portion of feed, ground thru No. 20 sieve, contg ca 3 mg nicotine and transfer to 250 mL centrf. bottle. Add 100 mL 0.5% NaOH soln, stopper (Neoprene or rubber), and shake vigorously 1 min. Centrf. ca 5 min at 1500 rpm. Decant free flowing and viscous liq. into 400–600 mL beaker. Rinse lip and centrf. bottle into beaker with few mL H<sub>2</sub>O, being careful not to dislodge solid material. Repeat extn, centrfg, and rinsing twice, combining supernates in beaker. Adjust soln to pH 2–3 with HCl and evap. on hot plate to ca 100 mL. Cool, adjust to pH 10–14 with NaOH (1+1), and transfer quant. to distn flask, using min. of H<sub>2</sub>O. Vol. must be ≤125 mL. Add 10 drops antifoam to flask. Place tip of condenser below surface of 7 mL H<sub>2</sub>SO<sub>4</sub> (1+5) in 500 mL flask or beaker (container must be tilted at first to obtain sufficient depth). Steam distil at rate of ≥8 mL/min. (It will be necessary to heat Claisen flask as distn proceeds to avoid condensation of steam in flask.) Collect ca 300 mL distillate. When distn is complete, rinse condenser into receiver with ca 5 mL H<sub>2</sub>O.

Transfer distillate to 500 mL separator, rinse with H<sub>2</sub>O, make distinctly alk. (pH 10–14) with NaOH (1+1), and ext with five 20 mL portions CHCl<sub>3</sub>. Combine CHCl<sub>3</sub> exts in 250 mL separator. Ext nicotine from CHCl<sub>3</sub> with 20, 20, 15, 15, and 15 mL portions 0.05*N* HCl. Combine HCl exts in 125 mL separator and shake gently few sec with 15 mL pet ether to remove any remaining CHCl<sub>3</sub>. Drain clear HCl layer into 250 mL vol. flask and wash pet ether with addnl 10 mL 0.05*N* HCl. Drain acid layer into vol. flask, dil. to vol. with 0.05*N* HCl, and record UV spectrum from 220 to 300 nm in 1 cm cell against 0.05*N* HCl in recording spectrophtr. Draw line tangent to 2 min. obtained (ca 226 and 280 nm), drop perpendicular from point of max. *A* (ca 259 nm) to tangent line, and det. net *A*. Similarly det. net *A'* of std soln.

$$\% \text{ Nicotine in feed} = (\text{Net } A \times \text{mg nicotine in final std soln} \times 100) / (\text{Net } A' \times \text{g sample} \times 1000).$$

**Nifursol (3,5-Dinitrosalicylic acid (5-nitrofurfurylidene) hydrazide) (25)—Official First Action****42.098****Principle**

Nifursol is extd from feed with dimethylformamide (DMF). Feed interferences are removed from DMF soln by column chromatgy on alumina. Drug is reacted with phenylhydrazine to form 5-nitrofurfural phenylhydrazone, which is extd into toluene

and detd spectrophtric at 555 nm immediately after addn of methylbenzethonium hydroxide.

**42.099****Apparatus**

(a) *Chromatographic tubes*.—400 × 20 mm id, with glass wool plug.

(b) *Spectrophotometer*.—For use at 555 nm.

**42.100****Reagents**

(a) *N,N-Dimethylformamide (DMF) solns*.—(1) 95% DMF.—Dil. 95 parts DMF (MC/B Manufacturing Chemists, DX1730, or equiv.) with 5 parts H<sub>2</sub>O. (2) 50% DMF.—Dil. 50 parts DMF with 50 parts H<sub>2</sub>O.

(b) *Alumina*.—To 100 parts 80–200 mesh alumina (Alcoa F-40, Fisher Scientific Co., A-540), add 6 parts powd Mg(OH)<sub>2</sub>. Shake mixt. in screw-cap bottle until thoroly mixed. Add 8 parts H<sub>2</sub>O and immediately mix until all lumps disappear.

(c) *Phenylhydrazine soln*.—Prep. immediately before use by dissolving 0.25 g phenylhydrazine.HCl crystals in 25 mL H<sub>2</sub>O. Add 25 mL HCl.

(d) *Hyamine® hydroxide 10-X (methylbenzethonium hydroxide)*.—1M soln in MeOH (Packard Instrument Co., Inc., 2200 Warrenville Rd, Downers Grove, IL 60515, No. 6003005).

(e) *Nifursol std solns*.—(1) *Stock soln*.—0.25 mg/mL. Weigh 25 mg nifursol (mp 224–226°, Salsbury Laboratories) into 100 mL vol. flask. Add 5 mL DMF, mix until all material is dissolved, and dil. to vol. with MeOH. (2) *Working soln*.—6.25 µg/mL. Pipet 5.0 mL stock soln into 200 mL vol. flask, add 100 mL 95% DMF, and dil. to vol. with H<sub>2</sub>O. (Nifursol solns are not stable for long periods of time; prep. fresh as needed.)

**42.101****Extraction**

Weigh 5.00 g finely ground feed into 250 mL erlenmeyer. Add exactly 50 mL 95% DMF, stopper, and shake gently 5 min on mech. shaker. Place sample 30 min in 60° H<sub>2</sub>O bath, remove, and shake vigorously 30 min on mech. shaker. Filter thru rapid paper in buchner, using vac. Transfer 40.0 mL aliquot of filtrate to beaker, add 40.0 mL H<sub>2</sub>O, stir, and let stand 30 min in dark.

**42.102****Chromatography**

Add 7 cm specially prepd alumina to chromatgc tube contg glass wool plug. Tap column walls to settle alumina; then add 1.5 cm *Ottawa sand* (available from Sargent-Welch Scientific Co.). Prewash column with 50 mL 50% DMF just before use. Add DMF sample soln to column, discard first 60 mL eluate, and collect next 12 mL. (Decrease in flow rate may occur with some feed exts due to accumulation of fine ppt that settles on surface of alumina. Increase flow rate by stirring top of alumina and sand to break up ppt layer or by applying gentle air pressure to top of column.)

**42.103****Determination**

Pipet 5 mL aliquot into 20 mL test tube. Add 5 mL freshly prepd phenylhydrazine soln to tube, mix, and place 20 min in 40° H<sub>2</sub>O bath. Cool tube under cold tap H<sub>2</sub>O (<20°) 5 min, add exactly 5 mL toluene, stopper tube, and shake vigorously. (*Caution*: Do not use black rubber stoppers.) Centrf. 5 min to clear toluene layer and transfer 3.0 mL toluene to 1 cm cell. Add 0.1 mL methylbenzethonium hydroxide to cell and mix immediately. Read sample within 1 min at 555 nm on spectrophtr. Det. concn of nifursol from std curve.

**42.104****Preparation of Standard Curve**

Pipet 0, 2, 3, 4, and 5 mL aliquots working soln (equiv. to 0.000, 0.0050, 0.0075, 0.0100, and 0.0125% in feed) into sep. 20

mL test tubes. Dil. to 5 mL with 50% DMF. Develop color as in 42.103 and plot *A* against % drug in feed.

**Nihydrazone (5-Nitro-2-furfuraldehyde acetylhydrazone) (26)—Official Final Action**

**42.105****Reagents**

(a) 95% *Dimethylformamide (DMF)*.—Dil. 95 parts DMF (Eastman Kodak Co. No. 5870, or equiv.) with 5 parts H<sub>2</sub>O. (*Caution*: See 51.053.)

(b) *Nihydrazone std solns*.—(1) *Stock soln*.—Weigh 110 mg cryst. nihydrazone (available from Norwich Pharmacol Co., Norwich, NY 13815) into 100 mL vol. flask, dissolve in DMF, and dil. to vol. with DMF. Protected from light, soln is stable several months. (2) *Working soln*.—For feeds contg 0.011% nihydrazone, pipet 1 mL aliquot stock soln into 100 mL vol. flask, add 50 mL DMF, and dil. to vol. with H<sub>2</sub>O.

**42.106****Determination**

Weigh 10 g sample into 125 mL erlenmeyer, add exactly 50 mL 95% DMF, stopper loosely, and place in boiling H<sub>2</sub>O bath 5 min (or until temp. of solv. reaches 90°). Shake mech. 10 min and filter thru rapid paper. To 25 mL filtrate add 25 mL H<sub>2</sub>O and mix. Let stand, protected from light, ≥30 min. (Some solids may sep.; standing for longer time is permissible.)

Prep. ca 20 mm diam. adsorption column contg adsorbent, 42.075(e), to ht of 5 cm. (With highly colored feeds, use somewhat longer column.) Use plug of cotton or glass wool to support column, and similar plug or layer of washed sea sand on top. Pass sample soln thru column, collecting ca 15 mL eluate. Pipet 5 mL aliquots into each of 2 tubes. Protect 1 tube from light; to other add 3 drops *freshly prepd* 2% *Na hydrosulfite soln*, mix, and let stand 5 min. Treat 5 mL aliquots dild std soln similarly.

Pipet 5 mL phenylhydrazine soln, 42.075(a), into all test tubes, mix, and heat 20 min in 40° H<sub>2</sub>O bath. Cool by placing tubes in 15° H<sub>2</sub>O bath 5 min. Add exactly 10 mL toluene to each tube, stopper, and shake vigorously 40 times. Sep. and centrf. toluene layer, and read *A* at 440 nm.

$$\% \text{ Nihydrazone} = [(A_{\text{samp.}} - A_{\text{red. samp.}}) \times 0.011] / (A_{\text{std}} - A_{\text{red. std}}).$$

**Nithiazide (1-Ethyl-3-(5-nitro-2-thiazolyl) urea) (27)  
Official Final Action**

**42.107****Reagents**

(a) *Dimethylformamide (DMF)*.—Reagent grade. If *A* of reagent blank as detd in 42.110 is >0.050, purify as follows: Add 1 g activated charcoal, NF XI/100 mL DMF. Shake ca 2 min, and filter. Refilter if not clear. (*Caution*: See 51.018, 51.040, and 51.053.)

(b) *Alumina*.—See 42.029(b).

(c) *Procaine soln*.—Dissolve 100 mg procaine.HCl, USP, in 70 mL H<sub>2</sub>O, add 20.0 mL HCl, mix well, cool to room temp., dil. to 100 mL with H<sub>2</sub>O, and mix well.

(d) *Coupling reagent*.—See 42.017(d). Prep. fresh daily.

(e) *Nithiazide std solns*.—(1) *Stock soln*.—0.400 mg/mL. Weigh 40.0 mg nithiazide into 100 mL vol. flask, and dissolve in and dil. to vol. with DMF. Protected from light, soln is stable ca 6 weeks. (2) *Working soln*.—10 µg/mL. Pipet 5 mL stock soln into 200 mL vol. flask, dil. to vol. with DMF, and mix well.

**42.108****Extraction**

Accurately weigh amt of ground sample (≤4 g) contg ca 0.5 mg nithiazide and transfer to 100 mL vol. flask. Add 50.0 mL DMF, stopper loosely, and heat 10 min at 60–75° (not >75°) in H<sub>2</sub>O bath or on steam bath, swirling frequently. Remove flask

and mech. shake 15 min. Cool to room temp., transfer mixt. to 50 mL centr. tube, and centr.

**42.109****Chromatography**

(a) *Preparation of alumina*.—Transfer 200 g alumina to 1 L beaker. Add 500 mL H<sub>2</sub>O and agitate 5 min with mech. stirrer. Let settle 5 min and decant supernate. Repeat washing with 2 addnl 500 mL portions H<sub>2</sub>O and decant supernate as completely as possible. Add 300 mL MeOH to alumina and agitate ca 3 min. Filter thru buchner, continue to apply suction ca 5 min, and dry 4 hr at 110°. Store in tightly stoppered bottle.

(b) *Preparation of column*.—Prep. chromatgc tube as in 42.031(b). Transfer 3.0 g prepd alumina to tube in 2 equal portions. Lightly tamp each portion with glass rod while applying gentle suction. Wash column with 10.0 mL DMF and drain liq. to ca 5 mm above bed level prior to adding sample soln. Do not permit column to run dry; keep 5 mm head of liq. at all times. Prep. sep. column for each sample, std, and reagent blank.

(c) *Chromatography of feed extract*.—Pipet 20 mL clear feed ext onto column and let it pass thru column by gravity. Do not let column run dry; keep 5 mm head of liq. Wash inner walls of tube and alumina with three 4.0 mL portions DMF added from pipet. Let final DMF wash drain thru column until no further liq. appears at tip of column. Dry tip of column with filter paper.

Elute column by gravity with 4 mL portions H<sub>2</sub>O. Collect first 1.0 mL eluate in graduate and reject; then collect eluate in 25 mL vol. flask until liq. level is just below mark. Adjust with H<sub>2</sub>O to mark, stopper, and mix well. (Required time for elution should be ≤60 min; appreciably longer time indicates improper column prepn.)

**42.110****Determination**

Pipet 10 mL clear eluate into 25 mL vol. flask. Add 5.0 mL 1*N* NaOH, mix well, and let stand 10 min at 20–25°. Add 5.0 mL procaine soln, mix well, and let stand 2 min at 20–25°; then add enough coupling reagent to mark, stopper, mix, and let stand 15 min. (If colored soln is not clear, filter thru clean fritted glass funnel of medium or fine porosity.) Det. *A* of purple-red soln, in 1 cm cell in spectrophtr or colorimeter at 540 nm, against H<sub>2</sub>O as ref.

Prep. reagent blank by transferring 20.0 mL DMF onto freshly prepd column and proceeding in exactly same manner as for sample.

Prep. std. by transferring 20.0 mL nithiazide working std onto freshly prepd column and proceeding in exactly same manner as for sample.

$$\% \text{ Nithiazide in feed} = 5C(A - A_0)/8W(A' - A_0),$$

where *A* refers to sample, *A'* to std, *A*<sub>0</sub> to reagent blank, *C* = mg nithiazide in final aliquot of std (0.080 mg), and *W* = g original sample.

**Nitrodan (3-Methyl-5-(*p*-nitrophenylazo) rhodanine) (28)**  
**Official Final Action**

(Not applicable in presence of interfering nitro compds)

**42.111****Reagents**

(a) *N,N*-Dimethylformamide (DMF)-alcohol solvent.—(1+1). Mix equal vols DMF and alcohol (anhyd. or SDF 3A). Store in tightly closed container.

(b) *Nitrodan std solns*.—(1) *Stock soln*.—200 µg/mL. Weigh exactly 50 mg nitrodan (available from Pet Products, Div. of Cooper Laboratories, Inc., Brentwood, NY 11717). Rinse into 250 mL vol. flask with DMF-alcohol solv., and dil. to ca 150 mL. Break up nitrodan particles with flattened stirring rod and shake to

facilitate soln or dissolve, using mag. stirrer. (Be sure all particles are dissolved.) Dil. to vol. and mix. (2) *Working soln*.—10 µg/mL. Pipet 5 mL stock soln into 100 mL vol. flask, dil. to vol. with DMF-alcohol solv., and mix.

Prep. all std solns same day as std curve.

**42.112****Preparation of Standard Curve**

Pipet 5, 10, 15, and 20 mL (50, 100, 150, and 200 µg nitrodan) working soln into four 50 mL vol. flasks. Dil. almost to vol. with DMF-alcohol solv. and mix. Just before reading, add 1 drop 2*N* NaOH to each flask, dil. to vol. with DMF-alcohol, and mix. Read *A* in 1 cm cells at 575 nm against solv. Plot *A* against concn (µg/mL).

**42.113****Preparation of Sample**

(a) *Meals and pellets*.—Grind sample to pass sieve with 1 mm circular openings and mix thoroly.

(b) *Expanded dog food*.—Grind ca 3 oz (85 g) representative sample in high-speed blender until chunks are broken (30–60 sec). Transfer to mixing jar and brush in fines that adhere to blender. Mix thoroly.

**42.114****Determination**

Weigh 2.0 g sample (or larger if necessary) and transfer to small glass mortar. Add ca 15 mL DMF-alcohol and grind with pestle to ensure complete contact of drug and solv. Quant. transfer mixt. to medium porosity fritted glass funnel connected to 250 mL suction flask. Filter and wash with small portions of solv. until washings and residue are no longer violet. (Avoid unnecessary delay.) Transfer filtrate to vol. flask of vol. to yield final concn of 1–4 µg nitrodan/mL. Add 1 drop 2*N* NaOH just before reading, dil. to vol. with solv., and mix. Measure *A* within 10 min in 1 cm cell at 575 nm against solv.

% Nitrodan in sample = [(µg nitrodan/mL final soln) (from std curve) × 100]/(g sample/mL final soln) × 10<sup>6</sup>.

**42.115 Nitrofurazone—Official Final Action**

See 42.075–42.076.

**Nitromide (3,5-Dinitrobenzamide) (3,5-DNBA) (29)**  
**Official Final Action**

**42.116****Reagents**

(a) *Diethylamine reagent (DEA), aged*.—(1 year or older.) Fresh DEA may be artificially aged as follows: Place 1 L DEA in dry 2 L flask with 40 g Na or K fluosilicate. Connect flask to 60 cm (24") bulb reflux condenser and reflux on sand bath 2–3 days in hood. When reagent is sufficiently "aged," 2 mL clear DEA added to 8 mL dimethylsulfoxide contg 50 µg 3,5-DNBA should develop max. color in ca 40 min. *A* as read on Beckman DU spectrophtr at 560 nm should be ca 0.375; on Klett-Summerson photoelec. colorimeter with No. 56 filter, ca 200. Reagent must be free from turbidity. Prep. new std curve for each batch of DEA.

(b) *3,5-Dinitrobenzamide (DNBA) std solns*.—(1) *Stock soln*.—1 mg/mL. Weigh 100 mg 3,5-DNBA into 100 mL flask and dil. to vol. with MeOH. (2) *Working soln*.—20 µg/mL. Transfer 2.0 mL stock soln to 100 mL vol. flask and dil. to vol. with MeOH.

**42.117****Preparation of Standard Curve**

Place 1.0, 2.0, 3.0, and 5.0 mL working soln contg 20, 40, 60, and 100 µg, resp., of 3,5-DNBA in 4 colorimeter tubes. Evap. to dryness at 50° in air current. Dissolve residue in 8 mL dimethylsulfoxide at 70°, cool, and add 2 mL DEA reagent. Place in

dark at 20–25° and read after 1 hr. Plot std curve, using *A* as ordinate and concn as abscissa.

**42.118****Preparation of Sample**

Weigh 5.0 g feed, contg 0.025% 3,5-DNBA, into 100 mL vol. flask and dil. to vol. with MeOH. Shake frequently 20 min and let stand 40 min to permit feed particles to settle.

If feed contains 0.075% 3,5-DNBA, use 2 g finely ground feed; if 0.15%, use 1 g in 100 mL or 5 g in 500 mL MeOH. Prep. premixes by weighing appropriate sample and serially dilg MeOH ext.

**42.119****Determination**

Pipet 4 mL aliquot of ext into g-s test tube. Place tube in 50° H<sub>2</sub>O bath and evap. to dryness with air current directed onto surface of MeOH. Add 8 mL dimethylsulfoxide and heat to 70° to hasten soln; cool, and add 2 mL DEA reagent. Place in dark 1 hr at 20–25°. Det *A* at 560 nm in Beckman DU spectrophtr, Klett-Summerson photoelec. colorimeter with No. 56 filter, or similar instrument, against dimethylsulfoxide as ref.

Det. amt of 3,5-DNBA in tube from std curve.

% 3,5-DNBA in feed

$$= \mu\text{g 3,5-DNBA in tube} \times 25 \times 100/5,000,000;$$

or  $\mu\text{g 3,5-DNBA in tube} \times 5 = \mu\text{g 3,5-DNBA/g feed or ppm.}$

★ **Nitrophenide (m,m'-Dinitrodiphenyldisulfide) (30)** ★  
**Official Final Action**

(Applicable in presence of arsanilic acid)

**42.120****Reagent**

**Buffer soln.**—pH 6.6. Dissolve 41.29 g anhyd. Na<sub>2</sub>HPO<sub>4</sub> in H<sub>2</sub>O and dil. to 1 L. Dissolve 11.47 g citric acid in H<sub>2</sub>O and dil. to 1 L. Mix in equal proportions.

**42.121****Determination**

Transfer 2 g ground sample to 300 mL erlenmeyer, add 0.5 g Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> and 50 mL buffer soln, and place in boiling H<sub>2</sub>O bath 20 min. Remove flask, slowly add 10 mL HCl, and replace flask in boiling H<sub>2</sub>O bath 5 min. (This heating destroys arsanilic acid and ppts colloidal S.) Remove flask, connect to compressed air or vac. manifold, and aerate vigorously 15 min. Transfer to 100 mL vol. flask, cool, dil. to vol. with H<sub>2</sub>O, and mix. Filter thru Whatman No. 42 paper, or equiv., discarding first 15 mL filtrate if turbid.

Pipet 5 mL portions of clear filtrate into each of two 50 mL beakers; to each add 2 mL *freshly prepd* 0.1% NaNO<sub>2</sub> soln. After 5 min, add 2 mL 0.50% aq. NH<sub>4</sub> sulfamate soln, and let stand 2 min. Add 1 mL coupling reagent, **42.017(d)**, to first beaker and 1 mL H<sub>2</sub>O to second. Thoroughly mix solns after adding each reagent. After 10 min, add 15 mL H<sub>2</sub>O to each beaker and mix. Read *A* of both solns against H<sub>2</sub>O blank in spectrophtr at 545 nm. Subtract *A* of feed blank from sample *A* and det. amt of nitrophenide from std curve. Divide by 1000 to obtain % nitrophenide.

**42.122****Preparation of Standard Curve**

Transfer 0.10 g pure nitrophenide to 100 mL vol. flask, dissolve in 50 mL acetone, and dil. to vol. with acetone. Pipet 10 mL aliquot into another 100 mL vol. flask and dil. to vol. with acetone. Pipet 2, 3, 4, 5, and 6 mL portions of this dild soln into sep. 100 mL vol. flasks and carefully evap. in gentle air stream.

To each flask add 0.5 g Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> and 50 mL buffer soln, and proceed as in **42.121**, aerating 20 min. Plot std curve representing 10, 15, 20, 25, and 30  $\mu\text{g}$  nitrophenide against *A*.

**Note:** Detn may be performed in 100 mL vol. flasks, if care is taken to add HCl *slowly* and in *small portions* with const swirling, after reduction, in order to avoid excessive foaming and loss of soln.

**4-Nitrophenylarsonic Acid (Nitarson) (31)**  
**Official Final Action**

**42.123****Principle**

Nitarson is extd from feed with 50% dimethylsulfoxide (DMSO) and sep'd from interferences by alumina chromatgy. Nitro group is reduced with TiCl<sub>3</sub> and resulting amine assayed colorimetrically at 530 nm with Bratton-Marshall reaction. Arsanilic acid and carbarsone interfere.

**42.124****Reagents**

(a) **Nitarson std solns.**—(1) **Stock soln.**—1 mg/mL. Weigh 100 mg nitarson std (available from Salsbury Laboratories) into 100 mL vol. flask and dil. to vol. with 4% NaOH. (2) **Working soln.**—50  $\mu\text{g/mL}$ . Dil. 10 mL stock soln to 200 mL with 4% NaOH.

(b) **Activated alumina.**—Alcoa grade F-20, 80–200 mesh (available from Fisher Scientific Co. as Alumina, adsorption, Fisher No. A-540). To det. suitability of alumina, perform entire detn on 100  $\mu\text{g}$  nitarson. Recovery should be >95%.

(c) **Dimethylsulfoxide (DMSO) soln.**—50%. Dil. with equal vol. H<sub>2</sub>O. (**Caution:** DMSO can be harmful. Avoid skin contact by wearing heavy rubber gloves. Use effective fume removal device.)

(d) **Titanous chloride soln.**—4% aq. Prep. fresh daily from 20% soln open  $\leq 3$  months and kept refrigerated, or from solid TiCl<sub>3</sub>. If >1 min is required for color disappearance in detn, use fresh source of TiCl<sub>3</sub>. (**Caution:** TiCl<sub>3</sub> is corrosive. Wear disposable plastic or rubber gloves. Avoid contact with eyes.)

(e) **Sodium nitrite soln.**—0.1% aq. Prep. weekly.

**42.125****Preparation of Standard Curve**

Pipet 0, 2, 5, 10, 15, 20, and 25 mL working soln into sep. 100 mL vol. flasks and dil. to vol. with 4% NaOH. Pipet 10 mL from each flask into sep. 50 mL vol. flasks, add 15 mL 4% NaOH, and dil. to vol. with H<sub>2</sub>O. Pipet 4 mL from each flask into sep. test tubes and develop color as in **42.127**, beginning "... add 2 drops 4% TiCl<sub>3</sub> ..." Std concns correspond to 0, 0.004, 0.010, 0.020, 0.030, 0.040, and 0.050% nitarson in feeds. Plot std curve of *A* against % drug in feed.

**42.126****Preparation of Sample**

Accurately weigh 5 g finely ground feed into 100 mL vol. flask. Add 75 mL 50% DMSO, place sample on wrist action mech. shaker, and shake at room temp. 30 min. Dil. to vol. with 50% DMSO and mix. Transfer 30–40 mL to 50 mL centrf. tube and centrf. 10 min at 2000 rpm.

**42.127****Determination**

(**Caution:** See **51.018**.)

Add alumina to 20 × 400 mm chromatgc tube with fritted glass disk to depth of 7 cm. Tap tube wall to settle alumina; then add 1 cm layer of sand. Prewash column with 50 mL 50% DMSO before use.

Pipet 10 mL supernate from prepn of sample onto prewashed column. For feeds contg >0.04% nitarson, use smaller aliquot.

★ Surplus method—see inside front cover.

Let sample enter column and then wash into column with several 5 mL portions H<sub>2</sub>O. Wash column with 75 mL H<sub>2</sub>O and discard eluate.

Elute nitarsone with 65 mL 4% NaOH, discarding first 15 mL. Collect remaining eluate in 100 mL vol. flask, letting column run dry. Nitarsone is eluted with ca 25–30 mL eluant. Dil. eluate to vol. with H<sub>2</sub>O and mix.

Pipet 4 mL dild eluate into 2 test tubes, add 2 drops 4% TiCl<sub>3</sub> to each with mixing, and shake or mix on Vortex mixer until black color disappears. Add 2 mL HCl to each and mix thoroly. Add 0.5 mL 0.1% NaNO<sub>2</sub>, (e), and mix. After 5 min, add 0.5 mL 0.5% NH<sub>4</sub> sulfamate, 42.017(c), and mix. After 2 min, add 0.5 mL 0.1% coupling reagent, 42.017(d), to one tube and 0.5 mL H<sub>2</sub>O to second tube for blank. Let color develop 15 min; then read A of sample and blank at 530 nm on spectrophtr. Correct sample A for blank A and det. amt nitarsone in sample from std curve.

#### Phenothiazine (32)—Official Final Action

##### 42.128

##### Reagent

*Phenothiazine std soln.*—Dissolve 10 mg recrystd (from 10% soln in toluene) phenothiazine in 50 mL alcohol and dil. to 100 mL with alcohol. For working stds, dil. with equal vol. of alcohol. (1 mL dild soln = 50 µg phenothiazine.) Use freshly prepd soln; alc. solns gradually develop rose tint within few hr.

##### 42.129

##### Determination

Place 1 g ground sample in 100 mL vol. flask, add 50 mL alcohol, and heat on steam bath 15 min. Cool, dil. to vol. with alcohol, mix, and let settle (ca 15 min) until supernate is clear.

Place 2 mL aliquot in 25 mL vol. flask and add 10 mL alcohol. To flask add, in order given, 1 mL 1% alc. *p*-aminobenzoic acid soln, 1 mL aq. 2% NaNO<sub>2</sub> soln, and 1 mL HCl (1+3). Dil. to vol. with alcohol. Read A of green soln at 600 nm in spectrophtr against reagent blank. Det. amt of phenothiazine from std curve.

$$\% \text{ Phenothiazine} = \mu\text{g}/200.$$

Prep. std curve, using 1, 2, and 3 mL dil. std soln, as above.

#### Piperazine (33)—Official Final Action

##### 42.130

##### Principle

Piperazine or piperazine salt is quant. extd from feed into slightly acidic aq. soln. Dild filtrate is reacted with equal vol. benzoquinone soln at 80°. Colored complex formed is detd spectrophtrically at 490 nm.

Applicable to detn of 0.05–0.5% piperazine, usually present as one of its salts, in animal feeds. Amines give similar color reaction. Alkalies produce increased color; pH adjustment in method overcomes interference of this kind.

##### 42.131

##### Apparatus

(a) *Water bath.*—Approx. 25 cm (10") diam. with 15–20 cm (6–8") depth H<sub>2</sub>O. Thermostatically controlled at 80±0.1°. (Viscosity bath is satisfactory.)

(b) *Test tubes.*—Pyrex, 15 × 125 mm, with rubber stoppers, and rack capable of supporting tubes when immersed in H<sub>2</sub>O bath.

##### 42.132

##### Reagents

(a) *Quinone soln.*—Dissolve 0.5 g *p*-benzoquinone in 2.5 mL HOAc and little alcohol in dry 100 mL vol. flask and dil. to vol. with alcohol. Keep soln in ice bath or refrigerator. Prep. fresh daily. (Note: *p*-Benzoquinone is lachrymator; avoid breathing vapor and contact with skin and clothing.) If blanks are high or variable, purify *p*-benzoquinone by steam distn in hood.

(b) *Piperazine std solns.*—(1) *Stock soln.*—Dissolve exactly 185 mg pure piperazine.2HCl (equiv. to 100 mg piperazine) in H<sub>2</sub>O and dil. to 250 mL. (2) *Working soln.*—20 µg/mL. Dil. 25.0 mL stock soln to vol. in 500 mL vol. flask.

##### 42.133

##### Preparation of Standard Curve

Using working soln, add, by microburet or pipets, 20, 40, 60, 80, and 100 µg piperazine equiv. and intermediate values, if required, into test tubes. Dil. to 5 mL in each test tube with H<sub>2</sub>O. Include H<sub>2</sub>O blank with each detn.

Add 5 mL quinone reagent to each std and blank. Stopper tubes and mix by inverting. Remove stoppers and immerse in H<sub>2</sub>O bath at 80±0.1° exactly 10 min. (Bath temp. can be varied; use same temp. for samples and stds.) Immediately immerse tubes in ice bath 3 min. Let stand at room temp. ≥20 min, but ≤40 min. Read A at 490 nm in 1.0 cm cells, using reagent blank to zero instrument. Plot A of each std against µg piperazine.

##### 42.134

##### Determination

Weigh 10.00 g well mixed feed (grind pellets in mortar) into 500 mL (16 oz) wide-mouth, screw-cap bottle. Add exactly 200 mL H<sub>2</sub>O from graduate and adjust to pH 4–5 (0.15 mL H<sub>2</sub>SO<sub>4</sub> (1+2) is usually enough for 10 g feed). Cap or stopper bottle and place in wrist-action shaker 30 min. Add ca 5 g Celite (Note: some grades may retain piperazine) as slurry to buchner contg 9.0 cm Whatman No. 3 paper and pull down under full vac. Wash pad with small portion feed ext and discard washing. Rapidly filter remaining feed ext and reserve filtrate for color development. (Do not delay; turbidity may form.)

Pipet 25.0 mL filtrate into 250 mL vol. flask and dil. to vol. with H<sub>2</sub>O. Pipet 5 mL aliquot into test tube and immediately proceed with color development as in 42.133. Include H<sub>2</sub>O blank with each detn.

Prep. sample color blank for each feed as follows: Pipet 5 mL aliquot dild ext into test tube and 5 mL H<sub>2</sub>O into another test tube as ref. To each, add 5 mL soln contg 2.5 mL HOAc dild to 100 mL with alcohol. Mix by inverting and omit heating. Read A at same wavelength and subtract from sample reading. Include 1 or 2 stds with each detn to detect shift in std curve; adjust accordingly. Obtain µg piperazine from std curve.

$$\% \text{ Piperazine} = (\mu\text{g piperazine} \times 10^{-4})/\text{g sample in aliquot.}$$

#### Pyrantel Tartrate (E-1,4,5,6-Tetrahydro-1-methyl-2-[(trans-2-(2-thienyl)vinyl]pyrimidine tartrate, Banminth®)

##### Spectrophotometric Method (34)—Official First Action

(Applicable to range 0.0106–0.8811%. Pyrantel tartrate solns are light sensitive. Exts must be protected from direct sunlight or artificial light.)

##### 42.135

##### Apparatus

(a) *High-speed blender.*—Waring Blender, or equiv.

(b) *Centrifuge.*—International Model EXD-2 (Damon/IEC Div., 300 Second Ave, Needham Hts, MA 02194), or equiv., equipped to hold 50 mL g-s centr. tubes.

(c) *Filter aid.*—Celite 545, acid-washed, or Millipore prefilter pad (No. AP2507500, Millipore Corp., Ashby Rd. Bedford, MA 01730), or equivs.

(d) *Filtrator.*—Fisher No. 9-788, low form (Fisher Scientific Co.), or equiv.

(e) *Mixer.*—Vortex Genie mixer (Scientific Products), or equiv.

(f) *Spectrophotometer.*—For use at 311 nm, with 1 cm cells.

## 42.136

## Reagents

- (a) *Hydrochloric acid*.—0.1*N*. Dil. 8.33 mL HCl to 1 L with H<sub>2</sub>O.  
 (b) *Leaching soln.*—Dissolve 100 g NaCl in 1 L H<sub>2</sub>O, add 1 L MeOH, and mix vigorously. Prep. fresh daily.  
 (c) *Perchloric acid*.—0.24*M*. Dil. 20 mL HClO<sub>4</sub> to 1 L with H<sub>2</sub>O.  
 (d) *Sodium hydroxide*.—0.1*N*. Dissolve 4 g NaOH in H<sub>2</sub>O and dil. to 1 L with H<sub>2</sub>O.  
 (e) *Pyrantel tartrate std solns.*—(1) *Stock soln.*—0.80 mg/mL. Weigh 80.0 mg Pyrantel Tartrate Ref. Std (available from Pfizer, Inc., Quality Control, Agricultural Div., 1107 S MO Rt 291, Lee's Summit, MO 64063) into 100 mL vol. flask, dissolve in leaching soln, (b), and dil. to vol. with same solv. Use ultrasonic bath to speed soln. If std does not dissolve readily, remake. Prep. fresh daily. (2) *Working soln.*—0.16 mg/mL. Pipet 20 mL stock soln into 100 mL vol. flask, dil. to vol. with leaching soln, and mix well. Prep. fresh daily.

## 42.137

## Preparation of Samples

Weigh duplicate portions feed ground in high-speed blender, (a), into 125 mL erlenmeyers: 15.000±0.010 g for 0.0106% pyrantel tartrate; 1.800±0.010 g, 0.0881%; and 1.000±0.010 g, 0.881%. Add 60 mL leaching soln to 1 portion; add 50 mL leaching soln and, by pipet, 10 mL working std soln, (e)(2), to other portion of 0.0106% or 0.0881% pairs or 10 mL stock std soln, (e)(1), to other of 0.881% pair. Cap with polypropylene stopper and shake mech. 1 hr.

Quant. transfer mixt. to buchner precoated with Celite or contg prefilter pad, (c), rinsing flask with small portions leaching soln, (b), and collecting filtrate under vac. with Filtrator, (d), contg 250 mL erlenmeyer, until vol. filtrate is 150 mL. Transfer filtrate to 200 mL vol. flask, and dil. to vol. with leaching soln. For 0.881% level, pipet 50 mL dild filtrate into 250 mL vol. flask, and dil. to vol. with leaching soln.

## 42.138

## Determination

Pipet 25 mL prepd sample soln into 250 mL separator contg 5 g finely ground KI, and shake to dissolve. Pipet in 100 mL CHCl<sub>3</sub> and shake 45 sec. Transfer lower CHCl<sub>3</sub> layer to another 250 mL separator contg 25 mL 0.24*M* HClO<sub>4</sub>, and shake 10 sec. Transfer ca 35 mL lower CHCl<sub>3</sub> layer to 50 mL g-s centr. tube contg 10.0 mL 0.1*N* NaOH. Stopper tube, and mix on vortex mixer, (e), 15 sec while shaking back and forth. Centrf. 10 min at 990 × *g* (1800 rpm). Pipet 25 mL lower CHCl<sub>3</sub> layer from tube into another 50 mL g-s centr. tube contg 10.0 mL 0.1*N* HCl. Stopper tube, mix, and centr. as before. Rapidly record *A* of upper aq. layer at 311 nm against CHCl<sub>3</sub>-satd 0.1*N* HCl as ref. solv.

% Pyrantel tartrate =  $(A/W) \times [W'/(A' - A)] \times F \times 100$ , where *A* and *A'* refer to absorbance of sample and spiked sample, resp.; *W* = g feed, supplement, or conc.; *W'* = g pyrantel tartrate ref. std used to prep. std soln; *F* = [(1/100 mL) × (20 mL/100 mL) × 10 mL] for 0.0106% and 0.0881% levels; and *F* = [(1/100) × 10] for 0.881% level.

★ Racephenicol (*d,l*-Threo-2,2-dichloro-  
 N-[β-hydroxy-α-(hydroxymethyl)-*p*-  
 (methylsulfonyl) phenethyl] acetamide)  
 Official Final Action

## 42.139

## Method I (35)

(Applicable to levels ≥0.002%)

Racephenicol is extd from feed with acetone, and the dichloroacetamido group is converted to amine compd by alk. hydrolysis. After cleanup, amine is oxidized with periodate to

*p*-methylsulfonylbenzaldehyde, which is detd by UV spectro-photometry. With blank correction, method will measure levels as low as 0.002%. See 42.128–42.131, 12th ed.

## 42.140

## Method II (36)

(Applicable to levels ≥0.0005%; *Caution:*  
 See 51.011, 51.018, 51.039, 51.040, and 51.043.)

Samples are extd with hot CH<sub>3</sub>CN. Fats are selectively removed with hexane and CH<sub>3</sub>CN is volatilized. Nonvolatile material remaining is hydrolyzed to remove dichloracetamido group of racephenicol. Soln is cleaned up with CHCl<sub>3</sub> and oxidized with periodate, converting residual amine compd to *p*-methylsulfonylbenzaldehyde, which is measured by UV spectrophotometry, using curvature inversion technic. See 42.133–42.136, 12th ed.

## Reserpine (37)—Official Final Action

(Applicable at 0.2–2.0 ppm level)

## 42.141

## Reagents

- (a) *Citric acid soln.*—Dissolve 2.0 g citric acid.H<sub>2</sub>O in H<sub>2</sub>O and dil. to 100 mL.  
 (b) *Sodium nitrite soln.*—Dissolve 0.1 g NaNO<sub>2</sub> in 50 mL H<sub>2</sub>O and dil. to 100 mL with MeOH. Prep. fresh daily.  
 (c) *Sodium bicarbonate soln.*—Dissolve 1.0 g NaHCO<sub>3</sub> in H<sub>2</sub>O and dil. to 100 mL.  
 (d) *Dilute sulfuric acid.*—Add 3.0 mL H<sub>2</sub>SO<sub>4</sub> to ca 1 L H<sub>2</sub>O and let cool to room temp.  
 (e) *Quinine sulfate soln.*—0.5 μg/mL. Dissolve 50 mg quinine sulfate in dil. H<sub>2</sub>SO<sub>4</sub> and dil. to 100 mL with dil. H<sub>2</sub>SO<sub>4</sub> (Soln 1). Dil 2 mL Soln 1 to 100 mL with dil. H<sub>2</sub>SO<sub>4</sub> (Soln 2). Dil 5 mL Soln 2 to 100 mL with dil. H<sub>2</sub>SO<sub>4</sub> (Soln 3).  
 (f) *Reserpine std soln.*—2 μg/mL. Dissolve 50 mg reserpine in CHCl<sub>3</sub> and dil. to 50 mL (Soln 1). Dil. 4 mL Soln 1 to 100 mL with CHCl<sub>3</sub> (Soln 2). Dil. 5 mL Soln 2 to 100 mL with CHCl<sub>3</sub> (Soln 3). Prep. all solns fresh daily.  
 (g) *Desicote.*—Beckman Instruments No. 18772.

## 42.142

## Apparatus

(a) *Photofluorometer.*—With primary filter PC-6 (Corning Glass Works No. 7–51) and secondary filter PC-9A (Corning No. 3–71). Wavelengths of max. excitation and fluorescence of reserpine treated with HNO<sub>2</sub> are 390 and 510 nm, resp. (*Caution:* See 51.008.)

(b) *Separators.*—500, 125, and 60 mL Squibb-type with Teflon stopcocks. Coat 500 mL separators with Desicote as precaution to prevent adsorption of reserpine by glass during *n*-hexane-citric acid extn. Adsorption is particularly significant in 8 μg std. Add 10–20 mL Desicote fluid to one 500 mL separator and shake until entire inner surface is wetted. Drain Desicote into other 500 mL separator and repeat. Dry separators by passing air current thru them. Remove any visible film by rinsing with CCl<sub>4</sub>. Discard CCl<sub>4</sub> and air dry separators as before. (*Caution:* Desicote may be harmful. Avoid contact with skin and eyes. Use effective fume removal device.)

- (c) *Funnel.*—Buchner with fritted disk, coarse porosity, 60 mL.  
 (d) *Filter bell.*—New York Laboratory Supply Co. No. 35070, or equiv.

## 42.143

## Extraction

(All glassware must be scrupulously clean. Wash with CHCl<sub>3</sub> and/or MeOH and dry. Complete all assays in 1 day. Keep exposure of reserpine in CHCl<sub>3</sub> to light at min.)

★ Surplus method—see inside front cover.

Accurately weigh 2 ca 40 g samples. (Grind pelletized feed in high-speed blender ca 5 min.) Treat each sep. as follows: Press sample down firmly in funnel, (c). Add 15–20 mL  $\text{CHCl}_3$  (do not stir) to each funnel and collect filtrate in 100 mL vol. flask in filter bell with mild vac. Continue extns with 10–15 mL portions  $\text{CHCl}_3$  until ca 100 mL collects; dil. to 100 mL with  $\text{CHCl}_3$  and mix well.

(a) For 2.0 ppm (0.0002%).—Pipet 10 mL  $\text{CHCl}_3$  ext of each sample and 30 mL  $\text{CHCl}_3$  into sep. 500 mL separators.

(b) For 1.0 ppm (0.0001%).—Pipet 20 mL  $\text{CHCl}_3$  ext of each sample and 20 mL  $\text{CHCl}_3$  into sep. 500 mL separators.

(c) For 0.2 ppm (0.00002%).—Transfer 100 mL  $\text{CHCl}_3$  ext to 500 mL r-b flask, rinsing with several small portions  $\text{CHCl}_3$ , and evap. to ca 20 mL under vac. at  $\leq 60^\circ$  in rotating vac. evaporator. Transfer each concd ext to sep. 500 mL separators. Rinse flasks with two 10 mL portions  $\text{CHCl}_3$  and add rinsings to separators.

Add 400 mL *n*-hexane to each separator and mix well. To each of 2 addnl 500 mL separators, add exactly 4 mL std reserpine Soln 3, 36 mL  $\text{CHCl}_3$ , and 400 mL *n*-hexane. Treat both samples and stds similarly and simultaneously. Ext with three 20 mL portions citric acid soln by shaking each ext gently for total of 5 min. (To avoid emulsions, shake 1 min and let sep.; repeat shaking twice for 2 min, and let sep. after each shaking.) Combine citric acid exts in 125 mL separator and ext with three 10 mL portions  $\text{CHCl}_3$  by shaking gently ca 1 min for each extn. Combine  $\text{CHCl}_3$  exts in 60 mL separator, add 5 mL  $\text{NaHCO}_3$  soln, and shake gently 1 min. Let sep., and withdraw lower  $\text{CHCl}_3$  layer into 50 mL vol. flask. Dil. to vol. with MeOH, and mix well.

#### 42.144

#### Determination

Pipet two 15 mL portions of each feed ext and two 15 mL portions of each extd std into sep. 25 mL vol. flasks (total of 8 flasks). To each add 0.5 mL HCl and swirl gently. To 1 flask from each feed extn and to 1 from each std, add 1.0 mL  $\text{NaNO}_2$  soln from pipet and swirl gently (total of 4 flasks). To other flasks (blanks), add 1 mL dil. MeOH (1+1). Let stand 30 min, swirling occasionally, and dil. to vol. with MeOH.

Adjust photofluorometer to give galvanometer readings of 100 with quinine sulfate Soln 3 and to 0 with dil.  $\text{H}_2\text{SO}_4$ . (With other suitable instruments, set 4.0 mL unextd std reserpine Soln 3, dild and developed as above for extd stds, to 60–80.) Det. fluorescence of std preps, *S*; feed preps, *F*; and resp. blanks, *S*<sub>0</sub> and *F*<sub>0</sub>.

(a) For 2.0 ppm:

$$\% \text{ Reserpine} = (F - F_0) / [(S - S_0) \times 125 \times W]$$

(b) For 1.0 ppm:

$$\% \text{ Reserpine} = (F - F_0) / [(S - S_0) \times 250 \times W]$$

(c) For 0.2 ppm:

$$\% \text{ Reserpine} = (F - F_0) / [(S - S_0) \times 1,250 \times W]$$

where *W* = g feed sample.

#### Ronnel (O,O-Dimethyl-O-(2,4,5-trichlorophenyl) phosphorothioate)

#### Gas Chromatographic Method (38)—Official Final Action

#### 42.145

#### Apparatus

**Gas chromatograph.**—With electron capture detector. Operating parameters: Column 1.2–1.8 m (4–6') glass, 3–4 mm id packed with 5% (w/w) SF-96 silicone fluid on 60–80 mesh Chromosorb W; temps (°): column 195, inlet 220; carrier gas  $\text{Ar-CH}_4$  (95+5), 60 mL/min; and attenuation to give ca 50% scale deflection with 1 ng ronnel. (Retention time for ronnel should be 5–10 min. Adjust column temp. if necessary.) Significant

variations in replicate injections indicate instability of instrument or faulty injection, and these should be rechecked.

#### 42.146

#### Reagents

(a) *Hexane.*—Spectral grade.

(b) *Ronnel std solns.*—(1) *Stock soln.*—1 mg/mL. Dissolve 0.1000 g ronnel std sample (available from Dow Chemical USA, Ag-Organics Dept.) in hexane and dil. to 100 mL. (2) *Intermediate soln.*—20  $\mu\text{g/mL}$ . Dil. 2.0 mL stock soln to 100 mL with hexane. (3) *Working soln.*—1 ng/5  $\mu\text{L}$ . Dil. 1.0 mL intermediate soln to 100 mL with hexane.

#### 42.147

#### Determination

Weigh 10.0 g sample into 8 oz (250 mL) screw-cap extn bottle, or equiv. Add 200.0 mL acetone and shake 4 hr. Remove from shaker and centr. portion 10 min. Pipet 1.0 mL into 100 mL vol. flask and dil. to vol. with hexane.

Inject 5  $\mu\text{L}$  portions in following sequence: ronnel working std soln, dild sample ext, duplicate of dild sample ext, and ronnel working std soln. Record chromatogram of each.

Measure ronnel peak hts and calc. % ronnel, using av. peak hts from std replicates (PH') and ext replicates (PH) for each detn:

$$\% \text{ Ronnel} = (\text{PH}/\text{PH}') \times 0.04$$

Sample wt and aliquot specified are for feeds contg 0.04% ronnel. With feeds contg other levels of ronnel, use 10.0 g sample but select aliquot or aliquots to give expected ronnel concn of 1 ng/5  $\mu\text{L}$  final diln.

$$\% \text{ Ronnel} = (\text{PH}/\text{PH}') \times \text{g ronnel in std injected} \times F \times 100, \text{ where } F = 1 / [( \text{g sample/mL in final diln} ) \times ( \mu\text{L sample injected} \times 10^{-3} )]$$

#### Ultraviolet Method (39)—Official Final Action

(For mineral feed mixts contg 1–40% ronnel)

#### 42.148

#### Principle

Ronnel is extd from feed with MeOH, cleaned up with ion exchange resin, and detd by UV measurement.

#### 42.149

#### Reagents

(a) *Methanol.*—Absolute. Coefficient *C* as detd in calibration with MeOH should be 0.0322–0.0330. If outside this range, adjust to this value by adding 5–15 drops HCl/L MeOH. Det. *C* on same day samples are analyzed.

(b) *Ronnel std solns.*—See 42.146(b).

(c) *Ion exchange resin.*—Dowex 2-X8, 50–100 mesh. Obtainable in chloride form. Convert to acetate form as follows: Plug 10 × 300 mm chromatgc tube, equipped with Teflon stopcock, with glass wool. Fill with aq. slurry of resin to ht of ca 120 mm. Wash resin with ca 500 mL 10% aq. NaOAc soln until effluent gives only faint test for Cl with  $\text{AgNO}_3$  after acidification with  $\text{HNO}_3$ . (Use ca 4 lb/sq in. (276 kPa) N pressure to speed washing.) Keep resin covered with liq. during prepn, storage, and analysis. Extrude or wash resin into 100 mL beaker; wash 3 times with  $\text{H}_2\text{O}$  by decantation, then 3 times with MeOH. Pour MeOH slurry back into tube and wash with 50 mL HOAc-MeOH (1+4), followed by 50 mL MeOH. Keep resin column (now ready for use) covered with MeOH.

Resin can be used repeatedly unless samples contain considerable salt. Check activity periodically by passing 10 mL of soln of 50 mg trichlorophenol in 100 mL MeOH thru column, washing with three 10 mL portions MeOH, and dilg eluate to 100 mL with MeOH. If soln has noticeable peaks at 292 and 298 nm, discard

resin. To prep. larger amts of resin, use larger column. Store resin in closed container under MeOH. It is stable  $\geq 1$  month.

**42.150****Calibration**

Weigh 0.1000 g ronnel std into 100 mL vol. flask, dissolve in MeOH, dil. to vol., and mix. Dil. 10.0 mL to 100 mL with MeOH. Det A against MeOH in 1 cm Si cell at 302, 282, and 262 nm.

Calc. coefficient  $C$  (g ronnel/100 mL final soln/A unit) =  $0.01/\Delta A$ , where  $\Delta A$  is  $A_{282} - [(A_{302} + A_{262})/2]$ . Coefficient  $C$  should be ca 0.0326.

**42.151****Determination**

(Caution: See 51.018 and 51.040.)

Weigh 10.0 g sample into 8 oz (250 mL) extn bottle, or equiv., add 100.0 mL MeOH, stopper, and shake vigorously 15 min on mech. shaker. Decant thru folded 18.5 cm Whatman No. 2V paper, or equiv., into 500 mL vol. flask. Repeat extn twice, shaking 3 min each time with 100 mL MeOH. Wash residue from bottle onto paper and wash thoroly with three 50 mL portions MeOH. Dil. to vol. with MeOH and mix. Pipet 20 mL aliquot onto ion exchange column, (c), and collect eluate in 250 mL vol. flask. Wash column with three 10 mL portions MeOH (do not let MeOH level drop below resin surface). Dil. to 250 mL with MeOH and mix. (If sample is reasonably fresh or if presence of 2,4,5-trichlorophenol is not suspected, ion exchange resin cleanup step may be omitted.) Det.  $\Delta A$  against MeOH as in 42.150.

% Ronnel =  $(\Delta A \times C \times 100)/\text{g sample in 100 mL final soln}$

Sample wt and aliquot specified are for mineral mixts contg 5% ronnel. With mineral mixts contg other levels of ronnel use 10.0 g sample but select aliquot to give expected ronnel concn of 0.01 g ronnel/100 mL of final diln. Calc. % ronnel from above formula.

**42.152****Gas Chromatography**

If GLC measurement of ronnel is desired, dil. 1.0 mL undild MeOH sample ext to 100 mL with hexane. (Dil. aliquot of MeOH ext with hexane same day to avoid hydrolysis of ronnel in MeOH.) Dil. 1.0 mL of this dild ext to 50 mL with hexane. Measure response from 5  $\mu$ L injections of ronnel working std soln and final diln of ext as in 42.147.

% Ronnel =  $(\text{PH}/\text{PH}') \times 5$ ,

where PH and PH' are peak hts of sample and std resp.

Sample wt and aliquots specified are for mineral mixts contg 5% ronnel. With mineral mixts contg other levels of ronnel use 10.0 g sample but select aliquot to give expected ronnel concn of 1 ng/5  $\mu$ L final diln. Calc. % ronnel by general formula given in 42.147.

**Roxarsone****(4-Hydroxy-3-nitrobenzenearsonic acid)****(40)—Official Final Action**

(Not applicable to pelleted feeds contg hemicellulose ext)

**42.153****Principle**

Roxarsone is extd from feed with 2%  $\text{K}_2\text{HPO}_4$ . Proteins are pptd at isoelec. point and removed by centrfg. Ext is treated with activated C at pH 12 to remove interferences and roxarsone is detd spectrophtrically at 410 nm.

**42.154****Apparatus**

- (a) *Centrifuge*.—International Model V, or equiv.
- (b) *Mechanical shaker*.—Burrell wrist-action (Burrell Corp.), or equiv.

**42.155****Reagents**

(a) *Potassium phosphate, dibasic, soln.*—2%. Dissolve 2 g  $\text{K}_2\text{HPO}_4$  in 100 mL  $\text{H}_2\text{O}$ .

(b) *Dilute hydrochloric acid*.—Dil. 45 mL HCl to 200 mL with  $\text{H}_2\text{O}$ .

(c) *Sodium hydroxide soln.*—Dissolve 24 g NaOH in 100 mL  $\text{H}_2\text{O}$ .

(d) *Charcoal adsorbent*.—Activated (Darco G-60, or equiv.).

(e) *Roxarsone std soln.*—300  $\mu\text{g}/\text{mL}$ . Accurately weigh 300 mg Roxarsone Ref. Std (Salsbury Laboratories) into 1 L vol. flask. Dissolve and dil. to vol. with 2%  $\text{K}_2\text{HPO}_4$  soln.

**42.156****Preparation of Sample**

Grind sample in high-speed blender to pass No. 20 sieve (ca 3 min) and mix thoroly. Weigh 15.0 g ground sample into 125 mL erlenmeyer, add 50.0 mL 2%  $\text{K}_2\text{HPO}_4$  soln, place on mech. shaker, and shake vigorously 5 min at room temp. Immediately transfer to 100 mL centrfg. tube and centrfg. 10 min at 3000 rpm. Perform extn and centrfg with min. delay.

Decant 30 mL aliquot supernate into 50 mL graduated centrfg. tube, pipet in 1 mL dil. HCl, stopper, and mix thoroly. Let sample stand until protein flocculates (ca 15 min) and centrfg. 10 min at 3000 rpm.

**42.157****Purification**

Pipet 25 mL clear supernate into 125 mL erlenmeyer. Pipet in 1 mL NaOH soln, and mix thoroly. Add 2.0 g activated C and swirl sample several times during 30 min standing. Filter thru Whatman No. 42 fluted paper into 50 mL erlenmeyer. Repeat C treatment with second 2.0 g portion.

**42.158****Determination**

Place 3 mL filtrate in cell and det. A at 410 nm against  $\text{H}_2\text{O}$  blank. Add 2 drops concd HCl from dropper (or 5 mL serological pipet), mix, and reread A. Difference in A of acidic and basic samples represents roxarsone present. Det. amt from std curve.

**42.159****Preparation of Standard Curve**

Pipet 0, 1, 3, 5, 7, and 10 mL aliquots std roxarsone soln into 100 mL vol. flasks and dil. to vol. with 2%  $\text{K}_2\text{HPO}_4$  soln. Pipet 30 mL aliquot from each flask into sep. erlenmeyers, pipet 1 mL dil. HCl into each flask, and mix. Pipet 25 mL aliquot this soln into sep. 50 mL erlenmeyers, pipet in 1 mL NaOH soln, and mix thoroly. Transfer 3 mL soln from erlenmeyers into sep. cells and det. A at 410 nm against  $\text{H}_2\text{O}$  blank. Add 2 drops concd HCl from dropper (or 5 mL serological pipet), mix, and reread A. Plot difference in A of std solns against concn of solns expressed as 0, 0.001, 0.003, 0.005, 0.007, and 0.010% roxarsone in feed when 15 g sample is used.

**42.160****Determination in Premix**

Weigh appropriate size sample of premix, place in 200 mL vol. flask, and add 50 mL 2%  $\text{K}_2\text{HPO}_4$  soln and 4.0 mL NaOH soln. Let stand 20 min, shaking occasionally; then dil. to vol. with 2%  $\text{K}_2\text{HPO}_4$  soln and let feed particles settle 30 min. Proceed as in 42.156, par. 2, using appropriate aliquots and dilns to give final concns in range of std curve.

(Example: 5% Premix.—Place 5 g thoroly mixed premix in 200 mL vol. flask and ext as above. Transfer 10 mL aliquot ext to 100 mL vol. flask, dil. to vol. with  $\text{H}_2\text{O}$ , and mix thoroly. Transfer 10 mL aliquot this soln to another 100 mL vol. flask and dil. to vol. with  $\text{H}_2\text{O}$ . Diln factor for this premix is 1200.)

After diln, transfer 30 mL aliquot to 125 mL erlenmeyer. Pipet in 1 mL dil. HCl and mix. Transfer 25 mL this soln to 125 mL

erlenmeyer, pipet in 1 mL NaOH soln, mix thoroly, add 2.0 g activated C, shake several times during 30 min, and filter. Repeat C treatment. Read  $A$  of filtrate and det. concn of roxarsone as in 42.158, multiplying by diln factor.

#### Sulfonamide Drugs (41)—Official First Action

(Applicable to premixes and concs)

##### 42.161

##### Determination of Absorptivities

Prep. sep. std solns of sulfathiazole (SZ), sulfamerazine (SM), and sulfamethazine (SH) by accurately weighing ca 50 mg each compd and transferring to sep. 50 mL vol. flasks; add 5 mL alcohol and 2 mL  $\text{NH}_4\text{OH}$ , and swirl to dissolve. For sulfaquinoxaline (SQ), weigh 45 mg, warm on steam bath to dissolve, and cool. Dil. each flask to vol. with alcohol, and mix. Evap. 2 mL aliquots to dryness in sep. small beakers, transfer to sep. 200 mL vol. flasks (100 mL for SQ) with several small portions 0.1N NaOH, and dil. to vol. with 0.1N NaOH. Also dil. 25 mL aliquot SQ soln to 50 mL with 0.1N NaOH. Obtain spectrum of each soln in 1 cm cell against 0.1N NaOH from 400 to 220 nm.

$$\text{Calc. } a_{255} (1.00 \text{ mg}/100 \text{ mL}) = A \times 50/W,$$

where  $A$  is reading at max., ca 255 nm, corrected for  $A$  at 400 nm, if any, and  $W$  is mg compd weighed. (For SQ, use  $A$  of dild soln.)

For SQ, also calc.  $a_{358} (2.00 \text{ mg}/100 \text{ mL}) = A \times 50/W$ , where  $A$  is reading at max., ca 358 nm, corrected for  $A$  at 400 nm, if any, of more concd soln.

##### 42.162

##### Preparation of Sample

(a) *Solids*.—Transfer accurately weighed sample contg ca 50 mg sulfonamide with lowest concn to 50 mL vol. flask, add 5 mL alcohol and 2 mL  $\text{NH}_4\text{OH}$ , and warm 10 min on steam bath. Cool to room temp., dil. to vol. with alcohol, and mix.

(b) *Liquid concentrates*.—Pipet aliquot contg ca 200 mg sulfonamide with lowest concn into 200 mL vol. flask, dil. to vol. with alcohol, and mix.

For each sulfonamide declared, calc. an  $R$  value to 2 decimal places by dividing its labeled amt by that of sulfonamide with lowest labeled amt, whose  $R = 1.00$ . Calc. to 2 decimal places. Designate each ratio as  $R_{\text{SQ}}$ ,  $R_{\text{SZ}}$ ,  $R_{\text{SM}}$ , and  $R_{\text{SH}}$ , and their sum as  $R_T$ . (If 4 sulfonamides are present in equal amts, all  $R = 1.00$  and  $R_T = 4.00$ .)

##### 42.163

##### Determination of Sulfaquinoxaline

Pipet 5 mL sample soln into g-s flask and add accurately measured vol. alcohol so that total mL of final soln =  $10 \times R_T$  (Soln I). Mix, pipet 10 mL into small beaker, and evap. to dryness on steam bath. Transfer residue to 100 mL vol. flask with several small portions 0.1N NaOH, dil. to vol. with 0.1N NaOH, and mix (Soln II). Obtain spectrum from 400 to 300 nm, and det.  $A$  at max., ca 358 nm.

$$\% \text{ SQ} = [A_{358} \times 2 \times R_T \times (V/5) \times 100] / (a_{358} \times S),$$

where  $V$  = mL original sample soln (50 or 200), and  $S$  = mg original sample (for solids) or mL  $\times 1000$  (for liqs).

If Na salt declared,  $\text{NaSQ} = \text{SQ}/0.9318$ .

##### 42.164

##### Determination of Total Sulfonamides

Dil. 20.0 mL Soln II to 100 mL with 0.1N NaOH. Obtain spectrum from 400 to 230 nm and det.  $A_T$  at max., ca 255 nm.

$$\% \text{ Total sulfonamides} = [A_T \times V \times R_T^2 \times 100] / [(R \times a)_{\text{SQ}} + (R \times a)_{\text{SZ}} + (R \times a)_{\text{SM}} + (R \times a)_{\text{SH}}] \times S.$$

If Na salts are present, multiply each  $a$  by appropriate factor: NaSQ, 0.9318; NaSZ, 0.9207; NaSM, 0.9232; and NaSH, 0.9268.

#### Separation by Thin Layer Chromatography

##### 42.165

##### Preparation of Plates

(a) *Plates A*.—Weigh 30 g silica gel H or HF 254 (Brinkmann Instruments, Inc.) into 250 mL g-s flask. (Add 100 mg fluorescent indicator H 254 if silica gel H is used.) Add 70 mL  $\text{H}_2\text{O}$  and shake well 1 min. Coat five  $20 \times 20$  cm plates with 0.25 mm layer and air dry. Do not dry in oven and do not store in presence of drying agent.

(b) *Plates B*.—Proceed as in (a) but use 0.1N NaOH instead of  $\text{H}_2\text{O}$  to slurry silica gel.

##### 42.166

##### Preparation of Blanks

Develop a plate A in  $\text{CHCl}_3$ -MeOH (97+3) to ht of ca 15 cm. Scrape 2 spots, each ca 2 sq cm, from developed section of plate, into centr. tubes and ext with 10 mL 0.1N NaOH. Scrape 2 addnl spots, each ca 4 sq cm, from developed portion and ext with 50 mL 0.1N NaOH. Centr. the 4 exts 5 min at high speed and decant most of soln into sep. small beakers, being careful not to disturb sediment.

Develop a plate B in  $\text{CHCl}_3$ -MeOH (90+10) and proceed as above.

Det.  $A$  at max., ca 255 nm, of all 8 exts.  $A$  should be  $\leq 0.04$ . If readings are low and reproducible, average each set of 4 values for 2 and 4 sq cm exts, resp. If readings are high or not reproducible, recentrf. exts at higher speed, and be very careful to exclude sediment during decanting. Av. blank  $A$  may be used for all detns which use same batch of silica gel and same speed of centrfg.

##### 42.167

##### Thin Layer Chromatography

Spot 100  $\mu\text{L}$  sample soln on plate A and plate B by repeated application of adjacent drops on line 4 cm long, drying each drop with gentle air current before applying another drop at same place. Develop plate A in  $\text{CHCl}_3$ -MeOH (93+7) and plate B in (90+10) until solv. front reaches top of plate.

View plates under shortwave UV light and delineate each spot with dissecting needle, including small margins whenever possible. Plate A should have 2 completely sepd spots, designated as  $c$  (lower: SZ) and  $d$  (upper: SM+SH+SQ); plate B should have 3 completely sepd spots designated as  $f$  (lower: SQ+SZ),  $h$  (middle: SM), and  $p$  (top: SH). If less than indicated no. of spots are sepd, spot another aliquot over slightly longer line and develop as before.

Use collection tube consisting of 7–8 cm of 8 mm od glass tubing with short constriction at one end and medium fritted glass disk fused near center. Clean tube with strong air current and attach wide tube to vac. Draw as much of spot as possible into tube, using narrow tube to loosen adsorbent layer. Without disconnecting vac., transfer tube to 10 mL vol. flask for spot  $c$  and 50 mL for spot  $d$ . Release vac., and transfer material to flask with repeated gentle tapping. Repeat until entire spot has been transferred; then blow out tube into flask with gentle air current to remove last of particles.

Fill each flask ca  $\frac{1}{2}$  full with 0.1N NaOH, swirl well 1 min, dil. to vol. with 0.1N NaOH, and mix. Centr. all or  $\geq 10$  mL each soln at same speed used for blanks and carefully decant ca 8 mL into small beakers. Obtain spectrum of each soln from 400 to 230 nm and record  $A_c$  of spot  $c$  ext and  $A_d$  of spot  $d$  ext at max., ca 255 nm. Correct  $A_c$  for av. blank of 2 sq cm exts and  $A_d$  for av. blank of 4 sq cm exts.

$$\text{Calc. recovery factor, } F = [(5 \times A_d) + A_c] / (R_T \times A_T).$$

$$\% \text{ SZ} = (A_c \times V \times 100) / (a_{\text{SZ},255} \times F \times S)$$

$$\% \text{ NaSZ} = \% \text{ SZ} / 0.9207$$

From plate B, transfer spot *f* to 50 mL vol. flask and spot *h* and *p* to 10 mL vol. flasks. Obtain blank corrected  $A_t$ ,  $A_h$ , and  $A_p$  as for exts of plate A.

Calc. recovery factor  $F' = [(5 \times A_t) + A_h + A_p]/(R_T \times A_T)$

$$\%SM = (A_h \times V \times 100)/(a_{SM} \times F' \times S)$$

$$\%SH = (A_p \times V \times 100)/(a_{SH} \times F' \times S)$$

$$\%NaSM = \%SM/0.9232$$

$$\%NaSH = \%SH/0.9268$$

**Sulfadimethoxine (*N'*-(2,6-Dimethoxy-4-pyrimidinyl)sulfanilamide (42)—Official First Action**

**42.168**

**Reagents and Apparatus**

See 42.017(b), (c), and (d), and in addn:

(a) *Ficin soln.*—0.2%. Disperse 500 mg ficin (Calbiochem, fig latex) in  $H_2O$  (preheated to 40°) and dil. to 250 mL. Use 10 mL of this warm soln in detn. (Caution: Ficin is very potent proteolytic enzyme which attacks living tissues. Avoid contact with skin and eyes and breathing dust.)

(b) *Petroleum ether.*—Bp 35–60°, purified on silica gel column.

(c) *Trichloroacetic acid soln.*—3%. Dissolve 30 g  $CCl_3COOH$  in  $H_2O$  and dil. to 1 L. (Caution: See 51.082.)

(d) *Sulfadimethoxine std soln.*—Accurately weigh 125 mg sulfadimethoxine USP Ref. Std and transfer quant. to 100 mL vol. flask. Add ca 70 mL acetone and shake until completely dissolved. Dil. to vol. with acetone and mix. Pipet 20 mL soln into 200 mL vol. flask, dil. to vol. with acetone, and mix. Pipet 10 mL (or 5 mL if working at 0.00625% level) of last diln into 200 mL vol. flask contg 10 mL 0.2% ficin soln. Add ca 120 mL acetone and 2 mL 40% NaOH soln, and mix. Dil. to vol. with acetone and mix. Pipet 25 mL final diln into 50 mL g-s centrif. tube, evap. almost to dryness under N stream in 50°  $H_2O$  bath, and proceed as in 42.169, beginning "Pipet 15 mL pet ether into centrif. tube . . ." Resulting clear filtrate is std soln.

(e) *Reagent blank.*—Into 200 mL vol. flask pipet 10 mL 0.2% ficin soln and 2 mL 40% NaOH soln. Dil. to vol. with acetone and mix. Pipet 25 mL of this soln into 50 mL g-s centrif. tube, evap. almost to dryness under N stream in 50°  $H_2O$  bath, and proceed as in 42.169, beginning "Pipet 15 mL pet ether into centrif. tube . . ." Resulting clear filtrate is blank soln.

(f) *Spectrophotometer.*—With 5 cm cells, or photoelec. colorimeter with 540 nm filter, or equiv.

**42.169**

**Preparation of Sample**

(Caution: See 51.004, 51.018, 51.039, and 51.046.)

Pipet 10 mL 0.2% ficin soln into high-speed blender. Accurately weigh 10 g sample into blender, spreading carefully on surface of liq. Let sample soak 10 min.

Add ca 120 mL acetone. Blend 2 min, adjusting speed with variable transformer, so that acetone does not wet screw cap. (Caution: To release pressure, stop blending after 3–4 sec and unscrew cap momentarily.) Blend 2 min and remove screw cap. Push down into acetone all solid particles adhering to container wall, using rubber policeman. Replace screw cap and continue blending 1 min. Remove screw cap, pipet 2 mL 40% NaOH soln into container, and continue blending 2 min. Push down into acetone all solid particles adhering to wall of container, using rubber policeman.

Quant. transfer blender contents to 250 mL g-s graduate, using small portions acetone to total vol. of 200 mL. Stopper, mix well, and let liq. and solids sep. Wrap tip of 50 mL pipet with glass wool and transfer ca 40 mL ext to 50 mL g-s centrif. tube. Centrif. 5 min at 2000 rpm. Pipet 25 mL clear acetone ext into another centrif. tube and evap. almost to dryness (only few drops of oily, sirupy liq. left) under N stream in 50°  $H_2O$  bath.

Pipet 15 mL pet ether into centrif. tube and dissolve or disperse residue in it.

Pipet 25 mL 0.2*N* NaOH into centrif. tube, stopper, and shake mech. 5 min. Centrif. 10 min at 2000 rpm. By pipet, transfer lower NaOH layer (ca 24 mL) into another centrif. tube and centrif. 10 min at 2000 rpm. Pipet 20 mL clear soln into 100 mL vol. flask. Dil. to vol. with 3%  $CCl_3COOH$  soln. Mix and let stand 10 min. Filter entire soln thru Whatman No. 42 paper, discarding first 10 mL filtrate. If turbid, filter thru second paper. Clear filtrate is sample soln.

**42.170**

**Determination**

(a) *Reading on spectrophotometer with 5 cm cells.*—Pipet following vols (mL) of indicated solns into 6 sep. labeled 25 mL vol. flasks:

Soln	Sample 1	Sample 2	Sample Blank	Std 1	Std 2	Reagent Blank
Sample	15	15	15	—	—	—
Std	—	—	—	15	15	—
Blank	—	—	—	—	—	15

Pipet 1 mL 0.1%  $NaNO_2$  soln, 42.017(b), into each, mix, and let stand 3 min. Pipet 1 mL 0.5%  $NH_4$  sulfamate soln, 42.017(c), into each, mix, and let stand 2 min. Pipet 1 mL 0.1% coupling reagent, 42.017(d), into all except sample blank, and 1 mL  $H_2O$  into sample blank. Mix and let stand 10 min in dark. Dil. each flask to vol. with  $H_2O$  and mix. Measure *A* of each soln at 540 nm in 5 cm cell against reagent blank in ref. cell.

(b) *Reading on photoelectric colorimeter.*—Proceed as in (a) except do not dil. after standing, but read at existing vol.; 50 mL g-s centrif. tubes may be used in place of vol. flasks. Transfer solns from flasks or tubes to matched colorimeter tubes. Set instrument with 540 nm filter to 100% *T* (0 *A*) with tube contg reagent blank. Det. *A* ( $= 2 - \log (\%T)$ ) of each of other tubes contg samples, sample blank, and stds.

(c) *Calculation.*—Higher levels of sulfadimethoxine:

$$\% \text{ Sulfadimethoxine} = [(A - A_0) \times S]/(1000 \times A' \times W)$$

Lower levels of sulfadimethoxine:

$$\% \text{ Sulfadimethoxine} = [(A - A_0) \times S]/(2000 \times A' \times W)$$

where *A*, *A*<sub>0</sub>, and *A'* refer to sample, reagent blank, and std, resp.; *W* = g original sample; and *S* = mg std weighed.

**42.171 Sulfaguanidine (43)—Official First Action**

Weigh 1 g ground sample into 250 mL vol. flask, and add 100 mL  $H_2O$  and 2.5 mL 0.50*N* NaOH. Heat in  $H_2O$  bath 15 min with occasional swirling, cool, dil. to vol., and mix well. Let material settle, pipet 25 mL into 100 mL vol. flask, add 10 mL 1.00%  $ZnSO_4 \cdot 7H_2O$  soln, dil. to vol., mix well, and let stand 1 min. Filter thru 18.5 cm Whatman No. 2 paper, discarding first 10 mL filtrate. (Filtrate must be free of turbidity.)

Pipet 2 mL clear filtrate into 25 mL vol. flask; add 2.5 mL 0.50*N* HCl and 2 mL 0.1%  $NaNO_2$  soln, 42.017(b). Let stand 3 min. Add 2 mL 0.50%  $NH_4$  sulfamate soln, 42.017(c), and wait addnl 2 min. Add 2 mL coupling reagent, 42.017(d), and dil. to vol. Swirl flask after addn of each reagent. Prep. blank, using  $H_2O$  and same vols reagents dild to 25 mL. Shake vigorously. Measure *A* of colored soln in spectrophtr at 545 nm against reagent blank, and det. amt of sulfaguanidine present by ref. to std curve.

$$\% \text{ Sulfaguanidine} = \mu\text{g sulfaguanidine} \times 0.05$$

Prep. std curve as follows: Dissolve 0.010 g pure sulfaguanidine in 2.5 mL 0.50*N* NaOH and 100 mL  $H_2O$  in 250 mL vol. flask

by heating 15 min in boiling H<sub>2</sub>O bath. Cool, and dil. to vol. with H<sub>2</sub>O. Pipet 25 mL of this soln into 100 mL vol. flask, add 10 mL ZnSO<sub>4</sub> soln, dil. to vol., and filter (1 mL = 10 µg sulfaguanidine). Pipet 1, 2, 3, and 4 mL portions of this dild soln (equiv. to 10, 20, 30, and 40 µg sulfaguanidine, resp.) into sep. 25 mL vol. flasks, dil. to 10 mL with H<sub>2</sub>O, and proceed as in second par. beginning "... add 2.5 mL 0.50N HCl ...". Plot *A* against µg sulfaguanidine.

**Sulfamethazine (*N*-(4,6-Dimethyl-2-pyrimidinyl)sulfanilamide) (44)—Official First Action**

(Applicable to feeds contg procaine penicillin)

**42.172**

**Reagents**

See 42.017(b), (c), and (d) and in addn:

(a) 50% Methanol soln.—50% (v/v) aq. soln of MeOH.

(b) Sulfamethazine std solns.—(1) Stock soln.—Accurately weigh 0.100 g pure sulfamethazine (available from American Cyanamid Co.) into 100 mL vol. flask. Add 50 mL 50% MeOH soln and shake until dissolved. Dil. to vol. with 50% MeOH soln. Soln is stable at least several weeks. (2) Intermediate soln.—Pipet 5 mL stock soln into 200 mL vol. flask, dil. to vol. with 50% MeOH, and mix well. Soln is also stable several weeks. (3) Working soln.—2.5 µg/mL. Pipet 10 mL intermediate soln into 100 mL vol. flask, add 1 mL HCl and 50 mL 50% MeOH, dil. to vol. with H<sub>2</sub>O, and mix well. Soln is stable ca 2 weeks.

**42.173**

**Preparation of Sample**

Weigh 5.00 g sample into 250 mL g-s erlenmeyer. Add 100.0 mL 50% MeOH soln, shake well on mech. shaker 1 hr, and centrf. Pipet aliquot supernate contg ca 250 µg sulfamethazine into 100 mL vol. flask, add 50% MeOH, if necessary, to vol. of ca 60 mL, followed by 1.0 mL HCl, and 10 mL 1% ZnSO<sub>4</sub> soln. Let stand 10 min, dil. to vol. with H<sub>2</sub>O, and mix.

**42.174**

**Determination**

Filter portion of prepd soln thru Whatman No. 42 paper, or equiv., into 250 mL flask. Filtrate should be clear. Pipet two 10 mL aliquots filtrate and 10 mL working std soln into sep. 50 mL centrf. tubes. To each tube add 1.0 mL 0.1% NaNO<sub>2</sub> soln, mix and let stand 3 min. Add 1.0 mL 0.5% NH<sub>4</sub> sulfamate soln; mix and let stand 2 min. Add 1.0 mL 0.1% *N*-(1-naphthyl)ethylenediamine·2HCl soln to one of sample solns and to std soln. To second sample soln add 1.0 mL H<sub>2</sub>O (sample blank). Mix all solns well and let stand 10 min.

To sample, sample blank, and std soln add ca 10 mL CHCl<sub>3</sub>, stopper, and shake vigorously 30 sec (30 sec is required to ensure complete removal of procaine dye). Add 0.8 mL 10N NaOH to sample, sample blank, and std soln. Stopper and shake vigorously ≥1 min to ensure complete removal of procaine dye. Centrf. solns at 2000 rpm 5 min or until aq. layer is completely clear. Remove 10.0 mL aq. phase with pipet and transfer to 50 mL erlenmeyer or 50 mL beaker. Add 1.0 mL HCl and remove fumes formed in flask with aspirator or air stream.

Read *A* of sample, sample blank, and std (*A'*) at 540 nm in spectrophtr, against H<sub>2</sub>O blank. Correct *A* of sample by subtracting that of sample blank.

% Sulfamethazine = (*A*/*A'*) × (2.5 µg/mL) × (100 mL/mL ext aliquot taken) × (100 mL/5 g) × (1 g/10<sup>6</sup> µg) × 100.

**Sulfanitran (Acetyl-*p*-nitrophenyl)sulfanilamide; APNPS) (45)—Official Final Action**

**42.175**

**Reagents**

See 42.017(b), (c), and (d) and in addn:

Sulfanitran std solns.—(1) Stock soln.—100 µg/mL. Accurately weigh 100 mg pure APNPS (available from Salsbury Laboratories) into 1 L vol. flask, add enough 1N NaOH for complete soln, and dil. to vol. with H<sub>2</sub>O. (2) Working soln.—10 µg/mL. Dil. 10 mL stock soln to 100 mL with H<sub>2</sub>O.

**42.176**

**Preparation of Standard Curve**

Pipet 0, 4, 6, 8, and 10 mL aliquots working std soln into sep. 50 mL vol. flasks. Add 0.5 mL HCl and adjust vol. with H<sub>2</sub>O to ca 15 mL. Place flasks in boiling H<sub>2</sub>O bath 1 hr to deacetylate. Cool, and dil. to vol. Transfer 5 mL aliquot from each flask to sep. colorimeter tubes. Develop color by adding 0.5 mL 0.1% NaNO<sub>2</sub> soln (not >5 days old, stored in refrigerator), 0.5 mL 0.5% NH<sub>4</sub> sulfamate soln, and 0.5 mL coupling reagent. Det. *A* at 540 nm against reagent blank (0 mL aliquot).

(To establish most reliable std curve, make detns on 3 sep. days and use av. values.)

**42.177**

**Extraction and Deacetylation**

(For premixes, use proper dilns to give 5–10 µg APNPS in final aliquot, taking dilns into consideration in final calcn.)

Weigh 5.0 g sample into 100 mL vol. flask and add 80 mL MeOH. Place flask in 60° H<sub>2</sub>O bath until MeOH is hot. Repeatedly remove and immerse flask during 20 min, shaking frequently. Cool to room temp., and dil. to vol. with MeOH. Shake thoroly, and let stand 40 min to permit particles to settle.

Pipet 25 mL aliquot MeOH ext into 50 mL vol. flask. Add 10 mL H<sub>2</sub>O, 5 mL 1.0% ZnSO<sub>4</sub> soln, and ca 3 drops 1N NaOH to improve flocculation. (Keep near neutrality.) Place flask in boiling H<sub>2</sub>O bath 2 min to aid pptn; then cool to room temp., dil. to vol., mix thoroly, and filter thru Whatman No. 42 paper, or equiv. Discard first 5 mL filtrate.

Pipet 10 mL aliquot filtrate into 50 mL vol. flask contg 8.0 mL H<sub>2</sub>O and 0.5 mL HCl. Place flask in boiling H<sub>2</sub>O bath 1 hr to evap. MeOH and deacetylate APNPS, shaking frequently during first 15 min. Cool to room temp. and dil. to vol. with H<sub>2</sub>O. Centrf. if turbidity appears.

**42.178**

**Determination**

Place 5.0 mL aliquot in each of 2 colorimeter tubes. To 1 tube (blank) add 1.0 mL H<sub>2</sub>O and 0.5 mL coupling reagent. To other tube add 0.5 mL 0.1% NaNO<sub>2</sub> soln; after 3 min, add 0.5 mL 0.5% NH<sub>4</sub> sulfamate soln, wait 2 min, and add 0.5 mL coupling reagent. Close tube with thumb and invert immediately after adding each reagent. Let stand 10 min for color development and det. *A* of sample and blank at 540 nm in spectrophtr or colorimeter against H<sub>2</sub>O. Det. amt APNPS from std curve after subtracting *A* of blank.

% APNPS in sample = µg APNPS in tube × 200 × 100/  
(5,000,000 × µg sample) = µg APNPS × 0.004.

**Sulfaquinoxaline (46)**

**Method I—Official First Action**

(Applicable only to nonpelleted feeds contg arsanilic acid. In absence of arsanilic acid, use 42.184.)

**42.179**

**Principle**

Sulfaquinoxaline is extd from feed with DMF and sepd from interfering substances by column chromatgy on alumina. Isolated sulfaquinoxaline is acidified, diazotized, and coupled in presence of Zr, and colored complex is extd with BuOH and measured at 550 nm. Arsanilic acid remains in final aq. soln and can be measured at 540 nm and compared with std treated similarly.

**42.180****Reagents**

See 42.017(b), (c), and (d) and in addn:

(a) *Alkaline salt soln.*—Dissolve 2.0 g NaOH and 100.0 g NaCl in 500 mL H<sub>2</sub>O.

(b) *Zirconium soln.*—Dissolve 5.0 g zirconyl chloride, ZrOCl<sub>2</sub>·8H<sub>2</sub>O (Fisher Scientific Co.), in 100 mL H<sub>2</sub>O.

(c) *Sulfaquinoxaline std solns.*—(1) *Stock soln.*—Weigh 40.0 mg Sulfaquinoxaline Ref. Std (available from Merck & Co., Inc.) and dissolve in 50.0 mL DMF. Soln is stable at least 1 month if kept tightly stoppered and protected from light. (2) *Intermediate soln.*—80 µg/mL. Dil. 5 mL stock soln to 50 mL with DMF. (3) *Working soln.*—8 µg/mL. Dil. 5 mL intermediate soln to 50 mL with DMF. Prep. from freshly prepd intermediate soln just before use.

(d) *Butanol mixture.*—Mix 100 mL *n*-hexane with 400 mL *n*-BuOH.

**42.181****Preparation of Sample**

Weigh 4.00 g ground feed sample into 100 mL vol. flask. Add 50.0 mL DMF, stopper, and agitate by mag. stirrer or mech. shaker 60 min. Transfer mixt. to 50 mL centr. tube and centr. 5 min at 2500 rpm.

**42.182****Chromatography**

(a) *Preparation of column.*—Constrict end of 50–60 cm length of 9–11 mm id glass tubing by rotating in hot flame until opening is 4–5 mm. Insert small plug of Pyrex glass wool in lower end and compress with glass rod to thickness of 2–3 mm. Transfer 5.0 g alumina, 42.029(b), to dry tube and pack by gentle tapping while applying vac.

(b) *Separation.*—Pipet 10 mL clear ext onto column and let pass thru by gravity. Do not let column run dry; keep 5 mm head of liq. Wash inner walls with two 5.0 mL portions CHCl<sub>3</sub>. Let final washing drain until no further liq. appears at tip. Discard effluent and washings. Attach column tip to vac. and draw air thru until alumina is dry, indicated by tube returning to room temp. Elute column by gravity with 25 mL alk. salt soln, collecting eluate in 25 mL vol. flask. Add 1.0 mL HCl to eluate, dil. to vol. with H<sub>2</sub>O, and mix well.

Prep. reagent blank by transferring 10 mL DMF onto fresh column and proceeding as for sample. Prep. std by transferring 10.0 mL sulfaquinoxaline working std soln onto fresh column and proceeding as for sample.

**42.183****Determination**

Transfer 10 mL aliquots of each eluate to sep. centr. tubes. Add 2.0 mL Zr soln and mix. Add 1.0 mL 0.1% NaNO<sub>2</sub> soln, mix, and let stand 2 min. Add 1.0 mL 0.5% NH<sub>4</sub> sulfamate soln, mix, and let stand 2 min. Add 1.0 mL coupling reagent, 42.017(d), mix, and let stand 10 min. Add 2.0 g NaCl and 10.0 mL BuOH mixt., stopper, and shake vigorously until NaCl dissolves. Centr., carefully transfer portion of clear, colored top solv. layer to 1 cm cell, and read *A* at 550 nm against BuOH mixt. Correct for reagent blank.

$$\% \text{ Sulfaquinoxaline} = 0.04 \times (A/A')/W,$$

where *A* and *A'* refer to sample and std (blank corrected), resp., and *W* = g sample.

**42.184****Method II—Official Final Action**

(Applicable in absence of arsanilic acid)

Weigh 5 g ground sample into 250 mL vol. flask, add 150 mL H<sub>2</sub>O and 5 mL 0.5*N* NaOH, and place in boiling H<sub>2</sub>O bath 15 min. Remove, cool, dil. to vol. with H<sub>2</sub>O, mix, and let settle. Transfer 50 mL supernatant to 100 mL vol. flask, add 3 mL HCl, and dil.

to vol. Mix, and filter thru 18.5 cm Whatman No. 2 paper (or equiv.), discarding first 15 mL filtrate if turbid.

To 10 mL filtrate in each of two 50 mL beakers add 2 mL freshly prepd 0.1% NaNO<sub>2</sub> soln and let stand 3 min. Add 2 mL 0.5% NH<sub>4</sub> sulfamate soln and let stand 2 min. Add 1 mL coupling reagent, 42.017(d), to first beaker and 1 mL H<sub>2</sub>O to second beaker. Mix thoroly after adding each reagent. After 10 min, read *A* in spectrophtr at 545 nm. Subtract *A* of feed blank from sample *A* and det. amt of sulfaquinoxaline from std curve. Divide by 1000 to obtain % sulfaquinoxaline.

Prep. std curve as follows: Dissolve 0.250 g pure sulfaquinoxaline in 5 mL 0.5*N* NaOH and 50 mL H<sub>2</sub>O in 500 mL vol. flask, and dil. to vol. with H<sub>2</sub>O. Pipet 5 mL aliquot of this soln into 100 mL vol. flask and dil. to vol. with H<sub>2</sub>O. Pipet 2, 4, 6, 8, and 10 mL portions of this dild soln (equiv. to 50, 100, 150, 200, and 250 µg sulfaquinoxaline, resp.) into sep. 100 mL vol. flasks, add 3 mL HCl to each flask, and dil. to vol. with H<sub>2</sub>O. Treat 10 mL aliquots of these final dilns as in second par. Det. *A* at 545 nm against H<sub>2</sub>O blank, and plot *A* against µg sulfaquinoxaline.

**Thiabendazole (2-(4-Thiazolyl)-benzimidazole) (47)**  
**Official Final Action**

**Method I**

(Applicable to all feeds)

**42.185****Principle**

Thiabendazole is extd from feed with 0.1*N* HCl. Interferences are removed by adjusting ext to pH 5–6 with Na citrate and extg with CHCl<sub>3</sub>. Thiabendazole is re-extd with 0.1*N* HCl and reduced with Zn slurry in 30% glycerol in presence of *p*-phenylenediamine. Oxidn with ferric iron yields blue complex which is extd with BuOH and measured at 605 nm.

**42.186****Reagents**

(a) *Zinc dust.*—Reagent grade. Crush fine lumps with spatula immediately before use.

(b) *Zinc slurry.*—Weigh 50 mg *p*-phenylenediamine·2HCl (Caution: *p*-phenylenediamine may be harmful; see 51.084) and 2 g Zn dust into dry 100 mL g-s graduate. Add 100 mL 30% (v/v) glycerol soln, stopper, and shake ca 30 sec to suspend Zn dust uniformly. (There must be no agglomeration of Zn.) Prep. just before use and use immediately.

(c) *Ferric soln.*—Dissolve 15.0 g FeNH<sub>4</sub>(SO<sub>4</sub>)<sub>2</sub>·12H<sub>2</sub>O in 75 mL H<sub>2</sub>O, add 10.0 mL 1*N* H<sub>2</sub>SO<sub>4</sub>, dil. to 100 mL, and mix.

(d) *Thiabendazole std solns.*—(1) *Stock soln.*—0.5 mg/mL. Dissolve 50.0 mg Thiabendazole Ref. Std (available from Merck & Co.) in 0.1*N* HCl and dil. to 100 mL. Soln is stable ≥1 month. (2) *Intermediate soln.*—50 µg/mL. Dil. 10 mL stock soln to 100 mL with 0.1*N* HCl. Soln is stable ≥1 month. (3) *Working soln.*—5 µg/mL. Dil. 20.0 mL intermediate soln to 200 mL with 0.1*N* HCl. (Use same 0.1*N* HCl as in extn of feed.)

**42.187****Determination**

Grind ca 100 g well mixed sample to pass No. 30 sieve and mix. (3 min in high-speed blender should be enough.)

Weigh 2.000 g ground sample into 250 mL 24/40 flat-bottom extn flask. (For feeds contg <0.025% thiabendazole, weigh 5.000 g.)

Add 100.0 mL 0.1*N* HCl to sample and add mag. stirring bar. Connect flask to reflux condenser (Allihn, drip tip) and reflux gently on mag. hot plate, while stirring, 30 min. Cool, transfer mixt. to centr. tube, and centr. ca 5 min. Dil. measured aliquot of supernate to concn of 5 µg thiabendazole/mL (serial dilns may be necessary). Such dilns det. "dilution factor," *DF*:

Declaration, %	Sample wt, g	Dilution(s)	DF
0.01	5	none	1
0.025	2	none	1
0.1	2	25-100	4
1.0	2	10-100; 25-100	40
6.0	2	10-100; 10-250	250

Mark series of 50 mL centr. tubes 1, 2, 3, 4, etc. Place 20.0 mL 0.1*N* HCl in tube 1 and 20.0 mL (100  $\mu$ g) working std soln in tubes 2 and 3. Place 20.0 mL aliquots of sample solns in tubes 4, 5, etc. Add 3 g Na citrate, 3 g NaCl, and 20.0 mL  $\text{CHCl}_3$  to each tube, stopper tightly with polyethylene stopper, and shake mech. 5 min. Centrf. ca 5 min and discard top layers. With pipet, transfer 10 mL  $\text{CHCl}_3$  ext to dry, marked, centr. tubes, add 25.0 mL 0.1*N* HCl to each, stopper, and shake 5 min. Centrf., and transfer, with pipet, 15 mL of top acid layer to another marked tube. (Because of timing, handle  $\leq 10$  tubes at one time.)

With rapid delivery pipet, add 5 mL freshly prepd Zn slurry, (b), to each tube. (5 mL pipet with tip cut off to give delivery in ca 5 sec is suitable. Hold pipet directly over center of soln.) Do not shake tube but *immediately stopper* tightly and let stand 4 min. Start timing after delivery of slurry to first tube.

After 4 min, add 5.0 mL ferric soln, (c), to each tube with rapid pipet, stopper, and mix by inverting tube. Let stand 5 min; then shake vigorously and centr. ca 3 min. With pipet, transfer 15 mL clear, colored soln to marked, dry, centr. tubes. Let stand 45 min from addn of ferric soln. Then add 5.00 mL *n*-BuOH and 3 g anhyd.  $\text{Na}_2\text{SO}_4$  to each tube. Stopper, and immediately shake each tube ca 5 sec to avoid caking of  $\text{Na}_2\text{SO}_4$ ; then shake all tubes ca 3 min or until  $\text{Na}_2\text{SO}_4$  is completely dissolved, and centr.

Transfer clear BuOH soln (top layer) to dry 1 cm cell and read *A* at 605 nm against *n*-BuOH as ref.

% Thiabendazole in feed =  $(A - A_0)(C)(DF)/360(A' - A_0)W$ , where *A* refers to sample, *A*<sub>0</sub> to reagent blank (tube 1), *A'* to std, *C* =  $\mu$ g thiabendazole std in final 15.0 mL colored soln (18  $\mu$ g), *DF* = diln factor, and *W* = g original sample.

#### Method II

(Applicable to cattle supplements and premixes contg  $>1\%$  thiabendazole. Principle is same as 42.185, except that single extn at room temp. with 0.1*N* HCl is used. Not applicable to feeds, premixes, or cattle supplements contg high levels of protein.)

#### 42.188

#### Reagents

See 42.186 except:

(a) *Thiabendazole working soln.*—2  $\mu$ g/mL. Dil. 10.0 mL thiabendazole intermediate soln, 42.186(d)(2), to 250 mL with 0.1*N* HCl.

#### 42.189

#### Determination

Prep. sample as in 42.187, except use ca 50 g representative sample.

Weigh 2.000 g ground sample into 1 L vol. flask and add 750 mL 0.1*N* HCl. Add mag. stirring bar, stopper, and mix vigorously on mag. stirrer 1 hr at room temp. (Mech. shaker providing vigorous agitation may be used.) Remove and rinse bar, and dil. to vol. with 0.1*N* HCl. Mix, centr., and dil. aliquots of clear ext with 0.1*N* HCl to concn of 2  $\mu$ g thiabendazole/mL. Diln factors, *DF*, are as follows (see 42.187):

Declaration, %	Dilution	DF
1.0	10-100	10
2.5	4.0-100	25
6.0	4.0-250	62.5

Develop color in exts as soon as possible after extn. (Acid exts of some feeds deteriorate upon standing.)

Mark series of 50 mL centr. tubes ( $\leq 10$ ) as in 42.187. Add 15.0 mL 0.1*N* HCl to tube 1, and 15.0 mL working soln, (a), to tubes 2 and 3. Add 15.0 mL sample exts to other tubes. Then with rapid delivery pipet, add 5.0 mL freshly prepd Zn slurry as in 42.187. Proceed as in 42.187 with addn of ferric soln, observing same technics and time precautions. Read final clear BuOH ext, as above, in 1 cm cell at 605 nm.

% Thiabendazole in feed =  $(A - A_0)(C)(DF)/90(A' - A_0)W$ , where symbols are as defined in 42.187.

#### Zoalene (3,5-Dinitro-*o*-toluamide) (48)

#### Official Final Action

(Not applicable in presence of furazolidone, nitrofurazone, and nihydrazone)

#### 42.190

#### Principle

Zoalene is extd from feeds, premixes, and concs contg 0.004–25% with 85%  $\text{CH}_3\text{CN}$ . For mixes contg  $<1\%$ , alumina is added. After filtration and diln, zoalene is detd colorimetrically after reaction with ethylenediamine.

#### 42.191

#### Reagents

(a) *Acetone.*—95%. Add 5 mL  $\text{H}_2\text{O}$  to 95 mL acetone.

(b) *Acetonitrile.*—85%. Add 850 mL practical grade  $\text{CH}_3\text{CN}$  to 150 mL  $\text{H}_2\text{O}$  (deionized or distd).

(c) *Activated alumina.*—Alcoa grade F 20, 80–200 mesh. (Available from Fisher Scientific Co. "Alumina, Adsorption, Fisher.")

(d) *Dimethylformamide (DMF).*—95%. Add 5 mL  $\text{H}_2\text{O}$  to 95 mL tech. DMF. Prep. fresh daily, since old solns may cause cloudiness.

(e) *Ethylenediamine.*—98–100%. (MC/B Manufacturing Chemists). Reagent must be practically colorless.

(f) *Zoalene std soln.*—40  $\mu$ g/mL. Weigh 40.0 mg Zoalene Ref. Std (available from Dow Chemical USA, Ag-Organics Dept.) into 1 L vol. flask, dil. to vol. with 85%  $\text{CH}_3\text{CN}$ , and mix.

#### 42.192

#### Determination

Weigh 10.0 g sample into 250 mL erlenmeyer and add 65 mL 85%  $\text{CH}_3\text{CN}$ . Warm on steam bath to  $50 \pm 5^\circ$ , swirling occasionally. Let cool to room temp. (ca 30 min). Add 20 g alumina and swirl occasionally ca 3 min. (Addn of alumina is unnecessary for concs contg  $\geq 1\%$  zoalene.) Filter with suction on medium or fine porosity 40 mm diam. fritted glass funnel, transferring as much solids as possible. Transfer remaining solids with min. vol. 85%  $\text{CH}_3\text{CN}$ , and suck dry. Suspend cake in funnel with min. vol. 85%  $\text{CH}_3\text{CN}$  and slight stirring but without suction. Then filter with suction and repeat suspension and filtering, keeping total vol.  $<100$  mL. Transfer combined filtrates to 100 mL vol. flask (or vol. flask may be used to collect filtrates directly), dil. to vol. with 85%  $\text{CH}_3\text{CN}$ , and mix.

Based on zoalene concn, make addnl dilns with 95% acetone and use aliquots indicated in Table 42.02.

Pipet indicated aliquots into three 50 mL beakers, X, Y, and Z, for concns  $<0.25\%$ ; omit X for samples  $>0.25\%$ . Pipet 1 mL std soln into beaker Z and evap. all solns to dryness with air current. (Heat may be used but temp. must not exceed  $60^\circ$ .) Pipet 10 mL 95% DMF into X and 2 mL each into Y and Z. Swirl intermittently during 5 min to dissolve zoalene. Pipet 8 mL ethylenediamine into Y and Z and mix. If turbidity persists after 2 min, filter thru small Reeve Angel No. 804, or equiv., paper. Read *A* of solns at 560 nm in stoppered 1 cm cells against 95%

**Table 42:02 Dilution of Sample for Determination**

% Zoalene in Sample	Addnl Diln	Aliquot Size, mL	Multiplication Factor <i>M</i>
0.004–0.012	None	4	1
0.012–0.025	None	2	2
0.025–0.050	10 to 100	10	4
0.050–0.10	10 to 100	5	8
0.10–0.25	10 to 100	2	20
0.25–0.5	1 to 100	10	40
0.5–1.0	1 to 100	5	80
1.0–2.5	1 to 100	2	200
2.5–5.0	1 to 1000	10	400
5.0–10.0	1 to 1000	5	800
10.0–25.0	1 to 1000	2	2000

DMF 5 min after addn of ethylenediamine. Keep cell compartment of spectrophtr at <30° to avoid rapid fading of color. If *A* is >1, reanalyze, using greater diln or smaller aliquot.

$$\% \text{ Zoalene} = (A_Y - A_X) \times M / 100 (A_Z - A_Y).$$

**Caution:** CH<sub>3</sub>CN and ethylenediamine are toxic. Handle in hood and avoid contact with skin.

## ANTIBIOTICS

### Microscopic Test for Chlortetracycline (49) Official Final Action

#### 42.193

#### Apparatus

*Microscopes.*—See 7.124(a) and (b).

#### 42.194

#### Reagent

*Modified Sakaguchi reagent.*—Dissolve 5 g H<sub>3</sub>BO<sub>3</sub> in 150 mL H<sub>2</sub>O and add 350 mL H<sub>2</sub>SO<sub>4</sub>. Store in g-s bottle in refrigerator. Use cold.

#### 42.195

#### Determination

Grind sample as in 7.002. Pipet ca 10 mL Sakaguchi reagent into 9 cm petri dish. Place No. 60 sieve over petri dish. With top of spatula, sprinkle ca 0.5 g sample on sieve, and gently tap it to obtain good distribution of particles over liq. surface. Place under stereoscopic microscope and examine with transmitted light at ca 15×. If substage illumination is not available, place petri dish on white surface and illuminate with blue light.

As particles of antibiotic slowly dissolve, diffusing chlortetracycline turns intense purple. Color fades in 5–10 min.

## MICROBIOLOGICAL METHODS (50)

#### 42.196

#### Culture Media

(Deionized H<sub>2</sub>O may be used for prepn of media.)

(a) *Agar medium A.*—(Antibiotic Medium 1.) Dissolve 6.0 g pancreatic digest of gelatin, 4.0 g pancreatic digest of casein, 3.0 g yeast ext, 1.5 g beef ext, 1.0 g anhyd. glucose, and 15 g agar in H<sub>2</sub>O, and dil. to 1 L. Adjust with 1*N* NaOH or HCl (1+9) so that after sterilization pH is 6.5–6.6. (Difco Penassay Seed Agar and BBL Seed Agar have been found satisfactory.)

(b) *Agar medium B.*—(Antibiotic Medium 4.) Dissolve 6.0 g pancreatic digest of gelatin, 3.0 g yeast ext, 1.5 g beef ext, 1.0 g anhyd. glucose, and 15 g agar in H<sub>2</sub>O, and dil. to 1 L. Adjust with 1*N* NaOH or HCl (1+9) so that after sterilization pH is 6.5–6.6. (Difco and BBL Yeast Beef Agar have been found satisfactory.)

(c) *Agar medium C.*—(Antibiotic Medium 2.) Dissolve 6.0 g pancreatic digest of gelatin, 3.0 g yeast ext, 1.5 g beef ext, and 15 g agar in H<sub>2</sub>O, and dil. to 1 L. Adjust with 1*N* NaOH or HCl

(1+9) so that after sterilization pH is 6.5–6.6. (Difco Penassay Base Agar and BBL Base Agar have been found satisfactory.)

(d) *Agar medium D.*—(Antibiotic Medium 8.) Use agar medium C adjusted with 1*N* NaOH or HCl (1+9) so that final pH is 5.7–5.9. (Difco Antibiotic Medium 8 and BBL Base Agar with low pH have been found satisfactory.)

(e) *Agar medium E.*—(Antibiotic Medium 5.) Use agar medium C adjusted with 1*N* NaOH so that final pH is 7.8–8.0. (Difco Streptomycin Assay Agar and BBL Streptomycin Assay Agar with Yeast Extract have been found satisfactory.)

(f) *Agar medium F.*—Adjust agar medium A with 3.5*N* NaOH (2.8–3.8 mL/L) so that after sterilization pH is 8.9–9.1.

(g) *Agar medium G.*—(Antibiotic Medium 32.) Use agar medium A to which is added 300 mg MnSO<sub>4</sub>·H<sub>2</sub>O or 0.4 mL 1% MnCl<sub>2</sub> soln/L.

(h) *Agar medium H.*—Dil. 1 L agar medium A to 1.2 L and adjust to pH 8.1.

(i) *Agar medium I.*—Dissolve 9.4 g pancreatic digest of gelatin, 4.7 g yeast ext, 2.4 g beef ext, 10.0 g NaCl, 10.0 g anhyd. glucose, 13.0 g anhyd. KH<sub>2</sub>PO<sub>4</sub>, 1 g Na<sub>2</sub>HPO<sub>4</sub>·7H<sub>2</sub>O, and 23.5 g agar in H<sub>2</sub>O, and dil. to 1 L. After sterilization pH is 5.3–5.5. (BBL Nystatin Assay Agar supplemented with 13.0 g anhyd. KH<sub>2</sub>PO<sub>4</sub> and 1 g Na<sub>2</sub>HPO<sub>4</sub>·7H<sub>2</sub>O has been found satisfactory.)

(j) *Agar medium J.*—(Antibiotic Medium 11.) Use agar medium A adjusted with 1*N* NaOH so that final pH is 7.9–8.0. (Difco and BBL Neomycin Assay Agar have been found satisfactory.)

(k) *Agar medium K.*—To each L agar medium J add 12.5 mL 2*M* CaCl<sub>2</sub> after autoclaving and just before pouring plates.

(l) *Agar medium L.*—Dissolve 0.69 g K<sub>2</sub>HPO<sub>4</sub>, 0.45 g KH<sub>2</sub>PO<sub>4</sub>, 2.5 g yeast ext, 10.0 g anhyd. glucose, and 15.0 g Purified Agar No. L 28 (Oxoid Canada Ltd, 145 Bentley Ave, Ottawa, Ontario K2E 6T7, Canada) in H<sub>2</sub>O and dil. to 1 L. Adjust to pH 6.0 with HCl before use.

(m) *Agar medium M.*—Dissolve 2.5 g yeast ext, 10.0 g glucose, 0.69 g K<sub>2</sub>HPO<sub>4</sub>, 0.45 g KH<sub>2</sub>PO<sub>4</sub>, and 20.0 g agar in H<sub>2</sub>O and dil. to 1 L. Before adding inoculum, adjust liquified medium to pH 6.0 with 1*N* HCl (ca 2 mL/L).

(n) *Broth medium A.*—(Antibiotic Medium 3.) Dissolve 5.0 g pancreatic digest of gelatin, 1.5 g yeast ext, 1.5 g beef ext, 3.5 g NaCl, 1.0 g anhyd. glucose, 3.68 g anhyd. K<sub>2</sub>HPO<sub>4</sub>, and 1.32 g anhyd. KH<sub>2</sub>PO<sub>4</sub> in H<sub>2</sub>O, and dil. to 1 L. Adjust with 1*N* NaOH or HCl (1+9) so that after sterilization pH is 6.95–7.05. (Difco Penassay Broth and BBL Antibiotic Assay Broth have been found satisfactory.)

(o) *Broth medium B.*—Dissolve 5.0 g pancreatic digest of casein, 5.0 g pancreatic digest of animal tissues, and 20 g anhyd. glucose in H<sub>2</sub>O, and dil. to 1 L. Adjust with 1*N* NaOH or with HCl (1+11) so that after sterilization pH is 5.6–5.7. (Difco Fluid Sabouraud Medium and BBL Sabouraud Liquid Broth Modified have been found satisfactory.)

#### 42.197

#### Reagents

(a) *Phosphate-bicarbonate buffer.*—pH 8. Dissolve 16.73 g anhyd. K<sub>2</sub>HPO<sub>4</sub>, 0.523 g anhyd. KH<sub>2</sub>PO<sub>4</sub>, and 20 g NaHCO<sub>3</sub> in H<sub>2</sub>O and dil. to 1 L.

(b) *Phosphate buffer.*—pH 8; 0.1*M*. Dissolve 16.73 g anhyd. K<sub>2</sub>HPO<sub>4</sub> and 0.523 g anhyd. KH<sub>2</sub>PO<sub>4</sub> in H<sub>2</sub>O and dil. to 1 L.

(c) *Phosphate buffer.*—pH 7.0; 0.1*M*. Dissolve 13.6 g anhyd. K<sub>2</sub>HPO<sub>4</sub> and 4.0 g anhyd. KH<sub>2</sub>PO<sub>4</sub> in H<sub>2</sub>O and dil. to 1 L.

(d) *5% Phosphate buffer.*—pH 6.5. Dissolve 22.15 g anhyd. K<sub>2</sub>HPO<sub>4</sub> and 27.85 g anhyd. KH<sub>2</sub>PO<sub>4</sub> in H<sub>2</sub>O and dil. to 1 L.

(e) *10% Phosphate buffer.*—pH 6. Dissolve 80 g anhyd. KH<sub>2</sub>PO<sub>4</sub> and 20 g anhyd. K<sub>2</sub>HPO<sub>4</sub> in H<sub>2</sub>O and dil. to 1 L.

(f) *1% Phosphate buffer.*—pH 6. Dissolve 8.0 g anhyd. KH<sub>2</sub>PO<sub>4</sub> and 2.0 g anhyd. K<sub>2</sub>HPO<sub>4</sub> in H<sub>2</sub>O and dil. to 1 L.

(g) *Phosphate buffer*.—pH 4.5; 0.1M. Dissolve 13.6 g anhyd.  $\text{KH}_2\text{PO}_4$  in  $\text{H}_2\text{O}$  and dil. to 1 L.

(h) *Pyridine-buffer soln.*—Mix 9 vols pyridine and 31 vols pH 6.0 buffer, (f).

(i) *40% Pyridine-buffer soln.*—Mix 4 vols pyridine (2° boiling range), 3 vols 5% phosphate buffer, (d), and 3 vols  $\text{H}_2\text{O}$ .

(j) *Acid-acetone*.—Mix 1 vol. 4N HCl, 13 vols acetone, and 6 vols  $\text{H}_2\text{O}$ .

(k) *Acid-methanol*.—Mix 1 vol. HCl and 50 vols MeOH.

(l) *Ethyl acetate*.—99% undenatured grade.

(m) *Buffer-acetone extractant*.—Mix equal vols pH 6 buffer, (f), and acetone.

(n) *Tris buffer*.—pH 8.0, 0.05M. Dissolve 6.05 g tris(hydroxymethyl)aminomethane (THAM, primary std, available from Fisher Scientific Co.) in 900 mL  $\text{H}_2\text{O}$ , adjust pH to 8.0 with HCl, and dil. to 1 L.

(o) *Calcium chloride soln.*—2M. Dissolve 294.04 g  $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$  and dil. to 1 L.

(q) *Sodium hypochlorite soln.*—5.25%. Use freshly opened bottle com. soln. (Clorox has been found satisfactory.) Store in dark at 2–10°.

(r) *Sterile isotonic saline soln.*—Dissolve 9.0 g NaCl in  $\text{H}_2\text{O}$  and dil. to 1 L. Autoclave 20 min at 121°.

(s) *Lead acetate soln.*—Dissolve 303 mg  $\text{Pb}(\text{OAc})_2 \cdot 3\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$  and dil. to 1 L with  $\text{H}_2\text{O}$ .

#### 42.198

#### Apparatus

(High-speed blender jars, after disassembling, must be cleaned with great care to eliminate all traces of antibiotics. All app. which contacts sample and solns must be thoroughly cleaned and be detergent-free.)

(a) *Cylinders*.—Polished open stainless steel cylinders,  $8 \pm 0.1$  mm od,  $6 \pm 0.1$  mm id, and  $10 \pm 0.1$  mm high (obtainable from S & L Metal Products Corp., 58–29 57th Drive, Maspeth, NY 11378).

(b) *Petri dishes (plates)*.—Glass or plastic; 100 mm wide  $\times$  20 mm deep. Porcelain covers glazed on outside or cover lids with filter pad inserts are satisfactory for absorbing  $\text{H}_2\text{O}$  of syneresis. Glass or plastic covers may be used if they are raised slightly to allow escape of  $\text{H}_2\text{O}$ .

(c) *Cylinder dispenser*.—Cylinders, (a), may be placed on plates with Shaw Dispenser, available from E. C. Condit, PO Box 75, Middle Haddam, CT 06456 or Arthur E. Farmer, PO Box 1785, Trenton, NJ 08618.

(d) *Heating mat*.—Masonite,  $20 \times 24 \times \frac{5}{16}$ " (available from Electrozot Corp., PO Box 1059, Monroe, NC 28110), or equiv.

(e) *Aluminum air sparger*.—Construct from 2.8 m (110") length of 0.25" Al tubing. Make 3 semicircular bends 64, 132, and 200 cm (25, 52, and 79") from short end and 70° bend 17 cm (6.5") from beginning of long end. Support sparger on 2 lengths of wood  $44 \times 2.5 \times 1.3$  cm ( $17.5 \times 1 \times 0.5$ "); drill 16 holes with 0.2 cm ( $\frac{1}{16}$ ") drill between supports 10 cm (3.75") apart and 8 other holes outside of supports so all holes will be centered over dishes they aerate. Connect both ends of sparger to glass Y-tube with Tygon tubing. Connect to air line supplying 276–345 kPa (40–50 lb/sq in.) and equipped with  $\text{H}_2\text{O}$  trap.

#### 42.199

#### Stock Cultures and Preparation of Test Organism Suspensions

For appropriate test organism designated below, prep. slant culture on  $\geq 1$  tube of agar medium A. Incubate overnight at indicated temp. held constant to  $\pm 0.5^\circ$ , and then store in dark at 2–10°. Do not use if  $> 2$  weeks old.

Prep. suspensions of test organisms as follows:

(a) *Micrococcus flavus*.—ATCC No. 10240. Incubate stock

culture at 32–35°. Wash growth from stock culture with ca 3 mL broth medium A and transfer liq. to surface of 300 mL agar medium A in Roux bottle. Spread suspension evenly over entire surface, using sterile glass beads, and incubate overnight at 32–35°. Wash growth from agar surface with ca 25 mL sterile isotonic saline soln. Store bulk suspension at 2–10°. Use for bacitracin assay.

(b) *Sarcina subflava*.—ATCC No. 7468. Incubate stock culture at 32–35°. Prep. suspension as in (a) and use as alternative organism for bacitracin assay.

(c) *Bacillus cereus*.—ATCC No. 11778. Incubate stock culture at 30°. Wash growth from stock culture with ca 3 mL sterile  $\text{H}_2\text{O}$ , transfer to surface of 300 mL agar medium A, and incubate 7 days at 30°. Wash growth from agar surface with ca 25 mL sterile  $\text{H}_2\text{O}$  and heat suspension 30 min at 65°. Centrif. and decant. Wash residual spores 3 times with sterile  $\text{H}_2\text{O}$ , centrif. and decanting each time. Discard wash  $\text{H}_2\text{O}$ . Heat residual spores 30 min at 65° and resuspend in sterile  $\text{H}_2\text{O}$ . Store this stock suspension at 2–10°. Use for chlortetracycline and oxytetracycline assays.

(d) *Bacillus subtilis*.—ATCC No. 6633. Incubate stock culture at 37°. Wash growth from stock culture with ca 3 mL sterile isotonic saline soln, transfer to surface of 300 mL agar medium G in Roux bottle, and incubate 7 days at 37°. Wash growth from agar surface with ca 50 mL sterile isotonic saline soln into centrif. bottle. Heat suspension 30 min in 65°  $\text{H}_2\text{O}$  bath to destroy vegetative cells. Centrif., decant, and resuspend cells in ca 50 mL sterile isotonic saline soln. Repeat heating, centrif., and suspending twice, or until supernate is clear. Final suspension is stock spore suspension. Store at 2–10°. Use for hygromycin B, monensin, and streptomycin assays.

(e) *Sarcina lutea*.—ATCC No. 9341. Incubate stock culture at 26–30°. Prep. organism suspension by one of following methods:

(1) *Roux bottle culture*.—Wash growth from 24 hr slant culture with ca 3 mL broth medium A, and transfer liq. to surface of 300 mL agar medium A in Roux bottle. Spread suspension evenly over entire surface, using sterile glass beads, and incubate 24 hr at 26–32°. Wash growth from agar surface with ca 15 mL sterile isotonic saline soln. Store bulk suspension  $\leq 2$  weeks at 2–10°.

(2) *Broth culture*.—Wash growth from stock culture with ca 3 mL broth medium A, and transfer liq. to 100 mL broth medium A. Incubate 48 hr at 26–32° with continuous mech. agitation. This 48 hr culture is inoculum. Store  $\leq 2$  weeks at 2–10°.

Use for erythromycin, lincomycin, novobiocin feed supplement, oleandomycin, penicillin, and tylosin assays.

(f) *Staphylococcus epidermidis*.—ATCC 12228. Incubate stock culture at 32°. Inoculate 30 mL broth medium A in 300 mL flask with 1 loop from stock culture, and incubate overnight at 26–32°. Prep. daily. Use for neomycin and for novobiocin final feed assays.

(g) *Saccharomyces cerevisiae*.—ATCC No. 9763. Incubate stock culture on agar medium I at 37°. Prep. inoculum by one of following methods:

(1) *Broth culture*.—Inoculate 100 mL broth medium B with 1 loop from stock culture and incubate overnight at 37°. This culture is inoculum. Store  $\leq 2$  weeks at 2–10°.

(2) *Roux bottle culture*.—Wash growth from stock culture with ca 3 mL sterile isotonic saline soln, and transfer liq. to surface of 300 mL agar medium I in Roux bottle. Spread suspension evenly over entire surface, using sterile glass beads, and incubate 24 hr at 37°. Wash growth from agar surface with ca 15 mL sterile isotonic saline soln. Store  $\leq 2$  weeks at 2–10°. Use for nystatin assay.

(h) *Escherichia coli*.—UC 527 (available from The Upjohn Co.).

Incubate at 36°. Inoculate 30 mL broth medium A in 250 mL flask from stock culture of *E. coli* and grow 18–24 hr at 36°. Prep. daily. Use for spectinomycin assay.

#### 42.200 Preparation of Standard Response Line

Prep. concns of Ref. Std (described for each antibiotic) simultaneously with assay soln. Use indicated concn as ref. concn.

Prep. plates with appropriate base agar layer and/or appropriate seed agar layer (described for each antibiotic). Distribute agar evenly by tilting plates from side to side with circular motion, and let harden. Use plates same day prepd.

Place 6 cylinders on each plate at ca 60° intervals on 2.8 cm radius. Fill 3 alternate cylinders with ref. concn and other 3 cylinders with one of other concns of std. Use 3 plates for each concn required for std response line, except ref. concn. Incubate plates overnight at appropriate temp., and measure diams of zones of inhibition as accurately as possible. (In most cases, it is possible to est. zone diams to nearest 0.1 mm.) Values given in each method for zones of inhibition to be obtained with ref. concns of antibiotics are for guidance only, but it is important that lowest concn on std response line give measurable zone and that slope of response line be adequate. In each set of 3 plates average the 9 readings of ref. concn and the 9 readings of concn being tested. Av. of all 36 readings of ref. concn from 12 plates is correction point for response line. Correct av. value obtained for each concn to appropriate figure if ref. concn reading on that set of 3 plates was same as correction point.

For example, if in correcting second concn of std response line, av. of 36 readings of ref. concn is 20.0 mm, and av. of 9 readings of ref. concn of this set of 3 plates is 19.8 mm, correction is +0.2 mm. If av. reading of second concn on same 3 plates is 17.0 mm, corrected value is 17.2 mm. Plot corrected values, including correction point, on semilog graph paper, using logarithmic scale for concn and arithmetic scale for av. zone diams. Draw line of best fit by inspection or calc. as follows:

$$L = (3a + 2b + c - e)/5$$

$$H = (3e + 2d + c - a)/5$$

where  $L$  and  $H$  = calcd zone diams for low and high concns, resp., of std response line;  $a$ ,  $b$ ,  $c$ ,  $d$ , and  $e$  = corrected av. zone diams for each concn on std response line.

For methods specifying 3 doses of std, calc. as follows:

$$L = (5a + 2b - c)/6$$

$$H = (5c + 2b - a)/6.$$

For methods specifying 4 doses of std, calc. as follows:

$$L = (7a + 4b + c - 2d)/10$$

$$H = (7d + 4c + b - 2a)/10.$$

Formulae for calcd  $L$  and  $H$  are applicable only when std doses are spaced at equal intervals on log scale; i.e., interval between successive log doses is same.

Plot values for  $L$  and  $H$  and connect with straight line. Ref. point is zone size intercept on arithmetic scale for ref. concn with plotted response line. Alternatively, det. slope  $B$  of std response line =  $(H - L)/(\log h - \log l)$ , where  $h$  and  $l$  are high and low std concns, resp., and  $B$  is the increase in zone size for each 10× increase in drug concn.

#### 42.201 Determination of Potency

Use 3 plates for each assay soln. On each plate fill 3 alternate cylinders with ref. concn and fill other 3 cylinders with assay soln. Incubate plates overnight at appropriate temp. and measure diam. of zones of inhibition. Average the 9 readings of ref. concn and the 9 readings of assay soln. If assay soln gives larger

av. than ref. concn, add difference between them to ref. point on std response line. If assay soln gives smaller value than ref. concn, subtract difference between them from ref. point on std response line. Using corrected value of assay soln, det. amt of antibiotic from std response line.

Alternatively, det. log relative potency  $M' = (\bar{y}_u - \bar{y}_s)/B$ , where  $\bar{y}_u$  and  $\bar{y}_s$  are av. of 9 readings of assay soln and ref. concn, resp., and  $B$  is slope of std response line. Antilog  $M'$  = potency of assay soln relative to std; and  $(\text{antilog } M') \times 100$  = potency of assay soln as % of std ref. concn.

For calcns, 1 ton = 908,000 g; ppm × 0.908 = g/ton.

### Bacitracin—Official Final Action

#### For Feed Supplements (50)

(Applicable to supplements contg ≥6 g/lb)

#### 42.202 Standard Solutions

(a) *Bacitracin stock soln.*—Dry ca 40 mg USP Zinc Bacitracin Ref. Std 3 hr at 60° in vac. oven at ≤5 mm (0.66 kPa) pressure. Det. accurate dry wt and dissolve in enough 0.01N HCl to give concn of exactly 100 units/mL. Prep. fresh daily. (1 g bacitracin = 42,000 units.)

(b) *Std response line.*—Dil. appropriate aliquots of stock soln, (a), with enough pH 6 buffer, 42.197(f), to obtain concns of 0.05, 0.10, 0.20, 0.40, and 0.80 unit/mL. Ref. concn is 0.20 unit/mL.

#### 42.203 Plates

(a) *Base layer.*—Add 10 mL melted agar medium C to sterile petri dishes, distribute evenly, and let harden on perfectly level surface.

(b) *Seed layer.*—Before assay, det. by prepn of trial plates optimum concn (usually 0.1–0.5%) of suspension of *M. flavus*, 42.199(a), or *S. subflava*, 42.199(b), to be added to agar medium A to obtain zones of inhibition of adequate size (20 mm ± 10% with 0.2 unit/mL) and sharpness. For actual assay add appropriate amt of suspension to agar medium A previously melted and cooled to 48°. Mix thoroly and add 4.0 mL to each plate contg base layer.

#### 42.204 Assay Solution

Obtain and prep. sample as in 7.001 and 7.002. Place 2 g feed supplement concn. in 150 mL beaker, add 5 mL HCl (2+5), and stir 1 min. Check pH; if pH is >2, add more acid until pH 2 is reached. Add 45 mL pyridine buffer soln, 42.197(h), and transfer mixt. to centr. tube. Shake well 5 min and centr. ca 15 min at 2000 rpm. Dil. aliquot of clear soln with enough pH 6 buffer, 42.197(f), to obtain estd concn of 0.20 unit/mL. Designate soln obtained as assay soln.

#### 42.205 Assay

Using bacitracin std response line, assay soln, and plates, proceed as in 42.200–42.201, incubating at 32–35°.

#### For Mixed Feeds (51)—Official First Action

(Applicable to feeds contg ≥20 g bacitracin/ton)

#### 42.206 Standard Solutions

(a) *Working soln.*—Dil. stock soln, 42.202(a), with enough pH 6.5 buffer, 42.197(d), to obtain concn of 10 units/mL. Prep. daily.

(b) *Std response line.*—Dil. appropriate aliquots of working soln, (a), with enough pH 6.5 buffer, 42.197(d), to obtain concns of 0.025, 0.05, 0.10, and 0.20 unit/mL. Ref. concn is 0.1 unit/mL.

**42.207****Plates**

Use single inoculated agar layer prep as in **42.203 (b)**, except add 10.0 mL to each plate and refrigerate  $\geq 1$  hr before use. Zone of 17.5 mm  $\pm 10\%$  should be obtained with 0.1 unit/mL.

**42.208****Assay Solution**

Transfer 10.0 g mixed feed contg  $\geq 20$  g bacitracin/ton to 150 mL beaker. Add 20 mL acetone, stir, and let stand few min. Decant most of liq. into 50 mL r-b centrf. tube (guide stream with stirring rod). Add 20 mL acetone to residue in beaker, stir, let stand few min, and decant again into centrf. tube. Centrf. 2–3 min at 1800 rpm, decant carefully, and discard supernate acetone. Place centrf. tube in 37° incubator and dry sediment. Tilt beaker contg acetone-soaked solids and spread solids with stirring rod to hasten solv. evapn. Dry beaker and rod in 37° incubator (ca 1 hr).

Add 25 mL HCl (1+32) to dried residue in centrf. tube. Stir, and transfer acid to dry feed in beaker. Add 25 mL 40% pyridine buffer soln, **42.197(i)**, and stir. Pour contents of beaker back and forth from beaker to tube to combine and mix entire sample. Centrf. mixt. 5 min at 1800 rpm. Pipet 15 mL supernate into 50 mL g-s graduate and add MeOH to vol. of 30.0 mL. Stopper, shake, and let proteins settle few min. Transfer mixt. to 50 mL centrf. tube and centrf. 2–3 min at 1800 rpm. Carefully pipet 10 mL supernate and transfer to petri dish with pour lip.

Center each dish on heating mat, **42.198(d)**, under corresponding hole in Al air sparger, **42.198(e)**. Slowly open air stopcock until open area ca 5–8 cm diam. is formed in liq. Aerate until dry. Add 3 mL 5% buffer, **42.197(d)**, and loosen and stir residue with neoprene policeman. Transfer to 25 mL g-s graduate, guiding soln with diagonal edge of policeman. Wash dish and policeman with four 1 mL portions 5% buffer, **42.197(d)**, pouring each wash into graduate. Add 1.0 mL 1N NaOH, stopper, and mix. Adjust to pH 6.50  $\pm 0.05$ , returning portions used for checking pH to graduate. Dil. to 10.0 mL (dil. 40 g/ton samples to 20.0 mL) with 5% buffer, **42.197(d)**. Transfer liq. to 15 mL centrf. tube and centrf. 5 min at 1800 rpm. Use clear supernate as assay soln.

**42.209****Assay**

Using bacitracin std response line, **42.206(b)**, assay soln, **42.208**, and plates, **42.207**, proceed as in **42.200–42.201**, except use 4 plates for each concn required for std response line (total of 12 plates) and for each assay soln. Incubate at 37°.

**42.210****Calculation**

$$\text{g/ton} = (\text{unit/mL assay soln}) \times (a/10) \times (30/15) \\ \times (50/\text{g sample}) \times (908,000/42,000),$$

where  $a = 10$  for 20 g/ton and 20 for 40 g/ton samples; 10 = mL aliquot dried; 30 = vol. after addn of MeOH; 15 = vol. supernate; 50 = vol. HCl and 40% pyridine buffer; 908,000 = number of g in ton; and 42,000 = number of units/g of bacitracin.

**Chlortetracycline (CTC) Hydrochloride (52)**  
**Official Final Action**

(Applicable to feeds contg  $\geq 10$  ppm)

**42.211****Standard Solutions**

(a) *Chlortetracycline stock soln.*—Accurately weigh ca 40 mg CTC.HCl USP Ref. Std and dissolve in enough 0.01N HCl to give concn of exactly 1000  $\mu\text{g/mL}$ . Store in dark  $\leq 5$  days at 2–10°.

(b) *Std solns and response line for samples containing more than 50 ppm chlortetracycline.HCl.*—Dil. appropriate aliquots of

stock soln, (a), with enough pH 4.5 buffer, **42.197(g)**, to obtain concns of 0.01, 0.02, 0.04, 0.08, and 0.16  $\mu\text{g/mL}$ . Ref. concn is 0.04  $\mu\text{g/mL}$ .

(c) *Std solns and response line for samples containing 10–50 ppm chlortetracycline.HCl.*—Prep. as in (b), but dil. with inactivated diluent, (d), instead of buffer soln and include concns of 0, 0.005, and 0.32  $\mu\text{g CTC.HCl/mL}$ . Draw best line of fit by inspection.

(d) *Inactivated diluent.*—To 10 mL acid-acetone feed ext (prep from feed under test as in **42.213(b)**) in 600 mL beaker, add 90 mL pH 4.5 phosphate buffer, **42.197(g)**, and adjust to pH 4.5–4.7 with 1N NaOH. Add 1.0 mL fresh 5.25% NaOCl soln, **42.197(q)**, and stir 1–2 min, rinsing sides of beaker. Heat, stirring thoroly at 10 min intervals, in uncovered beaker in boiling  $\text{H}_2\text{O}$  bath 30 min. Cool to room temp. under tap  $\text{H}_2\text{O}$  stream and transfer quant. to 100 mL vol. flask. Rinse beaker with 6 mL acetone, add rinsings to vol. flask, and dil. to vol. with pH 4.5 buffer. Transfer quant. to another flask and dil. with enough pH 4.5 buffer so that final concn of feed ext is same as that in assay soln.

**42.212****Plates**

(a) *Base layer.*—Add 6.0 mL melted agar medium D to sterile petri dishes, distribute evenly, and let harden on perfectly level surface.

(b) *Seed layer.*—Before assay, det. by prepn of trial plates optimum concn (usually 0.03–0.10%) of organism suspension of *B. cereus*, **42.199(c)**, to be added to agar medium D to obtain zones of inhibition with as little as 0.01  $\mu\text{g CTC.HCl/mL}$  for assaying samples contg  $> 50$  ppm and 0.005  $\mu\text{g/mL}$  for samples contg  $\leq 50$  ppm CTC.HCl. Zone of 20 mm  $\pm 10\%$  should be obtained with 0.04  $\mu\text{g/mL}$ . For actual assay add appropriate amt of suspension to agar medium D previously melted and cooled to 48°. Mix thoroly and add 4.0 mL to each of plates contg base layer.

**42.213****Assay Solution**

(Solv. losses may occur from evapn of volatile solvs in open containers. Carefully measure and record vols of solvs, and make appropriate mathematical corrections for any losses in vol.)

(a) *Samples containing more than 50 ppm chlortetracycline .HCl.*—Obtain and prep. sample as in **7.001** and **7.002**. Place 2, 10, or 20 g sample, resp., contg CTC.HCl  $\geq 10$  g/lb ( $> 2\%$ ),  $> 400$  ppm to 2%, or 50–400 ppm in 150 mL beaker and pipet in 40 mL acid-acetone soln, **42.197(j)**. Stir ca 2 min with glass rod, let stand 2 min, and stir. Adjust pH to 1.0–1.2 with HCl, if necessary, and note vol. HCl added. Transfer to 1 qt (1 L) high-speed blender jar, using addnl 20 mL (minus vol. equiv. to HCl added in adjusting pH) acid-acetone to rinse beaker and pH meter electrodes. Cover jar and blend 3 min at high speed. Transfer mixt. to 100 mL centrf. tubes. Wash blender jar with 40 mL acid-acetone and combine washings with ext in centrf. tubes. Shake well 5 min. Centrf. ca 15 min at 2000 rpm. Combine and mix clarified exts. Adjust 10 mL aliquot to pH 4.5 with 1N NaOH. Dil. adjusted soln with enough pH 4.5 buffer, **42.197(g)**, to obtain estd concn of 0.04  $\mu\text{g/mL}$ . Designate soln as assay soln.

(b) *Samples containing 10–50 ppm chlortetracycline.HCl.*—Obtain and prep. sample as in **7.001** and **7.002**. Place 50 g sample in 250 mL beaker and pipet in 100 mL acid-acetone soln, **42.197(j)**. Stir, adjust pH, and blend as in (a), using 50 mL (less vol. equiv. to HCl added in adjusting pH) acid-acetone to transfer to blender jar. After blending, transfer quant. to 250 mL centrf. bottle, rinsing jar with 50 mL acid-acetone soln. Shake thoroly and centrf. ca 15 min at 2000 rpm. Pipet 5 mL clear supernate

into 50 mL beaker, add ca 40 mL pH 4.5 buffer, **42.197(g)**, mix, and adjust pH to 4.5–4.7 with 1*N* NaOH. Transfer quant. to flask, rinse beaker and pH meter electrodes with pH 4.5 buffer, and add rinsings to flask. Add enough pH 4.5 buffer to obtain estd concn of 0.04 µg/mL. Designate as assay soln.

**42.214****Assay**

Using CTC.HCl std response line, assay soln, and plates, proceed as in **42.200–42.201**, incubating at 30°.

**Turbidimetric Method (53)—Official First Action**

(Applicable to feed supplements contg ≥20 g/lb)

**42.215****Apparatus and Reagents**

(a) *Assay broth*.—Prep. as in **42.196(n)**, but in 1.7× quantity.  
(b) *Homogenizer*.—Omni-Mixer (Du Pont Co. Sorvall Operations, Newtown, CT 06470), or equiv.

(c) *For manual assay*.—(1) *Spectrophotometer*.—Turner Model 330 (Turner Associates, 2524 Pulgas Ave, Palo Alto, CA 94303), or equiv. Response time must be rapid, <4 sec. (2) *Flow-cell*.—10 mm light path and 0.25 mL vol. (No. 8495-L10, Arthur H. Thomas Co., or equiv.) and adapter (No. 8475-F50, Arthur H. Thomas Co., or equiv.) to hold cell assembly in spectrophtr. Polyethylene tubing, 0.055" (1.4 mm) id, is used as inlet and outlet. Fit inlet tube with short length of stainless steel tube and connect outlet to vac. thru solenoid valve (EQ-0724, Elanco Products Co., PO Box 1750, Indianapolis, IN 46206, or equiv.). Adjust vac. to obtain flow rate of 1.0 mL/sec. Flowcell must be rigidly held in its holder and holder rigidly fixed in adapter. (3) *Water bath and heater*.—Part of AUTOTURB System, (d), or equiv. (4) *Constant voltage transformer*.—Sola transformer, wave form corrected, for stabilizing current voltage (Elanco Products Co., or equiv.); connected to spectrophtr. (5) *Filling unit*.—Filamatic single nozzle filler (National Instrument Co., Inc., 4119 Fordleigh Rd, Baltimore, MD 21215), or equiv. Use with Teflon tubing, 0.063" (1.6 mm) id, to fill assay tubes. (6) *Digital voltmeter*.—3½ or 4½ digit. Newport Model 400AS3 (Newport Laboratories, Inc., 630 E Young St, Santa Ana, CA 92705), or equiv. Connect to spectrophtr output to measure % *T*.

(d) *For automated assay*.—AUTOTURB System (Elanco Products Co.).

**42.216****Standard Solutions**

(a) *For manual assay*.—Dil. aliquots of stock soln, **42.211(a)**, in enough pH 4.5 buffer, **42.197(g)**, to give concns of 0.02, 0.04, 0.06, 0.08, and 0.10 µg CTC.HCl/mL.

(b) *For automated system*.—Prep. concns of 0.2, 0.4, 0.6, and 0.8 µg CTC.HCl/mL as in (a).

**42.217****Preparation of Inoculum**

Inoculate 200 mL broth medium A, **42.196(n)**, with 1 loop from 24 hr stock culture of *Staphylococcus aureus*, ATCC 9144, and incubate overnight at 37° on rotary shaker. Store ≤2 weeks at 2–10°.

**42.218****Preparation of Samples**

Weigh 2 g sample into 250 mL glass or plastic centr. bottle. Add 50 mL acid-acetone, **42.197(j)**. Stopper or cap immediately, agitate intermittently 5 min, and adjust to pH 1.0–1.2 with HCl, if necessary, using pH meter. Note vol. HCl used. Add 50 mL (minus vol. HCl used) of acid-acetone. Insert blades of homogenizer into centr. bottle and blend 3 min at high speed while keeping bottle covered. Rinse blades into bottle with 100 mL

acid-acetone. Tightly cap bottle and centr. ca 15 min at 2000 rpm. Filter thru Whatman No. 2V paper, or equiv. Make further dilns with pH 4.5 buffer, **42.197(g)**, to ca 0.09 and 0.06 µg CTC.HCl/mL for manual assay, and 0.6 for automated assay.

**42.219****Assay**

(a) *Manual method*.—Inoculate assay broth, **42.196(n)**, with 0.5–1.0 mL inoculum, **42.217**/100 mL. Incubate at 37° (20–30 min) until *A* is ca 0.05 at 600 nm in 10 mm flowcell, using uninoculated broth as blank.

Completely fill test tube carrier with 18 × 150 mm test tubes contg medium even tho assay may require only portion of these tubes. These tubes are included only to maintain uniform H<sub>2</sub>O flow in bath.

Pipet 1 mL pH 4.5 buffer, **42.197(g)**, into each of 4 blank tubes and into each of 4 zero level std tubes. Pipet into each of 4 tubes 1 mL of each std and each sample soln. Add 9.0 mL inoculated assay broth to all tubes. Refrigerate blank tubes. Incubate all other tubes at 37° until % *T* of zero level tubes is ca 30 at 600 nm (3–4 hr). Do not remove tubes from bath during incubation to observe growth. Use extra tubes for this purpose and after inspection, replace in bath but do not measure. Stop growth in all tubes by heating 1–2 min at 80°; then cool rapidly in cold H<sub>2</sub>O. Shake each tube by placing thumb over tube and inverting once. Do not shake mech. Measure turbidity at 600 nm in static suspension. Let culture flow ca 4 sec, stop flow ca 2 sec to dislodge air bubbles, and let flow again ca 3 sec. Stop flow and read % *T*. Average the 4 readings for each std and sample.

(b) *Automated method*.—System pipets two 0.10 and two 0.15 mL portions of sample soln and std solns into assay tubes, dilns with inoculated broth, and reads % *T* at 600 nm. Average the 2 readings.

**42.220****Calculations**

(a) *Manual assay*.—Convert av. % *T* to *A* and plot log *A* against µg CTC.HCl/mL on semi-log paper. Draw std response line. Read µg CTC.HCl/mL in sample from line.

(b) *Automated assay*.—Read µg CTC.HCl/mL from graph made as in (a) for 0.10 mL vols and for 0.15 mL vols. Average results.

$$\text{g/lb} = \mu\text{g CTC.HCl (from curve)} \times D \times 454 \times 10^{-6} / \text{g sample}$$
 where *D* = diln factor,  $454 \times 10^{-6}$  = conversion of µg/g to g/lb.

**Erythromycin (54)—Official First Action**

(Applicable to feeds contg 9.25 and 92.5 g/ton without pelleting adjuvants and ≥ 92.5 g/ton with bentonite or Masonex)

**42.221****Reagent**

*Dimethoxymethane (methylal)*.—Tech., CH<sub>2</sub>(OCH<sub>3</sub>)<sub>2</sub> (MC/B Manufacturing Chemists, No. MX-650; or Eastman Kodak No. 525).

**42.222****Standard Solution**

(a) *Erythromycin stock soln*.—Accurately weigh amt USP Erythromycin Ref. Std and dissolve in enough methylal-MeOH (4+1) to give concn of 1000 µg erythromycin base/mL. (1 µg base is equiv. to 1.08 µg of the thiocyanate.) Dil. further with pH 8 buffer, **42.197(b)**, to final concn of 100 µg/mL. Store in refrigerator ≤1 week.

(b) *Std response line*.—Dil. appropriate aliquots of stock soln, (a), with enough pH 8 buffer, **42.197(b)**, to obtain concns of 0.05, 0.1, 0.2, 0.4, and 0.8 µg erythromycin base/mL. Ref. concn is 0.2 µg/mL.

## 42.223

## Plates

Before assay, det. by prepn of trial plates optimum concn (usually 0.05–0.2%) of organism suspension of *Sarcina lutea*, 42.199(e)(1), to be added to agar medium J, 42.196(j), to obtain zones of inhibition of adequate size (17.5 mm ± 10% with ref. concn) and sharpness. For actual assay add appropriate amt suspension to agar medium J previously melted and cooled to 48°. Place 10 mL inoculated medium in each of required number of plates, let harden, and refrigerate in inverted position until just before use.

## 42.224

## Assay Solution

Accurately weigh ca 10 g sample contg equiv. of ≥92.5 g erythromycin base/ton or 40 g contg equiv. of 9.25 g erythromycin base/ton and transfer to 250 mL g-s erlenmeyer.

For feeds contg no pelleting adjuvants add 20.0 mL H<sub>2</sub>O and 80.0 mL methylal-MeOH (4+1) soln. For feeds contg bentonite or Masonex, add 20.0 mL 5% phosphate buffer, 42.196(b), and 15.0 mL MeOH. Mix and let feed slurry stand 10 min before adding 65.0 mL methylal. Stopper and mix 1 hr on mag. stirrer or mech. shaker (add glass beads for adequate mixing on shaker).

Let feed settle and dil. to 0.203 µg erythromycin base/mL as in (a) or (b) below:

(a) *Feeds containing equivalent of, or more than 92.5 g erythromycin base/ton.*—Dil. 2.0 mL ext to 100 mL with pH 8 buffer, 42.197(b).

(b) *Feeds containing equivalent of 9.25 g erythromycin base/ton.*—Dil. 5 mL ext to 100 mL with pH 8 buffer.

## 42.225

## Assay

Using erythromycin std response line, 42.222(b), assay soln, 42.224, and plates, 42.223, proceed as in 42.200–42.201, except use 4 plates for each concn required for std response line (total of 16 plates) and for each assay soln. Incubate at 30°.

## Hygromycin B (55)—Official Final Action

(Applicable to feeds contg ≥6000 units/lb)

## 42.226

## Standard Solutions

(a) *Hygromycin B stock soln.*—Accurately weigh amt of Hygromycin B Ref. Std (available from Elanco Analytical Laboratory, Dept. MC 757, Elanco Products Co. Division of Eli Lilly & Co., Indianapolis, IN 46206) contg 50,000 units, transfer to 50 mL vol. flask, and dil. to vol. with pH 7 phosphate buffer, 42.197(c). Store in refrigerator ≤2 weeks.

(b) *Std response line.*—Dil. appropriate aliquots of stock soln daily with enough pH 7 buffer, 42.197(c), to obtain concns of 15, 25, 50, and 75 units/mL. Ref. concn is 25 units/mL.

## 42.227

## Plates

(a) *Base layer.*—Add 10 mL melted agar medium E to sterile petri dishes, distribute evenly, and let harden on perfectly level surface.

(b) *Seed layer.*—Before assay, det. by prepn of trial plates optimum concn (usually 0.2% of 1:10 diln) of spore suspension of *B. subtilis*, 42.199(d), to be added to agar medium E. Zone of 16 mm ± 10% should be obtained with 25 units/mL. For actual assay add appropriate amt of spore suspension to agar medium E which has been melted and cooled to 48°. Mix thoroly and add 4.0 mL to each plate contg base layer. Store plates at 2–10° until just before use.

## 42.228

## Assay Solution

(a) *Preparation of ion exchange resin column.*—Slurry ca 1 lb (450 g) Amberlite IRC-50 ion exchange resin with 2 L 1N H<sub>2</sub>SO<sub>4</sub>, 3 hr. Wash until neut. with H<sub>2</sub>O and gradually add solid LiOH with stirring until pH remains at 7–8. Let stand overnight and wash with H<sub>2</sub>O ≥5 times. Neutze to pH 7.0 with 1N H<sub>3</sub>PO<sub>4</sub>. Store under H<sub>2</sub>O in glass container.

Place glass wool plug at bottom of 6 mm id × 140 mm long tube fitted with valve to control flow and 50 mL reservoir at top. Fill tube with H<sub>2</sub>O and add wet resin to within 20 mm of top of tube. Drain H<sub>2</sub>O to within 5 mm of resin surface. Wash with 25 mL sterile H<sub>2</sub>O immediately before use.

(b) *Preparation of assay soln.*—Obtain and prep. sample as in 7.001 and 7.002. Weigh 50 g sample contg 6000–12,000 units/lb (30 g for 18,000–24,000 units/lb, 20 g for >24,000) into jar of high-speed blender. Add 300 mL (500 for the higher potency feeds) pH 7 phosphate buffer, 42.197(c), and blend 5 min, operating blender from variable transformer set at 70. Centrf. 10 min at 2600 rpm. Adjust 125 mL supernate to pH 5.0 with HCl (ca 0.5 mL). Add 50 mL CHCl<sub>3</sub> previously washed with pH 7.0 buffer, stopper, and shake thoroly. Centrf. mixt. 10 min at 2600 rpm. Remove aq. phase, adjust to pH 7.0 with 40% NaOH soln (ca 0.7 mL), and centrf.

Transfer 100 mL neutzd soln (75 mL if feed contains ≥42,000 units/lb) to ion exchange column and adjust flow rate to 40 drops/min. Wash column with four 20 mL portions sterile H<sub>2</sub>O. Elute hygromycin B with 50 mL NH<sub>4</sub>OH (1+9) into 100 mL Pyrex beaker. Evap. to 3–5 mL and adjust to pH 7.0 with 1N HCl. Transfer to 10 mL vol. flask, dil. to vol. with pH 7.0 phosphate buffer, and designate as assay soln. (Final concn should be ca 25 units/mL.)

## 42.229

## Assay

Using hygromycin std response line, assay soln, and plates, proceed as in 42.200–42.201, except use 6 plates for each concn required for std response line (total of 18 plates) and for each assay soln. Equations for *L* and *H* cannot be used. Incubate at 37°.

## 42.230

## Calculation

Units/lb =  $[1.1 \times (\text{units/mL assay soln}) \times 454 \times \text{mL pH 7 buffer (300 or 500)} \times 10 \times (125 + \text{mL HCl} + \text{mL 40\% NaOH})] / [125 \text{ mL} \times \text{g sample} \times \text{mL neutzd soln put on column}]$ .

## Lasalocid

## Microbiological Method (56)—Official First Action

## 42.231

## Reagents and Apparatus

See 42.198(a)–(c), 42.306(a), and following:

(a) *Ethyl acetate.*—Purify by passage over silica gel and distil.

(b) *Methanol.*—75% and 19.4% by vol. in H<sub>2</sub>O.

(c) *Automatic pipetting machine.*—Brewer (available from BBL, Div of Bioquest), or equiv.

## 42.232

## Standard Solutions

(a) *Lasalocid sodium stock soln.*—100 µg/mL. Accurately weigh suitable amt Lasalocid Na Ref. Std (available from Hoffmann-La Roche Inc.) and dil. to appropriate vol. with anhyd. MeOH.

(b) *Std response line.*—Dil. aliquots stock soln, (a), using anhyd. MeOH and H<sub>2</sub>O, to obtain concns of 0.25, 0.5, 1.0, 2.0, and 4.0 µg/mL in 25% MeOH (v/v). Ref. concn is 1 µg/mL. Solns are stable ≤1 month at room temp.

**42.233 Stock Culture and Preparation of Inoculum**

Prep. slant culture of *Bacillus subtilis*, ATCC 6633, on  $\geq 1$  tube of agar medium A, **42.196(a)**. Incubate 16–24 hr at 37°. Wash growth from stock culture with ca 3 mL sterile distd H<sub>2</sub>O, transfer liq. to surface of 300 mL agar medium G, **42.196(g)**, in Roux bottle, and incubate 7 days at 37°. Wash growth from agar surface with ca 25 mL sterile distd H<sub>2</sub>O into centr. bottle. Heat suspension 30 min in 65° H<sub>2</sub>O bath. Centrf., decant, and resuspend cells in ca 25 mL sterile distd H<sub>2</sub>O. Repeat centrfg and suspending 3 times, discarding H<sub>2</sub>O washings. Heat residual spores 30 min in 65° H<sub>2</sub>O bath. Resuspend spores in ca 35 mL sterile distd H<sub>2</sub>O. Suspension may be kept 1 yr at ca 5°. Before use, dil. suspension with sterile distd H<sub>2</sub>O (usually 1+50) to read 20% *T* on spectrophtr at 530 nm; store  $\leq 1$  week at 5°.

**42.234****Plates**

**Seed layer.**—Use single inoculated agar layer. Before assay, det. by prepn of trial plates optimum concn (usually 5 mL for each 100 mL seed agar) of dild suspension of *B. subtilis*, **42.233**, to be added to agar medium M to obtain zones of inhibition of adequate size ( $17.5 \pm 2.5$  mm with 1.0  $\mu\text{g/mL}$ ) and sharpness. For actual assay, add appropriate amt of suspension to agar medium M previously melted, adjusted to pH 6.0, and cooled to 60°. Mix thoroly and add 6.0 mL to each plate. Distribute evenly and let harden on perfectly level surface. Prep plates 2.5–3 hr before use.

**42.235****Assay Solution**

(a) **Premixes, 15%.**—Accurately weigh 1.0 g premix, transfer to 200 mL vol. flask, add 100 mL MeOH, shake vigorously 3 min, and dil. to vol. with MeOH. Dil. 4.0 mL of this diln to 100 mL with MeOH. Further dil. 3.0 mL of last diln with 22 mL MeOH and H<sub>2</sub>O to 100 mL (1 mL = ca 1  $\mu\text{g}$  lasalocid Na/mL 25% MeOH).

(b) **Final feed, 0.0075%.**—Weigh 20 g mash feed or pellets ground to pass No. 20 sieve and transfer to 500 mL vol. flask. Add 12 mL pH 4.7 buffer and wet feed thoroly. Immerse flask 5 min in 70° H<sub>2</sub>O bath. Cool to room temp. Add 200 mL EtOAc, stopper, and shake mech. 10 min. Centrf. ca 100 mL EtOAc ext 10 min at 2000 rpm. Pipet 60 mL clear EtOAc ext into 200 mL vol. flask, add 8 mL 1.5*N* HCl, and shake 10 min. Let layers sep., transfer EtOAc layer to 100 mL g-s centr. tube, and centr. 10 min at 2000 rpm. Pipet 40 mL clear EtOAc ext into another 100 mL g-s centr. tube and add 2 mL 40% NaOH soln. Stopper and shake briefly by hand, add 8 g anhyd. Na<sub>2</sub>SO<sub>4</sub>, and shake again. Centrf. 10 min at 2000 rpm and decant 25 mL clear supernate into 50 mL g-s graduate. Evap. all EtOAc under stream of N with graduate immersed in 60° H<sub>2</sub>O bath. Dissolve residue in 5 mL hexane, add exactly 25 mL 75% MeOH (v/v), stopper, and shake vigorously 1 min. Transfer to 125 mL separator and let stand ca 1 hr. Withdraw lower (MeOH) layer into 25 mL beaker, pipet 5 mL into 50 mL vol. flask, and dil. to vol. with 19.4% (v/v) MeOH.

**42.236****Assay**

Using lasalocid Na std response line, assay soln, and plates, proceed as in **42.200–42.201**, incubating at  $35 \pm 1^\circ$ . Calc. L and H and fit straight line by simplified least square method, **42.200**.

**Lincomycin (57)—Official First Action****Method I**

(Applicable to feeds contg  $\geq 3.63$  g/ton)

**42.237****Standard Solutions**

(a) **Lincomycin stock soln.**—Accurately weigh ca 40 mg USP

Lincomycin.HCl Ref. Std and dissolve in enough pH 8 buffer, **42.197(b)**, to give concn of exactly 100  $\mu\text{g}$  lincomycin base/mL. Store  $\leq 30$  days at 2–10°.

(b) **Std response line.**—Dil. aliquots stock soln, (a), with enough pH 8 phosphate buffer, **42.197(b)**, to obtain concns of 0.2, 0.4, 0.8, 1.6, and 3.2  $\mu\text{g}$  lincomycin base/mL. Ref. concn is 0.8  $\mu\text{g/mL}$ .

**42.238****Plates**

(a) **Base layer.**—Add 10 mL melted agar medium E to sterile petri dishes, distribute evenly, and let harden on perfectly level surface.

(b) **Seed layer.**—Before assay, det. by prepn of trial plates optimum concn of organism suspension of *S. lutea* (usually 0.02–0.05% of suspension prepd as in **42.199(e)(1)** or 0.2–1% as in **42.199(e)(2)**) to be added to agar medium J to obtain zones of inhibition of adequate size ( $16 \text{ mm} \pm 10\%$  with 0.8  $\mu\text{g/mL}$ ) and sharpness. For assay, add appropriate amt of organism suspension to agar medium J previously melted and cooled to 48°. Mix thoroly and add 4.0 mL to each plate contg base layer.

**42.239****Assay Solution**

Obtain and prep. sample as in **7.001** and **7.002**. Accurately weigh ca 10 g ground sample and transfer to 250 mL g-s, r-b flask, add 20 mL H<sub>2</sub>O, and shake 10 min on wrist-action shaker. Add 50 mL 0.1*N* HCl-MeOH (1+4) and shake 10 min. Filter thru Whatman No. 4 paper, using 42 mm buchner and 500 mL flask. Repeat extn twice, using 50 mL HCl-MeOH each time. (Do not add more H<sub>2</sub>O.) Alternatively, conduct extns in 250 mL centr. bottle and centr. to clarify.

Transfer combined filtrates to 500 mL r-b flask and evap. to 15–20 mL, using rotary evaporator. (Do not heat  $> 60^\circ$ .) Transfer aq. ext to 125 mL separator. Rinse flask successively with 10 mL Skellysolve B, **3.029(o)**, 7–8 mL phosphate buffer, **42.197(b)**, and 10 mL Skellysolve B. Add all rinsings to separator, shake, and let sep. Drain aq. phase, ext Skellysolve B twice with 7–8 mL buffer, and adjust combined exts to pH 8.0 with dil. NaOH soln. Adjust vol. with pH 8 buffer to 0.6–1.0  $\mu\text{g}$  lincomycin base/mL.

**42.240****Assay**

Using lincomycin std response line and assay soln, proceed as in **42.200–42.201**, incubating at 32°.

**Method II**

(Applicable to feeds, feed supplements, and vitamin-mineral premixes contg 20–2600 g/ton)

**42.241****Standard Solutions**

**Std response line (for monolayer plates).**—Dil. aliquots stock soln, **42.237(a)**, with enough pH 8 phosphate buffer, **42.197(b)**, to obtain concns of 0.15, 0.3, 0.6, 1.2, and 2.4  $\mu\text{g}$  lincomycin base/mL. Ref. concn is 0.6  $\mu\text{g/mL}$ .

**42.242****Plates**

**Monolayer.**—Proceed as in **42.238(b)**, except zones of inhibition should be  $18.5 \text{ mm} \pm 10\%$  with 0.6  $\mu\text{g/mL}$ ; add 7.5 mL final mixt. to each plate, distribute evenly, and let harden on perfectly level surface.

**42.243****Assay Solution**

Obtain and prep. sample as in **7.001** and **7.002**.

(a) **For 20–80 g/ton.**—Accurately weigh ca 10–20 g ground sample (see Table **42.03**), and transfer quant. to 250 mL centr.

**Table 42:03 Examples of Sample Size and Dilution of Extract**

Assay soln. 42.243	Feed level of lincomycin,		Sample size, g	Total extrn vol., mL	Aliquot vol., mL	Final vol., mL	Final concn, $\mu\text{g/mL}$
	g/ton	$\mu\text{g/g}$					
(a)	20	22	20.0	75	5.0	50	0.59
(a)	40	44	10.0	75	5.0	50	0.59
(a)	80	88	10.0	75	2.5	50	0.59
(b)	80	88	6.0	100	1.0	10	0.53
(b)	140	154	6.0	100	1.0	15	0.62
(b)	200	220	6.0	100	1.0	25	0.53
(b)	400	440	6.0	100	1.0	50	0.53
(b)	1000	1100	4.0	100	1.0	100	0.44
(b)	2600	2860	4.0	100	1.0	200	0.57

bottle. Add 75.0 mL 0.1N HCl-MeOH (1+4), and shake 20 min on mech. shaker. Centrif. 5 min at ca 2500 rpm to clarify. Decant supernate into 250 mL separator, add 75 mL hexane, and shake moderately 1 min. Let layers sep.  $\geq 15$  min. Drain lower aq. layer into 100 mL beaker, and pipet 2.5–5 mL aliquot into 50 mL mixing cylinder. Adjust vol. to ca 40 mL with pH 8 phosphate buffer, 42.197(b), and add 1 drop 4N NaOH. Stopper and shake vigorously. If necessary, adjust to pH 8 and dil. to 50 mL with pH 8 buffer. Final concn should be 0.5–0.8  $\mu\text{g}$  lincomycin base/mL.

(b) For 80–2600 g/ton.—Accurately weigh 4–6 g ground sample (see Table 42:03), and transfer quant. to 250 mL centrif. bottle. Add 50.0 mL 0.1N HCl-MeOH (1+4), shake 20 min on mech. shaker, and add 50 mL pH 8 buffer. Shake mech. 5 min and centrif. 5 min at ca 2500 rpm to clarify. Dil. 1.0 mL aliquot with pH 8 buffer to 0.4–0.8  $\mu\text{g}$  lincomycin base/mL.

**42.244****Assay**

Using lincomycin std response line and assay soln, proceed as in 42.200–42.201, incubating at 32°, except use 2 plates instead of 3 and 6 readings instead of 9. Av. of all 24 readings of ref. concn from 8 plates is correction point for response line.

**Monensin—Official First Action****Method I (58)**

(Applicable to feeds contg  $\geq 90$  g/ton)

**42.245****Standard Solutions**

(a) *Monensin std solns.*—(1) *Stock soln.*—1 mg/mL. Accurately weigh enough Monensin Na Salt Ref. Std (Elanco Analytical Laboratory, Dept. MC757, Elanco Products Co. Division of Eli Lilly & Co., Indianapolis, IN 46206) into 100 mL vol. flask to give concn of 1 mg free acid/mL. Dil. to vol. with anhyd. MeOH. Store at 5°; discard after 2 weeks. (2) *Working soln.*—100  $\mu\text{g/mL}$ . Dil. 1 mL stock soln to 10 mL with aq. MeOH (1+1). Prep. fresh daily.

(b) *Std response line.*—Dil. aliquots of working soln, (a)(2), with enough aq. MeOH (1+1) to obtain concns of 0.25, 0.5, 1.0, and 2.0  $\mu\text{g}$  monensin/mL. Ref. concn is 0.5  $\mu\text{g/mL}$ .

**42.246****Plates**

*Seed layer.*—Use single inoculated agar layer. Before assay, det. by prepn of trial plates optimum concn (usually 0.5 mL for each 100 mL seed agar) of suspension of *B. subtilis*, 42.199(d), to be added to agar medium L to obtain zones of inhibition of adequate size ( $17.5 \pm 2.5$  mm with 0.5  $\mu\text{g/mL}$ ) and sharpness. Before use, dil. suspension with sterile H<sub>2</sub>O to read 20% *T* on spectrophtr at 530 nm; prep. dild suspension daily. For actual assay, add appropriate amt of suspension to agar medium L previously melted and cooled to 48–50°. Mix thoroly and add 6.0 mL to each plate. Cover and refrigerate  $\geq 1$  hr before use.

**42.247****Assay Solution**

Place glass wool plug at bottom of 19 mm id  $\times$  500 mm chromatgc tube and add ca 75 mm alumina, 41.003(a), with gentle tapping. Accurately weigh sample (20 g finished feed, 5 g premix) and add to column. Elute column with MeOH-H<sub>2</sub>O (9+1), using 200 mL vol. flask as receiver. Do not restrict flow. Collect 200 mL eluate, mix, and dil. with aq. MeOH (1+1) to 0.5  $\mu\text{g}$  monensin/mL. Designate soln obtained as assay soln.

**42.248****Assay**

Use 10 seeded agar plates for std curve. Place 4 stainless steel cylinders, 42.198(a), on each plate at 90° intervals. Fill 1 cylinder on each plate with different concn of std soln, (b), and incubate all plates 16–18 hr at 35–37°. Measure diams of zones of inhibition. Calc. av. zone diam. at each std concn and fit straight line by simplified least squares method, 42.200.

**42.249****Determination**

Use 5 plates for each assay soln and align cylinders at 90° intervals. On each plate fill alternate cylinders with ref. concn and fill other cylinders with assay soln. Incubate plates 16–18 hr at 35–37° and measure diams of zones of inhibition to nearest 0.1 mm. Average 10 readings of ref. concn and 10 readings of assay soln. Proceed as in 42.201.

**Turbidimetric Method (59)****42.250****Apparatus and Reagents**

(a) *Assay broth.*—In 500 mL erlenmeyer, dissolve 9.0 g low K ion medium (N-Z Case, Humko-Sheffield Chemical, PO Box 398, Memphis TN 38101), 3.0 g yeast ext, and 8.0 g glucose in 100 mL H<sub>2</sub>O while heating to bp. Cool immediately, and add to bottle contg 1500 mL sterile H<sub>2</sub>O, 4.5 mL 10% soln of polysorbate 80, and 12.5 mL citrate buffer soln, (c). pH should be  $5.2 \pm 0.1$ ; adjust if necessary.

(b) *Automated turbidimetric system.*—Autoturb® (Elanco Products Co., Division of Eli Lilly and Co., 740 S Alabama St, Indianapolis, IN 46206), or equiv. System pipets samples into assay tubes, dils with inoculated broth, incubates, and measures turbidity.

(c) *Citrate buffer soln.*—pH 4.0. Dissolve 105 g citric acid.H<sub>2</sub>O, 142 g Na citrate.2H<sub>2</sub>O, and 1.9 g KCl in H<sub>2</sub>O and dil. to 1 L with H<sub>2</sub>O.

(d) *Monensin std solns.*—(1) *Stock soln.*—1 mg free acid/mL. Accurately weigh enough Monensin Na Salt Ref. Std (Elanco Analytical Laboratory, Department MC757, Elanco Products Co.) into 100 mL vol. flask to give concn of 1 mg free acid/mL. Add MeOH to dissolve salt, dil. to vol. with MeOH, and stopper tightly. (Soln is stable at room or refrigerator temp. 1 month, except for gain in potency from loss of MeOH. Warm refrigerated soln to room temp. before pipetting.) (2) *Intermediate soln.*—10

$\mu\text{g/mL}$ . Dil. 1.0 mL stock soln to 100 mL with MeOH. (3) *Autoturb working solns.*—Using pipets and vol. flasks, prep. solns contg 0.25, 0.50, 0.75, and 1.0  $\mu\text{g/mL}$  MeOH. (4) *Manual working solns.*—Dil. stock soln to 10.0  $\mu\text{g/mL}$  with MeOH. Prep. std solns of 0.0, 0.05, 0.10, 0.15, and 0.20  $\mu\text{g/mL}$  by adding appropriate vols of 10.0  $\mu\text{g/mL}$  soln to vol. flasks, adding enough MeOH so that final MeOH concn is 20% in each flask, and adjusting to vol. with  $\text{H}_2\text{O}$ .

**42.251****Preparation of Inoculum**

Use *Streptococcus faecalis* (ATCC 8043) as assay organism in either frozen suspension or freshly grown inoculum. Prep. latter by inoculating flask of broth medium A, 42.196(n) (Difco No. 3 Broth), in afternoon and leaving flask overnight at room temp. Use 10–20 mL inoculum/L assay medium. Let assay medium inoculated with frozen suspension stand at room temp. 45 min before using. (This treatment prevents drift within test.)

**42.252****Preparation of Samples**

Grind  $\geq 100$  g feed sample, and mix. Accurately weigh 10.0 g representative well ground sample, and transfer to 4 oz (125 mL) jar fitted with Al foil-lined cap. Add 100.0 mL MeOH and tightly cap jar. Shake well and let stand overnight or  $\geq 8$  hr. Approx. 30 min before dilg, shake once more and let solids settle.

(a) *Autoturb system measurement.*—Dil. 1.0 mL ext to 20.0 mL with MeOH to prep. soln to be dild by system.

(b) *Manual measurement.*—Dil. ext 100-fold (1+99) and 66-fold (3+197) to obtain approx. assay concns of 0.10 and 0.15  $\mu\text{g/mL}$  by adding aliquots of sample to sep. vol. flasks, adding MeOH to 20% final concn, and dilg to vol. with  $\text{H}_2\text{O}$ . These solns are stable  $\geq 1$  week at room temp.

**42.253****Assay**

(a) *Autoturb system measurement.*—Place assay tube carrier in diluter unit. Place total of 20 sample tubes in sample turntable (including 5 tubes contg the 4 std levels and 1 tube with MeOH) in middle of test series. Fill remaining places in turntable with samples dild to estd concn of 0.6  $\mu\text{g/mL}$ . When diluter unit has processed tubes, place carrier in 37.5°  $\text{H}_2\text{O}$  bath 3–4 hr or until turbidity of 0 tube measures 40% *T* or slightly less. Stop growth by heating carrier with tubes in 80°  $\text{H}_2\text{O}$  bath 1–2 min. Cool and read at 650 nm.

(b) *Manual measurement.*—(1) *Std curve.*—Prep. series of culture tubes, in triplicate, by adding 0.5 mL of each working std soln to sep. tubes. Add 9.5 mL inoculated assay broth to each tube. (2) *Samples.*—Prep. 2 dilns for each sample to contain ca 0.1 and 0.15  $\mu\text{g}$  monensin activity/mL soln. Add 0.5 mL of each diln to 3 sep. tubes, and add 9.5 mL inoculated assay broth to each tube. Sample levels are ca 0.05 and 0.075  $\mu\text{g/tube}$ .

Incubate std and sample tubes 4–5 hr at 37.5° or until turbidity of control std tubes (0.0 monensin) measures ca 30% *T* at 650 nm. Terminate growth by heating tubes  $\geq 2$  min at 80°. Cool tubes, and measure turbidity of each tube at 650 nm.

**42.254****Preparation of Standard Curve**

(a) *Autoturb system measurement.*—Prep. 2 dose-response curves, 1 for 0.1 mL loop and other for 0.15 mL loop. Prep. graph of log % *T* against concn. Use av. turbidity of each pair of tubes in prepg std curves. Assay each sample in duplicate at 2 concns, 0.10 mL and 0.15 mL sample. Average readings from 0.10 mL loop for sample and obtain monensin equiv. by interpolation from 0.10 mL std curve. Repeat for 0.15 mL loop and use 0.15 mL std curve.

(b) *Manual measurement.*—Prep. only single std curve. Prep. graph of log % *T* against concn. Average 3 readings obtained for each diln of sample. Obtain monensin equiv. for each sample diln by interpolation from std curve.

**42.255****Calculations**

(a) *Autoturb system measurement.*—Average 2 readings of 0.10 mL vols for feed sample and obtain monensin equiv. by interpolation from 0.10 mL std curve ( $P_1$ ). Repeat for 0.15 mL sample vols to obtain  $P_2$ .

$$\mu\text{g Monensin activity/mL} = (P_1 + P_2)/2 = P_A$$

$$\mu\text{g Monensin/g feed} = P_A \times 200$$

$$\text{g Monensin activity (free acid/ton feed)} = P_A \times 200 \times 0.908$$

(b) *Manual measurement.*—Multiply av. monensin equiv. for each of the 2 sample dilns ( $M_1 = 0.10$  mL diln,  $M_2 = 0.15$  mL diln) by its respective diln factor (e.g., 100 and 66). Average the 2 values to obtain potency of original material ( $P_A$ ).

$$\mu\text{g Monensin activity/mL} = (M_1 + M_2)/2 = P_A$$

$$\mu\text{g Monensin/g feed} = P_A \times 200$$

$$\text{g Monensin activity (free acid/ton feed)} = P_A \times 200 \times 0.908$$

**Neomycin (60)—Official First Action**

(Applicable to feeds contg  $\geq 28$  g neomycin base/ton; soybean content  $>40\%$  reduces accuracy of method.)

**42.256****Standard Solutions**

(a) *Stock soln.*—Dry USP Neomycin Sulfate Ref. Std 3 hr in vac. oven at  $\leq 5$  mm (0.66 kPa). Accurately weigh enough dried std (10–50 mg) and dissolve in Tris buffer, 42.197(n), to give concn of 100  $\mu\text{g}$  neomycin base/mL. (Neomycin sulfate equiv. to neomycin base is given on container.) Store  $\leq 4$  weeks at 2–10°.

(b) *Std response line.*—Dil. aliquots of stock soln (a) with enough inactivated feed ext, 42.258(b), to obtain 0.50, 0.75, 1.13, 1.69, and 2.53  $\mu\text{g}$  neomycin base/mL. Prep. std response line for each feed sample.

**42.257****Plates**

(a) *Base layer.*—Add 10 mL melted agar medium K to petri dishes, distribute evenly, and let harden on perfectly level surface.

(b) *Seed layer.*—Add appropriate amt (usually 0.5–2%) broth culture of *S. epidermidis*, 42.199(f), to agar medium K previously melted and cooled to 48°. Mix thoroly and add 4.0 mL to each plate contg base layer. Distribute agar evenly by tilting plates from side to side with circular motion and let harden. Use plates same day prepd. Zone of inhibition of 18 mm  $\pm 15\%$  should be obtained with 1.13  $\mu\text{g/mL}$ .

**42.258****Assay Solution**

(a) *Preparation of sample.*—Obtain and prep. sample as in 7.001 and 7.002. Weigh 20 g sample into 500 mL r-b flask. Add 100.0 mL NaCl-CaCl<sub>2</sub> soln, 42.197(p), and shake 15 min on wrist-action shaker. Transfer to 250 mL centrf. bottle (do not rinse), centrf. 15 min at 1800–2000 rpm, and decant supernate into beaker. Transfer 20 mL aliquot to 100 mL beaker and set aside to prep. std response line diluent. Using pH meter, adjust remaining portion with HCl to pH 2.0. Wait  $\geq 5$  min; then readjust to pH 8.0 with 10*N* NaOH. (High concns of acid and base are used to avoid significant changes in vol.) Centrf. 30–35 mL 15 min at 1800–2000 rpm. Dil. ext soln with Tris buffer according to neomycin content in feed as in Table 42.04 (diln I).

(b) *Preparation of std response line diluent.*—Inactivate the 20 mL aliquot from (a) by adjusting to pH 4.5–4.7 with 2*N* HCl.

Add 1.5 mL fresh 5.25% NaOCl soln, **42.197(q)**, and heat 45 min in boiling H<sub>2</sub>O bath, stirring thoroly at least every 10 min during heating period. Cool to room temp., adjust to pH 8.0 with 3.5*N* NaOH, and dil. to 20 mL with H<sub>2</sub>O. Dil. inactivated ext with Tris buffer, **42.197(n)**, according to neomycin content in feed as in diln II column of Table **42:04**.

Use dild soln to prep. std response line solns.

**42.259****Assay**

Using neomycin std response line, assay soln, and plates, proceed as in **42.200–42.201**, incubating at 32–35°. Result may be calcd as neomycin sulfate by multiplying neomycin base by 1.428 (1.0 mg neomycin sulfate is equiv. to 0.7 mg neomycin base).

**Novobiocin (67)—Official Final Action**

(Applicable to feeds contg  $\geq 350$  ppm)

**42.260****Standard Solutions**

(a) *Novobiocin stock soln.*—Dry USP Novobiocin Ref. Std 3 hr at 60° in vac. oven at  $\leq 5$  mm (0.66 kPa). Accurately weigh ca 30 mg dried std, dissolve in 10 mL absolute alcohol, and dil. with enough pH 8 phosphate buffer, **42.197(b)**, to give concn of 1 mg/mL. Store  $\leq 3$  weeks at 2–10°.

(b) *Std response line for feed supplements.*—Dil. aliquots of stock soln, (a), with enough pH 6 buffer, **42.197(f)**, to obtain concns of 1.9, 2.4, 3.0, 3.8, and 4.7  $\mu\text{g/mL}$ . Ref. concn is 3.0  $\mu\text{g/mL}$ .

(c) *Std response line for finished feeds.*—Dil. aliquots of stock soln, (a), with enough pH 6 buffer, **42.197(f)**, to obtain concns of 0.128, 0.16, 0.20, 0.25, and 0.312  $\mu\text{g/mL}$ . Ref. concn is 0.20  $\mu\text{g/mL}$ .

**42.261****Plates**

(a) *For feed supplements.*—(1) *Base layer.*—Add 21 mL melted agar medium C to sterile petri dishes, distribute evenly, and let harden on perfectly level surface.

(2) *Seed layer.*—Before assay, det. by prepn of trial plates optimum concn of organism suspension of *S. lutea* (usually 0.2–0.5% of suspension prepd as in **42.199(e)(1)**) or 2–5% as in **42.199(e)(2)**) to be added to agar medium C to obtain zones of inhibition of adequate size (14 mm  $\pm 10\%$  with 3.0  $\mu\text{g/mL}$ ) and sharpness. For actual assay, add appropriate amt of organism suspension to agar medium C, previously melted and cooled to 48°. Mix thoroly and add 5.0 mL to each plate contg base layer.

(b) *For final feed.*—(1) *Base layer.*—Prep. as in (a) (1), using 15 mL melted agar medium C.

(2) *Seed layer.*—Add appropriate amt (usually 0.5–2%) broth culture of *S. epidermidis*, **42.199(f)**, to agar medium C previously melted and cooled to 48°. Mix thoroly and add 5 mL to each plate contg base layer. Zone of 14 mm  $\pm 10\%$  should be obtained with 0.20  $\mu\text{g/mL}$ .

**42.262****Assay Solution**

(a) *For feed supplements containing 50 mg/g.*—Obtain and prep. sample as in **7.001** and **7.002**. Accurately weigh suitable size sample and add enough absolute alcohol to give estd concn of 2 mg/mL. Let stand 30 min, shaking occasionally. Add equal vol. pH 8 phosphate buffer, **42.197(b)**, and mix. Dil. to estd concn of 3  $\mu\text{g/mL}$  with pH 6 buffer, **42.197(f)**, and use as assay soln.

(b) *For final feed containing not less than 350  $\mu\text{g/g}$ .*—Obtain and prep. sample as in **7.001** and **7.002**. Weigh 1 g sample into 50 mL g-s graduate; ext twice with 20 mL EtOAc, shaking vigorously 2 min. Decant supernate into second 50 mL g-s

**Table 42:04 Dilution of Extract**

Neomycin Base, g/ton	Sample Extract, Diln I	Neomycin Base, Final Concn, $\mu\text{g/mL}$	Inactivated Extract, Diln II
140	1 to 20	1.54	10 to 200
70	1 to 10	1.54	20 to 200
35	1 to 10	0.77	20 to 200

graduate. Dil. to 50 mL with EtOAc. Transfer 2.0–4.0 mL aliquot to 100 mL vol. flask, add 5.0 mL pH 8 phosphate buffer, **42.197(b)**, and mix thoroly. Dil. to vol. with pH 6 buffer, **42.197(f)**, and shake vigorously to dissolve all EtOAc. Final concn of novobiocin should be 0.15–0.30  $\mu\text{g/mL}$ .

**42.263****Assay**

Using proper novobiocin std response line, assay soln, and plates, proceed as in **42.200–42.201**, incubating at 32–35°.

**Nystatin (62)—Official First Action**

(For feeds contg  $\geq 50$  g/ton)

**42.264****Standard Solutions**

(a) *Nystatin stock soln.*—Dry ca 25 mg USP Nystatin Ref. Std 2 hr at 40° in vac. oven at  $\leq 5$  mm (0.66 kPa). Accurately det. dry wt and add enough MeOH to give concn of exactly 500 units/mL. Dissolve by shaking on mech. shaker 0.5 hr (soln may be slightly hazy). Prep. fresh daily. (1 g nystatin = 2,800,000 units.)

(b) *Std response line.*—Dil. aliquots stock soln, (a), with enough inactivated feed ext, **42.266(b)**, to obtain concns of 10, 20, and 40 units/mL. Prep. std response line for each feed sample. Ref. concn is 20 units/mL.

**42.265****Plates**

*Seed agar.*—Use single inoculated agar layer. Before assay, det. by prepn of trial plates optimum concn of organism suspension of *Sacch. cerevisiae* (usually 2.5% of suspension prepd as in **42.199(g)(1)**), to be added to agar medium I, **42.196(i)**, to obtain zones of inhibition of adequate size (18 mm  $\pm 10\%$  for 20 units/mL) and sharpness. For actual assay, add appropriate amt of organism suspension to agar medium I, previously melted and cooled to 48°. Mix thoroly and add 10 mL to each sterile petri dish.

**42.266****Assay Solution**

(a) *Preparation of sample.*—Obtain and prep. sample as in **7.001** and **7.002**. Weigh amt sample contg ca 50 g nystatin/ton (ca 7700 units total), into 500 mL erlenmeyer. Add 150 mL anhyd. MeOH, mix thoroly by hand, and then shake 1 hr on rotary shaker. Centrf. briefly. Dil. 4 parts ext with 6 parts 10% phosphate buffer, **42.197(e)**. Set aside 10 mL as sample test soln and use remainder to prep. response line diluent.

(b) *Preparation of std response line diluent.*—Measure vol. of remaining dild ext soln from (a). Place soln in cotton-plugged erlenmeyer having twice capacity of vol. to be contained, and autoclave 15 min at 121° (slow exhaust). Cool to room temp. and restore to original vol. by adding anhyd. MeOH. Mix thoroly and use dild soln to prep. std response line solns.

**42.267****Assay**

Use 10 plates for each sample. On each plate, fill alternate cylinders, each with 1 of std response line solns, and fill other

3 cylinders with sample test soln. Incubate plates overnight at 30–37°; then measure diams of zones of inhibition to nearest 0.1 mm. Calc. av. zone diam. at each std concn; plot values on semilog graph paper and draw line as in 42.200. Calc. av. zone diam. of sample test soln. Using this value, det. potency of antibiotic from std response line.

#### Oleandomycin (63)—Official Final Action

(For feeds contg  $\geq 2$  g/ton)

42.268

#### Standard Solutions

(a) *Oleandomycin stock soln.*—250  $\mu\text{g/mL}$ . Accurately weigh Oleandomycin Chloroform Adduct Ref. Std (available from Quality Control, Pfizer, Inc., 630 Flushing Ave, Brooklyn, NY 11206) or USP Ref. Std. Dissolve in ca 5 mL MeOH and dil. with enough pH 8.0 phosphate-bicarbonate buffer, 42.197(a), to give concn of 250  $\mu\text{g/mL}$ . Prep. fresh daily.

(b) *Intermediate std soln.*—5  $\mu\text{g/mL}$ . Dil. 5.0 mL stock soln to 250 mL in vol. flask with pH 8.0 phosphate-bicarbonate buffer, 42.197(a).

(c) *Std response line.*—Dil. intermediate std soln with pH 8.0 buffer, 42.197(a), to obtain concns of 0.025, 0.05, 0.10, 0.20, and 0.40  $\mu\text{g/mL}$ . Ref. concn is 0.10  $\mu\text{g/mL}$ .

42.269

#### Assay Solution

Obtain and prep. sample as in 7.001 and 7.002. Accurately weigh 20 g sample contg  $\geq 2$  g oleandomycin/ton into 500 mL boiling flask, add 200 mL pH 8.0 phosphate-bicarbonate buffer, 42.197(a), and shake mech. 45 min. Let settle, decant into 50 mL centr. tube, and centr. 5 min at 2000 rpm. Dil. supernate with addnl pH 8.0 buffer to approx. ref. concn of 0.1  $\mu\text{g/mL}$ . Use sample ext same day prep.

42.270

#### Plates

Use single inoculated agar layer. Before assay, det. by prepn of trial plates optimum concn of organism suspension of *S. lutea* (usually 0.05–0.1% of suspension prepd as in 42.199(e)(1)) to be added to agar medium J to obtain zones of inhibition of adequate size (16 mm  $\pm 10\%$  with 0.1  $\mu\text{g/mL}$ ) and sharpness. For actual assay, add appropriate amt of organism suspension to agar medium J previously melted and cooled to 48°. Mix thoroly and add 10.0 mL to each petri dish.

42.271

#### Assay

Using oleandomycin std response line, assay soln, and plates, proceed as in 42.200–42.201, incubating plates at 37°.

#### Oxytetracycline (64)—Official Final Action

(Applicable to feeds contg  $\geq 10$  g/ton)

42.272

#### Standard Solutions

(a) *Oxytetracycline stock soln.*—Accurately weigh ca 40 mg Oxytetracycline USP Ref. Std and dissolve in enough 0.1N HCl to give exact concn of 100  $\mu\text{g}$  oxytetracycline/mL. (1  $\mu\text{g}$  base is equiv. to 1.08  $\mu\text{g}$  of the hydrochloride.) Store in dark  $\leq 5$  days at 2–10°.

(b) *Std response line.*—Dil. appropriate aliquots stock soln, (a), with enough pH 4.5 buffer, 42.197(g), to obtain concns of 0.05, 0.10, 0.20, 0.40, and 0.80  $\mu\text{g}$  oxytetracycline/mL. Ref. concn is 0.20  $\mu\text{g/mL}$ .

#### Method I

(Applicable to  $>220$  mg/lb)

42.273

#### Assay Solution

(Solv. losses may occur from evapn of volatile solvs in open containers. Carefully measure and record vols. of solvs, and make appropriate mathematical corrections for any losses in vol.)

Obtain and prep. sample as in 7.001 and 7.002. Using mortar and pestle or high-speed blender, grind 2 g sample with 50 mL acid-MeOH, 42.197(k), and transfer mixt. to 100 mL centr. tube. Wash mortar and pestle or blender jar with 50 mL acid-MeOH and combine washings with ext in centr. tube. Shake well 5 min. Centr. ca 15 min at 2000 rpm. Remove 10 mL clear soln and adjust to pH 4.5 with 1N NaOH. Dil. adjusted soln with enough pH 4.5 buffer, 42.197(g), to obtain estd concn of 0.20  $\mu\text{g/mL}$ . Designate as assay soln.

42.274

#### Assay

Using oxytetracycline std response line and assay soln, and chlortetracycline plates, 42.212(b), proceed as in 42.200–42.201, incubating at 30°.

#### Method II

(Applicable to  $\leq 220$  mg/lb)

42.275

#### Plates

Use single inoculated agar layer. Before assay, det. by prepn of trial plates optimum concn (usually 0.03–0.10%) of stock suspension of *B. cereus*, 42.199(c), to be added to agar medium D, 42.196(d), to obtain zones of inhibition with as little as 0.05  $\mu\text{g}$  oxytetracycline/mL. Zone of 18 mm  $\pm 10\%$  should be obtained with 0.20  $\mu\text{g/mL}$ . For actual assay add appropriate amt of inoculum to agar medium D previously melted and cooled to 48°. Mix thoroly, and add 9.0 mL to each plate.

42.276

#### Assay Solution

(Solv. losses may occur from evapn of volatile solvs in open containers. Carefully measure and record vols of solvs, and make appropriate mathematical corrections for any losses in vol.)

Accurately weigh 20 g ground finished feed into 250 mL extn flask, add 100 mL acid-MeOH, 42.197(k), stopper, and shake mech. 5 min. Centr. ca 5 min at 2000 rpm. Remove 20 mL supernate and adjust to pH 4.5 with 1N NaOH. Dil. adjusted soln with enough pH 4.5 buffer, 42.197(g), to obtain estd concn of 0.20  $\mu\text{g/mL}$  and filter thru Whatman No. 2V paper, or equiv. Designate as assay soln.

42.277

#### Assay

Using oxytetracycline std response line, assay soln, 42.276, and plates, proceed as in 42.200–42.201, incubating at 28–30°. Calc. result as oxytetracycline.HCl by multiplying oxytetracycline base by 1.08.

#### Procaine Penicillin (65)—Official Final Action

(Applicable to feeds contg  $\geq 1.5$  g/ton)

42.278

#### Standard Solutions

(a) *Penicillin stock soln.*—Accurately weigh, in atm. of  $\leq 50\%$  relative humidity, ca 30 mg USP Potassium or Sodium Penicillin G Ref. Std. Dissolve in enough pH 6 buffer, 42.197(f), to give known concn of 100–1000 units/mL. Store in dark  $\leq 2$  days at 2–10°.

(b) *Std response line*.—Dil. appropriate aliquots of stock soln, (a), with enough pH 6 buffer, 42.197(f), to obtain concns of 0.0125, 0.025, 0.05, 0.10, and 0.20 unit/mL. Ref. concn is 0.05 unit/mL.

**42.279****Plates**

(a) *Base layer*.—Add 10 mL melted agar medium A to sterile petri dishes, distribute evenly, and let harden on perfectly level surface.

(b) *Seed layer*.—Before assay, det. by prepn of trial plates optimum concn of organism suspension of *S. lutea* (usually 0.2–0.5% of suspension prepd as in 42.199(e)(1) or 2–5% as in 42.199(e)(2)) to be added to agar medium B to obtain zones of inhibition of adequate size (19 mm  $\pm$  10% with 0.05 unit/mL) and sharpness.

For actual assay, add appropriate amt of organism suspension to agar medium B previously melted and cooled to 48°. Mix thoroly and add 4.0 mL to each plate contg base layer.

**42.280****Assay Solution**

(Solv. losses may occur from evapn of volatile solvs in open containers. Carefully measure and record vols of solvs, and make appropriate mathematical corrections for any losses in vol.)

Obtain and prep. sample as in 7.001 and 7.002. Vary amts of sample and extractant according to penicillin content of feed as follows:

Penicillin Content	Sample Size, g	Vol. Extractant, mL
$\geq 100$ g/lb	1	100
1–100 g/lb	3	100
0.1–1 g/lb	10	100
<0.1 g/lb (200 g/ton)	50	200

Ext appropriate amt of sample with pH 6 buffer-acetone extractant, 42.197(m), in suitable container, using either wrist-action or reciprocating mech. shaker 30 min or high-speed blender 2 min; let settle and decant supernate. Centrf. if more than slightly turbid. Dil. aliquot of supernate with enough pH 6 buffer, 42.197(f), to obtain estd concn of 0.05 unit/mL.

**42.281****Assay**

Using penicillin std response line, assay soln, and plates, proceed as in 42.200–42.201, incubating at 26–32°. Calc. result in terms of units or wt (1 unit is antibiotic activity of 0.6  $\mu$ g Na penicillin G; 1 mg Na salt = 1667 units; 1 mg K salt = 1595 units).

**42.282****Identity**

To aliquot of supernate assay soln, 42.280, add enough penicillinase soln to inactivate penicillin by incubating mixt. 1 hr at 37°. Further dil. with enough pH 6 buffer, 42.197(f), to give same diln factor as in 42.280. Assay as in 42.281. Absence of zone of inhibition indicates that activity in sample is due to penicillin. (See 16.141.)

**Spectinomycin (66)—Official First Action**

(Applicable in presence of lincomycin to feeds contg  $\geq 18$  g/ton)

**42.283****Standard Solutions**

(a) *Spectinomycin stock soln*.—1 mg spectinomycin base/mL. Accurately weigh amt of Spectinomycin.HCl.5H<sub>2</sub>O. Ref. Std (available from Agricultural Division, The Upjohn Co., Kalamazoo, MI 49001) and dissolve in enough H<sub>2</sub>O to give concn of

exactly 1.0 mg spectinomycin base/mL. Store in dark  $\leq 30$  days at 2–10°.

(b) *Std response line*.—Dil. stock soln with Tris buffer, 42.197(n), to obtain concn of 100  $\mu$ g/mL. Dil. this soln with Tris buffer to obtain 2.8, 4.4, 7.0, 11.0, and 17.4  $\mu$ g spectinomycin base/mL. Prep. daily. Ref. concn is 7.0  $\mu$ g/mL.

**42.284****Plates**

Before assay, det. by prepn of trial plates optimum concn of culture of *E. coli*, 42.199(h) (usually ca 0.04%) to be added to agar medium F to obtain zones of inhibition of adequate size and sharpness. Zones of 13  $\pm$  1 and 23  $\pm$  1 mm should be obtained for 2.8 and 17.4  $\mu$ g/mL, resp.

For actual assay, add appropriate amt of culture to agar medium F, previously melted and cooled to 48°. Mix thoroly and add 7.0 mL to each plate.

**42.285****Assay Solution**

Weigh 20 g feed into 250 mL centrf. tube and add 100 mL acid-MeOH (20 mL 1*N* HCl dild to 1 L with MeOH). Shake 15 min on wrist-action shaker, or equiv., centrf. 5 min at 2000 rpm, and decant into 500 mL r-b flask. Repeat extn twice, combining exts in r-b flask. Evap. ext under vac. until all MeOH and most of H<sub>2</sub>O have been removed. Do not exceed 60° and do not evap. to complete dryness. Add 30 mL Pb(OAc)<sub>2</sub> soln, 42.197(s), to flask, shake vigorously 2 min, and transfer quant. to 100 mL beaker. Rinse flask with 10–15 mL Tris buffer and add rinse to beaker. Adjust to pH 8.0 with 3.5*N* NaOH. Transfer quant. to 100 mL graduate, rinsing beaker with buffer, and dil. to 100 mL with buffer. Mix thoroly, and let sample stand 30 min. Centrf. 30–50 mL 10 min at 2000 rpm. Decant supernate into test vials for storage ( $\leq 2$  days) until assay. Designate soln obtained as assay soln.

**42.286****Assay**

Using spectinomycin std response line, assay soln, and plates, proceed as in 42.200–42.201, incubating at 26°.

g Spectinomycin/ton

$$= (\mu\text{g spectinomycin base/mL assay soln}) \times 4.54.$$

If zone size is plotted against g/ton instead of  $\mu$ g base/mL working stds as follows, calcs are not necessary.

$\mu$ g Base/mL	g/ton
2.8	12.7
4.4	20.0
7.0	31.8
11.0	50.0
17.4	79.0

**Streptomycin (67)—Official Final Action****Method I**

(Applicable to feeds contg  $\geq 30$  g/ton)

**42.287****Standard Solutions**

(a) *Streptomycin stock soln*.—Dry ca 40 mg USP Streptomycin Sulfate Ref. Std 3 hr at 60° in vac. oven at  $\leq 5$  mm (0.66 kPa). Det. accurate dry wt and dissolve in enough H<sub>2</sub>O to give concn of exactly 100  $\mu$ g streptomycin base/mL. Store  $\leq 30$  days at 2–10°.

(b) *Std response line*.—Dil. aliquots of stock soln, (a), with enough pH 8 buffer, 42.197(b), to obtain concns of 0.64, 0.80, 1.0, 1.25, and 1.56  $\mu$ g streptomycin base/mL. Ref. concn is 1.0  $\mu$ g/mL.

## 42.288

## Plates

(a) *Base layer*.—Add 12 mL melted agar medium E to sterile petri dishes. Distribute agar evenly and let harden on *perfectly level surface*.

(b) *Seed layer*.—Before assay, det. by prepn of trial plates optimum concn (usually 0.05–0.2%) of spore suspension of *B. subtilis*, 42.199(d), to be added to agar medium E. For actual assay, sharp zones of inhibition ( $14\text{ mm} \pm 10\%$ ) should be obtained with  $0.64\text{ }\mu\text{g}$  streptomycin base/mL. Add appropriate amt of spore suspension to agar medium E which has been melted and cooled to  $48^\circ$ . Mix thoroly and add 4.0 mL to each plate contg base layer.

## 42.289

## Assay Solution

Obtain and prep. sample as in 7.001 and 7.002. Using 10.0 g sample and 200 mL 0.5*N* HCl, shake mech. 30 min or blend 2 min in high-speed blender. Centrf. ca 15 min at 2000 rpm. Transfer aliquot of supernate to beaker, add ca 25 mL pH 8 buffer, 42.197(b), and adjust to  $\text{pH } 8 \pm 0.1$  with 5*N* and 1*N* NaOH. Transfer quant. to suitable vol. flask, dil. to vol. with pH 8 buffer, 42.197(b), and mix. Dil. aliquot with enough pH 8 phosphate buffer to obtain estd concn of  $1.0\text{ }\mu\text{g}$  streptomycin base/mL. Filter dild soln without suction thru Whatman No. 2V paper, or equiv. Designate as assay soln.

## 42.290

## Assay

Using streptomycin std response line, assay soln, and plates, proceed as in 42.200–42.201, incubating at  $37^\circ$ .

## Method II

(Applicable to feeds contg 5–30 g/ton)

## 42.291

## Standard Solutions

*Std response line*.—Dil. aliquots of stock soln, 42.287(a), with enough pH 8 buffer, 42.197(b), to obtain concns of 0.19, 0.24, 0.30, 0.38, and  $0.47\text{ }\mu\text{g}$  streptomycin base/mL. Ref. concn is  $0.30\text{ }\mu\text{g/mL}$ .

## 42.292

## Plates

(a) *Base layer*.—Prep. as in 42.288(a), except use 10 mL agar medium E.

(b) *Seed layer*.—Prep. as in 42.288(b), except that sharp zones of inhibition ( $11\text{ mm} \pm 10\%$ ) should be obtained with  $0.19\text{ }\mu\text{g/mL}$  std.

## 42.293

## Assay Solution

Proceed as in 42.289, using 40 g sample and dilg to estd final concn of  $0.3\text{ }\mu\text{g}$  streptomycin base/mL. Let soln stand 1 hr before filtering.

*Note*: Feeds may produce considerable gas during acid extn. When using mech. shaker, let each sample stand in acid extractant ca 1 hr with occasional swirling before placing on shaker. When using high-speed blender, use jar with lid cover rather than sealed jar, and hold lid down by hand at start of blending.

## 42.294

## Assay

Using streptomycin std response line, assay soln, and plates, proceed as in 42.200–42.201, incubating at  $22\text{--}25^\circ$ .

## Tylosin (68)—Official Final Action

(Applicable to feeds containing  $\geq 11\text{ g/ton}$ )

## 42.295

## Standard Solutions

(a) *Tylosin stock soln*.—Dry Tylosin base Ref. Std (available from Elanco Analytical Laboratory, Dept. MC757, Elanco Products Co. Division of Eli Lilly and Company, Indianapolis, IN 46206) 4 hr at  $70^\circ$  and store in desiccator over fresh  $\text{P}_2\text{O}_5$ . Accurately weigh suitable amt (10–15 mg) of dried std and dissolve in 5 mL MeOH. Adjust vol. with pH 7 phosphate buffer, 42.197(c), to give concn of  $1000\text{ }\mu\text{g/mL}$ . Store in refrigerator  $\leq 2$  weeks.

(b) *Std response line*.—Dil. appropriate aliquots of stock soln with mixt. of MeOH and pH 8 phosphate buffer, 42.197(b), (4+6), to obtain concns of 0.125, 0.25, 0.50, 1.0, and  $2.0\text{ }\mu\text{g/mL}$ . Ref. concn is  $0.50\text{ }\mu\text{g/mL}$ .

## 42.296

## Plates

(a) *Base layer*.—Add 10 mL melted agar medium H to petri dishes, distribute evenly, and let harden on *perfectly level surface*.

(b) *Seed layer*.—Before assay, det. by prepn of trial plates optimum concn of organism suspension of *S. lutea* (usually 0.05–0.2% of suspension prepd as in 42.199(e)(1) or 0.5–2% as in 42.199(e)(2)) to be added to agar medium H to obtain zones of inhibition of adequate size ( $15\text{ mm} \pm 10\%$  with  $0.50\text{ }\mu\text{g/mL}$ ) and sharpness. For actual assay, add appropriate amt of organism suspension to agar medium H melted and cooled to  $48^\circ$ . Mix thoroly and add 5.0 mL to each plate contg base layer. Refrigerate plates until just before application of assay solns.

## 42.297

## Assay Solution

Obtain and prep. sample as in 7.001 and 7.002. Accurately weigh 10 g feed premix or 20 g final feed into 250 mL homogenizer cup or blender jar. Add 90 mL hot ( $70\text{--}80^\circ$ ) pH 8 phosphate buffer, 42.197(b), and place on steam bath 10 min. Blend 5 min, add 60 mL MeOH, and blend addnl 5 min. Centrf. or filter thru Whatman No. 1 paper and dil., if necessary, with mixt. of MeOH and pH 8 phosphate buffer, 42.197(b), (4+6), to concn of  $0.5\text{ }\mu\text{g}$  tylosin/mL.

## 42.298

## Assay

Prep. 10 plates for std response line and 5 for each sample. Place 5 cylinders on each std response line plate at  $72^\circ$  intervals on 2.8 cm radius. Place 4 cylinders on each sample plate at  $90^\circ$  interval. Fill cylinders on each of 10 std plates with each concn of std response line. On each sample plate fill 2 diagonally opposite cylinders with ref. concn and remaining 2 cylinders with assay soln. Incubate plates overnight at  $30^\circ$ . Measure zones of inhibition to nearest 0.1 mm. Record av. zone diam. for each concn of std on std plates and proceed as in 42.200.

Average the 10 readings of ref. concn on sample plates and the 10 readings of assay soln. Proceed as in 42.201.

## CHEMICAL METHODS

## Griseofulvin (69)—Official Final Action

(Applicable to concns  $\geq 10\text{ mg/oz}$ .)

*Caution*: See 51.011, 51.040, and 51.056.)

## 42.299

## Reagents

(a) *Activated alumina*.—Alcoa grade F-20.

(b) *Solvent mixture*.—Pet ether- $\text{CHCl}_3$  (65+35).

(c) *Griseofulvin std soln*.— $10\text{ }\mu\text{g/mL}$ . Accurately weigh ca 25 mg USP Griseofulvin Ref. Std into 250 mL vol. flask; dissolve

and dil. to vol. with solv. mixt. Dil. 10 mL of this soln to 100 mL in vol. flask.

**42.300****Apparatus**

(a) *Chromatographic tube*.—20 × 400 mm, with fritted disk and stopcock.

(b) *High-speed blender*.—Waring-type, or equiv., 1 L capacity.

(c) *Spectrophotometer*.—Capable of accurate readings at 290 and 320 nm.

**42.301****Preparation of Sample**

Grind 250 g feed pellets or mash in high-speed blender 5 min. Accurately weigh ca 14 g finely powd feed into fat-free thimble and ext in Soxhlet app. 2 hr with 100 mL  $\text{CHCl}_3$ . Evap. ext to 10 mL on steam bath, dil. with 100 mL pet ether, and chromatograph.

**42.302****Preparation of Chromatographic Column**

Place 50 mL solv. mixt., (b), in tube and add 45 mL activated alumina portionwise, with tapping to ensure uniform packing. Place small glass wool pad on top of alumina and drain solv. to just below top of pad.

**42.303****Determination**

Add pet ether- $\text{CHCl}_3$  sample ext to column. As last of ext passes thru glass wool pad, rinse sample flask with solv. mixt., add to column, and begin elution with solv. mixt. Adjust liq. head to give flow rate of 15–20 mL/min. Start collecting 25 mL fractions when green eluate first appears (discard yellow and almost colorless eluates which precede). When *A* of fractions at 290 nm exceeds *A* at 320 nm, stop fractionating, and collect next 700 mL eluate. Dil. eluate to vol. in 1 L vol. flask with solv. mixt. Det. *A* of this soln and of griseofulvin std soln at 290 and 320 nm against solv. mixt. blank.

$$\text{mg Griseofulvin/oz} = (A_{290} - A_{320})(W') \\ (10) (28.35) / (A'_{290} - A'_{320}) (25) \text{ (g sample),}$$

where *A* refers to sample eluate, *A'* to std soln, and *W'* = mg ref. std griseofulvin used to prep. std soln.

**Lasalocid****Spectrofluorometric Method (70)****Official Final Action****42.304****Principle**

Compd is extd from pH 4.7 soln with EtOAc, fluorescent impurities are removed by acid and alkali treatments, and compd is detd fluorometrically, correcting for nonspecific fluorescence by complexing with  $\text{H}_3\text{BO}_3$ . Monensin and ethoxyquin do not interfere.

**42.305****Apparatus**

*Spectrofluorometer*.—With 10 mm fused quartz cells. Excitation and emission wavelengths, ca 310 and 419 nm, resp. Accurately det. peak excitation and emission wavelengths using std soln I, following manufacturer's directions. Do not change wavelength settings between readings.

For routine setting and checking of instrument, use std soln I.

Adjust settings to compensate for decreased intensity with age from dulled reflecting surfaces and lamp.

**42.306****Reagents**

(a) *Acetate buffer soln*.—pH 4.7. Dissolve 5.0 g NaOAc in ca

50 mL  $\text{H}_2\text{O}$ , adjust to pH 4.7 with HOAc, and dil. to 100 mL with  $\text{H}_2\text{O}$ .

(b) *Ethyl acetate*.—Must have ca 0 fluorescence. If necessary, purify as follows: Elute 1 gal. EtOAc thru 9–10 cm (od) column packed with ca 100 cm silica gel (activated desiccant, 100–200 mesh, Grade H, W. R. Grace & Co., Davison Chemical Div., PO Box 2117, Baltimore, MD 21203) topped with 5 cm layer of  $\text{NaHCO}_3$ . Redistil eluate from all-glass app. with 60 cm jacketed distg column, discarding first and last 10%. (*Caution*: See 51.011 and 51.057.) To redistd EtOAc add 40% aq. NaOH and mix briefly. Follow with anhyd.  $\text{Na}_2\text{SO}_4$  and shake again. (Ratio of EtOAc:40% NaOH: $\text{Na}_2\text{SO}_4$  is 1000:50:200 or multiple thereof.)

(c) *Methanolic boric acid soln*.—Dissolve 20.0 g  $\text{H}_3\text{BO}_3$  in MeOH and dil. to 500 mL with MeOH. Prep. fresh daily.

(d) *Lasalocid std solns*.—(1) *Std soln I*.—Dissolve 30.0 mg Lasalocid Ref. Std (available from Hoffmann-La Roche Inc.) in EtOAc and dil. to 100 mL with EtOAc. Pipet 4 mL into 100 mL vol. flask, dil. to vol. with EtOAc, and mix. Pipet 25 mL final diln into 50 mL g-s centr. tube contg 2.4 mL pH 4.7 buffer. Shake mech. 25–30 min and centr. 10 min at 2000 rpm. Pipet 2 mL clear EtOAc ext into 100 mL vol. flask, dil. to vol. with EtOAc, and mix. (2) *Std soln II*.—Pipet addnl 2 mL clear EtOAc ext into another 100 mL vol. flask contg 10 mL methanolic  $\text{H}_3\text{BO}_3$  soln, dil. to vol. with EtOAc, and mix.

**42.307****Preparation of Sample**

(a) *Feeds*.—Grind 200 g sample (mash, pellets, or crumbles) to pass No. 30 sieve, and mix thoroly. Accurately weigh ca 4 g sample into 50 mL g-s centr. tube contg 2.4 mL pH 4.7 buffer. Turn and shake tube by hand to wet uniformly. Immerse tube 4–5 min in 70°  $\text{H}_2\text{O}$  bath. Cool to room temp. and add 25 mL EtOAc by pipet. Stopper tube and shake briefly but vigorously by hand to disperse sample. If necessary, break up lumps with narrow-tip spatula or glass rod. Stopper tube and shake mech. 25–30 min. Centr. 10 min at 2000 rpm. Pipet 15 mL clear EtOAc ext into 50 mL centr. tube. Add 2 mL 1.5*N* HCl and shake 10 min. Centr. 10 min at 2000 rpm. Pipet 10 mL clear EtOAc ext into another 50 mL g-s centr. tube and add 0.5 mL 40% NaOH soln. Shake briefly by hand, add 2 g anhyd.  $\text{Na}_2\text{SO}_4$ , and shake again. Centr. 10 min at 2000 rpm. If EtOAc soln is not clear or fine particles are present at surface, swirl tube gently by hand and recentrf. Pipet 2 mL EtOAc layer into 100 mL vol. flask without disturbing aq. alk. soln, dil. to vol. with EtOAc, and mix. Designate as *Sample soln I*. Pipet another 2 mL aliquot EtOAc layer into second 100 mL vol. flask contg 10 mL methanolic  $\text{H}_3\text{BO}_3$  soln, dil. to vol. with EtOAc, and mix. Designate as *Sample soln II*.

Pipet 25 mL EtOAc into 50 mL g-s centr. tube contg 2.4 mL pH 4.7 buffer and proceed as above, beginning "Stopper tube and shake briefly . . ." Designate final solns as *Reagent blank soln I* and *Reagent blank soln II*.

(b) *Premixes*.—Accurately weigh 2.00 g 15% premix and transfer into 500 mL vol. flask. Add exactly 250 mL EtOAc and shake 25 min on mech. shaker. Centr. aliquot, and dil. with EtOAc as in (a) to obtain *Sample soln I* and *Sample soln II* (complex) contg ca 0.24  $\mu\text{g}$  lasalocid/mL EtOAc. Proceed with fluorescence measurements as in 42.308. (*Note*: Omit treatment with pH 4.7 buffer for both premix and std.)

**42.308****Determination**

Set excitation and emission wavelengths of app. at max. Adjust instrument with std. soln I, (d)(I), in cell to microammeter reading of 0.400. Check this ref. point before and after each reading, using same cell for all ref. readings. Because of decomposition in UV, discard and replace std soln I after every second

reading. Measure fluorescence at 419 nm in order: *Sample soln I* ( $U_1$ ), *Std soln I* ( $S_1$ ), *Reagent blank soln I* ( $R_1$ ), *Sample soln II* ( $U_2$ ), *Std soln II* ( $S_2$ ), and *Reagent blank soln II* ( $R_2$ ). If reading of std soln I drifts, adjust gain to initial setting. If drift is beyond 0.393–0.407, recheck readings of all solns.

Altho fluorescence response of std is linear from 0.12 to 0.48  $\mu\text{g/mL}$ , concn of lasalocid in sample soln should be  $\pm 25\%$  of that of std soln.

**42.309****Calculations**

$$(a) \% \text{ Lasalocid Na in feed} = [(U_1 - R_1) - (U_2 - R_2)] \times D \times S / [(S_1 - R_1) - (S_2 - R_2)] \times W \times 96 \times 100,$$

where  $U$ ,  $S_1$ ,  $S_2$ , and  $R$  are defined in **42.308**;  $D$  = diln factor ( $25 \times 100/2 = 1250$ );  $S$  = concn of lasalocid in *Std soln I* ( $= 0.24 \mu\text{g/mL}$ );  $W$  = g sample; and 96 = % recovery. When  $S = 0.24 \mu\text{g/mL}$ ,  $W = 4.00$  g, and  $R_1$  and  $R_2 = 0$ ,

$$\% \text{ Lasalocid Na in feed} = (U_1 - U_2) \times 0.00781 / (S_1 - S_2)$$

$$(b) \% \text{ Lasalocid Na in premix} = [(U_1 - R_1) - (U_2 - R_2)] \times D \times S / [(S_1 - R_1) - (S_2 - R_2)] \times W \times 10,000,$$

where  $U$ ,  $S_1$ ,  $S_2$ , and  $R$  are defined in **42.308**;  $D$  = diln factor ( $250 \times 50 \times 50 \times 100/5 \times 5 \times 2 = 1,250,000$ );  $S$  = concn of lasalocid in *Std soln I* ( $= 0.24 \mu\text{g/mL}$ );  $W$  = g sample. When  $S = 0.24 \mu\text{g/mL}$ ,  $W = 2.00$  g and  $R_1$  and  $R_2 = 0$ ,

$$\% \text{ Lasalocid Na in 15\% premix} = (U_1 - U_2) \times 15 / (S_1 - S_2)$$

## 43. Vitamins and Other Nutrients

### CHEMICAL METHODS

#### Vitamin A in Margarine (1)—Official First Action

##### 43.001

##### Principle

Unsaponifiable portion of margarine is chromatgd on adsorption column consisting of 2 segments of activated and stdzd alumina sepd by middle segment of alk. alumina. (If eluate fraction contg vitamin A is colored, it must be further chromatgd on column of MgO.) Top segment of alumina column prevents caking and initiates sepn of vitamin A from carotene and other interfering substances. Middle section of alk. alumina seps persistent interference that cannot be sepd by other adsorbents. Final portion of column is nonfluorescent and provides suitable background for observing vitamin A fluorescence on column, thus facilitating control of the chromatgy.

Carotene elutes from column first, second fraction of eluate is discarded, and third fraction contains vitamin A. Better control of chromatgy than is possible by observing colored and fluorescent bands on column is achieved by observing fluorescence in 1 mL portions from final parts of fluorescent and colored eluates. This technic achieves sepn of vitamin A from impurities that cause erroneously high values. Adequacy of sepn is detd from ratio of *A* of chromatgd vitamin A soln at 310 and 325 nm.

*A* of sample soln at 325 nm multiplied by factor 18.3 gives concn of vitamin A in units/mL.

##### 43.002

##### Apparatus

(a) *Spectrophotometer and cells*.—UV spectrophtr with suitable source of UV light is required. (Incandescent lamp is not suitable source.) Spectrophtr (such as Beckman DU, or equiv.) with continuous spectrum source and reading to 200 nm is recommended. Matched quartz cells with 1.0 cm internal light path are preferable. If cells are not matched, suitable corrections must be made. Periodically check wavelength and *A* scales of spectrophtr. (See Definitions of Terms and Explanatory Notes, item (23).)

(b) *Chromatographic tubes*.—(1) 12 mm od × 90 mm with sealed-in disk of medium porosity and with funnel on upper end and stem on lower end, 8 mm od × 40 mm. (Available from SGA Scientific, Inc.) (2) 8 mm od × 250 mm long with lower 50 mm pulled out to form tapered constricted exit 2 mm id. Plug ca 10 mm of upper part of constricted section with glass wool. Fuse flared tube, 18 mm od × 140 mm to top of 6 mm section.

(c) *Vacuum gage with bleeder valve or pinchcock regulator*.—Use vac. micro bell jar large enough to hold 100 mL beaker or flask for applying vac. and collecting eluates. Control vac. from line or H<sub>2</sub>O aspirator by gage and stopcock or screw-clamp bleeder on T-tube.

(d) *Long wavelength ultraviolet lamp*.—Use lamp source of weak UV for observing fluorescent bands on chromatgc columns. Lamp should provide radiation in long (300 nm) wavelength region. (Suitable lamp is available from Ultra-Violet Products, Inc., No. UVSL-55: LW 240.) With com. lamps, narrow aperture or screen may be necessary to reduce amt of destructive radiation. (Vitamin A is readily destroyed by too intense UV light.)

##### 43.003

##### Reagents

(a) *Potassium hydroxide soln*.—50% w/w (780 g/L).

(b) *Alcohol*.—Absolute and 95%. Shall not show *A* >0.05 when measured at 300 nm in suitable spectrophtr in 1.0 cm quartz cell against H<sub>2</sub>O. Isopropanol USP reagent of same spectral purity may be substituted for absolute alcohol in *A* measurements.

(c) *Ethyl ether*.—Peroxide-free. Use USP, freshly distilled, discarding first and last 10% of distillate; or use USP anesthesia grade in 0.5 lb cans. Must meet same *A* requirement as for alcohol, (b).

(d) *Petroleum ether*.—Bp 30–60°, free from fluorescence and with *T* at 300 nm >85% when measured against air in quartz spectrophtr fitted with 1 cm cell. This solv., available in 5 lb cans, should be suitable for chromatgc purposes. Also, in adsorbent activity test, eluant effect of 10 mL pet ether by itself must cause movement of visible color ≤1 cm below surface of column. To meet these requirements, purification by adsorption and/or distn may be necessary.

(e) *Eluting solns*.—(1) 16% redistd ether in pet ether; (2) 25% redistd ether in pet ether; (3) 10% absolute alcohol in pet ether. Dry (1) and (2) with anhyd. Na<sub>2</sub>SO<sub>4</sub> and store over bright Cu strip or turnings to inhibit peroxide formation.

(f) *Sodium sulfate*.—Anhyd., granular; 10% soln must not be acid (red) to Me red. Must not adsorb vitamin A.

(g) *Alumina*.—Alcoa grade F-20 or Fisher "Alumina, Adsorption," Cat. No. A-540. Before working with alumina it is essential to det. that following specifications for particle size have been met: Not >50% of alumina should pass No. 160 sieve; ca 50% should pass No. 100 sieve, but not No. 160 sieve. Remainder (≤20%) which does not pass thru No. 100 sieve should pass No. 60 sieve. Blend thoroly before use.

(h) *Standardized alumina*.—Heat portion of alumina 3 hr in furnace at 600°, and after partial cooling, place in tightly closed screw-cap glass jar. Cool to room temp., pass thru No. 80 sieve, weigh, and place in weighed screw-cap glass jar of such size that only 2/3 of vol. is used. Add H<sub>2</sub>O dropwise, with frequent shaking of capped bottle, until alumina contains 3% by wt of added H<sub>2</sub>O. (Proportion of H<sub>2</sub>O required may vary from 2 to 4%; 3% is usually sufficient for new alumina and 2% for rejuvenated material.) Continue shaking ≥15 min until no lumps remain and material is uniform. Transfer batch to several small, tightly capped jars.

Det. adsorption index as in 43.004, after alumina has remained in tightly capped jar overnight. (Since change in moisture content will affect adsorptivity of reagent, container must be kept tightly closed, except while removing portion of contents for use.) Adsorption index of stored material decreases with time and should be checked periodically. Alumina suitable for chromatgy has adsorption index of 30–40; extremely retentive alumina with index >50 will not permit clean-cut sepn. When index is <10, adsorbent has lost most of its retentiveness. Decreased retentiveness may be due to excess H<sub>2</sub>O content or to changed physical state caused by overheating.

(i) *Standardized alkaline alumina*.—Mix portion of alumina, (g), with equal wt of 10% (w/w) aq. KOH soln in evapg dish. Decant excess liq., and dry moist alumina overnight at 100°. Pass dry material thru No. 60 sieve and place in capped bottle filled ≤2/3 full. Add H<sub>2</sub>O dropwise with frequent shaking until alumina contains 3% by wt of added H<sub>2</sub>O. Det. adsorption index as in 43.004. To be suitable for use, alk. alumina should have index of 7–12. If desired adsorption index is not attained with

3% H<sub>2</sub>O, add addnl H<sub>2</sub>O in 2% increments to index of 7–12. Store in tightly capped jars.

(j) *Standardized adsorptive magnesia*.—(Westvaco Sea Sorb 43, Fisher Scientific Co., No. S-120.) Heat portion of magnesia 4 hr at 600°. After cooling, mix with equal portion of Hyflo Super-Cel (Celite), in ½ full, tightly closed jar. Det. adsorption index as in 43.005. To be suitable for use, the magnesia-Celite mixt. should have index of 20–35.

(k) *Ext. D&C Yellow No. 10 soln.*—Dissolve 20 mg dye (Yellow OB; formerly FD&C Yellow No. 4; Colour Index No. 11390) in 1 L pet ether.

#### 43.004 *Determination of Adsorption Index of Alumina*

Place adsorbent to be tested in chromatgc tube 8 mm od × 220 mm contg glass wool plug at bottom. Tap material into settled position, making column 10 cm high, and attach to vac. controlled bell jar. Add 1.0 mL dye soln, (k), to top of column. From accurately filled 50 mL graduate, add small portions of eluting soln, 16% ether in pet ether. Apply slight vac. (5" (16.9 kPa); or 635 mm Hg pressure). Accurately det. vol. of eluant required to elute dye completely from column. This vol. in mL is adsorption index. For easier recognition of end point, collect eluate until all apparent color on column has been removed, and then collect 2 mL fractions in small beakers until colorless fraction is obtained.

#### 43.005 *Determination of Adsorption Index of Magnesia*

Place magnesia-Celite mixt. to be tested in chromatgc tube 12 mm od × 90 mm, and fitted with sealed-in fritted glass disk. Apply 25" (635 mm; 84.7 kPa) vac. (125 mm, 16.7 kPa pressure) and, with aid of tamper of suitable diam., tightly pack column to ht of 1.5 cm. Release vac., and add 1.0 mL dye soln, (k). From accurately filled 50 mL graduate add small (ca 2 mL) portions eluting soln, 10% absolute alcohol in pet ether. Apply 20" (510 mm; 68.0 kPa) of vac. (250 mm, 33.3 kPa pressure) and continue to add portions of eluant until most of color is eluted. Collect final eluates in 1.0 mL portions under 5" (130 mm; 17.3 kPa) of vac. (630 mm, 84.0 kPa pressure). Vol. in mL of eluant required to produce first colorless 1 mL fraction is adsorption index of MgO-Celite mixt. (Removal of individual fractions is easily accomplished at 5" (130 mm; 17.3 kPa) of vac. by slipping edge of micro bell jar over edge of its base plate.)

#### 43.006 *Sampling*

Store sample in refrigerator. Remove outer layers from 1 lb prints and take sample from interior. Remove end slices from ¼ lb prints and take sample from remainder.

#### 43.007 *Determination*

(*Caution: See 51.011, 51.016, 51.039, 51.054, and 51.073.*)

(a) *General precautions*.—Protect vitamin A from strong illumination by working in subdued light or by using nonactinic glassware. Avoid undue exposure of vitamin A solns to air. Perform chromatgc steps in completely darkened room to make possible adequate monitoring of chromatgc columns with UV light. Complete all steps as promptly as possible.

(b) *Saponification*.—Weigh 10±0.1 g sample into wide-mouth 500 mL erlenmeyer equipped with cold finger condenser, and add 75 mL 95% alcohol and 25 mL 50% KOH soln. Heat on elec. hot plate and stir to break up lumps and completely disperse sample. Maintain soln at vigorous boil 5 min. Remove heat and let stand at room temp. 20 min with occasional stirring. Avoid rapid cooling.

(c) *Extraction*.—Transfer soln to 500 mL separator. Rinse saponification flask with 100 mL H<sub>2</sub>O in several portions and add rinsings to separator. Add 100 mL ether, shake vigorously, and let stand ca 2 min. Transfer aq. portion to another 500 mL separator and ext with four 50 mL portions ether. (In case of slow sepn, add 2–5 mL 95% alcohol and swirl gently.) Combine ether exts, pour two 100 mL portions H<sub>2</sub>O into combined ether exts, swirl gently, and sep. Ext these 2 combined rinses with 2 consecutive 50 mL portions ether, adding ether to original ether exts. Pour two 100 mL portions H<sub>2</sub>O thru combined ether exts and discard each washing without shaking. Add ca 10 mL 0.02N KOH, shake vigorously, and discard after sepn. Rinse with successive 50 mL portions H<sub>2</sub>O, with gentle agitation, until rinse H<sub>2</sub>O is alkali-free to phthln. Let ether soln stand 5 min, discard sepd H<sub>2</sub>O, transfer with rinsing to 400–500 mL tall beaker, add 3–5 g anhyd. Na<sub>2</sub>SO<sub>4</sub>, and stir gently to remove traces of H<sub>2</sub>O. Decant ether ext into another clean 400–500 mL beaker, and rinse Na<sub>2</sub>SO<sub>4</sub> thoroly (ca 6 times) with small portions ether. Combine rinses with ext.

(d) *Preparation of soln for chromatography*.—Evap. ext on steam bath to vol. of ca 25 mL. Transfer to 50 mL beaker and continue evapn on steam bath until viscous oily residue forms which, when stirred with small rod, shows no indication of volatilizing liq. Heat ca 20 sec, but ≤2 min, until droplets of oil form. Remove from steam bath and immediately apply stream of nitrogen 1 min. Add 5 mL pet ether, transfer to 10 mL vol. flask, and dil. to vol. with pet ether. This is sample soln.

(e) *Alumina chromatography*.—Pack each adsorbent in chromatgc tube 12 mm od × 90 mm by gravity and slight tapping. Add stdzd alumina to ht of 1 cm, then segment of alk. alumina 2 cm high, and another segment of stdzd alumina 4 cm high. Apply 5" (130 mm; 17.3 kPa) of vac. (630 mm, 84.0 kPa pressure), and add 5 mL pet ether, followed by 5 mL sample soln, then another 5 mL pet ether. As last of soln disappears into column, add 5 mL portions 16% ether eluant until all carotene elutes from column. Det. completeness of elution by collecting final part of eluate in 1 mL beakers and observing color against white background. Elution is complete when carotene color cannot be seen in last 1 mL fraction observed. Combine all carotene fractions and reserve for concn, below.

Continue elution with 5 mL portions 16% ether. Examine column regularly with UV lamp and observe progress of fluorescent vitamin A band. (Total time required to elute vitamin A should be ≤20 min. If it is desirable to accelerate movement of vitamin A down column, use 25% ether eluting solv. in 3 mL portions.) Discard eluate that collects after carotene fraction has been collected and before vitamin A band begins to elute. Collect all of vitamin A eluate in sep. beaker. Elution of vitamin A is complete when 1 mL portion of eluate collected in 1 mL beaker shows no vitamin A fluorescence when examined with UV lamp. Detn of cut-off point for collection of vitamin A fraction is very important. If it goes too far, extraneous material absorbing at 325 nm will be present, giving erroneously high results; if chosen too early, vitamin A values will be low. Combine all vitamin A-contg fractions. (*Note:* Some food dyes may not be sepd from vitamin A by alumina chromatgy. Whenever the fluorescent vitamin A eluate is colored, rechromatograph on magnesia column as in (f).)

Treat carotene eluate and vitamin A eluate sep., maintaining identity of each soln.

Reduce vol. of carotene eluate and of vitamin A eluate to ca 2 mL by evapn on steam bath. Completely remove remaining solv. by evapn at temp. ≤40° under vac. or with stream of N. Dissolve carotene in 5 mL pet ether, transfer to 10 mL vol. flask, and dil. to vol. with pet ether. This is carotene soln for spectrophtric measurement.

If vitamin A eluate shows no indication of color, dissolve residue in 5 mL absolute alcohol, transfer to 10 mL vol. flask, and dil. to vol. with absolute alcohol. If vitamin A eluate is colored, dissolve residue in ca 2 mL pet ether and proceed with chromatgy on magnesia-Celite.

(f) *Magnesium oxide chromatography*.—Pack magnesia-Celite mixt. in chromatgc tube 12 mm od × 65 mm, using full vac. and light tapping. Column should be 4 cm high. Add 5 mL pet ether and apply 15" (380 mm; 50.8 kPa) of vac. (380 mm, 50.8 kPa pressure). When pet ether disappears into column, add pet ether sample soln. Rinse container with three 2 mL portions pet ether and add each rinse to column. Elute vitamin A from column with 0.5% absolute alcohol in pet ether. Use technic of adding eluant, observing movement of vitamin A fluorescence, and collecting vitamin A eluate similar to that described for alumina chromatgy. This sepn should take ≤10 min. Loss of vitamin A may result if this chromatgc step is too slow. Evap. solv. as before, dissolve residue in 5 mL absolute alcohol, transfer to 10 mL vol. flask, and dil. to vol. with absolute alcohol.

(g) *Spectrophotometric measurements and calculations*.—(1) *Carotene*.—Det. A of pet ether soln of carotene at 450 nm in 1 cm cell.

$$\mu\text{g Carotene/lb} = A \times 4.17 \times 454/W;$$

$$\text{carotene as units vitamin A/lb} = A \times 6.95 \times 454/W;$$

where  $W$  = g sample/mL soln.

(2) *Vitamin A*.—Det. A of absolute alcohol soln of vitamin A at 310 nm and at 325 nm in 1 cm cell.

$$\mu\text{g Vitamin A/lb} = A_{325} \times 5.5 \times 454/W;$$

$$\text{units vitamin A/lb} = A_{325} \times 18.3 \times 454/W;$$

where  $A_{325}$  = A at 325 nm and  $W$  = g sample/mL soln.

Det. ratio of A at 310 and 325 nm; this ratio is usually ≤1.

#### Vitamin A in Mixed Feeds, Premixes, and Foods (2) Official First Action

(Not applicable to products contg provitamin A (carotene) as predominant source of vitamin A activity nor to high potency vitamin A concs used for feed, premix, and food manufacture)

#### 43.008

#### Apparatus

(a) *Photoelectric colorimeter*.—Evelyn or similar low-light transmitting colorimeter or spectrophtr with direct-reading deflecting-type galvanometer and optical mechanism or filter for 620 nm wavelength (vitamin A) and 440 nm (carotene). Use matched absorption tubes. Instrument providing linearity between A and concn is preferable.

(b) *Carr-Price reagent dispenser*.—9 or 10 mL all-glass app. with 3–4 mm diam. opening for rapid reagent delivery. Hypodermic syringe, pipet, automatic pipet, or glass cylinder may be used. Keep app. clean and moisture-free.

(c) *Chromatographic tubes*.—18 × 200 mm (ca 12 mm id), sealed to tube 5 × 100 mm.

(d) *Eluate receiver*.—Fraction collector, or 100 mL lipless graduate fitted with 2-hole stopper, with stem of chromatgc tube inserted thru one hole and bent glass tube connected to vac. source thru other. Use H<sub>2</sub>O aspirator for vac.

(e) *Alkaline digestion (hydrolysis) apparatus*.—H<sub>2</sub>O-cooled refluxing app. connected to long-neck 3 boiling flask, 250 or 500 mL. Calibrate at convenient vol. in neck (e.g., 250 mL flask at 260 mL). Heat on boiling H<sub>2</sub>O or steam bath, or hot plate with mag. stirrer.

(f) *Extraction apparatus*.—50–60 mL heavy duty centrf. tube, g-s or screw-cap with Teflon liner (check for leakage). For extg larger vol. needed for low potency samples, use 125 or 250 mL separator (no rubber stoppers).

(g) *Ultraviolet light*.—Longwave, 360 nm (Model UVL-22, Ultra-Violet Products, Inc., or equiv.). Use only low-intensity lamp.

(h) *Evaporation assemblies*.—Modify 2 arms of Y-tube to U-shape, and attach stoppers wrapped with tinfoil or Teflon ribbon (pipe seal). Connect top arm to H<sub>2</sub>O aspirator. Use back-flow safety bottle, and manometer or gage for measuring vac., and 2-way stopcock in system to open and close vac. Heat colorimeter tubes contg ≤10 mL vitamin A soln, attached 2 at a time to app., in H<sub>2</sub>O bath at 60–65°, shaking gently to prevent bumping and speed evapn. Optionally use partial vac. and N. To conc. larger vol. ext, use simple 50–200 mL vac. app. consisting of 3-way stopcock, single arm to flask, second to vac. thru trap, and third sealed to small vertical reservoir made from test tube for adding solv. when vac. is broken, or use rotary evap. app.

#### 43.009

#### Reagents

(a) *Adsorbent*.—Woelm alumina, neutral, activity grade 1 (ICN Pharmaceuticals Inc., Life Sciences Group). Place 5 g H<sub>2</sub>O in small g-s bottle, add 95 g alumina, and mix by shaking until no lumps are observed. Let stand and cool ≥2 hr before use. Adjust activity if necessary as in 43.010. Store in small, well filled, tightly closed bottles. Moisture content must be controlled; do not expose original or prepd alumina to air.

(b) *Chloroform*.—Reagent grade. If not clear, purify by distn, discarding first and last 10%. Discard distd CHCl<sub>3</sub> after 1 week. (Caution: See 51.011, 51.040, and 51.056.)

(c) *Hexane*.—Reagent, or high quality, com. grade, redistd from all-glass app., saving 64–68° fraction. Must be free of alcohols, esters, and ketones. (Caution: See 51.011, 51.039, and 51.061.)

(d) *Alcohol*.—95%. SDA No. 3-A, or No. 30; aldehyde-free by Schiff's test.

(e) *Acetone in hexane soln*.—4 and 15%. Dil. reagent grade acetone with hexane, (c).

(f) *Soln for removing antimony trichloride from colorimeter tubes*.—Wash tubes with HCl, or soak in 10% Rochelle salt soln to which small amt detergent is added. Wash thoroly in hot detergent soln.

(g) *Potassium hydroxide soln*.—Dissolve 70 g reagent grade KOH in 70 mL H<sub>2</sub>O, mix, and cool. Prep. fresh each time.

(h) *Antimony trichloride (Carr-Price) reagent*.—20%. (Caution: SbCl<sub>3</sub> is toxic and corrosive; avoid contact.) Use reagent grade SbCl<sub>3</sub> crystals from unopened, tightly sealed bottle. Do not use if bottle contains fluids or colored products, or if crystals are moist and sticky. Add 100 g SbCl<sub>3</sub> crystals to CHCl<sub>3</sub> and dil. to 500 mL. Warm and shake to dissolve. Cool, and add 15 mL Ac<sub>2</sub>O. (Caution: See 51.022.) If soln is not clear, filter, centrf., or let settle and decant. Work rapidly with min. exposure of crystals or prepd reagent to atm. Reagent is stable ≥2 months when stored in tight g-s brown bottle.

(i) *Vitamin A reference soln*.—Use USP Ref. Std Soln which contains cryst. all-trans retinyl acetate in cottonseed oil, equiv. to 30 mg retinol (vitamin A alcohol)/g oil (or as stated when purchased).

(j) *Carotene reference crystals*.—Pure α- and β-carotene are available from Sigma Chemical Co. Crystals should dissolve in hexane without residue and have characteristic spectrophtric curve. Det. concn as in 43.017, using spectrophtr.

#### 43.010

#### Adsorption Column

Place small glass wool or cotton plug at bottom of chromatgc tube. Pack with adsorbent added in small portions, tamping lightly, to ht 5–6 cm. (Vac. helps in packing.) Top with 0.5 cm powd, anhyd. Na<sub>2</sub>SO<sub>4</sub>, level, and pack lightly. Use immediately; do not expose to air flow.

Test column for recovery of vitamin A as follows: Hydrolyze and ext 100–200 mg USP Vitamin A Ref. Std as in **43.013(a)(2)** and **(b)**. Prep. soln to contain 30–40  $\mu\text{g}$  extd vitamin A and 50–100  $\mu\text{g}$  carotene, dild to 15 mL with hexane. Wash prepd column with 20 mL hexane and adjust vac. (only slight vac. required) for elution rate of ca 2 drops/sec. Add vitamin A-carotene mixt. before top of column runs dry. Elute carotene with 4% acetone in hexane (20–30 mL normally required). Locate vitamin A band by brief inspection with UV light. Band should be  $\leq 2$  cm below top of alumina. (*Caution:* Avoid looking at radiations. Use only low-intensity UV lamp.)

Elute vitamin A with 15% acetone in hexane (30–35 mL normally required). Inspect last few mL eluate for vitamin A fluorescence. If necessary, elute with more solv. until fluorescence no longer is observed in eluate. If vitamin A elutes too slowly, prep. adsorbent using 1–2% more  $\text{H}_2\text{O}$ , **43.009(a)**, and test again; if vitamin A elutes too rapidly, use less  $\text{H}_2\text{O}$ . Evap. suitable aliquot of eluate to dryness under vac. or N, add 1 mL  $\text{CHCl}_3$  to dissolve residue, and det. vitamin A as in **43.013(d)**. Compare result with that for hydrolyzed vitamin A not chromatd. Recovery should be  $\geq 90\%$ .

**43.011****Standardization**

Det. blank on all reagents, including cottonseed oil. A of blank should be almost 0.

(a) *Preparation of std vitamin A curve.*—Cut tip from capsule contg USP Ref. Std Soln of vitamin A and express oil into small tared beaker or watch glass. Weigh accurately. Transfer oil to vol. flask and dil. to vol. with  $\text{CHCl}_3$ . Use soln as soon as possible; discard after 8 hr. Work in subdued light or use low-actinic glassware. Make  $\geq 5$  dilns of vitamin A soln with  $\text{CHCl}_3$  so that 1 mL aliquots treated as in **43.013(d)** give  $T$  in 20–85% range ( $A$ , 0.7–0.07) at 620 nm. Plot  $T$  or  $A$  against  $\mu\text{g}$  vitamin A. If plot of  $A$  is straight line, factor may be calcd for detg vitamin A in samples.

(b) *Preparation of std carotene curve.*—Prep. series of dilns of carotene in hexane. Plot  $A$  at 440 nm against  $\mu\text{g}$  carotene. Use curve or factor to det. carotene concn of samples.

(c) *Determination of correction factor for yellow pigment in vitamin A eluate.*—Monohydroxy carotenoids (e.g., cryptoxanthol) elute with hydrolyzed vitamin A (vitamin A alcohol). Correct for pigment when present in more than traces, as follows: Hydrolyze 30–40 g ground yellow corn as in **43.013(a)(1)**. Ext 50 mL soln with two 50 mL portions hexane in separator. Wash ext with  $\text{H}_2\text{O}$ , dry with anhyd.  $\text{Na}_2\text{SO}_4$ , and conc. to 15–20 mL. Chromatograph as in **43.013(c)**, and save fraction eluting with 15% acetone in hexane. Make  $\geq 5$  dilns so that  $A$  values at 440 nm are in 0.1–0.6 range (conc. soln if necessary). Evap. 10 mL of each soln in colorimeter tubes as in **43.008(h)**, dissolve residue in 1 mL  $\text{CHCl}_3$ , and develop and read blue color at 620 nm as in **43.013(d)**. Plot  $A$  at 440 nm against  $A$  at 620 nm. Use this curve to calc.  $A$  of carotenoid pigment- $\text{SbCl}_3$  product in vitamin A detn at 620 nm, based on  $A$  of carotenoid at 440 nm. If plot is linear, calc. factor to correct for vitamin A equiv. to pigment in vitamin A detn.

**43.012****Storage and Preparation of Sample**

(a) *Dry mixed feed and premixes.*—Collect 600–800 g bulk sample. Refrigerate in dark in tightly closed glass or plastic containers. Immediately before analysis, warm to room temp., grind entire sample so that  $\geq 95\%$  passes No. 20 sieve, mix by rolling on paper, or by equiv. method, regrind, and remix. (Grinding helps fracture and disperse high-potency beadlet-type vitamin A products in sample.) Sample, avoiding loss of fine particles. Some high-potency products (e.g.,  $\geq 30$   $\mu\text{g}$  vitamin

A/g) contg stabilized vitamin A are sampled better if dild with freshly ground cereal grain before initial grinding and sampling. Do not store ground sample  $>1$  week.

(b) *Foods.*—Proceed as in (a), except bulk sample of 400 g is enough for products not contg stabilized vitamin A. Sticky pastries, prepd drink mixes, canned pet foods, etc., may require special sampling, e.g., use of sections of crushed pastry, individual pack of food, or as directed for official tests.

(c) *Liquid feed supplements and premixes.*—Store in cool place, but at  $\geq 8^\circ$ , in tightly closed glass or plastic containers. Warm to  $35\text{--}40^\circ$  immediately before analysis. Mix thoroly by repeated pouring or stirring before sampling.

**43.013****Determination**

(Work in subdued light; avoid high laboratory temp. Complete all steps of method as rapidly as consistent with careful following of directions.)

(1) *For products containing less than 5000 USP units vitamin A/lb* (ca 1500  $\mu\text{g/lb}$  or 3000  $\mu\text{g/kg}$ ), weigh  $\geq 40$  g sample prepd as in **43.012**, into 500 mL long-neck boiling flask. (2) *For products containing 5000–20,000 unit/lb*, use 20–40 g sample and 250–500 mL flask. (3) *For products containing 20,000–80,000 unit/lb*, use 10–20 g sample and 250 mL flask.

To low-fat products, add 1 g fresh cottonseed or peanut oil to boiling flask before alk. digestion. Proceed as in (a)(1) or (2).

(a) *Alkaline digestion (hydrolysis).*—(1) *Mixed dry samples, premixes, and semimoist foods.*—Add vol. (mL) alcohol equal to 4 times wt (g) sample, but  $\geq 40$  mL. Mix thoroly. Slowly add, with mixing, vol. KOH soln equal to g sample, but  $\geq 10$  mL. Place stirring bar in flask. Reflux 30 min at ca 2 drops/sec. Agitate flasks  $\geq 3$  times during refluxing to disperse any aggregates formed, or use hot plate with mag. stirring. (Hand agitation with stirring bar gives better dispersion on some samples than does mag. stirring.) Cool rapidly to room temp. Add alcohol- $\text{H}_2\text{O}$  soln (3+1) up to 20–30 mL below calibration mark. Shake to mix thoroly. Add alcohol- $\text{H}_2\text{O}$  soln to calibration mark, and mix again. (Use size flask to have vitamin A concn convenient for further steps of method; do not over-dil.) Let suspended matter settle. After standing, if soln in flask is single, homogeneous phase, proceed to (b); if not, see (b)(2). (Sticky film on walls of flask when sample has high sugar content apparently causes no difficulty if contents are well mixed.)

(2) *Liquid samples (supplements containing molasses, liquid breakfast drinks, etc.).*—If sample is viscous, mix thoroly with equal vol. warm  $\text{H}_2\text{O}$ . Add slowly, with mixing, vol. (mL) KOH soln equal to wt (g) sample. Add slowly, with mixing, vol. (mL) alcohol equal to 4 times wt (g) sample. Digest sample as in (1), beginning with "Place stirring bar in flask."

(b) *Extraction.*—(1) *For products containing more than 1500  $\mu\text{g}$  vitamin A/lb.*—Transfer 5.0–15.0 mL soln, depending on vitamin A concn, free of suspended matter, to the 50–60 mL centr. tube. Add 2 mL  $\text{H}_2\text{O}$  for each 5 mL soln, and add 20.0 mL hexane. Ext vitamin A by shaking vigorously  $\geq 1$  min. Let phases sep. and centr. briefly. If amt of vitamin A in ext is  $<1$  mg and if hexane layer is clear, with only traces of yellow color, draw lower layer from bottom of centr. tube with pipet and filler bulb, and discard; if hexane layer is yellow, proceed to (c). Wash ext in tube once with 20 mL  $\text{H}_2\text{O}$ , let layers sep., and centr. briefly. Transfer 1.0–10.0 mL hexane ext, as required for satisfactory color development, to colorimeter tube and proceed to vitamin A detn, (d). Avoid loss of hexane by evapn. If vitamin A recovery is low, again ext soln contg vitamin A, and combine exts before washing.

(2) *For solns of (a)(1) separating into two liquid phases.*—Shake vigorously and remove portion for extn before sepn

occurs, and proceed as in (1), or transfer total contents, without diln with alcohol-H<sub>2</sub>O, to separator. Add vol. (mL) H<sub>2</sub>O equal to 2 times wt (g) sample; ext once with vol. (mL) hexane equal to 3 times wt (g) sample and again with 2 vols hexane. Combine exts and wash with two 100 mL portions H<sub>2</sub>O, or until free of alkali. Dil. to smallest suitable vol. Centrf. portion, or dry with anhyd. Na<sub>2</sub>SO<sub>4</sub> and dil. to previous vol. Proceed to (c) or transfer 1.0–10.0 mL to colorimeter tube and proceed to (d) if no pigments are present.

(3) *For products containing less than 1500 µg vitamin A/lb that require extraction of more than 15 mL hydrolyzed soln, or those with measurable carotenoid pigments.*—Use separator, increasing H<sub>2</sub>O and hexane vols proportionally. Ext twice, combine exts, dil. to vol., wash, and centrf. or dry as in (2). Proceed to (c), or transfer 1.0–10.0 mL to colorimeter tube and proceed to (d) if no pigments are present.

(c) *Chromatography.*—If yellow pigments are present, chromatograph sample. If possible, use aliquot contg 25–60 µg vitamin A in 10–15 mL hexane ext. Conc. portion hexane ext under vac., 43.008(h), if necessary to obtain suitable vitamin A concn. Wash packed column with 20 mL hexane, and add ext contg vitamin A just before top of column runs dry. Elute at ca 2 drops/sec. Elute carotene with 4% acetone in hexane, and vitamin A with 15% acetone in hexane as in 43.010. Cryptoxanthin and related pigments elute with vitamin A.

(d) *Colorimetry.*—If carotene was sepd during chromatgy, det. concn as in 43.017.

If vitamin A eluate in 15% acetone-hexane soln contains yellow pigment, read *T* (or *A*) as carotene with 440 nm filter. Calc. correction, 43.011(c), to apply to *A* of blue-color reaction with vitamin A, using necessary diln factor if 1:10 vol. at 620 and 440 nm was not used.

Evap. soln as in 43.008(h) under vac. in H<sub>2</sub>O bath at 60–65°. Dissolve residue in 1 mL CHCl<sub>3</sub>. Adjust colorimeter to 100% *T* (or 0% *A*) at 620 nm, using 1 mL CHCl<sub>3</sub> and measured vol. (9 or 10 mL) SbCl<sub>3</sub> reagent. (This point must remain const for series of detns; readjust as required.) Place tube contg 1 mL CHCl<sub>3</sub> soln of vitamin A in instrument. Add measured vol. SbCl<sub>3</sub> reagent in 1–2 sec. Read *T* (or *A*) as first transitory pause point (*T* should be in 20–85% range). Read quickly; color begins to fade and *T* increases slowly after 3–5 sec. Instrument *cannot* be adjusted to make reading after SbCl<sub>3</sub> is added. Examine tube contents within short time; soln should be blue, without turbidity, and blue should fade.

Det. recovery factor, *R*, for vitamin A detn by adding known amt vitamin A to samples (or blank feeds or foods when available) of general types analyzed, carrying analysis thru entire method.

(e) *Calculation of vitamin A content.*—

$$\mu\text{g Vitamin A/g} = (C_u - C_c) \times [V/(W \times R)];$$

or

$$\mu\text{g Vitamin A/lb} = (C_u - C_c) \times V \times [454/(W \times R)];$$

where *C<sub>u</sub>* = uncorrected concn vitamin A from curve or factor; *C<sub>c</sub>* = correction for yellow pigment in vitamin A eluate; *V* = final vol. sample ext; *W* = g sample; and *R* = recovery factor for vitamin A.

(Note: If solids are present in flask after hydrolysis, results may be increased slightly. Ignore vol. of solids unless sample is large and vol. soln in flask is relatively small, in which case difference could be ≤5%. Correction for vol. of solids is difficult because some samples leave considerable unhydrolyzed residue and others, none. Max. correction is based on 10 g feed reducing vol. in hydrolysis flask by 3 mL. Apply estd correction, if necessary.)

### Carotenes in Fresh Plant Materials and Silages (3) Official Final Action

(Caution: See 51.004, 51.011, 51.039, 51.046, and 51.061.)

#### 43.014

#### Reagents

(a) *Acetone.*—Dry, alcohol-free. To dry, treat with anhyd. Na<sub>2</sub>SO<sub>4</sub> and distil over granular ca "10 mesh" Zn.

(b) *Commercial hexane.*—Bp 60–70°; distilled over KOH.

(c) *Adsorbent.*—Activated magnesnia (Sea Sorb 43; Fisher Scientific Co., No. S-120).

(d) *Diatomaceous earth.*—Hyflo Super-Cel.

#### 43.015

#### Extraction

Finely cut material with scissors or knife, or grind in food chopper to assure representative sample. If analysis cannot be performed immediately, blanch in boiling H<sub>2</sub>O 5–10 min and store in frozen condition. Place 2–5 g weighed sample in high-speed blender; add 40 mL acetone, 60 mL hexane, and 0.1 g MgCO<sub>3</sub>, and blend 5 min. Filter with suction or let residue settle and decant into separator. Wash residue with two 25 mL portions acetone, then with 25 mL hexane, and combine exts. Wash acetone from ext with five 100 mL portions H<sub>2</sub>O, transfer upper layer to 100 mL vol. flask contg 9 mL acetone, and dil. to vol. with hexane. If desired, alcohol may be used instead of acetone for extn. Use 80 mL alcohol and 60 mL hexane in blender; other vols same as for acetone.

#### 43.016

#### Separation of Pigments

Pack activated magnesnia-diat. earth mixt. (1+1) in chromatgc tube 22 mm od × 175 mm sealed to 10 mm od tube at bottom. To prep. column, place small glass wool or cotton plug inside tube, add loose adsorbent to 15 cm depth, attach tube to suction flask, and apply full vac. of H<sub>2</sub>O pump. Use flat instrument (such as inverted cork mounted on rod or tamping rod) to gently press adsorbent and flatten surface (packed column should be ca 10 cm deep). Place 1 cm layer anhyd. Na<sub>2</sub>SO<sub>4</sub> above adsorbent.

With vac. continuously applied to flask, pour ext into column. Use 50 mL acetone-hexane (1+9), or slightly more, if necessary, to develop chromatogram and wash visible carotenes thru adsorbent. Keep top of column covered with layer of solv. during entire operation (conveniently done by clamping inverted vol. flask full of solv. above column with neck 1–2 cm above surface of adsorbent).

Collect entire eluate. (Carotenes pass rapidly thru column; bands of xanthophylls, carotene oxidn products, and chlorophylls should be present in column when operation is complete.) Transfer eluate, which has been reduced in vol. by loss of vapor thru H<sub>2</sub>O pump, to 100 mL vol. flask, dil. to vol. with acetone-hexane (1+9), and det. carotene content photometrically.

#### 43.017

#### Determination

Det. *A* of soln as soon as possible with spectrophtr at 436 nm or with instrument having suitable filter system, such as Klett photometer with No. 44 filter, or Evelyn photoelec. colorimeter with 440 nm filter. Calibrate these instruments first with solns of high purity β-carotene as shown by characteristic absorption curve (J. Biol. Chem. 144, 21(1942)). Prep. calibration chart and convert *A* of soln to be detd to carotene concn from chart.

When detns are made with properly calibrated spectrophtr at 436 nm,

$$C = (A \times 454)/(196 \times L \times W),$$

where *C* = concn carotene (mg/lb) in original sample, *L* = cell length in cm, and *W* = g sample/mL final diln. Report results

as mg  $\beta$ -carotene/lb. Multiply by 2.2 to give ppm or by 1667 to give International Units/lb.

#### Carotenes and Xanthophylls in Dried Plant Materials and Mixed Feeds (4)—Official Final Action

(Caution: See 51.011, 51.018, 51.037, 51.039, and 51.046.)

#### 43.018

#### Apparatus

(a) *Chromatographic tube*.—12.5 mm id  $\times$  30 cm, Pyrex, with bottom capillary tube 2 mm id  $\times$  ca 10 cm to extend into neck of 25 mL vol. flask.

(b) *Vacuum filtration device*.—For collection of eluate in vol. flask (Fisher Scientific Co. "Filtrator," or equiv.). Attach rubber stopper to column to fit device.

#### 43.019

#### Reagents

(a) *Acetone*.—Dry, alcohol-free. Distil over Zn (granular, ca 10 mesh).

(b) *Hexane*.—Com.; Phillips Petroleum Co. "high purity," or equiv.

(c) *Extractant*.—Hexane-acetone-absolute alcohol-toluene (10+7+6+7).

(d) *Adsorbent I*.—Mix in mech. blender 1–2 hr 1+1 (w/w) silica gel G (according to Stahl; Brinkmann Instruments, Inc.) and diat. earth (Hyflo Super-Cel).

(e) *Adsorbent II*.—Mix in mech. blender 1–2 hr 1+1 (w/w) activated magnesia (Sea Sorb 43; Fisher Scientific Co.) and diat. earth (Hyflo Super-Cel).

(f) *Methanolic potassium hydroxide*.—40%. Dissolve 40 g KOH in MeOH, cool, and dil. to 100 mL with MeOH.

(g) *Sodium sulfate soln*.—10%. Dissolve 10 g anhyd.  $\text{Na}_2\text{SO}_4$  in 100 mL  $\text{H}_2\text{O}$ .

(h) *Eluants*.—(1) *Carotenes*.—Hexane-acetone (96+4). (2) *Monohydroxy pigments (MHP)*.—Hexane-acetone (90+10). (3) *Dihydroxy pigments (DHP)*.—Hexane-acetone (80+20). (4) *Total xanthophylls (TX)*.—Hexane-acetone-MeOH (80+10+10).

(i) *1-(Phenylazo)-2-naphthol (C.I. Solvent Yellow 14; Sudan I) std solns*.—(1) *Stock soln*.—1.0 millimolar (mM). Recrystallize std (Aldrich Chemical Co., or MC/B Manufacturing Chemists) from hot absolute alcohol. Dry crystals to const wt in 70° vac. oven. Dissolve 0.1241 g in 500 mL acetone-isopropanol (1+1). (2) *Working soln*.—0.04mM. Dil. 20 mL stock soln to 500 mL with acetone-isopropanol (1+1). Store in dark.

#### 43.020

#### Preparation of Sample

Grind sample to pass No. 40 sieve. Accurately weigh sample (2 g corn gluten or alfalfa meal; 50 mg marigold meal; 4 g mixed feed) into 100 mL vol. flask. Pipet 30 mL extractant into flask, stopper, and swirl 1 min. For low-moisture samples, e.g., marigold meal, dehydrated alfalfa, or corn gluten (not air-dried samples), also pipet 1 mL  $\text{H}_2\text{O}$ /2 g sample into flask, stopper, and swirl 1 min. For high-moisture (air-dried) samples, omit addn of  $\text{H}_2\text{O}$ .

(a) *Hot saponification*.—(For rapid extn and for samples contg xanthophyll esters.) Pipet 2 mL (4 mL for 4 g sample of mixed feed) 40% methanolic KOH into flask, swirl 1 min, and place flask in 56°  $\text{H}_2\text{O}$  bath 20 min. Attach air condenser or cool neck of flask to prevent loss of solv. Cool sample, and let stand in dark 1 hr. Pipet 30 mL hexane into flask, swirl 1 min, dil. to vol. with 10%  $\text{Na}_2\text{SO}_4$  soln, and shake vigorously 1 min. Let stand in dark 1 hr before chromatgy. Upper phase is 50 mL.

(b) *Cold (overnight) saponification*.—(For samples not contg xanthophyll esters.) Let mixt. stand in dark ca 16 hr. Pipet 2 mL

40% methanolic KOH into flask and swirl 1 min; let stand in dark 1 hr; then proceed with hexane addn as in (a).

#### 43.021

#### Chromatography

With column on Filtrator, place absorbent cotton or glass wool plug in bottom and add ca 12 cm layer Adsorbent I. Apply full vac. and add more adsorbent to give 7 cm layer. Use flat instrument such as inverted cork on glass rod to press and flatten surface of adsorbent. Place 2 cm layer anhyd.  $\text{Na}_2\text{SO}_4$  above adsorbent and press firmly.

(a) *Total carotenes*.—With 25 mL vol. flask as receiver, pipet 5 mL (or 10 mL if low pigment) of upper phase onto column and adjust vac. for flow of 2 or 3 drops/sec. Needle valve in vac. line helps control flow rate. Add carotene eluant as last of soln enters adsorbent and continue until carotene band is collected in flask. Keep adsorbent covered with solv. at all times. Release vac., place carotene soln in dark until it reaches room temp., and dil. to vol. with carotene eluant. Invert flask several times to mix; then det. A immediately, as in 43.022.

Xanthophylls remain on column. For sepn of monohydroxy from dihydroxy pigments (both free from epoxy and polyoxy pigments), or for total xanthophylls, proceed as in (b) or (c).

(b) *Separation of xanthophylls*.—(1) With 25 mL vol. flask in Filtrator and vac. applied to column, let eluant level approach adsorbent surface; then immediately add MHP eluant. Band of monohydroxy pigments (zeinoxanthin, cryptoxanthin) and any persistent mono- or di-esters should move down column ahead of other bands. When elution of MHP band is complete, place flask in dark to attain room temp. before dilg to vol. with MHP eluant and detg A. (2) Proceed as in (1), using DHP eluant to collect pigments of next band (lutein, zeaxanthin, and their isomers) in 25 (or 50) mL vol. flask. Violaxanthin, neoxanthin, and other polyoxy pigments (POP) remain on column.

(c) *Total xanthophylls*.—If value for total xanthophylls is desired, pipet fresh aliquot from upper phase of original ext onto 7 cm column of Adsorbent II, and elute carotenes with hexane-acetone (90+10) and total xanthophylls with hexane-acetone-MeOH (80+10+10).

#### 43.022

#### Determination

Measure A promptly to minimize isomerization and autoxidn losses. First, check calibration of spectrophtr by reading working std soln at 1 nm intervals between 469 and 479 nm. If max. value is not at 474 nm, recalibrate instrument. When instrument shows max. A at 474 nm and slit width is 0.03, working soln readings should be 0.561 (474) and 0.460 (436). Correct calcs from equations below, for instrument deviation factor. If instrument lacks controllable slit, est. concn by assuming that working std soln of dye, (i)(2), has same A as 2.35 mg carotenes/L at 436 nm and 2.38 mg xanthophylls/L at 474 nm.

Det. A of carotene fraction at 436 nm and MHP and DHP fractions at 474 nm. For highest accuracy, control soln vols to give A between 0.25 and 0.75.

#### 43.023

#### Calculations

Following equations are applicable to A data obtained from calibrated spectrophtrs that operate with narrow slit width. Values 196 and 236 are *a* for *trans*- $\beta$ -carotene and *trans*-lutein at prescribed wavelengths; *b* = cell length in cm; *d* = diln factor = (g sample  $\times$  mL ext on column)/(50 mL upper phase  $\times$  mL final diln); and *f* = instrument deviation factor = 0.460/observed  $A_{436}$  or 0.561/observed  $A_{474}$ .

Carotene fraction concn (mg/lb)

$$= (A_{436} \times 454 \times f) / (196 \times b \times d).$$

MHP fraction concn (mg/lb), or DHP fraction concn (mg/lb), or total xanthophylls (mg/lb)

$$=(A_{474} \times 454 \times f)/(236 \times b \times d).$$

#### Thiamine (Vitamin B<sub>1</sub>)

(Methods not applicable in presence of materials that adsorb thiamine or which contain extraneous materials which affect thiochrome fluorescence)

#### Fluorometric Method (5)—Official Final Action

##### 43.024

##### Reagents and Apparatus

(a) *Double-normal sodium acetate*.—Dissolve 272 g NaOAc · 3H<sub>2</sub>O in enough H<sub>2</sub>O to make 1 L.

(b) *Bromocresol green pH indicator*.—Dissolve 0.1 g indicator by triturating in agate mortar with 2.8 mL 0.05N NaOH, and dil. to 200 mL with H<sub>2</sub>O. Transition range: 4.0 (green)—5.8 (blue).

(c) *Bromophenol blue indicator*.—Dissolve 0.1 g indicator by triturating in agate mortar with 3.0 mL 0.05N NaOH, and dil. to 250 mL with H<sub>2</sub>O. Transition range: 3.0 (yellow)—4.6 (blue).

(d) *Enzyme soln*.—Prep., on day on which it is to be used, 10% aq. soln of enzyme prepn potent in diastatic and phosphorylolytic activity. (Among enzymes available for this purpose are Mylase P (Wallerstein Co.), and Clarase (Miles Laboratories, Inc.)).

(e) *Base-exchange silicate*.—Purify artificially prepd silicate of base-exchange type, in form of granular powder of "50–80 mesh" size, as follows: Place convenient amt (100–500 g) of base-exchange silicate in suitable beaker, add enough hot 3% HOAc to cover, and boil 10–15 min, stirring continuously. Let settle and decant supernate. Repeat washing 3 times, then wash similarly 3 times with hot neut. KCl soln, (g), and finally wash with boiling H<sub>2</sub>O until last washing gives no reaction for Cl. Dry material at ca 100° and store in well closed container. (Purified base-exchange silicate may be purchased as "Thiochrome Decalco," Fisher Scientific Co., No. T-97.)

(f) *Chromatographic columns*.—Use glass chromatgc tubes (ca 275 mm overall length, with reservoir capacity ca 60 mL) consisting of 3 parts fused together with following approx. dimensions (od × length, mm): (1) reservoir at top, 35 × 95, (2) adsorption tube in middle, 8 × 145, drawn into (3) capillary at bottom 35 mm long and of such diam. that when tube is filled, rate of flow will be ≤1 mL/min. Prep. tubes for use as follows: Over upper end of capillary, with aid of glass rod, place pledget of fine glass wool. To adsorption tube, add H<sub>2</sub>O suspension of 1.0–2.0 g purified base-exchange silicate, taking care to wash down all silicate from walls of reservoir. To keep air out of adsorption column, keep layer of liq. above surface of silicate during adsorption process. (Prevent tube from draining by placing rubber cap, filled with H<sub>2</sub>O to avoid inclusion of air, over lower end of capillary.)

(g) *Neutral potassium chloride soln*.—Dissolve 250 g KCl in H<sub>2</sub>O to make 1 L.

(h) *Acid potassium chloride soln*.—Add 8.5 mL HCl to 1 L of the neut. KCl soln.

(i) *Sodium hydroxide soln*.—15%. Dissolve 15 g NaOH in H<sub>2</sub>O to make 100 mL.

(j) *Potassium ferricyanide soln*.—1%. Dissolve 1 g K<sub>3</sub>Fe(CN)<sub>6</sub> in H<sub>2</sub>O to make 100 mL. Prep. soln on day it is used.

(k) *Oxidizing reagent*.—Mix 4.0 mL of the 1% K<sub>3</sub>Fe(CN)<sub>6</sub> soln with the 15% NaOH soln to make 100 mL. Use soln within 4 hr.

(l) *Isobutyl alcohol*.—Redistd in all-glass app. Use redistd product as anhyd. or H<sub>2</sub>O-satd.

(m) *Quinine sulfate stock soln*.—Use quinine sulfate soln to govern reproducibility of fluorometer. Prep. stock soln by dis-

solving 10 mg quinine sulfate in 0.1N H<sub>2</sub>SO<sub>4</sub> to make 1 L. Store in light-resistant containers.

(n) *Quinine sulfate std soln*.—Dil. 1 vol. quinine sulfate stock soln with 39 vols 0.1N H<sub>2</sub>SO<sub>4</sub>. (Soln fluoresces to ca same degree as does isobutanol ext of thiochrome obtained from 1 μg thiamine.HCl.) Store soln in light-resistant containers.

(o) *Thiamine hydrochloride std solns*.—(1) *Stock soln*.—100 μg/mL. Accurately weigh 50–60 mg USP Thiamine Hydrochloride Ref. Std that has been dried to const wt over P<sub>2</sub>O<sub>5</sub> in desiccator. (Ref. std is hygroscopic; avoid absorption of moisture.) Dissolve in 20% alcohol adjusted to pH 3.5–4.3 with HCl, and dil. to 500 mL with the acidified alcohol. Add enough addnl acidified alcohol to make concn exactly 100 μg thiamine.HCl/mL. Store at ca 10° in g-s, light-resistant bottle.

(2) *Intermediate soln*.—10 μg/mL. Dil. 100 mL stock soln to 1 L with 20% alcohol adjusted to pH 3.5–4.3 with HCl. Store at ca 10° in g-s, light-resistant bottle.

(3) *Working soln*.—1 μg/mL. To 10 mL intermediate soln, add ca 50 mL ca 0.1N HCl, digest or autoclave as in 43.025(a)(1), cool, and dil. to 100 mL with the 0.1N HCl. Prep. fresh soln for each assay.

For materials contg free thiamine, dil. 20 mL working soln to 100 mL with 0.1N HCl. Designate as assay std soln and proceed directly to oxidn, 43.028.

For materials contg thiamine pyrophosphate, take 20 mL working soln and proceed as in 43.026, beginning "... dil to ca 65 mL ...". Designate final 25 mL eluate (equiv. to 5 μg USP Thiamine.HCl Ref. Std) from 43.027 as assay std soln and proceed as in 43.028.

##### 43.025

##### Extraction

(a) *For materials containing free thiamine (not applicable in presence of thiamine pyrophosphate)*.—Place measured amt of sample in flask of suitable size, prep. sample by (1), (2), or (3), and proceed directly to oxidn, 43.028.

(1) *For dry or semidry materials containing no appreciable quantity of basic substances*.—Add vol. 0.1N HCl equal in mL to ≥10 times dry wt sample in g. Commminute and evenly disperse material in liq. if it is not readily sol. If lumping occurs, agitate vigorously so that all particles come in contact with liq.; then wash down sides of flask with 0.1N HCl. Digest 30 min at 95–100° in steam bath, or in boiling H<sub>2</sub>O, with frequent mixing; or autoclave mixt. 30 min at 121–123°. Cool, and if lumping occurs, agitate mixt. until particles are evenly dispersed. Dil. with 0.1N HCl to measured vol. contg ca 0.2 μg thiamine/mL. Designate as Assay Sample Soln.

(2) *For dry or semidry materials containing appreciable amounts of basic substances*.—Add dil. HCl to adjust mixt. to ca pH 4.0. Add amt of H<sub>2</sub>O such that total vol. liq. is equal in mL to ≥10 times dry wt sample in g. Add equiv. of 1 mL 10N HCl/100 mL liq. and proceed as in (1), beginning with second sentence.

(3) *For liquid materials*.—Adjust material to ca pH 4.0 with dil. HCl, or, with vigorous agitation, NaOH soln, and proceed as in (2), beginning with second sentence.

(b) *For materials containing thiamine pyrophosphate*.—Proceed as in (a)(1), but dil. with 0.1N HCl to measured vol. contg 0.2–5.0 μg thiamine/mL, followed by enzyme hydrolysis and purification, 43.026–43.027.

##### 43.026

##### Enzyme Hydrolysis

Take aliquot contg ca 10–25 μg thiamine, dil. to ca 65 mL with 0.1N HCl, and adjust pH to 4.0–4.5 with ca 5 mL 2N NaOAc, using pH meter or bromocresol green indicator and spot plate.

End point should be definitely on blue side of color change. Add 5 mL enzyme soln, mix, and incubate 3 hr at 45–50°. Cool, adjust to ca pH 3.5, using bromophenol blue indicator or pH meter, dil. to 100 mL with H<sub>2</sub>O, and filter thru paper known not to adsorb thiamine (ash-free papers have been found satisfactory).

**43.027****Purification**

Pass aliquot of filtered soln contg ca 5 µg thiamine thru prep'd chromatgc column, and wash column with three 5 mL portions of almost boiling H<sub>2</sub>O. Do not permit surface of liq. to fall below surface of base-exchange silicate.

Elute thiamine from base-exchange silicate by passing five 4.0–4.5 mL portions almost boiling acid-KCl soln thru column. Do not permit surface of liq. to fall below surface of silicate until final portion of acid-KCl soln has been added. Collect eluate in 25 mL vol. flask, cool, and dil. to vol. with acid-KCl soln. Designate this as Assay Sample Soln.

**43.028****Oxidation of Thiamine to Thiochrome**

To each of ≥4 ca 40 mL tubes (or reaction vessels) add ca 1.5 g NaCl or KCl and 5 mL assay std soln. (*Precision and accuracy of results depend upon uniform technic in conducting following oxidn.* Protect soln from light which destroys thiochrome. Use pipet that delivers 3 mL in 1–2 sec for addn of oxidizing reagent.) Place tip of pipet contg oxidizing reagent in neck of tube and hold it so that stream of soln does not hit side of tube. Gently swirl tube to produce rotary motion in liq. and immediately add 3 mL oxidizing reagent. Remove pipet and swirl tube again to ensure adequate mixing. *Immediately* add 13 mL isobutanol, stopper, and shake tube vigorously ≥15 sec. Similarly treat ≥1 tube and treat each of ≥2 remaining tubes (std blanks) similarly except replace oxidizing reagent with 15% NaOH soln.

To each of ≥4 similar tubes add 5 mL Assay Sample Soln. Treat these tubes in same manner as directed for tubes contg working std soln.

After isobutanol has been added to all tubes, shake again ca 2 min. (Tubes may be placed in shaker box for this addnl shaking.) Centrf. tubes at low speed until clear supernate can be obtained from each. Pipet or decant ca 10 mL isobutanol ext (upper layer) from each tube into cell for thiochrome fluorescence measurement.

**43.029****Thiochrome Fluorescence Measurement**

(Thiamine content of oxidized Assay Soln is detd by comparing intensity of fluorescence of ext of this soln with that from oxidized std soln. Intensity of fluorescence is proportional to amt of thiamine present and may be measured with suitable fluorometer. Input filter of narrow *T* range with max. ca 365 nm and output filter of narrow *T* range with max. ca 435 nm have been found satisfactory. Use quinine sulfate std soln to govern reproducibility of fluorometer. *Caution:* See 51.008.)

Measure fluorescence (*I*) of isobutanol ext from oxidized Assay Sample Soln. Next measure fluorescence (*b*) of ext from Assay Sample Soln which has been treated with 3 mL 15% NaOH soln. Then measure fluorescence (*S*) of ext from oxidized assay std soln. Finally, measure fluorescence (*d*) of ext from assay std soln which has been treated with 3 mL 15% NaOH soln (std blank).

**43.030****Calculation**

Calc. as follows:

$$\mu\text{g Thiamine.HCl in 5 mL Assay Soln} = (I - b)/(S - d).$$

**Rapid Fluorometric Method (6)—Official Final Action**

(Applicable to detn thiamine in enriched flour, farina, corn meal, macaroni, and noodle products, or where bound thiamine or thiamine pyrophosphate is not significant)

**43.031****Reagents**

See 43.024(c), (i), (j), (k), (l), (m), (n), and (o).

**43.032****Preparation of Standard Solution**

Dil. 5 mL thiamine.HCl intermediate soln, 43.024(o)(2), to 250 mL with ca 0.1*N* HCl (1 mL = 0.2 µg thiamine.HCl). Designate this as working std soln. If NaCl is to be added to sample for extn, add NaCl to working std soln, before final diln, to give final concn of ca 5% (w/v). Proceed as in 43.034.

**43.033****Extraction**

Weigh enough sample to give final Assay Soln with thiamine concn of ca 0.2 µg/mL (e.g., 4.54 g enriched flour for 100 mL or 9.07 g for 200 mL final vol.) and proceed by one of following methods:

(a) *95–100° Digestion.*—Place measured amt of sample in bottle or flask of suitable size. (Addn of NaCl to give final concn of ca 5% (w/v) aids in subsequent sepn of sample soln. Thoroughly mix flour and salt with stirring rod before adding 0.1*N* HCl.) Add in 2 portions, with vigorous stirring, vol. ca 0.1*N* HCl in proportion ca 15 mL acid to 1 g sample, using part of acid to wash down sides of vessel. Place vessel in H<sub>2</sub>O bath previously heated to 95–100°. Stir at frequent intervals to keep solids in suspension during thickening stage (5–8 min) and occasionally during balance of total heating time of 30 min.

After hydrolysis has proceeded ca 10 min, place drop of soln on spot plate and test with thymol blue. Soln should be distinctly red (pH 1.0–1.2). If not enough (indicating presence of basic substances in sample), add ca 1*N* HCl in 1.0 mL portions until desired acidity is reached. Note vol. of 1*N* acid required to supplement the 0.1*N* acid and *repeat digestion* with new sample wt and necessary mixt. of 1*N* and 0.1*N* acids. Cool, and dil. with 0.1*N* HCl to measured vol. contg ca 0.2 µg thiamine/mL.

Centrf. mixt. until supernate is clear or practically so and/or filter thru paper known not to adsorb thiamine (ash-free papers have been found satisfactory), or filter thru fritted glass funnel, using suitable anal. filter-aid (ash-free filter pulp and Celite Analytical Filter-Aid have been found satisfactory). Discard first 1/10 part of filtrate. Designate remainder of filtrate as Assay Sample Soln.

(b) *Autoclaved digestion.*—Proceed as in (a) without addn of NaCl, except to autoclave 20 min at 5 lb (34.5 kPa) pressure (108–109°) with total heating time ≤35 min including 5–10 min to attain desired pressure and ca 5 min to reduce pressure. (It may be necessary to preheat autoclave to ca 100° before inserting samples.)

**43.034****Oxidation**

Proceed as in 43.028, except add ca 2.5 g NaCl or KCl to each tube (or reaction vessel) before addn of 5 mL working std soln, 43.032, or 5 mL Assay Sample Soln, 43.033. After addn of working std soln or Assay Sample Soln, gently swirl each tube until most of salt is dissolved. Measure fluorescence of isobutanol exts as in 43.029, and calc. thiamine.HCl content as in 43.030.

*Alternative blank reading.*—Use following technic on samples giving extremely high blank readings with 15% NaOH soln: After reading fluorescence of all tubes, add 1 drop (0.05 mL) HCl (1+1) to each tube of isobutanol ext from oxidized Assay and

Std Solns, swirl, and take addnl reading. This quenches thiochrome fluorescence and provides blank reading for each tube. Use av. values obtained for Std and Assay Solns in place of *b* and *d* in 43.030.

#### Thiamine in Bread (7)—Official Final Action

##### 43.035

##### Reagents and Apparatus

Use reagents and app. as in 43.024 and following:

(a) *Thiamine hydrochloride working soln.*—1  $\mu\text{g}/\text{mL}$ . Pipet 20 mL thiamine.HCl intermediate soln, 43.024(o)(2), into 200 mL vol. flask and dil. to vol. with ca 0.1*N* HCl. Prep. fresh daily.

(b) *Procedural std soln.*—Pipet 40 mL working soln, (a), into one of the acid digestion containers, dil. to ca 150 mL with ca 0.1*N* HCl, and continue as under sample treatment (1 mL = 0.2  $\mu\text{g}$  thiamine.HCl in final vol.). (To be used for recovery experiments to test efficiency of method.)

(c) *Direct std soln.*—0.2  $\mu\text{g}/\text{mL}$ . Pipet 40 mL working soln, (a), into 200 mL vol. flask, add ca 16 mL  $\text{H}_2\text{O}$ , and dil. to vol. with eluting acid KCl soln, 43.024(h).

##### 43.036

##### Acid and Enzyme Digestions

Weigh ( $\pm 0.05$  g) amt of air-dried bread, 14.107, contg ca 40  $\mu\text{g}$  thiamine and transfer to 250 mL digestion flask or centr. bottle. Add 150 mL ca 0.1*N* HCl, stirring with glass rod to provide homogeneous mixt. with ca  $\frac{1}{2}$  of acid and using remainder to wash down side of container. Digest 30 min in boiling  $\text{H}_2\text{O}$  bath. Stir enough to prevent lumping or clotting, especially during first 5–10 min. Cool to room temp. and adjust pH to 4.5 by adding 2*N* NaOAc, 43.024(a), using pH meter or bromocresol green indicator, 43.024(b), and spot plate; end point should be definitely on blue side of green blue change. Alternatively, use const amt of hydrolyzing acid and previously detd amt of NaOAc soln required to adjust to pH 4.5.

Add 5 mL enzyme soln, 43.024(d), mix, warm to 45°, and digest in  $\text{H}_2\text{O}$  bath 1 hr at 45–50°. Stir at 10–15 min intervals. Cool, transfer to 200 mL vol. flask, and dil. to vol. with 0.1*N* HCl. Mix, and filter thru paper known not to adsorb thiamine. (Paper can be tested by comparing filtered and nonfiltered procedural std soln, 43.035(b). Ash-free papers have been found satisfactory.) Check pH of filtrate, using bromophenol blue indicator, 43.024(c), and spot plate, or pH meter (should be ca 3.5 for subsequent base-exchange sepn), and purify as in 43.027.

##### 43.037

##### Oxidation of Thiamine to Thiochrome

Pipet duplicate 5 mL aliquots of direct std soln, 43.035(c), and duplicate 5 mL aliquots of Assay Sample Soln into ca 40 mL tubes or reaction vessels, and proceed as in 43.028.

##### 43.038

##### Thiochrome Fluorescence Measurement

Thiamine content of oxidized Assay Soln is detd by comparing intensity of fluorescence of ext of this soln with that from oxidized direct std soln, 43.035(c), correcting for blank fluorescence of each of these solns. Intensity of fluorescence is linear in range 0–2  $\mu\text{g}$  thiamine and may be measured with fluorometer as in 43.029.

Correct for blank of Assay Solns giving extremely high blank fluorescence readings with 15% NaOH soln by alternative technic, 43.034.

mg Thiamine.HCl/lb (fresh basis)

$$= (I/B) \times (40 \times 454 \times F/W \times 1000),$$

if specified aliquots have been used, where *I* = corrected reading of assay soln; *B* = corrected reading of std soln; *W* = g air-dried bread sample; and *F* = air-dry wt: fresh wt ratio.

#### Riboflavin (Vitamin B<sub>2</sub>) (8)

##### Fluorometric Method—Official Final Action

##### 43.039

##### Apparatus

*Photofluorometer.*—Use fluorometer suitable for accurately measuring fluorescence of solns contg riboflavin in concns of 0.05–0.2  $\mu\text{g}/\text{mL}$ . Input filter of narrow *T* range with max. ca 440 nm and output filter of narrow *T* range with max. ca 565 nm have been found satisfactory.

##### 43.040

##### Reagents

(Do not shake std solns stored under toluene.)

(a) *Riboflavin std solns.*—(1) *Stock soln.*—100  $\mu\text{g}/\text{mL}$ . Dissolve 50 mg USP Riboflavin Ref. Std, previously dried and stored in dark in desiccator over  $\text{P}_2\text{O}_5$ , in 0.02*N* HOAc to make 500 mL. (To facilitate soln, warm with ca 300 mL 0.02*N* HOAc on steam bath with constant stirring until dissolved, cool, and add 0.02*N* HOAc to make 500 mL.) Store under toluene at ca 10°.

(2) *Intermediate soln.*—10  $\mu\text{g}/\text{mL}$ . Dil. 100 mL stock soln to 1 L with 0.02*N* HOAc. Store under toluene at ca 10°.

(3) *Working soln I.*—1  $\mu\text{g}/\text{mL}$ . Dil. 10 mL intermediate soln to 100 mL with  $\text{H}_2\text{O}$ . Prep. fresh for each assay. Use as std soln in 43.042.

(4) *Working soln II.*—0.1  $\mu\text{g}/\text{mL}$ . Dil. 10 mL intermediate soln to 1 L with  $\text{H}_2\text{O}$ . Prep. fresh for each assay. Use as std soln in 43.043.

(b) *Sodium hydrosulfite.*—High purity and stored to avoid undue exposure to light and air. Check suitability as follows: To each of  $\geq 2$  tubes add 10 mL  $\text{H}_2\text{O}$  and 1 mL std riboflavin soln contg 20  $\mu\text{g}/\text{mL}$ , and proceed as in 43.042 with respect to addn of HOAc,  $\text{KMnO}_4$  soln, and  $\text{H}_2\text{O}_2$  soln. Then when 8 mg  $\text{Na}_2\text{S}_2\text{O}_4$  is added with mixing, riboflavin should be completely reduced in  $\leq 5$  sec.

(c) *Extraction soln.*—Mix 300 mL MeOH, 100 mL pyridine, 100 mL  $\text{H}_2\text{O}$ , and 10 mL HOAc. (Proportionate amts may be prepd.)

##### 43.041

##### Preparation of Sample Solution

(Thruout all stages, protect solns from undue exposure to light and keep at pH <7.0. Where directed to filter thru paper, use paper known not to adsorb riboflavin (ash-free papers have been found satisfactory).)

Place measured amt of sample in suitable size flask and proceed by one of following methods:

(a) *For dry or semidry materials containing no appreciable amount of basic substances.*—Add vol. 0.1*N* HCl equal in mL to  $\geq 10$  times dry wt sample in g; resulting soln must contain  $\leq 0.1$  mg riboflavin/mL. If material is not readily sol., comminute so that it may be evenly dispersed in liq. Then agitate vigorously and wash down sides of flask with 0.1*N* HCl.

Heat mixt. in autoclave 30 min at 121–123° and cool. If lumping occurs, agitate until particles are evenly dispersed. Adjust, with vigorous agitation, to pH 6.0–6.5 with NaOH soln; then immediately add dil. HCl until no further pptn occurs (usually ca pH 4.5, isoelec. point of many proteins).

Dil. mixt. to measured vol. contg  $>0.1$   $\mu\text{g}$  riboflavin/mL and filter thru paper. (In case of mixt. difficult to filter, centrfg and/or filtering thru fritted glass, using suitable anal. filter-aid, may often be substituted for, or may precede, filtering thru paper. Ash-free filter paper pulp and Celite Analytical Filter-Aid have been found satisfactory.) Take aliquot of clear filtrate and check for dissolved protein by adding dropwise, first dil. HCl, and if no ppt forms, then, with vigorous agitation, NaOH soln, and proceed as follows:

(1) If no further pptn occurs, add, with vigorous agitation,

NaOH soln to pH 6.8, dil. soln to final measured vol. contg ca 0.1  $\mu\text{g}$  riboflavin/mL, and if cloudiness occurs, filter again.

(2) If further pptn occurs, adjust soln again to point of max. pptn, dil. to measured vol. contg  $>0.1 \mu\text{g}$  riboflavin/mL, and then filter. Take aliquot of clear filtrate and proceed as in (1).

If riboflavin content of sample is so low that these requirements cannot be met, conc. clear filtrate obtained at ca pH 4.5 to suitable vol. with heat under reduced pressure. Filter if necessary and proceed as in (1).

(b) *For dry or semidry materials containing appreciable amounts of basic substances.*—Adjust mixt. to pH 5.0–6.0 with dil. HCl. Add amt of  $\text{H}_2\text{O}$  such that total vol. liq. is equal in mL to  $\geq 10$  times dry wt sample in g. (Resulting soln must contain  $\leq 0.1 \text{ mg}$  riboflavin/mL.) Then add equiv. of 1.0 mL 10N HCl/100 mL liq. and proceed as in (a), beginning with second sentence.

(c) *For liquid materials.*—Adjust pH to 5.0–6.0 with dil. HCl or, with vigorous agitation, NaOH soln, and proceed as in (b), beginning with second sentence.

(d) *For concentrates, premixes, and multivitamin supplements.*—Place measured amt of sample in flask and add vol. extn soln equal in mL to  $\geq 10$  times dry wt sample in g; resulting soln must contain  $\leq 0.1 \text{ mg}$  riboflavin/mL. If sample is not readily sol., comminute so that it may be dispersed evenly in liq. Then agitate vigorously and wash down sides of flask with extn soln.

Reflux mixt. 1 hr and cool. If lumping occurs, agitate mixt. until particles are dispersed evenly. Dil. mixt. to measured vol. with extn soln and let any undissolved particles settle, or filter or centrfr., if necessary. Take aliquot of clear soln and dil. with  $\text{H}_2\text{O}$  to measured vol. contg ca 0.1  $\mu\text{g}$  riboflavin/mL and filter if soln is not clear. Proceed with detn, **43.043**.

#### 43.042

#### Determination

To each of  $\geq 4$  tubes (or reaction vessels) add 10 mL sample soln. (If fluorometer is type that requires tubular cuvets, all reactions may be carried out in matched set of these cuvets.) To each of  $\geq 2$  tubes add 1 mL std riboflavin working soln I, (a)(3), and mix, and to each of  $\geq 2$  remaining tubes, add 1 mL  $\text{H}_2\text{O}$  and mix. To each tube add 1 mL HOAc and mix; add, with mixing, 0.5 mL 4.0%  $\text{KMnO}_4$  soln (vol. may be increased for sample solns that contain excess of oxidizable material, but  $\leq 0.5 \text{ mL}$  in excess of that required to complete oxidn of foreign material should be added). Let stand 2 min; then to each tube add, with mixing, 0.5 mL 3.0%  $\text{H}_2\text{O}_2$  soln; permanganate color must be destroyed within 10 sec. Shake vigorously until excess O is expelled. If gas bubbles remain on sides of tubes after foaming stops, remove by tipping tubes so that soln flows slowly from end to end.

In fluorometer, measure fluorescence (X) of sample soln contg 1 mL added std riboflavin working soln I. Next, measure fluorescence (B) of sample soln contg 1 mL added  $\text{H}_2\text{O}$ . Add, with mixing, 20 mg *powd*  $\text{Na}_2\text{S}_2\text{O}_4$  to  $\geq 2$  tubes, measure min. fluorescence (C) within 5 sec. Calc. on basis of aliquots taken as follows:

$$\text{mg Riboflavin/mL final sample soln} = [(B - C)/(X - B)] \times 0.10 \times 0.001.$$

(Value of  $(B - C)/(X - B)$  must be  $\geq 0.66$  and  $\leq 1.5$ .)

*Note:* Quantity of  $\text{Na}_2\text{S}_2\text{O}_4$  appreciably  $>20 \text{ mg}$  may reduce foreign pigments and/or foreign fluorescing substances, thereby causing erroneous results.

#### 43.043

#### Alternative Determination—Official Final Action

(Applicable to high potency samples)

Add 10 mL sample soln to  $\geq 2$  cuvets. Add 10 mL working std

soln II, (a)(4), to each of another set of  $\geq 2$  cuvets. Add 1 mL HOAc to each tube and mix. Measure fluorescence of sample and std solns in fluorometer. Add, with mixing, 20 mg *powd*  $\text{Na}_2\text{S}_2\text{O}_4$  to 1 tube each of std and sample and measure min. fluorescence within 5 sec. Calc. on basis of aliquots taken as follows:

$$\text{mg Riboflavin/mL final sample soln} = [(I - Q)/(I' - Q')] \times (0.1 \times 0.001),$$

where I and I' = fluorescence intensities of sample and std, resp., and Q and Q' = fluorescences of sample and std, resp., after  $\text{Na}_2\text{S}_2\text{O}_4$  addn.

### Niacin (Nicotinic Acid) and Niacinamide (Nicotinamide) Official Final Action

#### Colorimetric Method (9)

#### 43.044

#### Reagents

(a) *Niacin std solns.*—(1) *Stock soln.*—100  $\mu\text{g}$ /mL. Dissolve 50 mg USP Niacin Ref. Std, previously dried and stored in dark in desiccator over  $\text{P}_2\text{O}_5$ , in 25% alcohol to make 500 mL. Store at ca  $10^\circ$ .

(2) *Working soln I.*—10  $\mu\text{g}$ /mL. Remove small portion stock soln and let come to room temp. Dil. 10 mL to 100 mL with  $\text{H}_2\text{O}$ . Use as std soln in **43.045(c)**.

(3) *Working soln II.*—4  $\mu\text{g}$ /mL. Dil. 2 mL stock soln, allowed to come to room temp. as in (2), to 50 mL with  $\text{H}_2\text{O}$ . Use as std soln in **43.045(b)** and **43.046(a)**.

(b) *Dilute ammonium hydroxide.*—Dil. 5 mL  $\text{NH}_4\text{OH}$  to 250 mL with  $\text{H}_2\text{O}$ .

(c) *Dilute hydrochloric acid.*—1 + 5.

(d) *Phosphate buffer soln.*—pH 8. Dissolve 60 g  $\text{Na}_2\text{HPO}_4 \cdot 7\text{H}_2\text{O}$  and 10 g  $\text{KH}_2\text{PO}_4$  in warm  $\text{H}_2\text{O}$  and dil. to 200 mL.

(e) *Cyanogen bromide soln.*—10%. Prep. under hood. Warm 370 mL  $\text{H}_2\text{O}$  to  $40^\circ$  in large flask and add 40 g CNBr. Shake until dissolved, cool, and dil. to 400 mL. Do not let CNBr or soln come in contact with skin. Store in refrigerator.

(f) *10% Sulfanilic acid soln.*—Add  $\text{NH}_4\text{OH}$  in 1 mL portions to mixt. of 20 g sulfanilic acid and 170 mL  $\text{H}_2\text{O}$  until acid dissolves. Adjust to pH 4.5 with HCl (1+1), using bromocresol green indicator, **43.024(b)**, and spot plate. Dil. to 200 mL. Soln should be almost colorless. Use in **43.046(a)**.

(g) *55% Sulfanilic acid soln.*—Add 27 mL  $\text{H}_2\text{O}$  and 27 mL  $\text{NH}_4\text{OH}$  to 55 g sulfanilic acid and shake until dissolved, warming if necessary. Adjust to pH 7 with few drops  $\text{NH}_4\text{OH}$  or 5N HCl and dil. to 100 mL. Store in dark. Use in **43.046(b)**.

#### 43.045

#### Preparation of Sample and Standards

(a) *Pharmaceutical preparations.*—Disperse  $\geq 5$  tablets or capsules in small vol.  $\text{H}_2\text{O}$  with heat. Tablets may be ground first. Cool, transfer to vol. flask, and dil. to vol. Soln should contain 50–200  $\mu\text{g}$  niacin/mL. Pipet 10 mL aliquot into 250 mL erlenmeyer and add 10 mL HCl. Evap. on hot plate to ca 2 mL, cool, add ca 25–50 mL  $\text{H}_2\text{O}$ , and adjust to pH 2.5–4.5 with 40% NaOH or KOH soln. Transfer to vol. flask of such size that soln contains ca 4  $\mu\text{g}$  niacin/mL. Filter, if necessary, discarding first 10 mL filtrate. Proceed as in **43.046(a)**.

(b) *Noncereal foods and feeds.*—Weigh 1 oz (28.35 g) sample into 1 L erlenmeyer, add 200 mL 1N  $\text{H}_2\text{SO}_4$ , mix, and heat 30 min in autoclave at 15 lb (104 kPa) pressure. Cool, adjust to pH 4.5 with 10N NaOH, using bromocresol green as outside indicator, dil. to 250 mL with  $\text{H}_2\text{O}$ , and filter. Weigh 17g  $(\text{NH}_4)_2\text{SO}_4$  into 50 mL vol. flask, pipet in 40 mL sample soln, dil. to vol. with  $\text{H}_2\text{O}$ , and shake vigorously. Filter, mix well, and use 1 mL for

color development. In case of samples contg 16 mg niacin/lb, final soln contains 3.2  $\mu\text{g/mL}$ .

Pipet 40 mL working soln II, (a)(3), into 17 g  $(\text{NH}_4)_2\text{SO}_4$  in 50 mL vol. flask, and dil. to vol. with  $\text{H}_2\text{O}$ . This std contains 3.2  $\mu\text{g/mL}$ . Proceed as in 43.046(a).

(c) *Cereal products*.—Run 1 reagent blank and 5 levels of working soln I, (a)(2), with samples thruout detn.

Place 1.5 g  $\text{Ca}(\text{OH})_2$  into each of six 250 mL erlenmeyers. From pipet add 0, 5, 10, 15, 20, and 25 mL working soln I, resp. Accurately weigh ca 2.5 g sample contg ca 100  $\mu\text{g}$  niacin into another flask contg ca 1.5 g  $\text{Ca}(\text{OH})_2$ . To all flasks add  $\text{H}_2\text{O}$  to ca 90 mL, shake to mix, and autoclave 2 hr at 15 lb (104 kPa) pressure. Mix thoroly while still hot. Cool to ca 40°, transfer to 100 mL vol. flasks, and dil. to vol. (When necessary, sample may be stored in refrigerator few days.)

Transfer ca 50 mL supernate from each vol. flask to sep. centrf. tubes and place in ice bath 15 min or in refrigerator  $\geq 2$  hr. Centrf. 15 min and pipet 20 mL supernate from each tube into sep. centrf. tubes contg 8 g  $(\text{NH}_4)_2\text{SO}_4$  and 2 mL phosphate buffer soln. Shake to dissolve and warm to 55–60°. Centrf. 5 min and filter thru Whatman No. 12 paper, or equiv., refiltering if necessary to obtain clear soln. Proceed as in 43.046(b).

#### 43.046

#### Determination

(a) *For pharmaceutical preparations and noncereal foods and feeds*.—Add 10% sulfanilic acid soln, (f), and CNBr soln under hood from burets or pipets filled by mech. suction. (Caution: CNBr is toxic.) Use working soln II, (a)(3). Prep. tubes as follows:

Standard Blank	Sample Blank
1.0 mL std soln	1.0 mL sample soln
5.0 mL $\text{H}_2\text{O}$	5.0 mL $\text{H}_2\text{O}$
0.5 mL dil. $\text{NH}_4\text{OH}$	0.5 mL dil. $\text{NH}_4\text{OH}$
2.0 mL 10% sulfanilic acid	2.0 mL 10% sulfanilic acid
0.5 mL dil. HCl	0.5 mL dil. HCl
Standard Soln	Sample Soln
1.0 mL std soln	1.0 mL sample soln
0.5 mL dil. $\text{NH}_4\text{OH}$	0.5 mL dil. $\text{NH}_4\text{OH}$
5.0 mL CNBr	5.0 mL CNBr
2.0 mL 10% sulfanilic acid	2.0 mL 10% sulfanilic acid
0.5 mL $\text{H}_2\text{O}$	0.5 mL $\text{H}_2\text{O}$

Prep. sep. sample blank for each sample.

Pipet std soln and sample soln into respective tubes; add 5 mL  $\text{H}_2\text{O}$  for std blank and sample blank. Add all subsequent solns to single tube and read color before proceeding with next tube. Starting with std blank, swirl tube to impart rotary motion in liq., immediately add dil.  $\text{NH}_4\text{OH}$ , swirl again, add sulfanilic acid, and swirl. Immediately add 0.5 mL dil. HCl, mix again, place in photoelec. colorimeter, and adjust instrument to 0 A at any specific wavelength between 430 and 450 nm within ca 30 sec after addn of sulfanilic acid soln. Treat std soln in same way as std blank with respect to addn of dil.  $\text{NH}_4\text{OH}$ . Immediately swirl tube, add CNBr soln, and swirl again. At 30 sec after addn of CNBr soln, swirl tube, add sulfanilic acid soln, and swirl again. Immediately add 0.5 mL  $\text{H}_2\text{O}$ , mix again, and stopper. With instrument set at 0 A for std blank, as above, read A of std soln at max. (Color reaches max. in ca 1.5 min after addn of sulfanilic acid soln, remains at peak ca 2 min, and then fades slowly.)

With sample blank set at 0 A, det. A of sample soln similarly. Niacin content is proportional to A if std and sample solns are ca same concn.

(b) *For cereal products*.—In each of 2 tubes place 5 mL std and in each of 2 addnl tubes place 5 mL sample soln. In addnl

tube to be used as reagent blank, place 5 mL  $\text{H}_2\text{O}$ . To one std tube and one sample tube to be used as their respective blanks, add 10 mL  $\text{H}_2\text{O}$ . Let all tubes stand 30 min in bath of finely crushed ice, preferably in refrigerator. To remaining sample and std tubes and to reagent blank, consecutively add 10 mL cold CNBr, followed in 30 sec by 1.0 mL 55% sulfanilic acid soln, (g). Mix immediately after addn of each reagent (most conveniently done by swirling), and stopper tubes contg CNBr. Replace all tubes in ice bath. To std and sample blank add 1.0 mL 55% sulfanilic acid soln.

Set colorimeter to 0 A at 470 nm with std blank, and read A of other tubes 12–15 min after addn of sulfanilic acid. Tubes must be cooled uniformly and each tube must be wiped dry just before placing in colorimeter. If tubes fog, dip momentarily in hot  $\text{H}_2\text{O}$  and wipe before reading.

Plot std curve of A of std minus that of reagent blank against niacin concn in  $\mu\text{g/mL}$ , drawing straight line of best fit. From this line read concn, C, corresponding to A of sample corrected for sample blank and reagent blank.

$$\text{mg Niacin}/100 \text{ g sample} = C/(10 \times \text{g sample}).$$

#### Automated Method (10)—Official Final Action

#### 43.047

#### Principle

Niacin and niacinamide are extd from cereal products with  $\text{Ca}(\text{OH})_2$ . Pyridine groups are cleaved by CNBr and reacted with sulfanilic acid to form yellow complex whose A is read at 470 nm.

#### 43.048

#### Apparatus and Reagents

(a) *Automatic analyzer*.—AutoAnalyzer AAll with following modules (Technicon Instruments Corp.): Sampler IV, proportioning pump, colorimeter with 470 nm filters, recorder, and manifold No. 116-D137. See Fig. 43.01.

(b) *Cyanogen bromide soln*.—10%. See 43.044(e).

(c) *Phosphate buffer soln I*.—pH 8. See 43.044(d).

(d) *Phosphate buffer soln II*.—pH 8. Dissolve 60 g  $\text{Na}_2\text{HPO}_4 \cdot 7\text{H}_2\text{O}$  and 10 g  $\text{KH}_2\text{PO}_4$  in warm  $\text{H}_2\text{O}$  and dil. to 2 L. Add 1 mL Brij-35 (Technicon Instruments Corp. No. T21-0110) and mix.

(e) *Sulfanilic acid soln*.—10%. Add 100 g sulfanilic acid to beaker contg 500 mL  $\text{H}_2\text{O}$ . Mix on mag. stirrer and slowly add  $\text{NH}_4\text{OH}$  until acid dissolves (ca 40 mL). Adjust to pH 7 with HCl (1+3) and dil. to 1 L.

(f) *Niacin std solns*.—(1) *Stock soln*.—100  $\mu\text{g/mL}$ . See 43.044(a)(1). (2) *Working soln*.—25  $\mu\text{g/mL}$ . Remove small portion stock soln and let come to room temp. Dil. 25 mL to 100 mL with  $\text{H}_2\text{O}$ . (3) *Calibration soln*.—2.5  $\mu\text{g/mL}$ . Dil. 10 mL working std soln to 100 mL with  $\text{H}_2\text{O}$ .

#### 43.049

#### Preparation of Samples and Standards

Run 4 levels of working std soln with samples thruout detn.

Place 1.5 g  $\text{Ca}(\text{OH})_2$  into each of four 250 mL erlenmeyers. From pipet add 5, 10, 15, and 20 mL working std soln, resp. Accurately weigh ca 5 g sample contg ca 150–400  $\mu\text{g}$  niacin into another flask contg 1.5 g  $\text{Ca}(\text{OH})_2$ . To all flasks add  $\text{H}_2\text{O}$  to ca 90 mL, shake to mix, and autoclave 2 hr at 15 lb (104 kPa) pressure. Mix thoroly while still hot. Cool to ca 40°, transfer to 100 mL vol. flasks, add 1 drop Brij-35, and dil. to vol. (When necessary, soln may be stored in refrigerator few days.)

Transfer ca 35 mL supernate from each vol. flask to sep. centrf. tubes and place in ice bath 15 min or in refrigerator 2 hr. Centrf. 15 min, pipet 20 mL supernate from each tube into sep. centrf. tubes, add 2 mL phosphate buffer soln I, mix thoroly, and filter thru Whatman No. 2 paper, or equiv.

## 43.050

**Determination**

(System should be operated under hood. If this is not possible, take following precautions to minimize CNBr fumes: Remove only portion of CNBr soln from refrigerator (usually 100 mL in 100 mL vol. flask is sufficient). Place tubing (polyethylene preferred) into flask and wrap opening with Al foil. Suspend waste lines from flowcell into 1 L erlenmeyer contg ca 100 mL 25% NaOH soln. Cover opening of flask with wet paper towel.)

Establish steady baseline with all reagents pumping thru system. Adjust 2.5  $\mu\text{g/mL}$  std soln (250  $\mu\text{g}/100\text{ mL}$ ) to 50 scale units on recorder by using "Std Cal" control on colorimeter. Fill sample cups in following order: stds, samples, and 2.5  $\mu\text{g/mL}$  std soln after every 10 samples. Dialyzer in system results in low blanks for most samples. Det. blank as follows: Place CNBr line into  $\text{H}_2\text{O}$  and flush system free of CNBr (ca 30 min). Keep all other tubing in resp. reagents and "Std Cal" setting locked in position as in analysis. Establish steady baseline and repeat detn on samples and stds in same order as in analysis.

## 43.051

**Calculations**

Plot std curve of  $A$  (chart units) of std minus blank against niacin concn in  $\mu\text{g/mL}$ , drawing line of best fit. Read concn,  $C$ , corresponding to  $A$  of sample corrected for blank and any shift in baseline during run.

For diln to 100 mL for both samples and stds,

$$\text{mg Niacin}/100\text{ g} = C/(10 \times \text{g sample}),$$

where  $C = (\mu\text{g/mL}) \times 100$ .

**Niacinamide in Multivitamin Preparations (11)**  
**Official Final Action**

## 43.052

**Principle**

Niacinamide is extd in  $\text{KH}_2\text{PO}_4$  soln at pH ca 4.5 and allowed to react with CNBr and barbituric acid. Reaction product is measured spectrophtrically. Niacin does not interfere unless present at 3 times concn of amide.

## 43.053

**Reagents**

(a) *Cyanogen bromide soln.*—10%. See 43.044(e). Let come to room temp. before use.

(b) *Potassium dihydrogen phosphate solns.*—(1) 3%. Dissolve and dil. 30 g  $\text{KH}_2\text{PO}_4$  to 1 L with  $\text{H}_2\text{O}$ . (2) 0.3%.—Dil. soln (1) with  $\text{H}_2\text{O}$  (1+9).

(c) *Barbituric acid buffered soln.*—Prep. vol. required for each batch of assays by adding 2 g reagent grade barbituric acid to each 100 mL 3%  $\text{KH}_2\text{PO}_4$  soln. Stir mech. 1 hr and filter before use.

(d) *Niacinamide std solns.*—(1) *Stock soln.*—250  $\mu\text{g/mL}$ . Dissolve and dil. 50 mg USP Niacinamide Ref. Std to 200 mL with 60% alcohol. Store at ca  $10^\circ$ . (2) *Working soln.*—5  $\mu\text{g/mL}$ . Let small portion stock soln warm to room temp. Dil. 2 mL to 100 mL with 0.3%  $\text{KH}_2\text{PO}_4$  soln.

## 43.054

**Preparation of Samples**

Take 5 tablets or capsules or appropriate vol. of liq. for each assay. Grind tablets to fine powder. Place accurately weighed sample in erlenmeyer (for sealed gelatin capsules, add ca 2 mL ethylene chloride to aid dispersion). Add vol. 0.3%  $\text{KH}_2\text{PO}_4$  soln equal in mL to at least twice mg niacinamide expected. If sample is not readily sol., shake to disperse and heat 15 min in boiling  $\text{H}_2\text{O}$  bath or in autoclave at 15 lb (104 kPa) pressure. Dil. to ca 5  $\mu\text{g/mL}$  with 0.3%  $\text{KH}_2\text{PO}_4$  soln. Filter if necessary.

## 43.055

**Determination**

Prep. sep. sample blank for each sample by replacing CNBr with  $\text{H}_2\text{O}$ .

To 1 mL working std soln or assay soln in spectrophtr tube, add 0.5 mL CNBr soln, mix, stopper, and let stand 25–30 min. (To avoid standing >30 min when analyzing several samples, allow regular interval of 1–2 min between addns of CNBr.) Add 10 mL barbituric acid soln and swirl. (If barbituric acid soln cannot be added after 30 min, transfer tubes to crushed ice bath to stabilize CNBr reaction.)

Set spectrophtr to 0  $A$  at 550 nm with appropriate blank in which CNBr is replaced by  $\text{H}_2\text{O}$ . Read  $A$  of reaction product at max. color development (ca 2–4 min after addn of barbituric acid soln; color remains stable ca 1 min, then fades slowly).

mg Niacinamide in original wt sample taken

$$= (A \times 5 \times \text{diln factor}) / (A' \times 1000),$$

where  $A$  and  $A'$  refer to sample and std soln, resp., and 5 =  $\mu\text{g}$

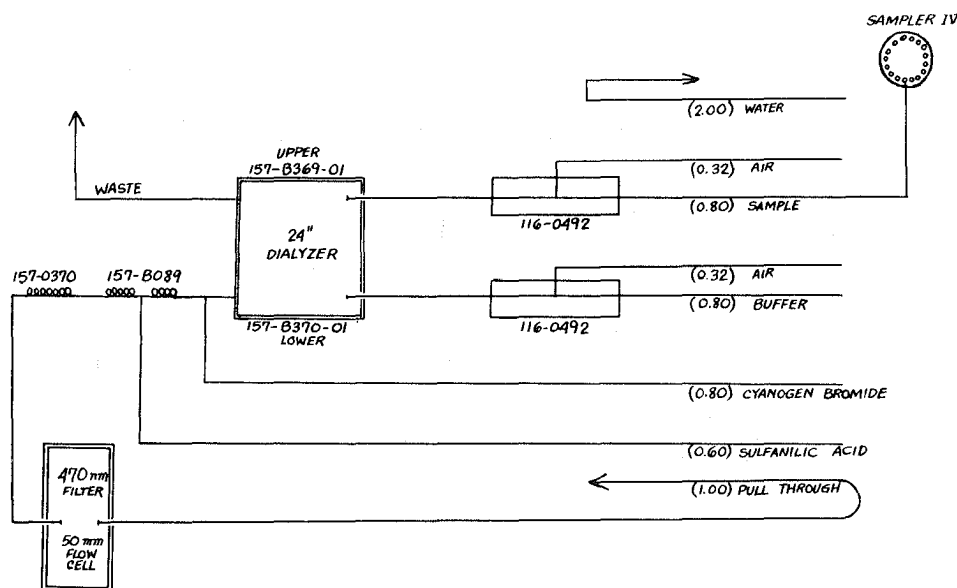

FIG. 43:01—Flow diagram for automated analysis for niacin and niacinamide

niacinamide/mL working std soln. Report mg niacinamide/tablet, capsule, or g or mL of liq.

### Vitamin C (Ascorbic Acid)—Official Final Action

#### 2,6-Dichloroindophenol Method (12)

(Applicable to detn of reduced ascorbic acid. Not applicable in presence of ferrous Fe, stannous Sn, cuprous Cu, SO<sub>2</sub>, sulfite, or thiosulfate. See Note.)

#### 43.056

#### Principle

Ascorbic acid reduces oxidn-reduction indicator dye, 2,6-dichloroindophenol, to colorless soln. At end point, excess unreduced dye is rose pink in acid soln. Vitamin is extd and titrn performed in presence of HPO<sub>3</sub>-HOAc or HPO<sub>3</sub>-HOAc-H<sub>2</sub>SO<sub>4</sub> soln to maintain proper acidity for reaction and to avoid autoxidn of ascorbic acid at high pH.

#### 43.057

#### Reagents

(a) *Extracting solns.*—(1) *Metaphosphoric acid-acetic acid soln.*—Dissolve, with shaking, 15 g HPO<sub>3</sub> pellets or freshly pulverized stick HPO<sub>3</sub> in 40 mL HOAc and 200 mL H<sub>2</sub>O; dil. to ca 500 mL, and filter rapidly thru fluted paper into g-s bottle. (HPO<sub>3</sub> slowly changes to H<sub>3</sub>PO<sub>4</sub>, but if stored in refrigerator, soln remains satisfactory 7–10 days.) (2) *Metaphosphoric acid-acetic acid-sulfuric acid soln.*—Proceed as in (1), except use 0.3N H<sub>2</sub>SO<sub>4</sub> in place of H<sub>2</sub>O.

(b) *Ascorbic acid std soln.*—1 mg/mL. Accurately weigh 50 mg USP Ascorbic Acid Ref. Std that has been stored in desiccator away from direct sunlight. Transfer to 50 mL vol. flask. Dil. to vol. immediately before use with HPO<sub>3</sub>-HOAc soln, (a)(1).

(c) *Indophenol std soln.*—Dissolve 50 mg 2,6-dichloroindophenol Na salt (Eastman Kodak Co. No. 3463), that has been stored in desiccator over soda lime, in 50 mL H<sub>2</sub>O to which has been added 42 mg NaHCO<sub>3</sub>; shake vigorously, and when dye dissolves, dil. to 200 mL with H<sub>2</sub>O. Filter thru fluted paper into amber g-s bottle. Keep stoppered, out of direct sunlight, and store in refrigerator. (Decomposition products that make end point indistinct occur in some batches of dry indophenol and also develop with time in stock soln. Add 5.0 mL extg soln contg excess ascorbic acid to 15 mL dye reagent. If reduced soln is not practically colorless, discard, and prep. new stock soln. If dry dye is at fault, obtain new supply.)

Transfer three 2.0 mL aliquots ascorbic acid std soln to each of three 50 mL erlenmeyers contg 5.0 mL HPO<sub>3</sub>-HOAc soln, (a)(1). Titr. rapidly with indophenol soln from 50 mL buret until light but distinct rose pink persists ≥5 sec. (Each titrn should require ca 15 mL indophenol soln, and titrns should check within 0.1 mL.) Similarly titr. 3 blanks composed of 7.0 mL HPO<sub>3</sub>-HOAc soln, (a)(1), plus vol. H<sub>2</sub>O ca equal to vol. indophenol soln used in direct titrns. After subtracting av. blanks (usually ca 0.1 mL) from stdzn titrns, calc. and express concn of indophenol soln as mg ascorbic acid equiv. to 1.0 mL reagent. Stdze indophenol soln daily with freshly prepd ascorbic acid std soln.

(d) *Thymol blue pH indicator.*—0.04%. Dissolve 0.1 g indicator by triturating in agate mortar with 10.75 mL 0.02N NaOH and dil. to 250 mL with H<sub>2</sub>O. Transition range: 1.2 (red)—2.8 (yellow).

#### 43.058

#### Preliminary Test for Appreciable Amount of Basic Substances

Grind representative sample or express contents from capsule and add ca 25 mL HPO<sub>3</sub>-HOAc soln, (a)(1). Test pH by placing drop thymol blue pH indicator on pestle or by using spot plate. (pH >1.2 indicates appreciable amts of basic substances.) For liq. preps, dil. representative sample ca two-fold with HPO<sub>3</sub>-HOAc soln, (a)(1), before testing with indicator.

#### 43.059

#### Preparation of Sample Assay Solution

(a) *For dry materials containing no appreciable amount of basic substances.*—Pulverize sample by gentle grinding, add HPO<sub>3</sub>-HOAc soln, (a)(1), and triturate until sample is in suspension. Dil. with HPO<sub>3</sub>-HOAc soln, (a)(1), to measured vol. Designate this vol. as V mL.

(Use ca 10 mL extg soln/g dry sample. Final soln should contain 10–100 mg ascorbic acid/100 mL.)

(b) *For dry materials containing appreciable amounts of basic substances.*—Pulverize sample by gentle grinding, add HPO<sub>3</sub>-HOAc-H<sub>2</sub>SO<sub>4</sub> soln, (a)(2), to adjust pH to ca 1.2, and triturate until sample is in suspension. Dil. with HPO<sub>3</sub>-HOAc soln, (a)(1), to measured vol. Designate this vol. as V mL.

(Use ca 10 mL extg soln/g dry sample. Final soln should contain 10–100 mg ascorbic acid/100 mL.)

(c) *For liquid materials.*—Take amt of sample contg ca 100 mg ascorbic acid. If appreciable amts of basic substances are present, adjust pH to ca 1.2 with HPO<sub>3</sub>-HOAc-H<sub>2</sub>SO<sub>4</sub> soln, (a)(2). Dil. with HPO<sub>3</sub>-HOAc soln, (a)(1), to measured vol. contg 10–100 mg ascorbic acid/100 mL. Designate this vol. as V mL.

(d) *For fruit and vegetable juices.*—Prep. juice as in 22.008(a). Add aliquots of ≥100 mL prepd juice to equal vols of HPO<sub>3</sub>-HOAc soln, (a)(1). Designate total vol. as V mL. Mix, and filter thru rapid folded paper (Eaton-Dikeman No. 195, 18.5 cm, or equiv.).

#### 43.060

#### Determination

Tit. 3 sample aliquots each contg ca 2 mg ascorbic acid and make blank detns for correction of titrns as in 43.057(c), using proper vols of HPO<sub>3</sub>-HOAc soln, (a)(1), and H<sub>2</sub>O. If ca 2 mg ascorbic acid is contained in sample aliquot <7 mL, add HPO<sub>3</sub>-HOAc soln to give 7 mL for titrn.

mg Ascorbic acid/g, tablet, mL, etc. =  $(X - B) \times (F/E) \times (V/Y)$ , where X = av. mL for sample titrn, B = av. mL for sample blank titrn, F = mg ascorbic acid equiv. to 1.0 mL indophenol std soln, E = number of g, tablets, mL, etc. assayed, V = vol. initial assay soln, and Y = vol. sample aliquot titrated.

*Note:* Products contg ferrous Fe, stannous Sn, and cuprous Cu give values in excess of their actual ascorbic acid content by this method. Following are simple tests to det. whether these reducing ions are present in such amts as to invalidate test: Add 2 drops 0.05% aq. soln of methylene blue to 10 mL freshly prepd mixt. (1+1) of sample soln and HPO<sub>3</sub>-HOAc reagent and mix. Disappearance of methylene blue color in 5–10 sec indicates presence of interfering substances. Stannous Sn does not give this test and may be tested for as follows: To another 10 mL sample soln to which 10 mL HCl (1+3) has been added, add 5 drops 0.05% aq. soln of indigo carmine and mix. Disappearance of color in 5–10 sec indicates presence of stannous Sn or other interfering substance.

#### Microfluorometric Method (13)

#### 43.061

#### Principle

Ascorbic acid is oxidized to dehydroascorbic acid in presence of Norit. Oxidized form is reacted with o-phenylenediamine to produce fluorophor having activation max. at ca 350 nm and fluorescence max. at ca 430 nm. Fluorescence intensity is proportional to concn.

Development of fluorescent derivative of vitamin is prevented by forming H<sub>3</sub>BO<sub>3</sub>-dehydroascorbic acid complex prior to addn of diamine soln. Any remaining fluorescence is due to extraneous materials. This serves as "blank."

Ascorbic plus dehydroascorbic acid is calcd by comparing corrected fluorescence reading for sample with that of std similarly oxidized and treated.

**43.062****Reagents**

(a) *Extracting solns.*—Prep.: (1)  $\text{HPO}_3\text{-HOAc}$  and (2)  $\text{HPO}_3\text{-HOAc-H}_2\text{SO}_4$  solns as in **43.057(a)**.

(b) *Ascorbic acid std soln.*—100  $\mu\text{g/mL}$ . Dil. 10 mL ascorbic acid std soln, **43.057(b)**, to 100 mL with  $\text{HPO}_3\text{-HOAc}$  soln, (a)(1).

(c) *o-Phenylenediamine soln.*—For each 100 mL soln required, weigh 20 mg *o*-phenylenediamine.2HCl (Eastman Kodak Co. No. 678). Dil. to vol. with  $\text{H}_2\text{O}$  immediately before use.

(d) *Thymol blue pH indicator.*—Prep. as in **43.057(d)**.

(e) *Sodium acetate soln.*—Dissolve 500 g  $\text{NaOAc}\cdot 3\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$  and dil. to 1 L.

(f) *Boric acid-sodium acetate soln.*—Dissolve 3 g  $\text{H}_3\text{BO}_3$  in 100 mL  $\text{NaOAc}$  soln. Prep. fresh for each assay.

(g) *Acid-washed Norit.*—Add 1 L HCl (1+9) to 200 g Norit Neutral (Fisher Scientific Co., Carbon, decolorizing, C-170), heat to bp, and filter with vac. Remove cake to large beaker. Add 1 L  $\text{H}_2\text{O}$ , stir, and filter. Repeat washing with  $\text{H}_2\text{O}$  and filtering. Dry overnight at 110–120°.

**43.063****Apparatus**

(a) *Automatic pipetting machine.*—Brewer, BBL Div. of Bioquest, or equiv. Calibrate to deliver 5 mL aliquots.

(b) *Vortex mixer.*—Scientific Industries, Inc., 70 Orville Dr, Bohemia, NY 11716, or equiv.

(c) *Fluorometer.*—Aminco Fluoro-Microphotometer (American Instrument Co.) with lamp F4T4/BL and cuvet adapter B12-63019 to accept 18 × 150 mm test tubes, or equiv. Use as primary filter Corning Glass Works Nos. 7380 (C.S. No. 0-52) and 5860 (C.S. No. 7-37) and as secondary filter Corning Nos. 5113 (C.S. No. 5-58) and 3389 (C.S. No. 3-73). (*Caution:* See **51.008**.)

(d) *Fluorescence reading tubes.*—Stdzd 18 × 150 mm test tubes.

**43.064****Preliminary Test for Appreciable Amount of Basic Substances**

Proceed as in **43.058**.

**43.065****Preparation of Sample Assay Solution**

(a) *For dry materials containing no appreciable amount of basic substances.*—Proceed as in **43.059(a)**. Dil. with  $\text{HPO}_3\text{-HOAc}$  soln, **43.057(a)(1)**, to ca 100  $\mu\text{g}$  ascorbic acid/mL. Designate this vol. as *V* mL. Filter solns contg large amts of suspended solids thru Whatman No. 12 paper, or equiv. Designate as sample assay soln.

(b) *For dry materials containing appreciable amounts of basic substances.*—Proceed as in **43.059(b)**. Then proceed as in (a), beginning "Dil. with . . ."

(c) *For liquid materials.*—Proceed as in **43.059(c)**. Then proceed as in (a), beginning "Dil. with . . ."

(d) *For gelatin-encapsulated pharmaceutical products.*—Place sample in small beaker and heat gently with enough proper extg soln, **43.057(a)(1)** or (2), to cover. If capsules do not disintegrate readily, crush with glass rod. Cool rapidly to room

temp. If appreciable amts of basic substances are present, adjust pH to ca 1.2 with  $\text{HPO}_3\text{-HOAc-H}_2\text{SO}_4$  soln, **43.057(a)(2)**. Proceed as in (a), beginning "Dil. with . . ."

*Note:* For samples difficult to filter, proceed as in applicable section, (a), (b), (c), or (d), except dil. sample assay soln with  $\text{HPO}_3\text{-HOAc}$  soln to ca 50  $\mu\text{g}$  ascorbic acid/mL. Compare with std soln prepd by dilg 5 mL ascorbic acid std soln, **43.057(b)**, to 100 mL with  $\text{HPO}_3\text{-HOAc}$  soln. (1 mL = 50  $\mu\text{g}$  ascorbic acid.)

**43.066****Determination**

*Following steps must be performed consecutively without delay.*

Transfer 100 mL std and sample assay solns to 300 mL erlenmeyers. Add 2 g acid-washed Norit, shake vigorously, and filter thru Whatman No. 12 paper, or equiv., discarding first few mL. Transfer 5 mL each filtrate to sep. 100 mL vol. flasks, contg 5 mL  $\text{H}_3\text{BO}_3\text{-NaOAc}$  soln. Let stand 15 min, swirling occasionally. Designate as std or sample blank solns, resp.

During 15 min period, transfer 5 mL of each filtrate to sep. 100 mL vol. flasks contg 5 mL  $\text{NaOAc}$  soln and ca 75 mL  $\text{H}_2\text{O}$ . Dil. to vol. with  $\text{H}_2\text{O}$ . Transfer 2 mL of each soln to each of 3 fluorescence reading tubes. Designate as std or sample tubes, resp.

At appropriate time, dil. blank solns to vol. with  $\text{H}_2\text{O}$ . Transfer 2 mL of these solns to each of 3 fluorescence reading tubes. Designate as std or sample blank tubes, resp.

Using automatic pipetting machine, add 5 mL *o*-phenylenediamine soln to all tubes. Use Vortex mixer to swirl tubes. Protect from light and let stand 35 min at room temp.

**43.067****Fluorometry**

Measure fluorescence of std tube (C), std blank tube (B), sample tube (X), and sample blank tube (D).

mg Ascorbic acid/g, tablet, mL, etc.

$$= [(\text{av. } X - \text{av. } D) / (\text{av. } C - \text{av. } B)] \times (20 \times S \times V/E)$$

where *V* = initial assay soln vol., *E* = number of g, tablets, mL, etc., and *S* = concn of std in mg/mL added to reading tube.

**Vitamin D (14)—Official Final Action**

(Avoid exposure of solns to actinic light thruout entire detn)

**43.068****Principle**

Specific steps required depend upon whether prepn contains oils or not, if other fat-sol. vitamins are present, and concn of vitamin D, as shown in Table **43:01**.

(a) *Vitamin D concentrates without other vitamins.*—Prepn is saponified and extd, and unsaponifiable material is treated with maleic anhydride to remove *trans*-isomers; however, certain other antirachitic-inactive isomers such as isotachysterol, if present, are not removed and are included in result. (Resin is treated directly with maleic anhydride without previous saponification and extn.) After maleic anhydride treatment, soln is reacted with  $\text{SbCl}_3$  and *A* is detd at 500 nm. By confirmation

**Table 43:01 Scheme for Analysis of Preparations of Vitamin D With and Without Other Fat-Soluble Vitamins<sup>a</sup>**

Prepns	IU/g	Steps for prepn without other vitamins	Steps for prepn contg vitamin A and tocopherols
Oily solns	500–100,000 ≥100,000	A + E + I A + I	A + E + F + H
Powders, capsules, tablets, and aq. dispersions	200–25,000 ≥25,000	B + E + I B + I	B + E + F + H
Vitamin D resin	≥20,000,000	C + G + I	

<sup>a</sup> All assays except vitamin D resin include diln (step D) and, prior to colorimetric detn (steps H or I), maleic anhydride addn (step G).

test, **43.078**, values  $\leq 5\%$  are considered neg. for isotachysterol. (Any appropriate technic for identification of isotachysterol may be used.) Vitamin D concs include vitamin D resins contg  $\geq 20,000,000$  IU/g, vitamin D in oily solns contg  $\geq 100,000$  IU/g, and vitamin D in powders and aq. dispersions contg  $\geq 25,000$  IU/g.

(b) *Vitamin D in multivitamin preparations.*—Prepn is saponified and extd, and unsaponifiable material is chromatgd successively on phosphate-treated alumina to remove tocopherols, carotene, and BHT, if present; and on polyethylene glycol 600-Chromosorb W and Florex to sep. vitamin A, if present. Purified sample is treated with maleic anhydride to remove biologically inactive *trans*-isomers. Vitamin D is detd colorimetrically by  $\text{SbCl}_3$  reaction, modified to correct for interfering decomposition products of vitamin A still present in final soln.

#### 43.069

#### Reagents

(a) *Solvents.*— $\geq 95\%$   $\text{Ac}_2\text{O}$ , alcohol, toluene-free benzene, peroxide- and acid-free ether, acid-free isooctane, peroxide- and acid-free polyethylene glycol 600, and acid-free toluene.

(b) *Petroleum ether.*—Reflux over KOH pellets and collect fraction distg between 40 and 60°. (Caution: See **51.011(a)**.)

(c) *Ethyl ether-petroleum ether eluants.*—8 and 30% ether in pet ether.

(d) *Ethylene dichloride.*—Nanograde, or purify reagent grade as follows: Reflux 1 L  $\text{CH}_2\text{ClCH}_2\text{Cl}$  with 50 g KOH pellets and ca 50 sq cm Al foil 2 hr. Remove KOH and Al. Shake  $\text{CH}_2\text{ClCH}_2\text{Cl}$  with 5 g powd  $\text{P}_2\text{O}_5$  and distil (bp 82°), discarding first 50 mL.

(e) *Acetyl chloride.*—Available in ampuls. Soln must be colorless and freshly redistd.

(f) *Column chromatography materials.*—(1) *Alumina.*—Type 1076 (E. Merck, Darmstadt, Germany). (2) *Sodium hydrogen phosphate.*— $\text{Na}_2\text{HPO}_4 \cdot 2\text{H}_2\text{O}$ . (3) *Diatomaceous earth.*—Acid-washed Chromosorb W, 80–100 mesh (150–180  $\mu\text{m}$ ). (4) *Granular fuller's earth.*—Florex-XXS (Floridin Co.). Sieve and retain 150–250  $\mu\text{m}$  fraction.

(g) *Color-inhibiting soln.*—Isooctane-toluene- $\text{Ac}_2\text{O}$  (1+1+1).

(h) *Sodium ascorbate soln.*—20%. Dissolve 3.5 g ascorbic acid in 20 mL 1N NaOH. Prep. fresh daily.

(i) *Potassium hydroxide solns.*—3, 6 (w/v), and 50 (w/w) % in  $\text{H}_2\text{O}$ .

(j) *Pyrogallol soln.*—20%. Dissolve 20 g in alcohol and dil. to 100 mL with alcohol.

(k) *Sodium sulfide soln.*—10%. Dissolve 12 g  $\text{Na}_2\text{S} \cdot 9\text{H}_2\text{O}$  in 20 mL  $\text{H}_2\text{O}$  and dil. to 100 mL with 87% glycerol.

(l)  *$\beta$ -Carotene soln.*—0.01% in isooctane.

(m) *Maleic anhydride solns.*—(1) *Stock soln.*—10%. Dissolve 10 g maleic anhydride (distd, bp 196°) in 100 mL toluene (clear soln, stable ca 1 month). (2) *Working soln.*—1%. Just before use, dil. aliquot with toluene to obtain 1% soln.

(n) *Color reagent.*—(Caution:  $\text{SbCl}_3$  is toxic and corrosive. Avoid contact with skin and eyes and breathing vapor.) Prep. 2 stock solns as follows: (1) *Soln A.*—Dissolve ca 110 g  $\text{SbCl}_3$  (dry, crystalline, and, if necessary, distd) in 400 mL  $\text{CH}_2\text{ClCH}_2\text{Cl}$ . Add ca 2 g anhyd. alumina, mix, and filter thru paper into 500 mL vol. flask. Dil. to vol. with  $\text{CH}_2\text{ClCH}_2\text{Cl}$  and mix. A of soln, detd in 2 cm cell at 500 nm with spectrophtr against  $\text{CH}_2\text{ClCH}_2\text{Cl}$ , should be  $\leq 0.070$ . (2) *Soln B.*—Mix under hood 100 mL colorless, distd  $\text{AcCl}$  and 400 mL  $\text{CH}_2\text{ClCH}_2\text{Cl}$  and store in cool place.

Mix 90 mL *Soln A* and 10 mL *Soln B*. Store in brown, g-s bottle, and use in  $\leq 7$  days; discard if any color develops.

(o) *Vitamin standards.*—USP Ref. Std Ergocalciferol (if sample is labeled as contg vitamin  $\text{D}_2$ ) or cholecalciferol (if sample is labeled as contg vitamin D or  $\text{D}_3$ ). Dissolve ca 25 mg calciferol ref. std, accurately weighed, in 100 mL 20% toluene in isooctane

soln contg 0.5 mg butylated hydroxytoluene (BHT)/mL. Soln is stable  $\leq 1$  month, if kept in dark at room temp. On day of assay, pipet 2 mL concd std soln into 100 mL vol. flask and dil. to vol. with 20% toluene in isooctane.

(p) *Butylated hydroxytoluene (BHT) Soln.*—0.1% in toluene.

(q) *Ethoxyquin soln.*—0.05 mg/mL in pet ether.

#### 43.070

#### Column I

(a) *Chromatographic tube.*—Seal coarse fritted glass disk in lower end of 20 (id)  $\times$  150 mm tube and 250 mL bulb at upper end. Fit constricted portion at lower end with Teflon stopcock.

(b) *Preparation and deactivation of phosphate-treated alumina.*—Sieve alumina and collect 50–150  $\mu\text{m}$  fraction. Heat 250 g sieved alumina with 1.6 L  $\text{H}_2\text{O}$  and 20 g  $\text{Na}_2\text{HPO}_4 \cdot 2\text{H}_2\text{O}$  in 2 L erlenmeyer 30 min on steam bath, swirling occasionally. Cool, swirl gently, and decant upper layer, which sometimes contains suspension of finest particles. Filter residue by suction on paper in buchner. Transfer alumina to 22 cm diam. porcelain disk. Dry in 150° oven 3 hr, mixing occasionally to prevent lumping. Cool disk on asbestos plate in vac. desiccator. Store activated alumina in air-tight (rubber-stoppered) container. Weigh 30 g dried alumina into each of three 100 mL erlenmeyers. Pipet in 0.6, 1.2, and 1.8 mL  $\text{H}_2\text{O}$  into the 3 flasks, resp., and stopper. Heat 5 min on steam bath. Vigorously shake warm flasks until powder is free flowing. Cool, and let stand 15 min.

Prep. 3 columns from the 3 deactivated phosphate-treated alumina portions, as in (c). Pipet 5 mL sample soln contg ca 4000 IU vitamin A alcohol in pet ether onto each column, and elute each column in 10 mL portions with 200 mL 8% (v/v) ether-pet ether. Discard eluates. Examine columns under 360 nm UV light with portable lamp. Column thru which green fluorescent vitamin A alcohol band has passed ca  $\frac{1}{3}$  way contains desired  $\text{H}_2\text{O}$  content in alumina. Elute this column with 150 mL 30% (v/v) ether-pet ether, and examine under 360 nm UV light. Column should not show any fluorescence. Prep. deactivated phosphate-treated alumina with desired  $\text{H}_2\text{O}$  content, and prep. column as in (c). Check activity of deactivated phosphate-treated alumina with chosen  $\text{H}_2\text{O}$  content by column performance test, **43.073**. If performance is  $< 97\%$ , repeat deactivation, using different vol. of  $\text{H}_2\text{O}$ . If performance remains  $< 97\%$ , distil pet ether as in **43.069(b)**.

(c) *Preparation of column.*—Add 40 mL pet ether to deactivated alumina, swirl, and transfer to tube, using pet ether. Let packing settle, maintain head of  $\geq 0.5$  cm liq. on column thruout assay, and use N to regulate flow rate at 4–5 mL/min. (Phosphate-treated alumina column can be used for only 1 assay.)

#### 43.071

#### Column II

(a) *Chromatographic tube.*—Constrict lower end (ca 5 cm) of 20 (id)  $\times$  300 mm tube to 8 mm diam. and insert coarse fritted glass disk at point of constriction. Fit constricted portion with Teflon stopcock.

(b) *Preparation of polyethylene glycol 600-Chromosorb W mixture.*—Weigh 10 g polyethylene glycol 600 in 1 L g-s erlenmeyer, and dissolve in 100 mL benzene. Add 20 g acid-washed Chromosorb W and swirl. Add 300 mL pet ether in small portions, and mix by swirling vigorously. Let settle, and decant upper layer. Wash slurry with two 100 mL portions pet ether, decanting upper layer each time.

(c) *Preparation of column.*—Connect lower end of tube to aspirator, and fill tube nearly to top with pet ether. Pour small portion of slurry, (b), into tube, and let settle by gravity. Pack column by intermittent suction, closing stopcock when 3–4 mL liq. is left on column. Fill tube again with pet ether, and repeat packing, beginning "Pour small portion ..." Pack column at

upper end with disk plunger while effluent keeps running off. Close stopcock when 3–4 mL liq. is left on column. Gently tap tube to make upper layer of column horizontal. Wash column with 100 mL isooctane to elute pet ether. Space under fritted glass disk must be empty. Check packing of column with 1 mL  $\beta$ -carotene soln, which should pass thru column as horizontal band. Otherwise, repeat packing. Check recovery by column performance test, **43.073**, together with Florex column, **43.075(b)** (Florex should have been checked previously as in **43.072(b)**). Use 1000 IU vitamin A alcohol as detector.

When polyethylene glycol 600-Chromosorb W column is dirty and gives poor performance test, wash Chromosorb W with three 200 mL portions alcohol, and decant upper layer. Wash again with two 200 mL portions ether. Evap. to dryness in r-b flask under vac. by swirling. Use cleaned-up Chromosorb W to prep. new polyethylene glycol 600-Chromosorb W mixt., (b), and column.

**43.072****Column III**

(a) *Chromatographic tube*.—Use same tube as column I.

(b) *Preparation and deactivation of Florex*.—Eliminate small particles as follows: Suspend 200 g Florex in 500 mL alcohol and boil few min in 1 L r-b flask. Decant upper layer contg colloidal suspension. Shake with 250 mL alcohol and decant upper layer. Repeat washing with two 250 mL portions of ether. (Caution: Perform ether washing and evapn under effective fume removal device.) Dry suspension on steam bath at 100°, using aspirator, and store in air-tight container. Weigh 10 g dried Florex into 50 mL erlenmeyer. Add 1.6 mL H<sub>2</sub>O by pipet, stopper flask, and heat 5 min on steam bath. Gently swirl warm flask to obtain free-flowing powder. Cool, and let stand 15 min. Check activity of deactivated Florex (16% H<sub>2</sub>O) by column performance test, **43.073**. If performance is <97%, repeat deactivation, using different vol. H<sub>2</sub>O.

(c) *Preparation of column*.—Add 20 mL pet ether to flask, swirl, and transfer Florex with pet ether to tube; let packing settle. Regulate flow rate at 2 mL/min with stopcock. Elute with 50 mL isooctane and discard eluate. Maintain head of 1 cm liq. on column thruout assay.

**43.073****Column Performance Test**

Pipet 10 mL soln contg 5  $\mu$ g cryst. cholecalciferol (or ergocalciferol)/mL pet ether onto column, and elute as in **43.075(a)** or (b), collecting eluate in 250 mL r-b flask. Evap. to dryness under vac. in ca 40° H<sub>2</sub>O bath. Evap. 10.0 mL untreated calciferol soln in same way. Cool and restore atm. pressure with N. Without delay, sep. dissolve each residue in 10.0 mL 20% toluene in isooctane and measure as follows: Pipet 2 mL into 2 cm cell, add 5 mL color reagent from rapid delivery pipet, and mix. Measure *A* at 500 nm against blank consisting of 2 mL 20% toluene in isooctane and 5 mL color reagent.

% Performance = 100 (*A*/*A<sub>r</sub>*), where *A* and *A<sub>r</sub>* refer to *A* of soln with and without chromatgy, resp.

This column performance test can also be used to check the 3 columns together. Result of performance tests should be between 97 and 103%; if not, repeat deactivation of column materials with different vols of H<sub>2</sub>O and recheck by performance test.

**43.074****Preparation of Sample**

(Caution: See **51.018**, **51.045**, and **51.073**.)

(a) *Step A. Isolation of unsaponifiable matter from oils*.—Factor *m* is nearest integral number, indicating number of 1 g

samples taken. Factor *r* is nearest integral number, indicating multiple of 100  $\mu$ g (4000 IU) vitamin D in sample taken.

For concs contg >2.5 mg (100,000 IU) vitamin D/g, accurately weigh ca 1 g sample into saponification flask. Define *m* (= 1) and *r*.

For low potency preps contg 12.5–2500  $\mu$ g (500–100,000 IU) vitamin D/g, accurately weigh amt of sample  $\geq 1$  g equiv. to ca  $r \times 100 \mu$ g ( $r \times 4000$  IU) vitamin D and contg  $\leq 75$  mg  $\alpha$ -tocopheryl acetate into saponification flask. Define *m* and *r*. Add  $m \times 10$  mL 20% pyrogallol soln,  $m \times 1$  mL 20% Na ascorbate soln,  $m \times 25$  mL alcohol, and  $m \times 4$  mL 50% aq. KOH soln, and reflux 30 min on steam bath, using air condenser. Add  $m \times 5$  mL 20% pyrogallol soln to hot soln and then cool. Add, without delay,  $m \times 100.0$  mL benzene, mix, and transfer to separator *without rinsing*. Add  $m \times 40$  mL 6% aq. KOH soln, shake vigorously 10 sec, let layers sep. (2–3 min), and discard still turbid aq. layer. Wash benzene layer with 1 portion of  $m \times 40$  mL 3% aq. KOH soln and  $m \times 40$  mL portions of H<sub>2</sub>O until discarded H<sub>2</sub>O is neut. to phthln (usually 4–5 washings). Drain last few drops of H<sub>2</sub>O, add  $m \times 2$  sheets of 9 cm filter paper (in strips) to funnel, and shake until benzene layer is clear. Store this soln in stoppered flask and continue as in (d).

(Note: During washing, turbid aq. layer contains droplets of benzene. As droplets have same vitamin D concn as benzene layer, detn of concn of vitamin D in benzene layer, **43.077(a)** or (b), is not influenced by loss of these droplets.)

(b) *Step B. Isolation of unsaponifiable matter from powders, capsules, tablets, and aqueous dispersions*.—Factor *n* is nearest integral number, indicating number of 5 g samples of powder, 5 g samples of capsules or tablets, or 2 g samples of aq. dispersions taken. Factor *r* is nearest integral number, indicating multiple of 100  $\mu$ g (4000 IU) vitamin D in sample taken.

For concs contg  $\geq 625 \mu$ g (25,000 IU) vitamin D/g, accurately weigh  $\geq 0.1$  g sample into saponification flask. Define *n* (= 1) and *r*.

For low potency preps contg 5–625  $\mu$ g (200–25,000 IU) vitamin D/g, accurately weigh amt of sample or take known number (*W*) of capsules or tablets, contg ca 100  $\mu$ g (4000 IU) vitamin D and contg  $\leq 75$  mg  $\alpha$ -tocopheryl acetate into saponification flask. Define *r* (= 1) and *n*.

For capsules or tablets, warm sample with  $n \times 10$  mL 20% Na ascorbate soln ca 10 min on steam bath, swirling occasionally. Crush remaining solid with blunt glass rod, warm 5 min longer, and add  $n \times 3$  drops of Na<sub>2</sub>S soln. Add dropwise, with gentle swirling,  $n \times 20$  mL 20% pyrogallol soln and then, all at once,  $n \times 10$  mL 50% aq. KOH soln, followed by dropwise addn, with gentle swirling, of  $n \times 25$  mL alcohol; reflux 30 min on steam bath. Add  $n \times 5$  mL 20% pyrogallol soln and  $n \times 80$  mL alcohol to hot soln, with swirling; then cool. Add, without delay,  $n \times 100.0$  mL benzene, mix, and transfer to separator *without rinsing*. Add  $n \times 200$  mL 6% aq. KOH soln, shake vigorously 10 sec, let layers sep. (2–3 min), and discard still turbid aq. layer. Wash benzene layer once with  $n \times 40$  mL portion of 3% aq. KOH soln and then with  $n \times 40$  mL portions of H<sub>2</sub>O until discarded H<sub>2</sub>O is neut. to phthln (usually 4–5 washings). Drain last few drops of H<sub>2</sub>O, add  $n \times 2$  sheets of 9 cm filter paper (in strips) to funnel, and shake until benzene layer is clear. Store this soln in g-s flask and continue as in (d).

For dry preps and aq. dispersions, warm 3–4 min at 35° with  $n \times 10$  mL 20% Na ascorbate soln, swirl, and add  $n \times 3$  drops Na<sub>2</sub>S soln to sample. Proceed as above, par. 4, beginning with "Add dropwise, . . ."

(c) *Step C. Preparation of vitamin D resin in tins*.—Factor *r* is as defined in (a) and (b).

For resins contg ca 25,000,000 IU vitamin D/g, scatter sample by sharp blows on outside of container. Into 50 mL flask,

accurately weigh ca 0.8 g (contg ca 20,000,000 IU vitamin D) of largest lumps from lower part of container. (Caution: Resin sample must *never* be powdered.) Dissolve sample in toluene and dil. to mark. Dil. aliquot to exactly  $r$  times its vol. with pet ether. Pipet 25 mL, contg 50  $\mu$ g (2000 IU) vitamin D, into r-b flask. Evap. aliquot to dryness under vac. by swirling in  $H_2O$  bath at  $<40^\circ$ . Cool, restore atm. pressure with N, and continue without delay as in 43.076.

(d) *Step D. Preparation of aliquot of unsaponifiable matter.*—Factors  $m$ ,  $n$ , and  $r$  are as defined in (a) and (b).

For concs without other vitamins, dil. aliquot of benzene soln from (a) or (b) to exactly  $r$  times its vol. with benzene or pet ether and pipet 50 mL, contg 50  $\mu$ g (2000 IU) vitamin D, into r-b flask. Evap. as in (c), and continue without delay as in 43.076.

For concs of multivitamin preps, dil. aliquot of benzene soln from (a) or (b) to exactly  $r$  times its vol. with benzene or pet ether and pipet 75 mL contg 75  $\mu$ g (3000 IU) vitamin D into r-b flask. Add 1 mL ethoxyquin soln. Evap. as in (c), and continue without delay as in 43.075.

For low potency multivitamin preps, pipet aliquot of benzene soln from (a) or (b),  $m \times 75.0$  mL or  $n \times 75.0$  mL, resp., contg 75  $\mu$ g (3000 IU) vitamin D into r-b flask. Add 1 mL ethoxyquin soln. Evap. as in (c), and continue without delay as in 43.075.

For low potency preps without other vitamins, pipet  $m \times 50.0$  mL or  $n \times 50.0$  mL, contg 50  $\mu$ g (2000 IU) vitamin D, into r-b flask. Evap. aliquot to dryness under vac. by swirling in  $H_2O$  bath at  $<40^\circ$ . Cool, restore atm. pressure with N, and continue without delay as in 43.075.

#### 43.075

#### Column Chromatography

(a) *Step E. Alumina.*—Dissolve residue from 43.074(d) in 5 mL pet ether. Transfer to column I with aid of 10 mL pet ether, let liq. drain, and wash with 10 mL pet ether. Elute column, in 10 mL portions, with 200 mL 8% ether-pet ether and discard eluate. Elute column with 150 mL 30% ether-pet ether, collecting eluate in r-b flask. Add 1 mL ethoxyquin soln. Evap. eluate to dryness under vac. at  $40^\circ$ . Cool, restore atm. pressure with N, and continue without delay as in (b). (For preps without other vitamins, continue as in 43.076.)

(b) *Step F. Polyethylene glycol 600-Chromosorb W and Florex.*—Dissolve residue from (a) in 3.00 mL isooctane. Let solv. drain from column II. Just as meniscus of solv. reaches surface of column, pipet 2 mL sample soln onto column. When meniscus of soln reaches surface of column, add 1 mL isooctane and elute thru column; repeat this elution twice. When last of isooctane enters column, continue adding isooctane from dropping funnel or in 10 mL portions, keeping flow rate to ca 2 mL/min. Let eluate drain into column III, keeping  $\geq 1$  cm soln on column III by means of stopcock. Examine column II  $\leq 1$  sec under UV light (360 nm) with portable UV lamp at intervals during chromatgy, and stop when front of fluorescent vitamin A band is located 3 cm from bottom of column II. Remove column II. Vitamin D is on column III. Discard eluate of column III. Elute all vitamin A from column II with isooctane. Column II is now ready for another vitamin D detn.

Elute column III with 150 mL benzene, collecting eluate in r-b flask, and add 1 mL ethoxyquin soln. Evap. to dryness under vac. at  $40^\circ$ , cool, restore atm. pressure with N, and continue without delay.

#### 43.076

#### Inactivation of Tachysterol

*Step G. Maleic anhydride addition.*—Dissolve residue from 43.074(c) or (d) or 43.075(a) or (b), contg preferably ca 2000 IU vitamin D, in 2.00 mL 1% maleic anhydride soln in r-b flask;

stopper flask and swirl. Let stand 30 min in dark at room temp. Add 8.00 mL isooctane by buret or pipet to soln (sample prepn).

#### 43.077

#### Colorimetric Determination

(a) *Step H. Multivitamin sample preparations.*—Designate 3 suitable, matched colorimetric tubes ca 20 mm id as 1, 2, and 3, resp. Pipet 2 mL sample prepn from 43.076 into tube 1, 2 mL std soln into tube 2, and 1 mL sample prepn and 1 mL color-inhibiting soln into tube 3. To each tube add quickly, and preferably from automatic pipet, 5.0 mL color reagent, and mix. After 45 sec, accurately timed from addn of color reagent, det.  $A$  of the 3 solns at 500 nm, with spectrophtr, using blank of 2 mL 20% toluene in isooctane and 5 mL color reagent. Make second reading at 550 nm 45 sec after first reading for each soln. (Note: Some batches of color reagent develop max. color after 45 sec. Check this first with std prepn. Other batches give max. after 45–120 sec. Use exact time of max. and measure 45 sec later at 550 nm.) Designate  $A$  as  $A_{1(500)}$ ,  $A_{2(500)}$ ,  $A_{3(500)}$ ,  $A_{1(550)}$ ,  $A_{2(550)}$ , and  $A_{3(550)}$ , resp., in which subscripts indicate number of tube and wavelength (in parentheses).

Calc.  $\mu$ g or IU vitamin D/g sample, capsule, or tablet as follows:

$$\text{Potency} = C \times (V_s/W) \times (A_D/A_{2(500)}),$$

where  $C$  =  $\mu$ g or IU cholecalciferol or ergocalciferol/mL in std soln (1  $\mu$ g = 40 IU),  $W$  = g sample or number of capsules or tablets,  $V_s$  = final vol. of sample ( $r \times 20$  mL), and  $r$  = diln factor for sample, 43.074(a), (b), (c), and (d); and

$$A_D = [q/(q-p)] \times A_{1(500)} - [1/(q-p)] \times A_{1(550)},$$

where  $p = A_{2(550)}/A_{2(500)}$  and  $q = A_{3(550)}/A_{3(500)}$ .

In spectrophtr with  $\leq 10$  nm band pass,  $A$  of std soln at 550 nm will be negligible. Then  $p$  is  $<0.01$  and, for this spectrophtr,  $A_D = A_{1(500)} - (A_{1(550)}/q)$ . If  $q$  is  $<1$ , it should be taken as 1, to avoid systematic errors.

(b) *Step I. Sample preparations without other vitamins.*—Designate 2 suitable, matched colorimetric tubes ca 20 mm id as 1 and 2, resp. Pipet 2 mL sample prepn from 43.076 into tube 1 and 2 mL std soln into tube 2. To each tube add quickly, and preferably from automatic pipet, 5.0 mL color reagent, and mix. Then 60 sec, accurately timed (see Note in (a)), after addn of color reagent, det.  $A$  of the 2 solns at 500 nm, with spectrophtr, using blank of 2 mL 20% toluene in isooctane and 5 mL color reagent. Designate  $A$  as  $A_{1(500)}$  and  $A_{2(500)}$ , resp., in which subscripts indicate number of tube and wavelength (in parentheses).

Calc.  $\mu$ g or IU vitamin D/g sample as follows:

$$\text{Potency} = C \times (V_s/W) \times (A_{1(500)}/A_{2(500)}),$$

where  $C$ ,  $V_s$ , and  $W$  are as defined in (a).

#### 43.078

#### Confirmation of Identity in Concentrates

Prep. sample residue, as in 43.074, contg ca 2.5 mg vitamin D (100,000 IU) and dissolve in 10.00 mL 0.1% BHT soln, (p). Pipet 4 mL of this soln into each of two 10 mL vol. flasks. To one flask add 2 mL 10% maleic anhydride soln, (m)(1). Place plastic tube over neck of flask. Fill flask with N and close tube with pinch cock. Heat 3 hr in dark in  $100^\circ H_2O$  bath, and cool. Dil. solns (treated with maleic anhydride and untreated) to vol. with 0.1% BHT soln. Quant. transfer untreated soln to 200 mL vol. flask and dil. to vol. with 0.1% BHT soln. Det.  $A$  of treated and dild untreated solns colorimetrically with color reagent as in 43.077(b).

$$\text{Residual color value (\%)} = 5 \times (A/A_u),$$

where  $A$  and  $A_u$  refer to  $A$  of treated and dild untreated solns, resp. Residual color values  $\leq 5\%$  are considered neg. for isotachysterol.

### High Performance (Pressure) Liquid Chromatographic Method (15)—Official First Action

(Applicable to oils contg  $\geq 100,000$  IU cholecalciferol or vitamin D<sub>3</sub>/g, and powders and aq. dispersions ( $\geq 25,000$  IU cholecalciferol/g))

#### 43.079

#### Principle

Dry concs and aq. dispersions are saponified and extd. Vitamin D resins and oil solns are dissolved in solv. Vitamin D and previtamin D are sepd from impurities by HPLC. Previtamin D concn is calcd as vitamin D using calibration factor. Vitamin D is sum of vitamin D and previtamin D.

#### 43.080

#### Apparatus

(a) *Liquid chromatograph*.—Hewlett Packard 1010 A, or equiv. with 254 nm UV detector. Typical operating conditions: chart speed, 1 cm/min; eluant flow rate, 2 mL/min (ca 100 atm.); detector sensitivity, 0.128 AUFS; temp., ambient; and valve injection vol., 20  $\mu$ L.

(b) *Chromatographic column*.—Stainless steel, 150  $\times$  4.6 (id) mm, packed with 5  $\mu$ m particle size LiChrosorb Si 60, passing system suitability test. Before entering this column, mobile phase must be pumped thru 100 cm  $\times$  4 mm stainless steel column contg 50–250  $\mu$  silica, dried 4 hr at 250°. Different column lengths and brands of packing may be substituted, and injection vol. may be varied between 10–30  $\mu$ L, provided system suitability test is met.

#### 43.081

#### Reagents

(a) *n-Hexane*.—Spectroquality. Dry by passing thru column 60  $\times$  8 cm diam. contg 500 g 50–250  $\mu$  silica dried 4 hr at 150°.

(b) *n-Amyl alcohol*.—Reagent grade.

(c) *Mobile phase*.—*n*-Hexane and *n*-amyl alcohol (997 + 3). Adjust ratio of components, if necessary, to meet suitability test.

(d) *Toluene*.—Reagent or Nanograde.

(e) *Vitamin D std soln*.—Accurately weigh ca 80 mg USP Cholecalciferol Ref. Std into 50 mL amber vol. flask. Dissolve without heat in toluene, and dil. to vol. with toluene. Prep. fresh daily.

(f) *Suitability std soln*.—Prep. soln contg 2 mg vitamin D<sub>3</sub> and 0.2 mg trans-vitamin D<sub>3</sub>/g vegetable oil. Dissolve 0.25 g this soln in 10 mL toluene-mobile phase (1+1). Peaks of trans-vitamin D<sub>3</sub> and previtamin D<sub>3</sub> should have ca same peak ht. If necessary, previtamin D<sub>3</sub> content can be increased by warming oil soln at 90° ca 45 min. Store oil at 5°.

(g) *Sodium ascorbate soln*.—Dissolve 3.5 g ascorbic acid in 20 mL 1*N* NaOH. Prep. fresh daily.

(h) *Sodium sulfide soln*.—Dissolve 12 g Na<sub>2</sub>S·9H<sub>2</sub>O in 20 mL H<sub>2</sub>O and dil. to 100 mL with 87% glycerol.

(i) *Potassium hydroxide solns*.—(1) 50% (w/w).—Dissolve 50 g KOH in 50 mL H<sub>2</sub>O and cool. Prep. fresh. (2) 3% in alcohol. —Dissolve 3 g KOH in H<sub>2</sub>O, add 10 mL alcohol, and dil. to 100 mL with H<sub>2</sub>O. Prep. fresh.

(j) *Ether*.—Acid- and peroxide-free.

#### 43.082

#### System Suitability Test

Chromatograph 20  $\mu$ L portions suitability std soln 6 times. Det. constancy of peak ht by calcd std deviation and then relative std deviation = std deviation  $\times$  100/mean peak ht. Relative std deviation should be  $\leq 1\%$ .

Det. peak resolution (*R*) between previtamin D<sub>3</sub> and trans-vitamin D<sub>3</sub>:

$$R = 2D/(B + C),$$

where *D* = distance between peak max. of previtamin D<sub>3</sub> and

trans-vitamin D<sub>3</sub>; *B* = peak width of previtamin D<sub>3</sub>; and *C* = peak width of trans-vitamin D<sub>3</sub>. Peak resolution should be  $\geq 1.0$  for previtamin D<sub>3</sub>/trans-vitamin D<sub>3</sub>.

#### 43.083

#### Determination of Calibration Factor

Pipet 4 mL vitamin D std soln, (e), into 25 mL vol. flask. Add 1 mL toluene and dil. to vol. with mobile phase. Store in ice bath. Inject 20  $\mu$ L onto column thru sampling valve and adjust operating conditions of detector to obtain max. on scale peak hts. Repeat injection and average peak hts (=K).

Pipet 5 mL vitamin D std soln, (e), into 25 mL vol. flask, add few crystals *butylated hydroxytoluene*, displace air with N<sub>2</sub>, and attach reflux condenser. Heat in 90° H<sub>2</sub>O bath in dark under N<sub>2</sub>, and cool. Dil. to vol. with mobile phase. Inject 20  $\mu$ L onto column under same conditions as above. Det. peak ht of heated vitamin D (*L*) and of previtamin D formed (*M*). Calc.:

$$CF = [(5K/4) - L]/M.$$

#### 43.084

#### Preparation of Sample

(a) *Resins*.—Shatter sample by sharp blows on outside of container. Into 100 mL flask, accurately weigh ca 0.8 g (contg ca 20,000,000 IU vitamin D) of largest lumps from lower part of container. (Caution: Resin sample must never be powdered.) Dissolve in toluene and dil. to vol. with toluene. Pipet 5 mL into 100 mL vol. flask, add 15 mL toluene, and dil. to vol. with mobile phase. (Concn = 10,000 IU or 0.25 mg vitamin D/mL.)

(b) *Vitamin D in oil*.—Accurately weigh amt of oil contg ca 500,000 IU into 50 mL vol. flask. Dissolve in 10.0 mL toluene, and dil. to vol. with mobile phase.

(c) *Dry preparations and aqueous dispersions*.—Accurately weigh into saponification flask amt sample contg ca 100,000 IU cholecalciferol. Add in small portions, with gentle swirling, 25 mL alcohol, 2 mL Na ascorbate soln, (g), and 5 mL KOH soln, (i)(1). Reflux on H<sub>2</sub>O bath 30 min and cool rapidly under running H<sub>2</sub>O. Transfer soln to separator with aid of two 15 mL portions H<sub>2</sub>O, and two 50 mL portions ether.

Shake vigorously 30 sec and let stand until clear. Transfer aq. (lower) phase to second separator and shake with 10 mL alcohol and 50 mL *n*-pentane. Let sep., and transfer lower aq. layer to third separator and upper pentane phase to first separator, washing second separator with two 10 mL portions pentane, adding washings to first separator. Shake aq. phase in third separator with 50 mL pentane, discard aq. phase, and add pentane to first separator. Wash combined pentane exts with three 50 mL portions 3% KOH soln, (i)(2), shaking vigorously, and then wash with successive 50 mL portions H<sub>2</sub>O until last washing is neut. to phthln. Drain last few drops of H<sub>2</sub>O, add 2 sheets of 9 cm filter paper in strips to funnel, and shake. Transfer washed pentane ext to r-b flask, rinsing separator and paper with pentane.

Evap. soln to dryness under vac. by swirling in H<sub>2</sub>O bath at  $\leq 40^\circ$ . Cool under running H<sub>2</sub>O and restore atm. pressure with N<sub>2</sub>. Dissolve residue immediately in 2.0 mL toluene, transfer to 10 mL amber vol. flask, rinsing with 1 mL portions mobile phase, and dil. to vol. with mobile phase.

#### 43.085

#### Determination

Inject 20  $\mu$ L vitamin D std soln and prepd sample soln onto column thru sampling valve with detector adjusted as in 43.083. Measure peak hts of vitamin D and previtamin D. Repeat injections and re-inject std soln after every 4 sample injections to verify that response remains const.

## 43.086

## Calculations

Average peak hts obtained for std replicates and sample duplicates.

IU vitamin D/g =  $\{[P_D + (P_P \times CF)]/P_R\}(W'/W)(V/V') \times 40,000$ , where  $P_D$ ,  $P_P$ , and  $P_R$  = peak ht of vitamin D in sample, previtamin D in sample, and vitamin D in std, resp.;  $CF$  = calibration factor previtamin D/vitamin D;  $W'$  = wt std in mg;  $W$  = wt sample in g;  $V$  = total mL sample soln;  $V'$  = total mL std soln ( $= 25 \times 50/4$ ); and 40,000 = IU vitamin D/mg USP ref. std.

## 43.087

Nomenclature for Vitamin E (16)  
Official First Action

(a) Term *vitamin E* should be used as generic descriptor for all tocopherols and tocotrienols exhibiting biological activity of  $\alpha$ -tocopherol. Thus phrases such as "vitamin E activity," "vitamin E deficiency," and "vitamin E in form of . . ." represent preferred usage.

(b) Term *tocopherols* should be used as generic descriptor for all Me tocopherols. Thus term "tocopherol" is not synonymous with term "vitamin E."

(c) Compd 5,7,8-trimethyltolcopherol should be designated  $\alpha$ -tocopherol. The trivial name  $\alpha$ -tocopherol without stereochem. designation should never be used to refer to specific material. Important diastereoisomers and mixts of diastereoisomers of  $\alpha$ -tocopherol are further named below.

(d) Compd identical to that isolated from natural sources, 2*R*,4*R*,8*R*- $\alpha$ -tocopherol with structure in Fig. 43:02, formerly known as *d*- $\alpha$ -tocopherol, should be designated *RRR*- $\alpha$ -tocopherol.

(e) Totally synthetic  $\alpha$ -tocopherol obtained from totally synthetic phytol or isophytol as starting material is mixt. of 8 diastereoisomers as 4 racemates or pairs of enantiomers in unspecified proportions. It was formerly known as *dl*- $\alpha$ -tocopherol and should be designated *all-rac*- $\alpha$ -tocopherol.

(f) Mixt. of *RRR*- $\alpha$ -tocopherol and 2-*epi*- $\alpha$ -tocopherol obtained by synthesis using natural phytol (and as acetate ester formerly known as "synthetic racemic  $\alpha$ -tocopheryl acetate" and formerly the International Std for vitamin E) should be designated as 2-*ambo*- $\alpha$ -tocopherol. Such an asymmetric reaction would only by chance result in formation of equimolar amts of the 2 possible epimers. However, 2-*ambo*- $\alpha$ -tocopherol obtained as described above closely approaches equimolar proportions of its epimers.

(g) Compd 2*S*,4*R*,8*R*- $\alpha$ -tocopherol, also known as the epimer of *d*- $\alpha$ -tocopherol, or 2*l*- $\alpha$ -tocopherol, or *l*- $\alpha$ -tocopherol, should be designated 2-*epi*- $\alpha$ -tocopherol.

(h) Esters of tocopherols and tocotrienols should be designated tocopheryl esters and tocotrienyl esters, resp.

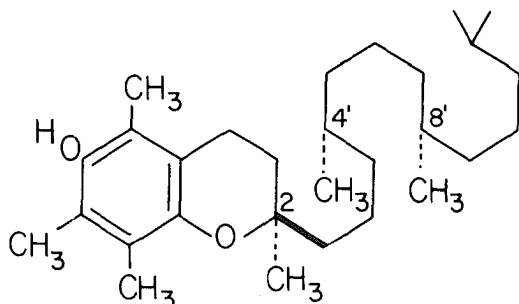

FIG. 43:02—*RRR*- $\alpha$ -tocopherol (formerly *d*- $\alpha$ -tocopherol)

# alpha-Tocopherol and alpha-Tocopheryl Acetate (17) Official Final Action

(Applicable to foods and feeds)

## 43.088

## Principle

Following methods are designed to det. vitamin E in foods and feeds in the several forms in which it may occur. Unsupplemented food or feed will contain *natural*  $\alpha$ -tocopherol associated with many other reducing substances. This type of sample is extd, lipid residue saponified, and  $\alpha$ -tocopherol isolated by TLC and detd colorimetrically. Foods or feeds may be supplemented with  $\alpha$ -tocopheryl acetate added either as oil or in various dry forms. Assay for *total*  $\alpha$ -tocopherol (natural plus supplemental) follows same operations described above. To specifically det.  $\alpha$ -tocopheryl acetate, sample is extd, reducing substances, including natural  $\alpha$ -tocopherol, are removed by oxidative chromatgy,  $\alpha$ -tocopheryl acetate is saponified, and resulting  $\alpha$ -tocopherol is detd colorimetrically.

Calcn of assay results for supplemented foods and feeds in terms of International Units (IU) is complicated by fact that natural and synthetic  $\alpha$ -tocopheryl acetates have different wt-activity factors.  $\alpha$ -Tocopherol occurring naturally is in *RRR*-form. With samples supplemented with *RRR*- $\alpha$ -tocopheryl acetate (natural), resulting total  $\alpha$ -tocopherol is all in *RRR*-form and IU potency of sample can readily be detd by using appropriate factor. With samples supplemented with *all-rac*- $\alpha$ -tocopheryl acetate (synthetic), resulting total  $\alpha$ -tocopherol is mixt. of *RRR*- and *all-rac*-forms. To convert to IU, level of supplementation with *all-rac*- $\alpha$ -tocopheryl acetate must be detd specifically and natural  $\alpha$ -tocopherol is detd by difference. Appropriate factors are then sep. applied to detd levels of *RRR*- and *all-rac*-forms and results are added to det. IU potency of sample. If isomeric nature of supplement is not known, it must be detd sep., 43.097–43.105, before IU potency of supplemented samples can be detd.

**Precautions.**—Evap. tocopherol solns with N stream or under vac. Do not use air stream. Do not let soln of tocopherol evap. to dryness for >2–3 sec because tocopherol in thin film is subject to oxidn. Perform TLC, including detection step (except for UV light), in darkness or very subdued light. Complete all steps as promptly as possible. If analysis cannot be completed in 1 day, store solns at  $-20^\circ$ .

## 43.089

## Apparatus

(a) **Spectrophotometric colorimeter.**—Bausch & Lomb Spectronic 20 colorimeter with matched 13 mm test tubes, or equiv.

(b) **Spectrophotometer.**—Beckman Model DU with incandescent light source and matched cells (1 cm light path; 4.5 or 1.6 mL capacity), or equiv. (If cell holder does not elevate larger cells so liq. is in light path, use small plugs (usually 1 cm) in bottom of holder.)

(c) **Extractor.**—Hot alcohol extn app. (*Anal. Chem.* 20, 1221(1948)), Goldfish extractor (Labconco Corp.), or equiv.

(d) **Chromagram**® sheet.—Type X6062. Alumina absorbent without fluorescent indicator, for AOAC vitamin E assay (Eastman Kodak Co.). If activation is necessary, heat 30 min at  $105^\circ$  in air oven.

(e) **Pipets.**—Ultra-micro, measuring pipets, 50  $\mu$ L capacity (VWR Scientific, No. 53477-089, or equiv.).

(f) **Developing chamber.**—Corning Glass Works Pyrex 6944, or equiv.

(g) **Sprayer.**—Aerosol propellant (VWR Scientific No. 21434-086, or equiv.).

(h) *Vials*.—Glass 1.8 mL (½ dram) with screw caps (Demuth Glass, Inc., Parkersburg, WV 26101) and 25 mL (7 dram) with polyethylene stoppers (Kimble Products No. 60975-L, or equiv.).

(i) *Ultraviolet lamps*.—366 nm wavelength (longwave) (Blak-Ray UVL-21, Ultra-Violet Products, Inc.) or 254 nm wavelength (shortwave) (Spectronics Corp, 956 Brush Hollow Rd, Westbury, NY 11590, Model R-51, or equiv.). (*Caution: See 51.016.*)

(j) *Chromatographic tubes*.—18 (id) × 270 mm.

## 43.090

## Reagents

(a) *Petroleum ether*.—(1) *Purified*.—Boiling range 35–60° (Skellysolve F, Getty Refining and Marketing Co, or equiv.). Redistil from KOH pellets and Zn granules or dust, discarding first and last 5%. (*Caution: See 51.011(a), 51.039, and 51.073.*)

(2) *High boiling*.—Boiling range 60–71° (Skellysolve B, or equiv.).

(b) *Alcohol*.—Absolute or SDA 3-A (absolute). If significant reducing substances are present, redistil from Al and KOH. (*Caution: See 51.011, 51.039, and 51.055.*)

(c) *Petroleum ether-absolute alcohol mixture*.—Dil. 600 mL pet ether, (a)(2), to 1 L with absolute alcohol.

(d) *RRR- $\alpha$ -Tocopherol*.—Eastman grade or equiv. purity. Prep. 1 mg/mL std soln in absolute alcohol and store at 5°.

(e) *2',7'-Dichlorofluorescein soln*.—Dissolve 4 mg dye (Eastman 373) in 100 mL absolute alcohol.

(f) *Anhydrous ether*.—Redistil from KOH pellets and Al granules or dust, discarding first and last 5%. (*Caution: See 51.011(a), 51.039, and 51.054.*)

(g) *Bathophenanthroline soln*.—0.003M. Dissolve 100 mg 4,7-diphenyl-1,10-phenanthroline (bathophenanthroline, G. Frederick Smith Chemical Co.) in 100 mL absolute alcohol. Store in amber or opaque glassware at 5°. Prep. fresh soln every 3 weeks.

(h) *Ferric chloride soln*.—0.002M. Dissolve 55 mg FeCl<sub>3</sub>·6H<sub>2</sub>O in 100 mL absolute alcohol. Store in amber or opaque glassware at 5°.

(i) *Orthophosphoric acid*.—0.172M. Dil. 1.1 mL 86% H<sub>3</sub>PO<sub>4</sub> to 100 mL with absolute alcohol.

(j) *Anhydrous sodium sulfate*.—Granular and powd.

(k) *Concentrated potassium hydroxide soln*.—Dissolve 80 g KOH pellets in 50 mL H<sub>2</sub>O.

(l) *Phenolphthalein soln*.—Dissolve 1 g phthln in 100 mL absolute alcohol.

(m) *Isopropyl ether*.—Eastman 1193, or equiv.

(n) *Water-saturated n-butanol*.—Mix 800 mL n-BuOH with 160 mL H<sub>2</sub>O.

(o) *Ascorbic acid*.—Eastman 4640, or equiv.

(p) *Cyclohexane*.—Eastman 702, or equiv.

(q) *Fuller's earth*.—Florex AA-RVM grade, 60–100 mesh (Floridin Co.).

(r) *Ceric sulfate-treated fuller's earth*.—To 4.8 g Ce(HSO<sub>4</sub>)<sub>4</sub> (G. Frederick Smith Chemical Co.) add mixt. of 0.5 mL H<sub>2</sub>SO<sub>4</sub> and ca 5 mL H<sub>2</sub>O, and stir. Dil. to 100 mL with H<sub>2</sub>O. Warm in hot H<sub>2</sub>O bath and shake until almost all Ce(HSO<sub>4</sub>)<sub>4</sub> is dissolved. Cool to ca 35–40° and use promptly (Ce(HSO<sub>4</sub>)<sub>4</sub> ppts on standing at room temp.). Spread 200 g fuller's earth in large glazed porcelain dish. Distribute 100 mL Ce(HSO<sub>4</sub>)<sub>4</sub> soln on fuller's earth, stir gently but thoroly, and dry 48 hr in 60° oven. Store in tightly capped bottle.

(s) *Diatomaceous earth*.—Celite 501, or equiv. inert filter-aid.

(t) *Benzene*.—Eastman grade, or product of equiv. purity without addnl purification.

(u) *Olive oil*.—USP, contg 1.5 mg total reducing substances/g, or equiv. oil.

## 43.091

## Preparation of Sample and Extraction

(*Caution: See 51.009, 51.011, 51.015, 51.039, 51.054, 51.055, and 51.073.*)

(Use for detn of natural  $\alpha$ -tocopherol, total  $\alpha$ -tocopherol (natural  $\alpha$ -tocopherol + supplemental  $\alpha$ -tocopheryl acetate), or supplemental  $\alpha$ -tocopheryl acetate.)

Sample size of 10 g is convenient for most foods and feeds. Use 40 g with dry feeds and foods supplemented with high potency preps at low levels (1 IU/100 g). Min. wt is 1 g, contg 0.1 IU of total  $\alpha$ -tocopherol or supplemental  $\alpha$ -tocopheryl acetate; if assay for both is performed on same initial sample, min. amt is 0.2 IU for each component.

(a) *Fat or oil*.—Gently warm solid fat to liquefy, mix thoroly, and weigh. To det. total  $\alpha$ -tocopherol, place sample in 125 mL r-b flask for saponification as in 43.092. To det. supplemental  $\alpha$ -tocopheryl acetate, proceed directly as in 43.107.

(b) *Milk and milk products*.—Measure exactly 60 mL milk or reconstituted powd or concd milk product, add equal vol. absolute alcohol, and shake to mix. Add 150 mL ether, shake 30 sec, add 150 mL pet ether, (a)(1), and shake 30 sec. Let layers sep. and remove ether layer. Repeat extn  $\geq 2$  times, using 25 mL absolute alcohol, 100 mL ether, and 100 mL pet ether each time. Combine ether layers and evap. to 50 mL. Take 10 mL aliquot, evap. solv., and weigh lipid. Transfer remaining 40 mL or aliquot contg ca 1 g lipid and  $\geq 0.1$  IU vitamin E to 125 mL r-b flask. Evap. solv. under N on steam bath. To det. total  $\alpha$ -tocopherol, proceed immediately to saponification as in 43.092. To det. supplemental  $\alpha$ -tocopheryl acetate, proceed as in 43.107.

(c) *Wet products*.—Place accurately weighed sample in large mortar and grind thoroly with 2–3 times its wt of anhyd. powd Na<sub>2</sub>SO<sub>4</sub> until dry mixt. is obtained. Quant. transfer mixt. to  $\geq 1$  Soxhlet thimbles, using absolute alcohol as rinsing liq., and proceed as in (d).

(d) *Dry products*.—(Applicable to products such as premixes, feed concs, and feeds which may or may not be supplemented with  $\alpha$ -tocopheryl acetate, either in dry carrier or added directly to product, but not in gelatin, vegetable gum, or dextrin matrix.) If coarse particles are present, grind sample. Place accurately weighed sample into Soxhlet thimble. Place 100 mL absolute alcohol and boiling chip in flask and either mark liq. level or weigh flask and contents. Assemble hot ethanol extn app., attach condenser, and ext over steam bath 16 hr (overnight). (Use 4 hr extn with Goldfish extractor.) Stopper flask, cool ext to room temp., and add absolute alcohol, if necessary, to restore to ca original vol.

Transfer ext to separator, rinse flask with 100 mL H<sub>2</sub>O followed by 50 mL pet ether, (a)(2), and ca 0.5 g granular anhyd. Na<sub>2</sub>SO<sub>4</sub>, and add rinses to separator. Shake separator 10 min, let layers sep., and drain and discard aq. layer. Dil. pet ether ext to 50 mL; take 10 mL aliquot, evap. solv., and weigh lipid. Continue as in (b), beginning "Transfer remaining 40 mL or . . ."

(e) *Dry products supplemented with  $\alpha$ -tocopheryl acetate in gelatin, vegetable gum, or dextrin matrix*.—Proceed as in (d), thru "... discard aq. layer." Retain pet ether ext. Quant. transfer contents of Soxhlet extn thimble to 125 mL r-b flask, with total of 50 mL 2.5N H<sub>2</sub>SO<sub>4</sub>. Attach reflux condenser and reflux 30 min on hot plate. Cool to room temp. and transfer to separator, rinsing flask with 50 mL absolute alcohol. Ext with two 75 mL and one 50 mL portions pet ether, (a)(2). Combine pet ether exts and pet ether ext obtained from hot alcohol extn. Evap. under N to <50 mL and dil. to 50 mL. Take 10 mL aliquot, evap. solv., and weigh lipid. Continue as in (b), beginning "Transfer remaining 40 mL or . . ." except that 43.107 is not applicable to det. supplemental  $\alpha$ -tocopheryl acetate.

(f) *Expanded dog foods and baked dog biscuits supplemented*

before expansion, processing, or baking.—Grind sample. Place accurately weighed portion in 250 mL r-b flask connected to H<sub>2</sub>O condenser. Add 25 mL H<sub>2</sub>O-satd *n*-BuOH. Insert condenser, heat soln to bp over steam bath, and reflux 1 hr, swirling every 10 min. Cool, and evap. to absolute dryness under vac. at 60°. Quant. transfer dried sample to ≥1 Soxhlet extn thimbles, using absolute alcohol as rinsing liq., and proceed as in (d).

#### 43.092 Saponification and Re-extraction

(Caution: See 51.011, 51.039, and 51.054.)

Prep. sample as in 43.091 or 43.108. For each g (or fraction of g) of lipid residue in 125 mL r-b flask, add 4 mL absolute alcohol and 0.3 g ascorbic acid. Attach reflux condenser and heat to bp in boiling H<sub>2</sub>O bath. Raise condenser and add 1 mL concd KOH soln for each g (or fraction of g) of lipid residue, replace condenser, and reflux 15 min. (Note: Exclusion of air is essential, since tocopherols in alk. solns are easily oxidized.)

Stopper and cool rapidly under cold running H<sub>2</sub>O. Transfer soln to separator, using 20 mL H<sub>2</sub>O/g (or fraction of g) of lipid residue. Ext unsaponifiable matter by rinsing saponification flask and shaking with each of three 25 mL portions ether for each g (or fraction of g) of lipid residue. (Caution: Emulsions may form; add salt to break.) Combine ether exts and wash with equal vols H<sub>2</sub>O until soln is neut. to phthln. Filter washed ether ext thru anhyd. granular Na<sub>2</sub>SO<sub>4</sub> into erlenmeyer, rinsing with ether. Conc. ether soln to ca 5 mL under N with gentle warming. Transfer soln to 10 mL vol. flask, rinse, and dil. to vol. with ether. Use one aliquot of this ether soln for TLC, 43.093, and another aliquot for detn of total reducing substances, 43.094.

(Note: If samples contain ethoxyquin or BHA, wash ether unsaponifiable ext (before H<sub>2</sub>O wash) twice with equal vol. H<sub>2</sub>SO<sub>4</sub> (1+1). Then proceed with H<sub>2</sub>O wash of ether. Caution: If ether is visible in the H<sub>2</sub>SO<sub>4</sub> (1+1), wash the H<sub>2</sub>SO<sub>4</sub> (1+1) once with ether and combine this ether with original ether.)

#### 43.093 Thin Layer Chromatography of Unsaponifiable Matter and Elution of alpha-Tocopherol

(Caution: See 51.016 and 51.017.)

Perform TLC of α-tocopherol in darkness or subdued light.

(a) *Establishment of recovery factor.*—(TLC method is sensitive to ambient humidity.) Based on ambient relative humidity, treat alumina sheet and select solv. systems as given in Table 43:02 to obtain *R<sub>f</sub>* for α-tocopherol of 0.5–0.7.

Using micropipet, quant. transfer 10 μL std soln (10 μg α-tocopherol) slowly to form small spot ca 2 cm from lower and left-hand edges of alumina sheet. Use small amt of ether to rinse micropipet and add to spot. Dry spot with N jet during spotting.

Immediately place sheet in chamber and develop in first dimension, using predetd first dimension solv. system (Table 43:02). Develop chromatogram until solv. front has moved ca 15–16 cm from bottom of sheet, remove sheet from chamber,

and dry with N. Turn sheet 90° counterclockwise, immediately place in second chamber, and develop with predetd second dimension solv. system until solv. front is ca 15–16 cm from bottom of sheet.

Remove sheet from chamber and dry with N. Spray sheet lightly with alc. dichlorofluorescein soln. When sheet is completely dry (ca 5 min), locate tocopherol spots under UV light. (Warning: Excessive use of UV light can destroy tocopherol.)

Circle tocopherol spot (allowing safety margin of ca 5 mm around spot) and also circle spot of comparable size from unused but sprayed portion of sheet for blank. Cut out both spots and place in sep. 25 mL vials contg 1.4 mL bathophenanthroline soln, (g), replace cap, swirl, and let stand 15 min for elution. Proceed as in 43.094(a) for colorimetry.

Recovery factor(s) = μg α-tocopherol recovered from sheet/μg-tocopherol taken as sample. (Recovery factors should be const within a laboratory but may range from ca 75 to 85%.)

(b) *TLC of sample.*—Pipet aliquot of ether soln of unsaponifiable matter, contg ca 10–20 μg α-tocopherol, into 1.8 mL screw-cap vial. Evap. ether with N until 0.1–0.2 mL remains. Using micropipet, transfer entire contents of vial slowly to form small spot ca 2 cm from lower and left-hand edges of alumina sheet. Use few drops ether to rinse vial and transfer this soln to same spot. Dry spot with jet of N during spotting.

Immediately place sheet in chamber and develop as in (a). (If ethoxyquin has not been completely removed in 43.092, it will be very bright blue fluorescent spot located ca 1 cm above α-tocopherol spot (dark purple with no fluorescence).)

Elute α-tocopherol spot as in (a). (Most desirable way to identify α-tocopherol spot correctly is to chromatograph α-tocopherol std with ext aliquot. In first dimension, spot std ca 2 cm from lower and righthand edges of sheet. In second dimension, spot std ca 2 cm from lower and left-hand edges of sheet after sheet has been turned 90° counterclockwise.)

#### 43.094 Colorimetry of alpha-Tocopherol

(Method (a) is applicable only to Beckman spectrophtr and samples low in fat; (b) is applicable to any spectrophtr using working vol. of ≤6 mL in colorimeter tube and sample may contain considerable fat.)

(a) *Colorimetry after TLC.*—Take 1.0 mL from 1.4 mL bathophenanthroline soln from each vial. Place in 15 mL centr. tube, add 0.3 mL FeCl<sub>3</sub> soln, (h), dropwise, and swirl. Exactly 15 sec after addn of last drop, add 0.3 mL H<sub>3</sub>PO<sub>4</sub> soln, (i), and swirl. After 3 min, color formed is stable 90 min.

If necessary, centr. to settle adsorbent particles. Add supernate to sep. cells and measure *A* in Beckman spectrophtr at 534 nm against *A* of blank spot.

Det. amts of α-tocopherol in circled spot, using response factor or calibration curve prep'd by colorimetry above and recovery factor det'd in 43.093(a).

(b) *Colorimetry of alpha-tocopherol or total reducing material.*—Select colorimeter tubes matched with 6 mL pet ether, (a)(2)-absolute alcohol (3+2). Maintain const subdued lighting conditions thruout colorimetry.

(1) *Calibration curve.*—Place exactly 4 mL pet ether, (a)(2)-absolute alcohol (3+2) contg 5 μg pure α-tocopherol in 25 mL vial. Add exactly 1.0 mL bathophenanthroline soln, swirl, add exactly 0.5 mL FeCl<sub>3</sub> soln dropwise, and swirl. Exactly 15 sec after addn of last drop of FeCl<sub>3</sub> soln, add exactly 0.5 mL H<sub>3</sub>PO<sub>4</sub> soln and swirl. After 3 min, color formed is stable 90 min.

Transfer soln to matched colorimeter tube and measure *A* in spectrophtr at 534 nm against reagent blank prep'd in same manner but without addn of α-tocopherol.

Table 43:02 Humidity Conditions for TLC of alpha-Tocopherol

Relative Humidity, %	Activation of Sheet	Solvent Systems	
		1st Dimension Benzene-Ether	2nd Dimension Pet Ether, (a)(1)–IsoPr Ether
<20	No	60 + 40 + 1% H <sub>2</sub> O	50 + 50 + 1% H <sub>2</sub> O
20	No	60 + 40	50 + 50
40	No	90 + 10	80 + 20
60	No	100 + 0	90 + 10
>60	Yes	cyclohexane-benzene, 20 + 80	100 + 0

Repeat steps 5 times, using 5–50  $\mu\text{g}$   $\alpha$ -tocopherol; plot *A* against  $\mu\text{g}$   $\alpha$ -tocopherol/6 mL on linear graph paper. Draw best fitting smooth curve thru 6 points and origin. Check calibration curve daily and prep. new curve when new reagent solns are prepd.

(2) *Colorimetric determination*.—Accurately transfer sample or aliquot contg ca 20  $\mu\text{g}$   $\alpha$ -tocopherol or equiv. amt of reducing substances to 25 mL vial. Evap. to dryness under N, immediately add exactly 4 mL pet ether, (a)(2)-absolute alcohol (3+2), and swirl until sample is dissolved. Proceed as in (1), beginning "Add exactly 1.0 mL bathophenanthroline soln, . . ."

If sample contains appreciable amts (>100 mg) of lipid or unsaponifiable matter, transfer soln to colorimeter or centrfr. tube and centrfr. ca 10 min at ca 2500 rpm before colorimetric detn. If color formed is too great for accurate *A* detn, dil. soln with reagent blank soln and read *A* again.

Det.  $\alpha$ -tocopherol or  $\alpha$ -tocopherol equiv. of reducing substances from previously established std curve in  $\mu\text{g}$   $\alpha$ -tocopherol/6 mL.

**43.095****Calculations**

(a) *For TLC*.— $\text{mg } \alpha\text{-Tocopherol/sample} = \mu\text{g } \alpha\text{-tocopherol measured} \times (1.4/1.0) \times (x/y) \times (v/w) \times (1/1000)$ , where 1.4 and 1.0 = mL bathophenanthroline used for elution and taken from eluate, resp.; *x* = total mL ext before saponification; *y* = mL of *x* used for saponification; *v* = total mL unsaponifiable ext; *w* = mL of *v* used for spotting on TLC, 1/1000 = factor to convert  $\mu\text{g}$  to mg.

(b) *For total reducing material*.— $\text{mg } \alpha\text{-Tocopherol equiv./sample} = \mu\text{g } \alpha\text{-tocopherol measured} \times (x/y) \times (d/e) \times (1/1000)$ , where symbols are defined in (a), *d* = total mL unsaponifiable ext, and *e* = mL of *d* used for colorimeter reading.

**43.096****Calculation of IU Potency**

(a) *For products not containing added alpha-tocopheryl acetate*.— $\text{IU/g sample} = (\text{mg } \alpha\text{-tocopherol in sample/wt sample in g}) \times 1.49$ .

(b) *For products supplemented with RRR-alpha-tocopheryl acetate (natural)*.—Calc. as in (a).

(c) *For products supplemented with all-rac-alpha-tocopheryl acetate (synthetic)*.— $\text{mg all-rac-}\alpha\text{-Tocopherol/g sample} = (\text{mg all-rac-}\alpha\text{-tocopherol in sample (43.110(c))/wt sample in g})$ .

$\text{mg RRR-}\alpha\text{-Tocopherol/g sample} = (\text{mg } \alpha\text{-tocopherol in sample (43.095)/wt sample in g}) - (\text{mg all-rac-}\alpha\text{-tocopherol/wt sample in g})$ .

$\text{IU/g sample} = (\text{mg RRR-}\alpha\text{-tocopherol/wt sample in g}) \times 1.49 + (\text{mg all-rac-}\alpha\text{-tocopherol/wt sample in g}) \times 1.10$ .

**Identification of RRR- or all-rac-alpha-Tocopherol (18)**  
**Official First Action**

**43.097****Principle**

To calc. vitamin E in International Units (IU), it is necessary to know or to identify  $\alpha$ -tocopherol or  $\alpha$ -tocopherol ester as *RRR* or *all-rac* form. Sample is extd and saponified, and extraneous color is removed by chromatgy. Optical rotation of ferricyanide oxidn product of resulting  $\alpha$ -tocopherol is negligible for *all-rac* forms and pos. for *RRR* form.

Applicable to pharmaceutical prepsns and food or feed supplements contg  $\alpha$ -tocopherol esters if the  $\alpha$ -tocopherol is present at or can be concd to  $\geq 200$  mg  $\alpha$ -tocopherol/g before oxidn step.

*Precautions*.—See 43.088.

**43.098****Apparatus**

See 43.089(a) and (j), and following:

*High precision polarimeter*.—Reading to  $\leq 0.002^\circ$  (Rudolph Model 85, Rudolph Instruments, PO Box 161, Little Falls, NJ 07424, or equiv.); with 2.8 mL semimicro glass tube, 4.0 mm bore, 20 cm long, and central tubulation.

**43.099****Reagents**

See 43.090 and following:

(a) *Magnesium silicate*.—Florissil grade 60–100 mesh (Floridin Co.).

(b) *Petroleum ether-ether mixture*.—Dil. 200 mL anhyd. ether, 43.090(f), to 1 L with pet ether, 43.090(a)(7).

(c) *Isooctane*.—ACS UV grade.

(d) *Potassium ferricyanide soln*.—Dissolve 5.0 g  $\text{K}_3\text{Fe}(\text{CN})_6$  in 50 mL 0.2N NaOH. (Caution: Avoid residual acetone on glassware. If soln is brown, discard.)

**43.100 Preparation of Sample and Extraction**

(Caution: See 51.011, 51.015, 51.039, 51.045, 51.054, 51.055, and 51.073.)

See 43.091 and following:

(a) *Oily forms*.—Weigh sample contg 100–120 IU vitamin E and place in  $\frac{1}{2}$  125 mL r-b flask. Saponify as in 43.101.

(b) *Dry forms and hard-shell multivitamin capsules*.—(If necessary, grind in mortar to fine powder.) Place accurately weighed sample of dry product or capsule contents contg 100–120 IU vitamin E in  $\frac{1}{2}$  flask and add 50 mL 2.5N  $\text{H}_2\text{SO}_4$ . Attach reflux condenser and reflux 30 min on hot plate. Cool to room temp. and transfer to separator, rinsing flask with 50 mL absolute alcohol. Ext with two 75 mL and one 50 mL portions high boiling pet ether, 43.090(a)(2). Combine pet ether exts, and evap. under N to <50 mL. Transfer to  $\frac{1}{2}$  125 mL r-b flask and evap. solv. under N on steam bath. Saponify as in 43.101.

(c) *Soft-shelled multivitamin capsules*.—(1) *Preparation of column*.—Place in order, on top of small glass wool plug in chromatgc tube: 3 g fuller's earth, 3 g  $\text{Ce}(\text{HSO}_4)_4$ -treated fuller's earth, 3 mm layer fuller's earth, 3 g  $\text{Ce}(\text{HSO}_4)_4$ -treated fuller's earth, 4 g fuller's earth, and 5 mm layer diat. earth on top. Tap gently after addn of each portion of adsorbent to ensure even packing. Wash column under suction with ca 200 mL pet ether, 43.090(a)(7). Keep layer of solv. above top of adsorbent at all times. Use new column for each assay.

(2) *Elution of vitamin E*.—Weigh sample of capsule contents contg 100–120 IU vitamin E, dissolve in 4 mL pet ether, 43.090(a)(7), and quant. transfer to top of chromatgc column, using elongated dropper. If aliquot contains <500 mg lipid, add olive oil as necessary to give this min. amt lipid. Use five ca 1.0 mL portions pet ether, 43.090(a)(7), as rinses for quant. transfer. To prevent column from running dry, do not use vac. during sample transfer. Elute column with 100 mL benzene. Evap. benzene eluate to ca 4 mL on steam bath under N stream and then to dryness under N with reduced heat. Saponify as in 43.101.

**43.101****Saponification and Re-extraction**

Proceed as in 43.092. Use 0.2 mL of this ether soln to det.  $\alpha$ -tocopherol as in 43.102(a) or (b), and purify remainder as in 43.103.

**43.102****Determination of alpha-Tocopherol**

(a) *By colorimetry*.—Proceed as in 43.094(b). Calc. as follows:  
 $\text{mg } \alpha\text{-Tocopherol equiv./sample}$   
 $= \mu\text{g } \alpha\text{-tocopherol measured} \times (d/e) \times (1/1000)$

where  $d$  = total mL unsaponifiable ext,  $e$  = mL of  $d$  used for colorimetric reading, and  $(1/1000)$  = factor to convert  $\mu\text{g}$  to  $\text{mg}$ .

(b) *By gas-liquid chromatography.*—Proceed as in **43.111–43.118**. Det.  $\text{mg } \alpha\text{-tocopherol equiv./sample}$ .

#### 43.103 *Chromatographic Purification*

(Caution: See **51.011**, **51.054**, and **51.073**.)

(If sample is one of pure forms of vitamin E (USP), omit this step. Evap. ether, add exactly 4.8 mL isooctane, and proceed as in **43.104**. Caution: Avoid residual acetone on glassware.)

(a) *Preparation of column.*—Place in order, on top of small glass wool plug in chromatgc tube: 10 g Mg silicate and 5 mm layer diat. earth on top. Tap gently after addn of each portion to ensure even packing. Wash column under suction with ca 200 mL pet ether, **43.090(a)(1)**. Keep layer of solv. above top of adsorbent at all times. Use new column for each assay.

(b) *Elution of purified tocopherols.*—Quant. transfer 9.8 mL ether soln of tocopherols, **43.101**, to 15 mL centr. tube. Evap. to dryness under N and dissolve residue in 5 mL pet ether, **43.090(a)(1)**. Quant. transfer pet ether soln to top of chromatgc column, using elongated dropper, and five ca 1.0 mL portions pet ether as rinses. To prevent column from running dry, do not use vac. during sample transfer. Develop column with ca 100 mL pet ether and discard pet ether. Elute column with ca 100 mL of pet ether-ether mixture, (b). Evap. pet ether-ether mixt. eluate to ca 2 mL on steam bath under N stream. Quant. transfer to 5 mL centr. tube and evap. to dryness under N with reduced heat. Add exactly 5 mL isooctane. This is *Soln I*. Quant. remove 0.2 mL of *Soln I* and det.  $\text{mg tocopherols/mL}$  as in **43.102**. Using remaining 4.8 mL of *Soln I*, proceed as in **43.104**.

#### 43.104 *Oxidation and Polarimetry*

(a) *Direct measurement.*—Measure optical rotation of *Soln I*. Calc. specific rotation before oxidn as in **43.105**.

(b) *Oxidation.*—Quant. transfer exactly 4 mL *Soln I* to 250 mL separator, using 50 mL pet ether, **43.090(a)(1)**. Add 10 mL  $\text{K}_3\text{Fe}(\text{CN})_6$  soln, stopper, and shake 3 min. Discard aq. layer; wash solv. layer by gentle shaking with two 50 mL portions  $\text{H}_2\text{O}$ . Dry washed soln with anhyd. granular  $\text{Na}_2\text{SO}_4$ . Transfer quant. to flask and evap. under N with gentle warming to ca 2 mL. Transfer quant. to 5 mL centr. tube and evap. to dryness under N with reduced heat. Add exactly 3 mL isooctane and measure optical rotation. Calc. specific rotation after oxidn as in **43.105**.

#### 43.105 *Calculations*

(a) *Specific rotation.*—Calc. in terms of  $\alpha\text{-tocopherol}$ :

$$[\alpha]_D^{25} = (r \times V)/(C \times l),$$

where  $[\alpha]_D^{25}$  = specific rotation at  $25^\circ$  with Na light;  $r$  = observed rotation;  $V$  = mL soln resulting from diln;  $C$  = g tocopherols in soln; and  $l$  = length of tube in dm ( $= 2$ ).

(1) *Before oxidation.*— $V = 4.8$ ;

$$C = [(4.8/1000) \times (\text{mg tocopherols/mL})];$$

(2) *After oxidation.*— $V = 3.0$ ;

$$C = [(4.0/1000) \times (\text{mg tocopherols/mL})];$$

where 4.8 = mL of *Soln I* remaining after removal of aliquot for  $\alpha\text{-tocopherol}$  detn;  $\text{mg tocopherol/mL}$  refers to *Soln I*; 1000 = factor to convert  $\text{mg}$  to  $\text{g}$ ; 3.0 = vol. oxidized soln resulting from diln; and 4.0 = vol. of *Soln I* used for oxidn.

(b) *Specific rotation ratio.*—Calc. ratio

$$= ([\alpha]_D^{25} \text{ after oxidn} - [\alpha]_D^{25} \text{ before oxidn})/25.5,$$

where 25.5 is specific rotation of oxidn product of pure *RRR*- $\alpha\text{-tocopherol}$ . If ratio =  $1.0 \pm 0.30$ , sample is identified as *RRR*- $\alpha\text{-tocopherol}$ ;

if ratio =  $0.00 \pm 0.10$ , sample is identified as *all-rac*- $\alpha\text{-tocopherol}$ .

(c) *International Units.*—(1) If *RRR*- $\alpha\text{-tocopherol}$  is present:

$$\text{IU vitamin E/g sample} = (\text{mg } \alpha\text{-tocopherol equiv. in sample/g sample}) \times 1.10.$$

(2) If *all-rac*- $\alpha\text{-tocopherol}$  is present:

$$\text{IU vitamin E/g sample} = (\text{mg } \alpha\text{-tocopherol equiv. in sample/g sample}) \times 1.10.$$

#### Supplemental alpha-Tocopheryl Acetate in Foods and Feeds (17)—Official Final Action

#### 43.106 *Modified Extraction for Supplemental alpha-Tocopheryl Acetate Only*

(Caution: See **51.011**, **51.015**, **51.039**, and **51.073**.)

(Methods for sample prepn and extn described in **43.091** are usually sufficient. Following modified extn technics may be used for special cases.)

(a) *Wet products.*—Place accurately weighed sample in large mortar and grind thoroly with 2–3 times its wt anhyd. powd  $\text{Na}_2\text{SO}_4$  until dry mixt. is obtained. Quant. transfer mixt. to g-s flask, add 50 mL purified ether, shake thoroly 15 min, and let solids settle. Take 10 mL aliquot of clear ext, evap. solv., and weigh lipid. Transfer  $\leq 30$  mL aliquot contg ca 1 g lipid and ca 0.1 IU supplemental vitamin E to  $\approx 125$  mL r-b flask, evap. solv. under N on steam bath, and proceed as in **43.107**.

(b) *Expanded dog foods and baked dog biscuits supplemented before expansion, processing, or baking.*—Proceed as in **43.091(f)**, except after refluxing, cool soln and let solids settle. Assume that vol. liq. present equals vol.  $\text{H}_2\text{O}$ -satd *n*-BuOH added plus  $\text{H}_2\text{O}$  content of sample extd. Take aliquot of  $\text{H}_2\text{O}$ -satd *n*-BuOH ext contg ca 0.1 IU supplemental vitamin E and evap. to dryness under vac. in  $60^\circ$   $\text{H}_2\text{O}$  bath. Quant. transfer dried aliquot to Soxhlet extn thimble, using purified pet ether, (a)(1), as rinsing liq. Re-ext residue in Soxhlet 45 min with 50 mL purified pet ether, (a)(1). Evap. under N to  $< 50$  mL and dil. to 50 mL. Take 10 mL aliquot, evap. solv., and weigh lipid. Transfer remaining 40 mL or aliquot contg ca 1 g lipid and 0.1 IU supplemental vitamin E to  $\approx 125$  mL r-b flask, evap. solv. under N on steam bath, and proceed as in **43.107**.

#### 43.107 *Oxidative Chromatography*

(a) *Preparation of column.*—See **43.100(c)(1)**.

(b) *Elution of  $\alpha\text{-tocopheryl acetate}$ .*—Quant. transfer test sample or aliquot contg ca 0.1 IU supplemental  $\alpha\text{-tocopheryl acetate}$  from **43.091** or **43.106** in 4 mL pet ether, (a)(1) (aliquot may be evapd just to dryness under N and residue then dissolved in pet ether, (a)(1)) to top of chromatgc column, using elongated dropper. If aliquot contains  $< 500$  mg lipid, add olive oil as necessary to give this min. amt of lipid. Use ca five 1.0 mL portions pet ether, (a)(1), as rinses for quant. transfer. To prevent column from running dry, do not use vac. during sample transfer. Elute column with 100 mL benzene. Evap. benzene eluate to ca 4 mL on steam bath under N stream and then to dryness under N with reduced heat. Dissolve residue and dil. to 10 mL with pet ether, (a)(2)-absolute alcohol (3+2). Use  $\leq 5$  mL to det. reducing substances before saponification as in **43.109(a)**. Use  $\leq 4$  mL for saponification in **43.108**.

#### 43.108 *Saponification*

Accurately transfer  $\leq 4$  mL aliquot of pet ether, (a)(2)-absolute alcohol (3+2) contg ca  $20 \mu\text{g } \alpha\text{-tocopherol}$  to  $\approx 125$  mL r-b flask. Evap. to dryness under N and saponify as in **43.092**, except that entire dry ether ext should be concd to small vol. in 25 mL vial. Proceed as in **43.109(b)**.

**43.109****Colorimetry**

(a) *Before saponification*.—Using  $\leq 5$  mL pet ether, (a)(2)-absolute alcohol soln from **43.107**, det.  $\alpha$ -tocopherol equiv. of extraneous reducing substances not removed in oxidative chromatgy by colorimetry as in **43.094(b)**.

(Note: If  $\alpha$ -tocopherol equiv. of reducing substances before saponification ( $\mu\text{g/g}$  sample) exceeds 15% of  $\alpha$ -tocopherol after saponification ( $\mu\text{g/g}$  sample), repeat assay, using  $\geq 2$  oxidative chromatgc columns, or equiv. With unusually high levels of antioxidants, solv. partition or other purification steps may be necessary.)

(b) *After saponification*.—Assay concd ether exts in 25 mL vial from **43.108** for  $\alpha$ -tocopherol as in **43.094(b)**.

(Note: If excessive amts of non- $\alpha$ -tocopheryl acetate ( $>15\%$ ) are present in feed supplement or supplemented feed, det.  $\alpha$ -tocopherol as follows: After oxidative chromatgy as in **43.107** and saponification as in **43.092**, use aliquot of ether ext for TLC, **43.093**. Apply ratio of  $\alpha$ -tocopherol in **43.094(a)** to total tocopherols as detd in **43.109(b)** as correction factor to mg  $\alpha$ -tocopherol/g sample in **43.110(c)**.)

**43.110****Calculations**

(a) mg Reducing substances before saponification/sample =  $\mu\text{g}$  substances measured  $\times (x/y) \times (10/w) \times (1/1000)$ , where  $x$  = total mL ext from **43.091**;  $y$  = mL ext used for chromatgy, **43.107**;  $10$  = mL soln after chromatgy;  $w$  = mL taken for colorimetry; and  $1/1000$  = factor to convert  $\mu\text{g}$  to mg.

(b) mg  $\alpha$ -Tocopherol after saponification/sample =  $\mu\text{g}$   $\alpha$ -tocopherol measured  $\times (x/y) \times (10/v) \times (1/1000)$ , where symbols are defined in (a),  $10$  = mL soln after chromatgy, and  $v$  = mL taken for saponification.

(c) mg  $\alpha$ -Tocopherol/sample = (mg  $\alpha$ -tocopherol/sample, after saponification) – (mg reducing substances/sample, before saponification).

(d) mg  $\alpha$ -Tocopheryl acetate/g sample = (mg  $\alpha$ -tocopherol in sample/wt sample in g)  $\times 1.098$ .

(e) Det. IU added vitamin E/g sample as follows:

If *RRR*- $\alpha$ -tocopheryl acetate is present: IU vitamin E/g sample = (mg  $\alpha$ -tocopheryl acetate/wt sample in g)  $\times 1.36$ .

If *all-rac*- $\alpha$ -tocopheryl acetate is present: IU vitamin E/g sample = (mg  $\alpha$ -tocopheryl acetate/wt sample in g)  $\times 1.00$ .

**Vitamin E (19)—Official Final Action**

(Applicable to pharmaceutical prepsns)

**43.111****Apparatus**

(a) *Gas chromatograph*.—Equipped with either H flame or  $\beta$ -Ar ionization detector; capable of accepting glass column and glass-lined sample introduction system or on-column injection. Typical operating conditions: temps ( $^{\circ}$ )—column 270–285, injection system 295, detector 295; N or Ar carrier gas flow adjusted so  $\alpha$ -tocopheryl acetate peak appears 23–27 min after sample introduction; satisfactory recorder chart speed 0.33"/min; and  $\beta$ -Ar detector 900 v dc.

(b) *Filter assembly*.—Consisting of Millipore filter holder, No. XX 1004700, and microfiber glass prefilter disk, No. AP 2004200 (Millipore Corp., Ashby Rd, Bedford, MA 01730); and Filtrator, Fisher Scientific Co. No. 9-788.

**43.112****Reagents**

(a) *n*-Hexane.—Pure grade, Phillips Petroleum Co.

(b) *RRR*- or *all-rac*- $\alpha$ -Tocopherol.—Eastman Kodak Co. No. 6340; or Hoffmann-La Roche, Inc. No. 60524.

(c) *RRR*- or *all-rac*- $\alpha$ -Tocopheryl acetate.—Eastman No. 6679; or Hoffmann-La Roche No. 60526.

(d) *RRR*- or *all-rac*- $\alpha$ -Tocopheryl hydrogen succinate.—Eastman No. 6347; or Hoffmann-La Roche No. 60540.

(e) *Internal std soln*.—Dissolve 500 mg hexadecyl palmitate (cetyl palmitate, primary internal std, Analabs No. LMS-067, or equiv.) or, alternatively 500 mg dotriacontane (Eastman Kodak Co., No. 3555) in *n*-hexane in 500 mL vol. flask and dil. to vol. with *n*-hexane.

(f) *Vitamin E std solns*.—Prep. desired vitamin E analog(s) Ref. Std(s) by transferring 100 mg analog into 100 mL vol. flask and dissolve and dil. to vol. with internal std soln or with *n*-hexane (for external std method). Refrigerate all std solns in amber Pyrex vol. flasks under N.

**43.113****Preparation of Column**

Fill 2.4 m (8')  $\times$  4 mm id (uniform bore) Pyrex tube with 5% SE-30 on 100–120 mesh Gas-Chrom Q to within 10 cm of injection point and 2.5 cm of column exit. Vibrate column while filling. Insert glass wool plugs, one extending to top of carrier gas inlet arm at column injection end and another filling space between packing and septum at exit.

Condition column 24 hr at 285 $^{\circ}$  and 80 mL/min carrier gas flow. Let column cool with gas flowing. Connect column outlet to detector; bring chromatograph to operating temp. and carrier gas flow rate. Record baseline to check instrument stability. Baseline drift should be  $\leq 1\%$  in 30 min.

(Pretested column available from Applied Science Laboratories.)

(Occasionally column is rendered unusable for 1–4 hr following direct injection. If this situation arises, either increase column temp. for short time to drive off sample contaminants or wait until baseline stabilizes at column operating temp.)

**43.114****Preparation of Sample**

(Caution: See **51.011** and **51.061**.)

(a) *Tablets*.—Grind in mortar and ext with four 25 mL portions *n*-hexane. Filter thru filter assembly into receiver. (1) *Internal std method*.—Evap. hexane under N stream and dil. with internal std soln to such vol. that final concn is 1 mg vitamin E/mL. (2) *External std method*.—Dil. with hexane to such vol. that final concn is 1 mg vitamin E/mL based on label claim.

(b) *Capsules*.—Dissolve in *n*-hexane under N, heating slightly if needed. If capsules do not disintegrate, cut open and remove contents with *n*-hexane. Open slip-capsules and place contents and capsule parts in *n*-hexane. Continue as in (a).

(c) *Injectables and liquids*.—Dil. with internal std soln (for internal std method) or with *n*-hexane (for external std method) so that final concn is 1 mg vitamin E/mL. If product is not miscible with *n*-hexane, inject  $\mu\text{L}$  aliquots of product directly onto GLC column and use external std method for detn.

(d) *Other preparations*.—If sample is not directly extractable with *n*-hexane, disperse with  $\text{H}_2\text{O}$  and dissolve in suitable solv. Evap. solv. under N and proceed as in (a).

**43.115****Injection Technic**

(a) *Internal std method*.—Injection technic is not critical.

(b) *External std method*.—Use following injection technic with 10  $\mu\text{L}$  Hamilton microsyringe: Draw 1  $\mu\text{L}$  air into barrel, insert needle into sample, and draw desired amt into barrel; remove needle from soln, and draw 1  $\mu\text{L}$  air into barrel. Check sample vol. between same  $\mu\text{L}$  range on calibration scale each time sample is obtained to ensure uniformity in vol.

## 43.116

## Performance Check

Monitor instrument and column performance by observing sepn of  $\alpha$ -tocopherol and  $\alpha$ -tocopheryl acetate peaks expressed as peak resolution.

Peak resolution =  $2D/(B + C)$ , where  $D$  = distance between analog peak maxima,  $B$  =  $\alpha$ -tocopheryl acetate peak base width, and  $C$  =  $\alpha$ -tocopherol peak base width.

Det. these values with mixt. of equal wts  $\alpha$ -tocopherol and  $\alpha$ -tocopheryl acetate, using sample size so that ht of peaks is ca 50% full scale. If peak resolution is  $\geq 1.0$ , column and instrument are satisfactory. All columns will show gradual loss in peak resolution; when value is  $< 1.0$ , install new column.

(a) *Internal std method*.—Calibrate instrument by injecting amt (usually 2–5  $\mu$ L) std soln(s) to produce peaks for vitamin E analogs and internal std that give ca 50% full scale deflection. Measure area of analog(s) and internal std peaks with integrator, or by peak ht times width at half peak ht, recording sensitivity and retention times. Calc. relative response factor,  $RF$ , for std soln =  $(Q_s/Q_d)$ , where  $Q_s$  and  $Q_d$  are peak areas of specific vitamin E analog and internal std, resp. Repeat calibration until  $RF$  is const (within 2%) for 3 consecutive injections and other parameters are stabilized. Repeat calibration for each vitamin E analog of interest.

(b) *External std method*.—Prep. std curve of 2–5  $\mu$ g of each analog of interest daily. Plot response in area against  $\mu$ g injected, using  $\geq 3$  points in duplicate for each analog to be measured.

## 43.117

## Peak Identification

Compare retention times of samples and stds. Distinguish  $\alpha$ -tocopherol from  $\alpha$ -tocopheryl hydrogen succinate in sample exts (these vitamin E analogs have similar retention times) as follows: Obtain GLC analysis of ext. Add 1 mL  $\text{Ac}_2\text{O}$ -pyridine (2+1) to ext, and shake 10 min. Evap. soln under N stream, dil. to original vol. with  $n$ -hexane, and obtain GLC analysis. If peak shifts to  $\alpha$ -tocopheryl acetate position, sample contains alcohol; if it does not shift, sample contains  $\alpha$ -tocopheryl hydrogen succinate. Relative retention times are:  $\alpha$ -tocopheryl acetate, 1.0;  $\alpha$ -tocopherol, 0.9;  $\alpha$ -tocopheryl hydrogen succinate, 0.9.

Relative to hexadecyl palmitate and dotriacontane, resp., in internal std method, retention times are:  $\alpha$ -tocopherol, 0.53 and 0.75;  $\alpha$ -tocopheryl hydrogen succinate, 0.54 and 0.76;  $\alpha$ -tocopheryl acetate, 0.62 and 0.86.

## 43.118

## Determination

(a) *Internal std method*.—Inject vol. sample soln, 43.114, prepd on basis of label claim, to give expected response comparable to that of std soln(s) as in 43.116(a). Measure area of peak(s) of vitamin E analog(s) and internal std.

mg Vitamin E analog(s)/tablet, capsule, or mL

$$= (Q_x/Q_d) \times (\text{declared potency}/RF),$$

where  $Q_x$  and  $Q_d$  are peak areas of vitamin E analog from sample and internal std, resp., and  $RF$  is detd as in 43.116(a).

If label claims are stated as International Units (IU), convert to wt, using following conversion factors:

1 mg *all-rac*- $\alpha$ -tocopheryl acetate = 1 IU; 1 mg *all-rac*- $\alpha$ -tocopherol = 1.1 IU; 1 mg *RRR*- $\alpha$ -tocopheryl acetate = 1.36 IU; 1 mg *RRR*- $\alpha$ -tocopherol = 1.49 IU; 1 mg *RRR*- $\alpha$ -tocopheryl hydrogen succinate = 1.21 IU.

(b) *External std method*.—Inject 2  $\mu$ L sample ext. Det. area of each peak with electromech. or electronic integrator, or by triangulation, i.e., peak ht  $\times$  peak width at half ht. Convert peak area to amt vitamin E analog, using sp calibration plot.

mg Vitamin E analog(s)/tablet, capsule, or mL =  $(X/N)(V/U)$ ,

where  $X$  =  $\mu$ g read from calibration curve,  $N$  =  $\mu$ L injected

(normally 2),  $V$  = vol. total ext (mL), and  $U$  = number tablets, capsules, or mL initially used. If necessary, convert to IU as in (a).

## 43.119

## ★ Calcium Pantothenate (20) ★

## Official First Action

Pantothenate molecule is cleaved with acid and resulting  $\beta$ -alanine is treated with chlorinating soln and then with KI. Free I is measured spectrophtrically. See 43.086–43.090, 12th ed.

**Menadione Sodium Bisulfite**  
(Water-Soluble Vitamin K<sub>3</sub>) (27)

## Official Final Action

## 43.120

## Principle

Menadione is extd as menadione. $\text{NaHSO}_3 \cdot 3\text{H}_2\text{O}$  with MeOH and converted to menadione by on-column pyrolytic GLC.

## 43.121

## Apparatus

(a) *Gas chromatograph*.—With flame ionization detector. Operating conditions: temps ( $^{\circ}$ )—column 135, injection port 250, detector block 235; flow rates (mL/min)—N 25, H 25, air 300. Adjust conditions to give  $\geq 0.5$  full scale deflection for 0.5 mg menadione/mL.

(b) *Column*.—Pyrex or stainless steel 120  $\times$  0.64 cm (4'  $\times$  1/4") or 180  $\times$  0.32 cm (6'  $\times$  1/8"), with glass-lined sample introduction system or on-column injection, packed with (1) 2% OV-17 on 80–100 mesh acid-washed Chromosorb W (Supelco, Inc.) silylated with BSA (*N,O*-bis-(trimethylsilyl) acetamide)-TMCS (trimethyl chlorosilane), 5 + 1; or (2) 3% Dexsil 300 on 100–120 mesh Gas Chrom Q. Condition 2% OV-17 column (1) 12 hr at 250 $^{\circ}$  with N. (Caution: Silanes are toxic. Wear disposable gloves and use effective fume removal device when handling.)

## 43.122

## Standard Solutions

(a) *Menadione std soln*.—(1) *Stock soln*.—4 mg/mL. Dissolve 200 mg USP Menadione Ref. Std in MeOH and dil. to 50 mL with MeOH. Store in dark; prep. fresh daily. (2) *Working solns*.—Prep std solns, each contg 1.0 mg diethyl phthalate (DEP)/mL, as follows:

Soln	mg Menadione/mL				
	0.8	0.6	0.5	0.4	0.2
MeOH	3	7	15	4	9
Stock soln	2	3	5	1	1
DEP soln	5	10	20	5	10
Final vol., mL	10	20	40	10	20

(b) *Menadione sodium bisulfite std soln*.—(1) *Stock soln*.—2 mg/mL. Dissolve 200 mg menadione. $\text{NaHSO}_3 \cdot 3\text{H}_2\text{O}$  (94+%, ICN Pharmaceuticals, Inc., Life Sciences Group) in MeOH and dil. to 100 mL with MeOH. Prep. weekly. (2) *Check soln*.—Mix equal parts soln (b)(1) and (c); final concn is 1.0 mg menadione. $\text{NaHSO}_3 \cdot 3\text{H}_2\text{O}$  and 1.0 mg DEP/mL.

(c) *Diethyl phthalate (DEP) internal std soln*.—2 mg/mL. Dissolve 1.0 g DEP (Aldrich Chemical Co., Inc.) in MeOH and dil. to 500 mL with MeOH.

## 43.123

## Preparation of Sample

Accurately weigh 5.0 g feed premix contg ca 5.0 g menadione/lb (16 g menadione. $\text{NaHSO}_3 \cdot 3\text{H}_2\text{O}$ /lb) and transfer

★ Surplus method—see inside front cover.

to 200 mL g-s erlenmeyer. Add 50 mL internal std soln, (c), mix gently 10 min, and let stand 5 min. Dil. 5 mL aliquot with 5 mL MeOH, mix, and centr. For premixes with different menadione levels, adjust extn technic to obtain final concn so that equiv. menadione content is ca 0.5 mg/mL and soln contains 1.0 mg DEP/mL.

**43.124****Calibration**

Inject 2  $\mu$ L 0.5 mg menadione-DEP working std soln into gas chromatograph. Adjust to give  $\geq 0.5$  full scale deflection. Det. menadione/DEP peak response ratio ( $R_1$ ), using integrator or peak areas as follows:

$$R_1 = PA_1/PA_2$$

where  $PA_1$  and  $PA_2$  = peak areas of menadione (0.5 mg/mL) and DEP (1.0 mg/mL), resp.

Inject 2  $\mu$ L aliquot of each menadione std soln and det. menadione/DEP peak response ratios. Prep. std curve by plotting mg menadione/mL against menadione/DEP peak response ratio for each std soln. Adjust instrument to obtain linear std curve.

Prior to sample analysis, check injection port temp. for on-column pyrolysis of menadione.  $\text{NaHSO}_3 \cdot 3\text{H}_2\text{O}$  compd to menadione by injecting 2  $\mu$ L aliquot menadione.  $\text{NaHSO}_3 \cdot 3\text{H}_2\text{O}$  check std soln. Det. menadione (pyrolytic product)/DEP peak response ratio ( $R_2$ ) and calc. % menadione in menadione.  $\text{NaHSO}_3 \cdot 3\text{H}_2\text{O}$  check std soln

$$= (MD_1/MSB_2) \times (R_2/R_1) \times 100$$

where  $MD_1$  = mg menadione/mL in std soln, and  $MSB_2$  = mg menadione.  $\text{NaHSO}_3 \cdot 3\text{H}_2\text{O}$ /mL in check std soln.

**43.125****Determination**

Check chromatgc conditions daily by injecting 2  $\mu$ L 0.5 mg/mL std soln  $\geq 3$  times and det. av. peak response ratio,  $R_1$ , which should be within  $\pm 10\%$  of std curve. If not, readjust temps and flow rates.

Inject 2  $\mu$ L sample soln  $\geq 2$  times and det. av. menadione/DEP peak response ratio,  $R_x$ .

$$\text{g Menadione/g sample} = (MD_1/PM_x) \times (R_x/R_1),$$

where  $PM_x$  = mg sample/mL sample soln.

$$\begin{aligned} \text{g Menadione/lb sample} \\ = (\text{g menadione/g premix}) \times (453.7 \text{ g/lb}). \end{aligned}$$

**MICROBIOLOGICAL METHODS****Vitamins—Official Final Action**

(Thruout all stages, except where otherwise directed, protect solns from undue exposure to light.)

**43.126****Stock Solutions for Basal Media**

(Store all solns in dark at ca 10°. Store all solns except those contg alcohol under toluene. Proportionate amts may be prepd.)

(a) *Acid-hydrolyzed casein soln.*—(Caution: See 51.011 and 51.015.) Mix 400 g vitamin-free casein with 2 L const-boiling HCl (ca 5N) and either reflux 8–12 hr, or autoclave 8–12 hr at 121–123°. Remove HCl from mixt. by distn under reduced pressure until thick paste remains. Redissolve paste in  $\text{H}_2\text{O}$ , adjust soln to pH 3.5  $\pm$  0.1 with ca 10% NaOH soln, and dil. with  $\text{H}_2\text{O}$  to 4 L. Add 80 g activated charcoal, stir 1 hr, and filter. Repeat treatment with activated charcoal. Filter soln if ppt forms upon storage. (Some com. sources of vitamin-free acid-hydrolyzed casein have been found satisfactory.)

(b) *Adenine-guanine-uracil soln.*—Dissolve 1.0 g each of adenine sulfate, guanine.HCl, and uracil in 50 mL warm HCl (1+1), cool, and dil. with  $\text{H}_2\text{O}$  to 1 L.

(c) *Asparagine soln.*—Dissolve 10 g L-asparagine.  $\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$  and dil. to 1 L.

(d) *Cystine soln.*—Suspend 2 g L-cystine in ca 750 mL  $\text{H}_2\text{O}$ , heat to 70–80°, and add HCl (1+1), dropwise, with stirring, until solid dissolves. Cool, and dil. with  $\text{H}_2\text{O}$  to 1 L.

(e) *Cystine-tryptophan soln.*—Suspend 8 g L-cystine and 2 g L-tryptophan (or 4 g D,L-tryptophan) in ca 1.5 L  $\text{H}_2\text{O}$ , heat to 70–80°, and add HCl (1+1), dropwise, with stirring, until solids dissolve. Cool, and dil. with  $\text{H}_2\text{O}$  to 2 L.

(f) *Manganese sulfate soln.*—Dissolve 2 g  $\text{MnSO}_4 \cdot \text{H}_2\text{O}$  in  $\text{H}_2\text{O}$  and dil. to 200 mL.

(g) *Photolyzed peptone soln.*—Dissolve 100 g peptone in 625 mL  $\text{H}_2\text{O}$ , add soln of 50 g NaOH in 625 mL  $\text{H}_2\text{O}$ , and mix in vessel (such as crystg dish) of such size that depth of soln is 1–2 cm. Place 100–500 watt bulb, fitted with reflector, ca 30–50 cm from soln, and expose soln, with occasional stirring, to light from bulb until riboflavin is destroyed (4–10 hr may be enough). Maintain soln at  $\leq 25^\circ$  during this treatment. Adjust soln to pH 6.0–6.5 with HOAc, add 18 g anhyd. NaOAc, stir until solid dissolves, dil. with  $\text{H}_2\text{O}$  to 2 L, and filter if soln is not clear.

(h) *Polysorbate 80 soln.*—Dissolve 25 g polysorbate 80 (polyoxyethylene sorbitan monooleate) in alcohol to make 250 mL.

(i) *Salt soln A.*—Dissolve 50 g anhyd.  $\text{KH}_2\text{PO}_4$  and 50 g anhyd.  $\text{K}_2\text{HPO}_4$  in  $\text{H}_2\text{O}$ , dil. to 1 L, and add 10 drops HCl.

(j) *Salt soln B.*—Dissolve 20 g  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ , 1 g NaCl, 1 g  $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ , and 1 g  $\text{MnSO}_4 \cdot \text{H}_2\text{O}$  in  $\text{H}_2\text{O}$ , dil. to 1 L, and add 10 drops HCl.

(k) *Tryptophan soln.*—Suspend 2.0 g L-tryptophan (or 4.0 g D,L-tryptophan) in 700–800 mL  $\text{H}_2\text{O}$ , heat to 70–80°, and add HCl (1+1), dropwise, with stirring, until solid dissolves. Cool, and dil. with  $\text{H}_2\text{O}$  to 1 L.

(l) *Vitamin soln I.*—Dissolve 25 mg riboflavin, 25 mg thiamine.HCl, 0.25 mg biotin, and 50 mg niacin in 0.02N HOAc to make 1 L.

(m) *Vitamin soln II.*—Dissolve 50 mg *p*-aminobenzoic acid, 25 mg Ca pantothenate, 100 mg pyridoxine.HCl, 100 mg pyridoxal.HCl, 20 mg pyridoxamine.2HCl, and 5 mg folic acid in 25% alcohol to make 1 L.

(n) *Vitamin soln III.*—Dissolve 10 mg *p*-aminobenzoic acid, 40 mg pyridoxine.HCl, 4 mg thiamine.HCl, 8 mg Ca pantothenate, 8 mg niacin, and 0.2 mg biotin in ca 300 mL  $\text{H}_2\text{O}$ . Add 10 mg riboflavin dissolved in ca 200 mL 0.02N HOAc. Then add soln contg 1.9 g anhyd. NaOAc and 1.6 mL HOAc in ca 40 mL  $\text{H}_2\text{O}$ , and dil. with  $\text{H}_2\text{O}$  to 2 L.

(o) *Vitamin soln IV.*—Dissolve 20 mg riboflavin, 10 mg thiamine.HCl, and 0.04 mg biotin in 0.02N HOAc to make 1 L.

(p) *Vitamin soln V.*—Dissolve 10 mg *p*-aminobenzoic acid, 20 mg Ca pantothenate, and 40 mg pyridoxine.HCl in 25% alcohol to make 1 L.

(q) *Vitamin soln VI.*—Dissolve 10 mg *p*-aminobenzoic acid, 50 mg niacin, and 40 mg pyridoxine.HCl in 25% alcohol to make 1 L.

(r) *Xanthine soln.*—Suspend 1.0 g xanthine in 150–200 mL  $\text{H}_2\text{O}$ , heat to ca 70°, add 30 mL  $\text{NH}_4\text{OH}$  (2+3), and stir until solid dissolves. Cool, and dil. with  $\text{H}_2\text{O}$  to 1 L.

(s) *Yeast supplement soln.*—Dissolve 20 g  $\text{H}_2\text{O}$ -sol. yeast ext in 100 mL  $\text{H}_2\text{O}$ , add soln of 30 g Pb subacetate in 100 mL  $\text{H}_2\text{O}$  (soln is turbid), and mix. Filter, and adjust filtrate to pH 10 with  $\text{NH}_4\text{OH}$  (1+2). Filter, and adjust filtrate to pH 6.5 with HOAc. Ppt excess Pb with  $\text{H}_2\text{S}$ , filter, and dil. filtrate with  $\text{H}_2\text{O}$  to 200 mL.

**43.127****Culture and Suspension Media**

(a) *Liquid culture medium.*—Dissolve 15 g peptonized milk, 5 g  $\text{H}_2\text{O}$ -sol. yeast ext, 10 g anhyd. glucose, and 2 g anhyd.  $\text{KH}_2\text{PO}_4$  in ca 600 mL  $\text{H}_2\text{O}$ . Add 100 mL filtered tomato juice, and adjust to pH 6.5–6.8 with NaOH soln. Add, with mixing, 10 mL polysorbate 80 soln, (h), and dil. with  $\text{H}_2\text{O}$  to 1 L. Add 10 mL

portions soln to test tubes, cover to prevent contamination, sterilize 15 min in autoclave at 121–123°, and cool tubes as rapidly as practicable to keep color formation at min. Store in dark at ca 10°. (Difco Lactobacilli Broth AOAC, Difco Laboratories, has been found satisfactory.)

(b) *Agar culture medium*.—To 500 mL liq. culture medium, (a), add 5.0–7.5 g agar, and heat with stirring on steam bath until agar dissolves. Add ca 10 mL portions hot soln to test tubes, cover to prevent contamination, sterilize 15 min in autoclave at 121–123°, and cool tubes in upright position as rapidly as practicable to keep color formation at min. Store in dark at ca 10°. (Difco agar culture medium for AOAC microbiological assays (Lactobacilli Agar AOAC) has been found satisfactory.)

(c) *Suspension medium*.—Dil. measured vol. appropriate basal medium stock soln, Table 43:03, with equal vol. H<sub>2</sub>O. Add 10 mL portions dild medium to test tubes, cover to prevent contamination, sterilize 15 min in autoclave at 121–123°, and cool tubes as rapidly as practicable to keep color formation at min. Store in dark at ca 10°.

#### 43.128

#### Stock Cultures of Test Organisms

For appropriate test organism, designated below, prep. stab culture in ≥1 tubes of *agar culture medium*, 43.127(b). Incubate 6–24 hr at any selected temp. between 30 and 40° held const to within ±0.5°, and finally store in dark at ca 10°. Before using new culture in assay, make several successive transfers of culture in 1–2 week period.

Prep. fresh stab culture ≥1 time weekly and do not use for prepg inoculum if >1 week old.

Activity of slow-growing culture may be increased by daily or twice-daily transfer of stab culture, and is considered satisfactory when definite turbidity in liq. inoculum can be observed 2–4 hr

after inoculation. Slow-growing culture seldom gives suitable response curve and may cause erratic results.

(a) *Lactobacillus leichmannii*.—ATCC No. 7830. For use in assay of cobalamin.

(b) *Streptococcus faecalis (faecium)*.—ATCC No. 8043. For use in assay of folic acid.

(c) *Lactobacillus plantarum*.—ATCC No. 8014. For use in assay of niacin and pantothenic acid.

(d) *Lactobacillus casei* subsp. *rharnosus*.—ATCC No. 7469. For use in assay of riboflavin.

#### 43.129

#### Assay Tubes

Meticulously cleanse by suitable means (Na lauryl sulfate USP has been found satisfactory as detergent), hard-glass test tubes, ca 20 × 150 mm, and other necessary glassware. (Test organisms are highly sensitive to minute amts of growth factors and to many cleansing agents. Therefore, it may be preferred to follow cleansing by heating 1–2 hr at ca 250°. This is of particular importance in cobalamin assay.)

Prep. tubes contg appropriate std soln as follows: To test tubes add, in duplicate (or replicate), 0.0 (for uninoculated blanks), 0.0 (for inoculated blanks), 1.0, 2.0, 3.0, 4.0, and 5.0 mL, resp., of std soln.

Prep. tubes contg appropriate assay soln as follows: To similar test tubes add, in duplicate (or replicate), 1.0, 2.0, 3.0, and 4.0 mL, resp., of assay soln.

To each tube of std soln and assay soln add H<sub>2</sub>O to make 5.0 mL. Then add 5.0 mL appropriate basal medium stock soln, Table 43:03, and mix. Cover tubes suitably to prevent bacterial contamination, and sterilize (10 min for titrimetric method, 43.130; or 5 min for turbidimetric method, 43.132) in autoclave at 121–123°, reaching this temp. in ≤10 min. Cool as rapidly as

Table 43:03 Basal Media Stock Solutions for 250 mL (Proportionate Amounts May be Prepared)<sup>a</sup>

Ingredients (Stock Solutions, 43.126)		(a) Cobalamin (Vitamin B <sub>12</sub> Activity)	(b) Folic Acid (Pteroylglutamic Acid)	(c) Niacin and Niacinamide	(d) Pantothenic Acid	(e) Riboflavin (Vitamin B <sub>2</sub> )

<sup>a</sup> Some com. sources of basal media have been found satisfactory.

practicable to keep color formation at min. Take precautions to keep sterilizing and cooling conditions uniform thruout assay. Too close packing of tubes in autoclave, or overloading of it, may cause variation in heating rate.

Aseptically inoculate each tube, except 1 set of duplicate (or replicate) tubes contg 0.0 mL std soln (uninoculated blanks), with 1 drop appropriate inoculum. Incubate for time period designated in titrimetric method, **43.130**, or turbidimetric method, **43.132**, at any selected temp. between 30 and 40° held const to within  $\pm 0.5^\circ$ . Contamination of assay tubes with any foreign organism invalidates assay.

#### *Titrimetric Method*

##### **43.130**

##### *Determination*

Incubate tubes 72 hr, and then titr. contents of each tube with 0.1*N* NaOH, using bromothymol blue indicator, or to pH 6.8 measured potentiometrically.

Disregard results of assay if response at inoculated blank level is equiv. to titrn of  $>1.5$  mL greater than that at uninoculated blank level. Response at 5.0 mL level of std soln should be equiv. to titrn of ca 8–12 mL.

Prep. std concn-response curve by plotting titrn values, expressed in mL 0.1*N* NaOH for each level of std soln used, against amt of ref. std contained in respective tubes.

Det. amt of vitamin for each level of assay soln by interpolation from std curve. Discard any observed titrn values equiv. to  $<0.5$  mL or  $>4.5$  mL, resp., of std soln. Proceed as in **43.133**.

#### *Turbidimetric Method*

(Not applicable in presence of extraneous turbidity or color in amt that interferes with turbidimetric measurements)

##### **43.131**

##### *Calibration of Photometer*

Using inoculum and std stock soln as prescribed for appropriate vitamin in following table, and using suspension medium **43.127(c)**, proceed as directed below.

Vitamin	Inoculum	Std Stock Soln
Cobalamin	<b>43.136*</b>	<b>43.135(a)</b>
Folic acid	<b>43.144</b>	<b>43.143(b)</b>
Niacin	<b>43.156</b>	<b>43.151(a)</b>
Pantothenic acid	<b>43.165</b>	<b>43.160(a)</b>
Riboflavin	<b>43.174</b>	<b>43.169(a)</b>

\* Proceed as in **43.136**, except replace fifth sentence with the following: "Dil 0.2–1.0 mL aliquot of this suspension with 10 mL sterile suspension medium."

Aseptically add 1 mL inoculum to ca 300 mL sterile suspension medium contg 1.0 mL std stock soln, and incubate mixt. for same period and at same temp. to be employed in detn, **43.132**. After incubating, centr. and wash cells 3 times with ca 50 mL portions 0.9% NaCl soln; then resuspend cells in the NaCl soln to make 25 mL.

Evap. 10 mL aliquot of cell suspension on steam bath, and dry to const wt at 110° in vac. oven. Correcting for wt of NaCl, calc. dry wt of cells in mg/mL of suspension.

Dil. second measured aliquot of cell suspension with 0.9% NaCl soln so that each mL is equiv. to 0.5 mg dry cells. To test tubes add, in triplicate, 0.0 (for blanks), 0.5, 1.0, 1.5, 2.0, 2.5, 3.0, 4.0, and 5.0 mL, resp., of this dild cell suspension. To each tube add 0.9% NaCl soln to make 5.0 mL. Then add 5.0 mL appropriate basal medium stock soln, Table **43.03**, mix (1 drop of suitable antifoam agent may be added; 1–2% soln of Dow Corning Antifoam AF Emulsion or Antifoam B has been found satisfactory), and transfer to optical cell. With blanks set at 100% *T*,

measure % *T* of each tube under same conditions to be used in respective assay. Prep. curve by plotting % *T* readings for each level of dild cell suspension used against cell content (mg dry wt) of respective tubes.

Repeat appropriate calibration step at least twice more for photometer to be used in respective assay. Draw composite curve, best representing 3 or more individual curves, relating % *T* to mg dried cell wt for photometer under conditions of respective assay. Once appropriate curve for particular instrument is established, all subsequent relationships between % *T* and cell wt are detd directly from this curve. Respective assay limits expressed as mg dried cell wt/tube are so detd.

##### **43.132**

##### *Determination*

Incubate tubes 16–24 hr until max. turbidity is obtained, as demonstrated by lack of significant change during 2 hr addnl incubation period in tubes contg highest level of std soln.

Det. *T* of tubes as follows: Thoro mix contents of each tube (1 drop of suitable antifoam agent soln may be added; 1–2% soln of Dow Corning Antifoam AF Emulsion or Antifoam B has been found satisfactory), and transfer to optical cell. Agitate contents, place cell in photometer set at any specific wavelength between 540 and 660 nm, and read % *T* when steady state is reached.

Steady state is observed few sec after agitation when galvanometer reading remains const  $\geq 30$  sec. Allow ca same time interval for reading on each tube.

With *T* set at 100% for uninoculated blank level, read % *T* of inoculated blank level. If this reading corresponds to dried cell wt  $>0.6$  mg/tube, disregard results of assay. Then with *T* reset at 100% for inoculated blank level, read % *T* for each of remaining tubes. Disregard results of assay if % *T* observed at 5.0 mL level of std soln (against inoculated blank) is equiv. to that for dried cell wt of  $<1.25$  mg/tube.

Prep. std concn-response curve by plotting % *T* readings for each level of std soln used against amt of ref. std contained in respective tubes.

Det. amt of vitamin for each level of assay soln by interpolation from std curve. Discard any observed *T* values equiv. to  $<0.5$  mL or  $>4.5$  mL, resp., of std soln. Proceed as in **43.133**.

##### **43.133**

##### *Calculation for Both Titrimetric and Turbidimetric Methods*

For each level of assay soln used, calc. vitamin content/mL of assay soln. Calc. av. of values obtained from tubes that do not vary by  $>\pm 10\%$  from this av. If number of acceptable values remaining is  $<\frac{2}{3}$  of original number of tubes used in the 4 levels of assay soln, data are insufficient for calcg potency of sample. If number of acceptable values remaining is  $\geq \frac{2}{3}$  of original number of tubes, calc. potency of sample from av. of them.

#### **Cobalamin (Vitamin B<sub>12</sub> Activity) (22)**

(Applicable to materials contg ca  $\geq 0.1$   $\mu$ g of vitamin B<sub>12</sub> activity/g or mL)

##### **43.134**

##### *Basal Medium Stock Solution*

Using ingredients in amts prescribed for cobalamin, Table **43.03(a)**, proceed as directed below.

Dissolve L-cystine and D,L-tryptophan in 10 mL 1*N* HCl. Using solns prepd as in **43.126**, add, with mixing, and in following order: adenine-guanine-uracil soln, (b); xanthine soln, (r); vitamin soln I, (l); vitamin soln II, (m); salt soln A, (i); salt soln B, (j); asparagine soln, (c); and acid-hydrolyzed casein soln, (a). Add ca 100 mL H<sub>2</sub>O and add, with mixing, anhyd. glucose, NaOAc.3H<sub>2</sub>O, and ascorbic acid. When soln is complete, adjust

to pH 6.0 with NaOH soln, add, with mixing, polysorbate 80 soln, (h), and dil. with H<sub>2</sub>O to 250 mL.

#### Titrimetric Method

##### 43.135 Cyanocobalamin Standard Solutions

(a) *Stock soln.*—100 ng/mL. Accurately weigh, in closed system, USP Cyanocobalamin Ref. Std equiv. to 50–60 µg cyanocobalamin, that has been dried to const wt and stored in dark over P<sub>2</sub>O<sub>5</sub> in desiccator. Dissolve in 25% alcohol, and dil. with addnl 25% alcohol to make cyanocobalamin concn exactly 100 ng/mL. Store in dark at ca 10°.

(b) *Intermediate soln.*—1 ng/mL. Dil. 10 mL stock soln, (a), with 25% alcohol to 1 L. Store in dark at ca 10°.

(c) *Working soln.*—Dil. suitable vol. intermediate soln, (b), with H<sub>2</sub>O to measured vol. such that after incubation as in 43.129 and 43.130, response at 5.0 mL level of this soln is equiv. to titrn (as described in 43.130) of ca 8–12 mL. Designate this as std soln. (This concn is usually 0.01–0.04 ng cyanocobalamin/mL std soln.) Prep. fresh std soln for each assay.

##### 43.136

##### Inoculum

Make transfer of cells from stock culture of *Lactobacillus leichmannii*, 43.128(a), to sterile tube contg 10 mL liq. culture medium, 43.127(a). Incubate 6–24 hr at any selected temp. between 30 and 40° held const to within ±0.5°. Under aseptic conditions, centrf. culture and decant supernate. Wash cells with 3 ca 10 mL portions sterile 0.9% NaCl soln or sterile suspension medium, 43.127(c). Resuspend cells in 10 mL sterile 0.9% NaCl soln or sterile suspension medium. Dil. aliquot with sterile 0.9% NaCl soln or sterile suspension medium to give 7 equiv. to that for dried cell wt (as described in 43.131) of 0.50–0.75 mg/tube when read against suspension medium set at 100% *T*. Cell suspension so obtained is inoculum.

##### 43.137

##### Assay Solution

Prep. aq. extg soln just before use contg, in each 100 mL, 1.3 g anhyd. Na<sub>2</sub>HPO<sub>4</sub>, 1.2 g citric acid.H<sub>2</sub>O, and 1.0 g anhyd. Na metabisulfite, Na<sub>2</sub>S<sub>2</sub>O<sub>5</sub>. Place measured amt of sample in flask contg ≥25 mL extg soln for each g or mL sample taken. If sample is not readily sol., comminute to disperse it evenly in liq.; then agitate vigorously and wash down sides of flask with H<sub>2</sub>O.

Autoclave mixt. 10 min at 121–123° and cool. If lumping occurs, agitate mixt. until particles are evenly dispersed. Dil. mixt. to measured vol. with H<sub>2</sub>O, and let any undissolved particles settle, or filter or centrf. if necessary. Take aliquot of clear soln, add H<sub>2</sub>O, adjust to pH 6.0, and dil. with addnl H<sub>2</sub>O to measured vol. contg, per mL, cobalamin activity ca equiv. to that of std soln, 43.135(c). Designate this as assay soln. Excess of bisulfite may affect test organism. Therefore, assay soln must contain ≤0.03 mg Na<sub>2</sub>S<sub>2</sub>O<sub>5</sub>/mL.

##### 43.138

##### Assay

Using std soln, 43.135(c), assay soln, 43.137, basal medium stock soln, 43.134, and inoculum, 43.136, proceed as in 43.129, 43.130, and 43.133.

#### Turbidimetric Method

##### 43.139 Cyanocobalamin Standard Solution

Dil. suitable vol. cyanocobalamin intermediate std soln, 43.135(b), with H<sub>2</sub>O to measured vol. such that after incubation as in 43.129 and 43.132, with inoculated blank set at 100% *T*, % *T* at 5.0 mL level of this soln is equiv. to that for dried cell wt

(as described in 43.131) of ≥1.25 mg. Designate this as std soln. (This concn is usually 0.01–0.04 ng cyanocobalamin/mL std soln.) Prep. fresh std soln for each assay.

##### 43.140

##### Assay Solution

Proceed as in 43.137, except that where ref. is made to concn of cyanocobalamin activity ca equiv. to that of std soln, 43.135(c), replace by concn of cyanocobalamin activity ca equiv. to that of std soln, 43.139. Designate soln so obtained as assay soln.

##### 43.141

##### Assay

Using std soln, 43.139, assay soln, 43.140, basal medium stock soln, 43.134, and inoculum, 43.136, proceed as in 43.129, 43.132, and 43.133.

#### Folic Acid (Pteroylglutamic Acid) (23)

(Applicable only to materials contg free forms of folic acid)

##### 43.142

##### Basal Medium Stock Solution

Using ingredients in amts prescribed for folic acid, Table 43.03(b), proceed as directed below.

Using solns prep'd as in 43.126 add, with mixing, and in following order: acid-hydrolyzed casein soln, (a); tryptophan soln, (k); adenine-guanine-uracil soln, (b); xanthine soln, (r); asparagine soln, (c); vitamin soln III, (n); and salt soln B, (j). Add ca 50 mL H<sub>2</sub>O, and add, with mixing, cysteine, anhyd. glucose, Na citrate dihydrate, anhyd. K<sub>2</sub>HPO<sub>4</sub>, and glutathione. When soln is complete, adjust to pH 6.8 with NaOH soln, add, with mixing, polysorbate 80 soln, (h), and MnSO<sub>4</sub> soln, (f), and dil. with H<sub>2</sub>O to 250 mL.

#### Titrimetric Method

##### 43.143

##### Folic Acid Standard Solutions

(Do not shake std solns stored under toluene.)

(a) *Stock soln.*—100 µg/mL. Accurately weigh, in closed system, USP Folic Acid Ref. Std, equiv. to 50–60 mg folic acid, that has been dried to const wt and stored in dark over P<sub>2</sub>O<sub>5</sub> in desiccator. Dissolve in ca 30 mL 0.01*N* NaOH, add ca 300 mL H<sub>2</sub>O, adjust to pH 7–8 with HCl soln, and dil. with addnl H<sub>2</sub>O to make folic acid concn exactly 100 µg/mL. Store under toluene in dark at ca 10°.

(b) *Intermediate soln I.*—1 µg/mL. To 10 mL stock soln, (a), add ca 500 mL H<sub>2</sub>O, adjust to pH 7–8, and dil. with addnl H<sub>2</sub>O to 1 L. Store under toluene in dark at ca 10°.

(c) *Intermediate soln II.*—100 ng/mL. To 100 mL intermediate soln I, (b), add ca 500 mL H<sub>2</sub>O, adjust to pH 7–8, and dil. with addnl H<sub>2</sub>O to 1 L. Store under toluene in dark at ca 10°.

(d) *Working soln.*—Dil. suitable vol. intermediate soln II (c), with H<sub>2</sub>O to measured vol. such that after incubation as in 43.129 and 43.130, response at 5.0 mL level of this soln is equiv. to titrn (as described in 43.130) of ca 8–12 mL. Designate this as std soln. (This concn is usually 1.0–4.0 ng folic acid/mL std soln.) Prep. fresh std soln for each assay.

##### 43.144

##### Inoculum

Make transfer of cells from stock culture of *Streptococcus faecalis*, 43.128(b), to sterile tube contg 10 mL liq. culture medium, 43.127(a). Incubate 6–24 hr at any selected temp. between 30 and 40° held const to within ±0.5°. Under aseptic conditions, centrf. culture and decant supernate. Wash cells with 3 ca 10 mL portions sterile 0.9% NaCl soln or sterile suspension medium, 43.127(c). Resuspend cells in 10 mL sterile 0.9% NaCl soln or sterile suspension medium. Cell suspension so obtained is inoculum.

**43.145****Assay Solution**

Place measured amt of sample in flask and add vol. H<sub>2</sub>O equal in mL to  $\geq 10$  times dry wt sample in g; resulting soln must contain  $\leq 1.0$  mg folic acid/mL. Add equiv. of 2 mL NH<sub>4</sub>OH (2+3)/100 mL liq. If sample is not readily sol., comminute to disperse it evenly in liq.; then agitate vigorously and wash down sides of flask with 0.1N NH<sub>4</sub>OH.

Autoclave mixt. 15 min at 121–123° and cool. If lumping occurs, agitate mixt. until particles are evenly dispersed. Dil. mixt. to measured vol. with H<sub>2</sub>O, and let any undissolved particles settle, or filter or centr. if necessary. Take aliquot of clear soln, add H<sub>2</sub>O, adjust to pH 6.8, and dil. with addnl H<sub>2</sub>O to measured vol. contg, per mL, folic acid ca equiv. to that of std soln, **43.143(d)**. Designate this as assay soln.

**43.146****Assay**

Using std soln, **43.143(d)**, assay soln, **43.145**, basal medium stock soln, **43.142**, and inoculum, **43.144**, proceed as in **43.129**, **43.130**, and **43.133**.

**Turbidimetric Method****43.147****Folic Acid Standard Solution**

Dil. suitable vol. folic acid intermediate soln II, **43.143(c)**, with H<sub>2</sub>O to measured vol. such that after incubation as in **43.129** and **43.132**, with inoculated blank set at 100% *T*, % *T* at 5.0 mL level of this soln is equiv. to that for dried cell wt (as described in **43.131**) of  $\geq 1.25$  mg. Designate this as std soln. (This concn is usually 0.5–2.0 ng folic acid/mL std soln.) Prep. fresh std soln for each assay.

**43.148****Assay Solution**

Proceed as in **43.145**, except that where ref. is made to folic acid concn ca equiv. to that of std soln, **43.143(d)**, replace by folic acid concn ca equiv. to that of std soln, **43.147**. Designate soln so obtained as assay soln.

**43.149****Assay**

Using std soln, **43.147**, assay soln, **43.148**, basal medium stock soln, **43.142**, and inoculum, **43.144**, proceed as in **43.129**, **43.132**, and **43.133**.

**Niacin and Niacinamide**  
(Nicotinic Acid and Nicotinamide) (24)

**43.150****Basal Medium Stock Solution**

Using ingredients in amts prescribed for niacin, Table **43:03(c)**, proceed as below.

Using solns prepd as in **43.126**, add, with mixing, and in following order: acid-hydrolyzed casein soln, (a); cystine-tryptophan soln, (e); adenine-guanine-uracil soln, (b); vitamin soln IV, (o); vitamin soln V, (p); salt soln A, (i); and salt soln B, (j). Add ca 100 mL H<sub>2</sub>O, and add, with mixing, anhyd. glucose and NaOAc.3H<sub>2</sub>O. When soln is complete, adjust to pH 6.8 with NaOH soln, and dil. with H<sub>2</sub>O to 250 mL.

**Titrimetric Method****43.151****Niacin Standard Solutions**

(a) *Stock soln.*—100  $\mu$ g/mL. Accurately weigh, in closed system, 50–60 mg USP Niacin Ref. Std that has been dried to const wt and stored in dark over P<sub>2</sub>O<sub>5</sub> in desiccator. Dissolve in 25% alcohol, and dil. with addnl 25% alcohol to make niacin concn exactly 100  $\mu$ g/mL. Store in dark at ca 10°.

(b) *Intermediate soln I.*—10  $\mu$ g/mL. Dil. 100 mL stock soln, (a), with 25% alcohol to 1 L. Store in dark at ca 10°.

(c) *Working soln.*—Dil. suitable vol. intermediate soln, (b), with H<sub>2</sub>O to measured vol. such that after incubation as in **43.129** and **43.130**, response at 5.0 mL level of this soln is equiv. to titrn (as described in **43.130**) of ca 8–12 mL. Designate this as std soln. (This concn is usually 0.1–0.4  $\mu$ g niacin/mL std soln.) Prep. fresh std soln for each assay.

**43.152****Inoculum**

(a) *Liquid culture medium.*—Dil. measured vol. basal medium stock soln, **43.150**, with equal vol. aq. soln contg 0.2  $\mu$ g niacin/mL. Add 10 mL portions dild medium to test tubes, cover to prevent contamination, sterilize 15 min in autoclave at 121–123°, and cool tubes as rapidly as practicable to avoid color formation from overheating. Store in dark at ca 10°.

(b) *Inoculum.*—Make transfer of cells from stock culture of *Lactobacillus plantarum*, **43.128(c)**, to sterile tube contg 10 mL liq. culture medium, (a). Incubate 6–24 hr at any selected temp. between 30 and 40° held const to within  $\pm 0.5^\circ$ . Under aseptic conditions, centr. culture and decant supernate. Wash cells with 3 ca 10 mL portions sterile 0.9% NaCl soln or sterile suspension medium, **43.127(c)**. Resuspend cells in 10 mL sterile 0.9% NaCl soln or sterile suspension medium. Cell suspension so obtained is inoculum.

**43.153****Assay Solution**

Place measured amt of sample in flask and proceed as below. Designate final measured vol. so obtained as assay soln.

(a) *For dry or semidry materials containing no appreciable amount of basic substances.*—Add vol. 1N H<sub>2</sub>SO<sub>4</sub> equal in mL to  $\geq 10$  times dry wt sample in g; resulting soln must contain  $\leq 5.0$  mg niacin/mL. If sample is not readily sol., comminute to disperse it evenly in liq. Then agitate vigorously and wash down sides of flask with 1N H<sub>2</sub>SO<sub>4</sub>.

Autoclave mixt. 30 min at 121–123° and cool. If lumping occurs, agitate mixt. until particles are evenly dispersed. If dissolved protein is not present, adjust mixt. to pH 6.8 with NaOH soln, dil. with H<sub>2</sub>O to final measured vol. contg, per mL, niacin ca equiv. to that of std soln, **43.151(c)**, and filter if soln is not clear.

If dissolved protein is present, adjust mixt., with vigorous agitation, to pH 6.0–6.5 with NaOH soln; then immediately add dil. HCl until no further pptn occurs (usually ca pH 4.5, isoelec. point of many proteins). Dil. mixt. to measured vol. with H<sub>2</sub>O, and filter. (In case of mixt. difficult to filter, centrfg and/or filtering thru fritted glass, using suitable anal. filter-aid, may often be substituted for, or may precede, filtering thru paper. Ash-free filter paper pulp and Celite Analytical Filter-Aid have been found satisfactory.) Take aliquot of clear filtrate and check for dissolved protein by adding dropwise, first dil. HCl, and if no ppt forms, then, with vigorous agitation, NaOH soln, and proceed as follows with this aliquot:

(1) If no further pptn occurs, add, with vigorous agitation, NaOH soln to pH 6.8, and dil. with H<sub>2</sub>O to final measured vol. contg, per mL, niacin ca equiv. to that of std soln, **43.151(c)**. If cloudiness occurs, refilter.

(2) If further pptn occurs, adjust mixt. again to point of max. pptn, dil. with H<sub>2</sub>O to measured vol., and then filter. Take aliquot of clear filtrate and proceed as in (1).

(b) *For dry or semidry materials containing appreciable amounts of basic substances.*—Adjust mixt. to pH 5.0–6.0 with dil. H<sub>2</sub>SO<sub>4</sub>. Add vol. H<sub>2</sub>O equal in mL to  $\geq 10$  times dry wt sample in g; resulting soln must contain  $\leq 5.0$  mg niacin/mL. Then add equiv. of 10 mL 10N H<sub>2</sub>SO<sub>4</sub>/100 mL liq. and proceed as in (a),

beginning with second sentence, "If sample is not readily sol., . . ."

(c) *For liquid materials.*—Adjust mixt. to pH 5.0–6.0 with  $\text{H}_2\text{SO}_4$  soln or NaOH soln and proceed as in (b), beginning with second sentence, "Add vol.  $\text{H}_2\text{O}$  . . ."

#### 43.154

#### Assay

Using std soln, **43.151(c)**, assay soln, **43.153**, basal medium stock soln, **43.150**, and inoculum, **43.152(b)**, proceed as in **43.129**, **43.130**, and **43.133**. Value so obtained is potency of sample expressed as niacin. Multiply this value by 0.992 if potency is to be expressed as niacinamide.

#### Turbidimetric Method

#### 43.155

#### Niacin Standard Solutions

(a) *Intermediate soln II.*—1.0  $\mu\text{g}/\text{mL}$ . Dil. 10 mL niacin std stock soln, **43.151(a)**, with 25% alcohol to 1 L. Store in dark at ca  $10^\circ$ .

(b) *Working soln.*—Dil. suitable vol. intermediate soln II, (a), with  $\text{H}_2\text{O}$  to measured vol. such that after incubation as in **43.129** and **43.132**, with inoculated blank set at 100%  $T$ , %  $T$  at 5.0 mL level of this soln is equiv. to that for dried cell wt (as described in **43.131**) of  $\geq 1.25$  mg. Designate this as std soln. (This concn is usually 0.01–0.04  $\mu\text{g}$  niacin/mL std soln.) Prep. fresh std soln for each assay.

#### 43.156

#### Inoculum

Proceed as in **43.152(b)**.

#### 43.157

#### Assay Solution

Proceed as in **43.153**, except that where ref. is made to niacin concn ca equiv. to that of std soln, **43.151(c)**, replace by niacin concn ca equiv. to that of std soln, **43.155(b)**. Designate soln so obtained as assay soln.

#### 43.158

#### Assay

Using std soln, **43.155(b)**, assay soln, **43.157**, basal medium stock soln, **43.150**, and inoculum, **43.156**, proceed as in **43.129**, **43.132**, and **43.133**. Value so obtained is potency of sample expressed as niacin. Multiply this value by 0.992 if potency is to be expressed as niacinamide.

#### Pantothenic Acid (25)

(Applicable only to materials contg Ca pantothenate or other free forms of pantothenic acid)

#### 43.159

#### Basal Medium Stock Solution

Using ingredients in amts prescribed for pantothenic acid, Table **43:03(d)**, proceed as below.

Using solns prepd as in **43.126**, add, with mixing, and in following order: acid-hydrolyzed casein soln, (a); cystine-tryptophan soln, (e); adenine-guanine-uracil soln, (b); vitamin soln IV, (o); vitamin soln VI, (q); salt soln A, (i); and salt soln B, (j). Add ca 100 mL  $\text{H}_2\text{O}$  and add, with mixing, anhyd. glucose and  $\text{NaOAc} \cdot 3\text{H}_2\text{O}$ . When soln is complete, adjust to pH 6.8 with NaOH soln, add, with mixing, polysorbate 80 soln, (h), and dil. with  $\text{H}_2\text{O}$  to 250 mL.

#### Titrimetric Method

#### 43.160

#### Pantothenic Acid Standard Solutions

(Do not shake std solns stored under toluene.)

(a) *Stock soln.*—40  $\mu\text{g}/\text{mL}$ . Accurately weigh, in closed system, 45–55 mg USP Calcium Pantothenate Ref. Std that has

been dried to const wt and stored in dark over  $\text{P}_2\text{O}_5$  in desiccator. Dissolve in ca 500 mL  $\text{H}_2\text{O}$ , add 10 mL 0.2*N* HOAc and 100 mL 0.2*N* NaOAc, and dil. with addnl  $\text{H}_2\text{O}$  to make Ca pantothenate concn exactly 43.47  $\mu\text{g}/\text{mL}$  (40  $\mu\text{g}$  pantothenic acid/mL). Store under toluene in dark at ca  $10^\circ$ .

(b) *Intermediate soln.*—1.0  $\mu\text{g}/\text{mL}$ . To 25 mL stock soln, (a), add ca 500 mL  $\text{H}_2\text{O}$ , 10 mL 0.2*N* HOAc, and 100 mL 0.2*N* NaOAc, and dil. with addnl  $\text{H}_2\text{O}$  to 1 L. Store under toluene in dark at ca  $10^\circ$ .

(c) *Working soln.*—Dil. suitable vol. of intermediate soln, (b), with  $\text{H}_2\text{O}$  to measured vol. such that after incubation as in **43.129** and **43.130**, response at 5.0 mL level of this soln is equiv. to titrn (as described in **43.130**) of ca 8–12 mL. Designate this as std soln. (This concn is usually 0.005–0.020  $\mu\text{g}$  pantothenic acid/mL std soln.) Prep. fresh std soln for each assay.

#### 43.161

#### Inoculum

(a) *Liquid culture medium.*—Dil. measured vol. basal medium stock soln, **43.159**, with equal vol. aq. soln contg 0.04  $\mu\text{g}$  pantothenic acid/mL. Add 10 mL portions dild medium to test tubes, cover to prevent contamination, sterilize 15 min in autoclave at  $121$ – $123^\circ$ , and cool tubes as rapidly as practicable to avoid color formation from overheating. Store in dark at ca  $10^\circ$ .

(b) Make transfer of cells from stock culture of *Lactobacillus plantarum*, **43.128(c)**, to sterile tube contg 10 mL liq. culture medium, (a). Incubate 6–24 hr at any selected temp. between  $30$  and  $40^\circ$  held const to within  $\pm 0.5^\circ$ . Under aseptic conditions, centrfr. culture and decant supernate. Wash cells with 3 ca 10 mL portions sterile 0.9% NaCl soln or sterile suspension medium, **43.127(c)**. Resuspend cells in 10 mL sterile 0.9% NaCl soln or sterile suspension medium. Cell suspension so obtained is inoculum.

#### 43.162

#### Assay Solution

(Thruout all stages, keep soln below pH 7.0 to prevent loss of pantothenic acid.)

Place measured amt of sample in flask and proceed as below. (Where directed to filter thru paper, use paper known not to adsorb pantothenic acid. Ash-free papers have been found satisfactory.) Designate final measured vol. so obtained as assay soln.

(a) *For dry or semidry materials containing no appreciable amount of basic substances.*—Add vol.  $\text{H}_2\text{O}$  equal in mL to  $\geq 10$  times dry wt sample in g; resulting soln must contain  $\leq 5$  mg pantothenic acid/mL. Adjust mixt. to pH  $5.65 \pm 0.05$  with HOAc soln or NaOAc soln. If sample is not readily sol., comminute so that it may be evenly dispersed in liq. Then agitate vigorously and wash down sides of flask with aq. soln contg in each liter 10 mL 0.2*N* HOAc and 100 mL 0.2*N* NaOAc.

Autoclave mixt. 5–7 min at  $121$ – $123^\circ$  and cool. Then proceed as in **43.153(a)**, beginning with second sentence in second par., "If lumping occurs, . . ." except where ref. is made to niacin concn ca equiv. to that of std soln, **43.151(c)**, replace by pantothenic acid concn ca equiv. to that of std soln, **43.160(c)**.

(b) *For dry or semidry materials containing appreciable amounts of basic substances.*—Adjust mixt. to pH 5.0–6.0 with HOAc soln. Add vol.  $\text{H}_2\text{O}$  equal in mL to  $\geq 10$  times dry wt sample in g; resulting soln must contain  $\leq 5$  mg pantothenic acid/mL. Then proceed as in (a), beginning with second sentence: "Adjust mixt. to pH  $5.65 \pm 0.05$  . . ."

(c) *For liquid materials.*—Adjust mixt. to pH 5.0–6.0 with HOAc soln or NaOAc soln and proceed as in (b), beginning with second sentence: "Add vol.  $\text{H}_2\text{O}$  . . ."

**43.163****Assay**

Using std soln, **43.160(c)**, assay soln, **43.162**, basal medium stock soln, **43.159**, and inoculum, **43.161(b)**, proceed as in **43.129**, **43.130**, and **43.133**. Value so obtained is potency of sample expressed as D-pantothenic acid. Multiply this value by 1.087 if potency is to be expressed as Ca D-pantothenate. Multiply this value by 1.100 if potency is to be expressed as Na pantothenate.

**Turbidimetric Method****43.164****Pantothenic Acid Standard Solution**

Dil. suitable amt of pantothenic acid intermediate soln, **43.160(b)**, with H<sub>2</sub>O to measured vol. such that after incubation as in **43.129** and **43.132**, with inoculated blank set at 100% *T*, % *T* at 5.0 mL level of this soln is equiv. to that for dried cell wt (as described in **43.131**) of  $\geq 1.25$  mg. Designate this as std soln. (This concn is usually 0.003–0.012  $\mu$ g pantothenic acid/mL std soln.) Prep. fresh std soln for each assay.

**43.165****Inoculum**

Proceed as in **43.161(b)**.

**43.166****Assay Solution**

Proceed as in **43.162**, except that where ref. is made to pantothenic acid concn ca equiv. to that of std soln, **43.160(c)**, replace by pantothenic acid concn ca equiv. to that of std soln, **43.164**. Designate soln so obtained as assay soln.

**43.167****Assay**

Using std soln, **43.164**, assay soln, **43.166**, basal medium stock soln, **43.159**, and inoculum, **43.165**, proceed as in **43.129**, **43.132**, and **43.133**. Value so obtained is potency of sample expressed as D-pantothenic acid. Multiply this value by 1.087 if potency is to be expressed as Ca D-pantothenate.

**Riboflavin (Vitamin B<sub>2</sub>) (26)**

(Not applicable in presence of materials which adsorb riboflavin)

**43.168****Basal Medium Stock Solution**

Using ingredients in amts prescribed for riboflavin, Table **43:03(e)**, proceed as below.

Using solns prepd as in **43.126**, add, with mixing, and in following order: photolyzed peptone soln, (g); cystine soln, (d); yeast supplement soln, (s); salt soln A, (i); and salt soln B, (j). Add ca 100 mL H<sub>2</sub>O, and add anhyd. glucose with mixing. When soln is complete, adjust to pH 6.8 with NaOH soln, and dil. with H<sub>2</sub>O to 250 mL.

**Titrimetric Method****43.169****Riboflavin Standard Solutions**

(Do not shake std solns stored under toluene.)

(a) *Stock soln.*—100  $\mu$ g/mL. Accurately weigh, in closed system, 50–60 mg USP Riboflavin Ref. Std that has been dried to const wt and stored in dark over P<sub>2</sub>O<sub>5</sub> in desiccator. Suspend in ca 300 mL 0.02*N* HOAc and warm on steam bath, with stirring, until solid dissolves. Cool, and dil. with 0.02*N* HOAc to make riboflavin concn exactly 100  $\mu$ g/mL. Store under toluene in dark at ca 10°.

(b) *Intermediate soln I.*—10  $\mu$ g/mL. Dil. 100 mL stock soln, (a), with 0.02*N* HOAc to 1 L. Store under toluene in dark at ca 10°.

(c) *Working soln.*—Dil. suitable vol. intermediate soln, (b), with H<sub>2</sub>O to measured vol. such that after incubation as in **43.129** and **43.130**, response at 5.0 mL level of this soln is equiv. to titrn

(as described in **43.130**) of ca 8–12 mL. Designate this as std soln. (This concn is usually 0.05–0.20  $\mu$ g riboflavin/mL std soln.) Prep. fresh std soln for each assay.

**43.170****Inoculum**

(a) *Liquid culture medium.*—Dil. measured vol. basal medium stock soln, **43.168**, with equal vol. aq. soln contg 0.1  $\mu$ g riboflavin/mL. Add 10 mL portions dild medium to test tubes, cover to prevent contamination, sterilize 15 min in autoclave at 121–123°, and cool tubes as rapidly as practicable to avoid color formation from overheating. Store in dark at ca 10°.

(b) Make transfer of cells from stock culture of *Lactobacillus casei*, **43.128(d)**, to sterile tube contg 10 mL liq. culture medium, (a). Incubate 6–24 hr at any selected temp. between 30 and 40° held const to within  $\pm 0.5^\circ$ . Under aseptic conditions, centrf. culture and decant supernate. Wash cells with 3 ca 10 mL portions sterile 0.9% NaCl soln or sterile suspension medium, **43.127(c)**. Resuspend cells in 10 mL sterile 0.9% NaCl soln or sterile suspension medium. Cell suspension so obtained is inoculum.

**43.171****Assay Solution**

(Thruout all stages, keep solution below pH 7.0 to prevent loss of riboflavin.)

Place measured amt of sample in flask and proceed as below. (Where directed to filter thru paper, use paper known not to adsorb riboflavin. Ash-free papers have been found satisfactory.) Designate final measured vol. so obtained as assay soln.

(a) *For dry or semidry materials containing no appreciable amount of basic substances.*—Add vol. 0.1*N* HCl equal in mL to  $\geq 10$  times dry wt sample in g; resulting soln must contain  $\leq 0.1$  mg riboflavin/mL. If sample is not readily sol., comminute so that it may be evenly dispersed in liq. Then agitate vigorously and wash down sides of flask with 0.1*N* HCl.

Then proceed as in **43.153(a)**, beginning with second par., "Autoclave mixt. 30 min . . ." except that where ref. is made to niacin concn ca equiv. to that of std soln, **43.151(c)**, replace by riboflavin concn ca equiv. to that of std soln, **43.169(c)**.

If riboflavin content of sample is so low that these requirements cannot be met, conc. clear filtrate obtained at ca pH 4.5 to suitable vol. with heat under reduced pressure. Filter if necessary, and proceed as in **43.153(a)(7)**.

(b) *For dry or semidry materials containing appreciable amounts of basic substances.*—Adjust mixt. to pH 5.0–6.0 with dil. HCl. Add vol. H<sub>2</sub>O equal in mL to  $\geq 10$  times dry wt sample in g; resulting soln must contain  $\leq 0.1$  mg riboflavin/mL. Then add equiv. of 1.0 mL 10*N* HCl/100 mL liq. and proceed as in (a), beginning with second sentence, "If sample is not readily sol., . . ."

(c) *For liquid materials.*—Adjust mixt. to pH 5.0–6.0 with dil. HCl, or with vigorous agitation, NaOH soln, and proceed as in (b), beginning with second sentence, "Add vol. H<sub>2</sub>O . . ."

**43.172****Assay**

Using std soln, **43.169(c)**, assay soln, **43.171**, basal medium stock soln, **43.168**, and inoculum, **43.170(b)**, proceed as in **43.129**, **43.130**, and **43.133**.

**Turbidimetric Method****43.173****Riboflavin Standard Solutions**

(Do not shake std solns stored under toluene.)

(a) *Intermediate soln II.*—1.0  $\mu$ g/mL. Dil. 10 mL riboflavin stock soln, **43.169(a)**, with 0.02*N* HOAc to 1 L. Store under toluene in dark at ca 10°.

(b) *Std soln.*—Dil. suitable vol. intermediate soln II, (a), with H<sub>2</sub>O to measured vol. such that after incubation as in 43.129 and 43.132, with inoculated blank set at 100% *T*, % *T* at 5.0 mL level of this soln is equiv. to that for dried cell wt (as described in 43.131) of  $\geq 1.25$  mg. Designate this as std soln. (This concn is usually 0.01–0.04  $\mu$ g riboflavin/mL std soln.) Prep. fresh std soln for each assay.

**43.174****Inoculum**

Proceed as in 43.170(b).

**43.175****Assay Solution**

Proceed as in 43.171, except that where ref. is made to riboflavin concn ca equiv. to that of std soln, 43.169(c), replace by riboflavin concn ca equiv. to that of std soln, 43.173(b). Designate soln so obtained as assay soln.

**43.176****Assay**

Using std soln, 43.173(b), assay soln, 43.175, basal medium stock soln, 43.168, and inoculum, 43.174, proceed as in 43.129, 43.132, and 43.133.

**Amino Acids (27)—Official First Action**

(Applicable only to materials contg free forms of amino acids in absence of appreciable amt of protein)

**43.177****Stock Solutions for Basal Media**

(Store all solns under toluene; in addn, store vitamin and amino acid solns in dark at ca 10°.)

(a) *Amino acid soln.*—Prep. stock soln of each amino acid as in Table 43.04. Use amino acids of highest purity available. (DL form may be preferred since it is less likely to be contaminated with other amino acids.) If DL form is used, double wt given in table. Dissolve amino acid with heat, if necessary, and dil. to indicated vol. with H<sub>2</sub>O. Where special solvs are indicated, dissolve amino acid in vol. initial solv. specified, and dil. to final vol. with H<sub>2</sub>O.

(b) *Adenine-guanine-uracil soln.*—See 43.126(b).

(c) *Salt soln A.*—Dissolve 50 g anhyd. K<sub>2</sub>HPO<sub>4</sub> and 50 g anhyd. KH<sub>2</sub>PO<sub>4</sub> in H<sub>2</sub>O, dil. to 500 mL, and add 5 drops HCl.

(d) *Salt soln B.*—Dissolve 20 g MgSO<sub>4</sub>·7H<sub>2</sub>O, 1 g NaCl, 1 g FeSO<sub>4</sub>·7H<sub>2</sub>O, and 1 g MnSO<sub>4</sub>·H<sub>2</sub>O in H<sub>2</sub>O, dil. to 500 mL, and add 5 drops HCl.

(e) *Vitamin soln I.*—Dissolve 25 mg riboflavin, 25 mg thiamine.HCl, 50 mg niacin, and 0.15 mg biotin in 0.02*N* HOAc to make 1 L.

(f) *Vitamin soln II.*—Dissolve 50 mg pyridoxal, 50 mg pyridoxamine.HCl, 25 mg Ca pantothenate, 5 mg *p*-aminobenzoic acid, and 0.25 mg folic acid in 25% alcohol to make 1 L.

**43.178****Basal Medium**

Complete assay medium is given in Table 43.05. In prep medium for given assay, omit particular amino acid to be assayed from medium. Concn of all ingredients in basal medium is twice what it will be in assay tube after addn of sample or std soln and H<sub>2</sub>O. Table lists amts of ingredients required for 50, 100, 150, and 200 tubes. Prep. fresh for each assay.

To combined solns add glucose and NaOAc with mixing. When soln is complete, adjust to pH 6.8 and dil. to vol. (Note: Amts of glucose and NaOAc depend upon organism used in assay.)

**43.179****Culture and Suspension Media**

(a) *Agar culture medium.*—See 43.127(b). (Available from Difco Laboratories as Lactobacilli Agar AOAC.)

(b) *Liquid culture medium.*—Dil. measured vol. of complete amino acid basal medium, 43.178, with equal vol. H<sub>2</sub>O. Add 10 mL portions to test tubes, cover to prevent contamination (or screw-cap tubes may be used), sterilize 15 min in autoclave at 121–123°, and cool tubes as rapidly as practicable to keep color formation at min. Store in dark at ca 10°.

(c) *Liquid suspension medium.*—Dil. measured vol. appropriate basal medium (without amino acid being assayed), 43.178, with equal vol. H<sub>2</sub>O. Add 10 mL portions to test tubes, cover to prevent contamination, sterilize 15 min at 121–123°, and cool as rapidly as practicable to keep color formation at min. Store in dark at ca 10°.

**Table 43:04 Amino Acid Stock Solns**

Amino Acid		Weight	Initial Solvent	Final Volume	Final Concn
		g	mL	mL	mg/mL
(a)	L-Alanine	5.000	900 H <sub>2</sub> O	1000	5
(b)	L-Arginine.HCl	12.095	400 H <sub>2</sub> O	500	20
(c)	L-Asparagine	5.000	400 H <sub>2</sub> O	500	10
(d)	L-Aspartic acid	10.000	100 1 <i>N</i> NaOH	1000	10
(e)	L-Cysteine.HCl	5.000	100 2 <i>N</i> HCl	1000	5
(f)	L-Cystine	5.000	100 2 <i>N</i> HCl	1000	5
(g)	L-Glutamic acid	10.000	100 1 <i>N</i> NaOH	1000	10
(h)	Glycine	10.000	400 H <sub>2</sub> O	500	20
(i)	L-Histidine.HCl	12.351	400 H <sub>2</sub> O	500	20
(j)	L-Hydroxyproline	5.000	150 H <sub>2</sub> O	250	20
(k)	L-Isoleucine	5.000	900 H <sub>2</sub> O	1000	5
(l)	L-Leucine	10.000	900 H <sub>2</sub> O	1000	10
(m)	L-Lysine.HCl	6.248	400 H <sub>2</sub> O	500	10
(n)	L-Methionine	5.000	900 H <sub>2</sub> O	1000	5
(o)	L-Norleucine	5.000	100 2 <i>N</i> HCl	1000	5
(p)	L-Phenylalanine	5.000	900 H <sub>2</sub> O	1000	5
(q)	L-Proline	5.000	150 H <sub>2</sub> O	250	20
(r)	L-Serine	5.000	900 H <sub>2</sub> O	1000	5
(s)	L-Threonine	5.000	900 H <sub>2</sub> O	1000	5
(t)	L-Tryptophan	5.000	50 1 <i>N</i> NaOH	500	10
(u)	L-Tyrosine	5.000	50 1 <i>N</i> NaOH	500	10
(v)	L-Valine	5.000	900 H <sub>2</sub> O	1000	5

**Table 43:05 Composition of Basal Medium**

Ingredients (Stock solns, 43.177)		250 mL	500 mL	750 mL	1 L
		mL	mL	mL	mL
(a)	Amino Acid Solns:				
	L-Alanine	10	20	30	40
	L-Arginine.HCl	5	10	15	20
	L-Asparagine	5	10	15	20
	L-Aspartic acid	5	10	15	20
	L-Cysteine.HCl	5	10	15	20
	L-Cystine	5	10	15	20
	L-Glutamic acid <sup>a</sup>	25	50	75	100
	Glycine	5	10	15	20
	L-Histidine.HCl	5	10	15	20
	L-Hydroxyproline	2.5	5	7.5	10
	L-Isoleucine	10	20	30	40
	L-Leucine	5	10	15	20
	L-Lysine.HCl	5	10	15	20
	L-Methionine	10	20	30	40
	L-Norleucine	10	20	30	40
	L-Phenylalanine	10	20	30	40
	L-Proline	2.5	5	7.5	10
	L-Serine	10	20	30	40
	L-Threonine	10	20	30	40
	L-Tryptophan	5	10	15	20
	L-Tyrosine	10	20	30	40
	L-Valine	10	20	30	40
(b)	Adenine-guanine-uracil	5	10	15	20
(c)	Salt Soln A	2.5	5.0	7.5	10
(d)	Salt Soln B	2.5	5.0	7.5	10
(e)	Vitamin Soln I	10	20	30	40
(f)	Vitamin Soln II	10	20	30	40
	Glucose, anhyd.				
	with <i>S. faecalis</i>	5 g	10 g	15 g	20 g
	with <i>L. plantarum</i> or <i>P. cerevisiae</i>	10 g	20 g	30 g	40 g
	NaOAc, anhyd.				
	with <i>S. faecalis</i>	3 g	6 g	9 g	12 g
	with <i>L. plantarum</i> or <i>P. cerevisiae</i>	6 g	12 g	18 g	24 g

<sup>a</sup> For methionine assay use DL-glutamic acid, since L-glutamic acid often contains methionine.

**43.180****Stock Cultures of Test Organisms**

Prep. and test cultures as in 43.128. Use following organisms:

(a) *Streptococcus faecalis* (*faecium*).—ATCC No. 9790. For use in assay of isoleucine, leucine, threonine, tryptophan, valine, arginine, and histidine.

(b) *Lactobacillus plantarum*.—ATCC No. 8014. For use in assay of isoleucine, leucine, methionine, phenylalanine, tryptophan, and valine.

(c) *Pediococcus cerevisiae* (*acidilactici*).—ATCC No. 8042. For use in assay of lysine, methionine, phenylalanine, tyrosine, cystine, and histidine.

**43.181****Inoculum**

Make transfer of cells from fresh stock culture of appropriate organism to sterile tube contg 10 mL liq. culture medium, 43.179(b). Incubate 16–24 hr at 34±0.5°. Under aseptic conditions, centrf. and decant supernate. Suspend cells in 10 mL appropriate sterile suspension medium, 43.179(c).

**43.182****Reference Standard Solutions of Amino Acids**

Dry stdzd amino acids (available from ICN Pharmaceuticals, Inc., Life Sciences Group) to const wt over P<sub>2</sub>O<sub>5</sub> and store in desiccator over P<sub>2</sub>O<sub>5</sub>. Prep. stock soln of each amino acid by accurately weighing amt designated in Table 43:06 in closed system and dilg to final vol. with H<sub>2</sub>O. Prep. std working soln by dilg aliquot std stock soln to designated vol. with H<sub>2</sub>O. Store std

stock solns under toluene in dark at ca 10°. Prep. std working solns fresh for each assay. (Do not shake std solns stored under toluene.)

**43.183****Calibration of Photometer**

Using inoculum, 43.181, and std stock solns, Table 43:06, proceed as in 43.131, incubating 16–24 hr at 34±0.5°. In measurement, use basal medium, 43.178, for dilg.

**43.184****Preparation of Sample**

(a) *Liquids containing free amino acids*.—Dil. with H<sub>2</sub>O to concn required to obtain assay soln.

(b) *Dry or semidry materials*.—Add H<sub>2</sub>O equal in mL to ≥10 times dry wt in g of sample. Heat 10 min in autoclave at 121–123°. Cool, dil. to vol., and filter if necessary to obtain assay soln.

**43.185****Assay**

Proceed as in 43.129 (disregard ref. to titrimetric method), using working std solns, Table 43:06, assay soln, 43.184, and basal medium, Table 43:05 (omitting amino acid being assayed). Incubate 16–24 hr at 34±0.5°.

**43.186****Determination**

Proceed as in 43.132.

**43.187****Calculation**

Proceed as in 43.133.

Table 43:06 Preparation of Reference Stock and Standard Amino Acid Solutions

Amino Acid	mg	Std Stock Soln final vol. mL	concn $\mu\text{g/mL}$	aliquot mL	Std Working Soln final vol. mL	concn $\mu\text{g/mL}$
L-Arginine.HCl	121	500	200	5	200	5
L-Cystine (dissolve in 100 ml 1 <i>N</i> HCl)	100	1000	100	15	500	3
L-Histidine.HCl.H <sub>2</sub> O	135	1000	100	15	500	3
L-Isoleucine	100	1000	100	5	100	5
L-Leucine	100	1000	100			
(with <i>L. plantarum</i> )				5	100	5
(with <i>S. faecalis</i> )				10	100	10
L-Lysine.HCl	251	1000	200	15	200	15
L-Methionine	50	1000	50	10	250	2
L-Phenylalanine	100	1000	100	5	100	5

L-Tryptophan (dissolve in 100 ml 0.1 <i>N</i> NaOH)	40	1000	40	5	250	0.8
L-Tyrosine (dissolve in 100 ml 0.1 <i>N</i> NaOH)	100	1000	100			
(with <i>L. plantarum</i> )				5	250	2
(with <i>P. cerevisiae</i> )				10	250	4
L-Valine	100	1000	100			
(with <i>L. plantarum</i> )				10	200	5
(with <i>S. faecalis</i> )				10	100	10

**Vitamin B<sub>6</sub> (Pyridoxine, Pyridoxal,  
Pyridoxamine) in Food Extracts (28)**  
Official Final Action

## 43.188

## Reagents

(Work in subdued light with all solns contg vitamin B<sub>6</sub>.)

(a) *Potassium acetate buffers*.—(1) 0.01*M*, pH 4.5.—Dissolve 0.981 g KOAc in H<sub>2</sub>O and dil. to 1 L. Adjust pH with HOAc. (2) 0.02*M*, pH 5.5.—Dissolve 1.96 g KOAc in H<sub>2</sub>O and dil. to 1 L. Adjust pH with HOAc. (3) 0.04*M*, pH 6.0.—Dissolve 3.92 g KOAc in H<sub>2</sub>O and dil. to 1 L. Adjust pH with HOAc. (4) 0.1*M*, pH 7.0.—Dissolve 9.815 g KOAc in H<sub>2</sub>O and dil. to 1 L. Adjust pH with HOAc or KOH soln.

(b) *Potassium chloride-phosphate buffer*.—pH 8.0. Dissolve 74.6 g KCl and 17.4 g K<sub>2</sub>HPO<sub>4</sub> in 800 mL H<sub>2</sub>O and adjust pH with HOAc. Dil. to 1 L.

(c) *Ion exchange resin*.—Dowex AG 50W-X8, 100–200 mesh.

(d) *Acid-hydrolyzed casein soln*.—100 mg/mL. (Caution: See 51.011 and 51.015.) Mix 100 g vitamin-free casein with 500 mL const-boiling HCl (ca 5*N* HCl, 208 mL HCl dild to 500 mL with H<sub>2</sub>O) and reflux 8 hr. Remove HCl from mixt. by distn under vac. until very thick sirup remains, keeping H<sub>2</sub>O bath temp. <80°. Dissolve sirup in H<sub>2</sub>O and conc. again in same manner. Redissolve sirup in H<sub>2</sub>O.

Adjust to pH 4 with 40% NaOH, add H<sub>2</sub>O to ca 600 mL, add 40 g activated C, stir 4 hr, and filter with vac. thru buchner with thin pad of HCl-washed Filter-Cel. Continue following activated C treatments only if soln is not clear and colorless: Add 20 g activated C to filtrate, stir 1 hr, and refilter. Repeat with fresh 10 g portion activated C and filter. When soln is clear and colorless, dil. to 1 L with H<sub>2</sub>O. (Before soln is dild to vol., 2–3 mL 6*N* HCl may be added to extend time before microbial growth occurs.) Store in refrigerator.

(e) *Vitamin soln I*.—Dissolve 10 mg thiamine and 1 g inositol in ca 200 mL H<sub>2</sub>O and dil. to 1 L. Store in refrigerator. (1 mL = 10  $\mu\text{g}$  thiamine and 1 mg inositol.)

(f) *Vitamin soln II*.—Dissolve 10 mg biotin in 100 mL 50% alcohol. Store in refrigerator. (1 mL = 100  $\mu\text{g}$  biotin.) Dissolve 200 mg Ca pantothenate and 200 mg niacin in ca 200 mL H<sub>2</sub>O; add 8 mL biotin soln and dil. to 1 L with H<sub>2</sub>O. Store in refrigerator. (1 mL = 200  $\mu\text{g}$  each Ca pantothenate and niacin and 0.8  $\mu\text{g}$  biotin.)

(g) *Salt soln I*.—Dissolve 17 g KCl, 10.3 g MgSO<sub>4</sub>·7H<sub>2</sub>O, 100 mg FeCl<sub>3</sub>·6H<sub>2</sub>O, and 100 mg MnSO<sub>4</sub>·H<sub>2</sub>O in ca 800 mL H<sub>2</sub>O. Add 2 mL HCl. Dissolve 5 g CaCl<sub>2</sub>·2H<sub>2</sub>O in ca 100 mL H<sub>2</sub>O, add to first

soln, and dil. to 1 L with H<sub>2</sub>O. Store in refrigerator. (1 mL = 17 mg KCl, 10.3 mg MgSO<sub>4</sub>·7H<sub>2</sub>O, 100  $\mu\text{g}$  FeCl<sub>3</sub>·6H<sub>2</sub>O, 100  $\mu\text{g}$  MnSO<sub>4</sub>·H<sub>2</sub>O, and 5 mg CaCl<sub>2</sub>·2H<sub>2</sub>O.)

(h) *Salt soln II*.—Dissolve 22 g KH<sub>2</sub>PO<sub>4</sub> and 40 g (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub> in H<sub>2</sub>O and dil. to 1 L. Store in refrigerator. (1 mL = 22 mg KH<sub>2</sub>PO<sub>4</sub> and 40 mg (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub>.)

(i) *Polysorbate 80 soln*.—Weigh 2.5 g polysorbate 80 (Tween 80) in small beaker. Transfer with warm (45°) H<sub>2</sub>O and dil. to 500 mL. Store in refrigerator. (1 mL = 5 mg polysorbate 80.)

(j) *Citric acid soln*.—(1+1). Dissolve 50 g citric acid in 50 mL H<sub>2</sub>O. Store at room temp. in bottle with plastic stopper.

(k) *Ammonium phosphate soln*.—(1+2). Dissolve 25 g (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub> in 50 mL H<sub>2</sub>O. Store at room temp. in bottle with plastic stopper.

(l) *Pyridoxine, pyridoxal, and pyridoxamine std solns*.—Prep. sep. solns for each as follows: (1) *Stock soln*.—10.0  $\mu\text{g/mL}$ . Dissolve 12.16 mg pyridoxine.HCl, 12.18 mg pyridoxal.HCl, and 14.34 mg pyridoxamine.HCl, resp., in 1*N* HCl and dil. to 1 L with 1*N* HCl. Store in g-s bottles in refrigerator.

(2) *Intermediate soln*.—1.0  $\mu\text{g/mL}$ . Dil. 10 mL stock soln to 100 mL with H<sub>2</sub>O.

(3) *Working soln*.—1.0 ng/mL. Dil. 5 mL intermediate soln to 500 mL with H<sub>2</sub>O and mix. Dil. 10 mL to 100 mL with H<sub>2</sub>O. Prep. fresh for each assay.

(m) *Mixed pyridoxine, pyridoxal, pyridoxamine solns (for liquid broth culture)*.—Pipet 2 mL of each intermediate soln (1.0  $\mu\text{g/mL}$ ) into 1 L vol. flask and dil. to vol. with H<sub>2</sub>O.

(n) *Citrate buffer soln*.—Dissolve 100 g K citrate and 20 g citric acid in H<sub>2</sub>O and dil. to 1 L. Store in refrigerator. (1 mL = 100 mg K citrate and 20 mg citric acid.)

(o) *Basal medium stock soln (for 200 tubes)*.—To make 1 L medium, add to ca 400 mL H<sub>2</sub>O: 100 mL citrate buffer, 100 mL hydrolyzed casein soln, 50 mL vitamin soln I, 25 mL vitamin soln II, 50 mL salt soln I, and 50 mL salt soln II. Dissolve 100 g glucose in this soln. Dissolve 22 mg DL-tryptophan, 27 mg L-histidine.HCl, 100 mg DL-methionine, 216 mg DL-isoleucine, and 256 mg DL-valine in 10 mL HCl (1+9) in small beaker and add to above. Add 20 mL polysorbate 80 soln. Adjust to pH 4.5 with citric acid (1+1) or (NH<sub>4</sub>)<sub>2</sub>HPO<sub>4</sub> (1+2) solns. Dil. to 1 L with H<sub>2</sub>O. Store in Pyrex bottle plugged with cotton in refrigerator. Prep.  $\leq$ 24 hr before use. When ready, steam 10 min and cool.

(p) *Test organism*.—*Saccharomyces uvarum* (ATCC No. 9080). Maintain by weekly transfers on wort agar slants (q). Incubate these freshly seeded agar slants 24 hr at 30° and refrigerate.

(q) *Agar culture medium*.—Suspend 25 g Bactowort agar in ca 400 mL H<sub>2</sub>O in marked 500 mL wide-mouth erlenmeyer. Cover to prevent contamination, steam ca 10 min to dissolve agar, and adjust vol. to 500 mL. Pipet hot agar in ca 10 mL portions into 20 × 150 mm test tubes, plug with absorbent cotton, and autoclave 15 min at 121°. Since this medium has acid reaction, avoid overheating, which results in softer medium. Tilt hot agar tubes to form slants and cool in this position.

(r) *Liquid culture medium*.—Pipet 5 mL mixed soln, (m), into 16 × 150 mm test tubes contg two 4 mm glass beads, cover to prevent contamination, and autoclave 10 min at 121°. Add 5 mL steamed vitamin B<sub>6</sub>-free basal medium, (o), under aseptic conditions. Store tubes in refrigerator.

(s) *Inoculum rinse*.—Pipet 5 mL H<sub>2</sub>O into test tubes, cover to prevent contamination, and autoclave 10 min at 121°. Add 5 mL steamed vitamin B<sub>6</sub>-free basal medium, (o), under aseptic conditions. Store tubes in refrigerator.

## 43.189

*Assay Inoculum*

(Caution: See 51.005.)

Incubate cells for inoculum on agar 24 hr at 30° before use. Transfer these cells under aseptic conditions to liq. broth culture tubes. Plug with absorbent cotton held on with masking tape (or other cover to prevent contamination) and place tubes on shaker 20 hr in 30° room. Replace cotton plugs aseptically with sterile rubber stoppers; centrif. 1.5 min at 2500 rpm. Decant liq. and resuspend in 10 mL inoculum rinse. Sep. by centrif. 1.5 min at 2500 rpm. Decant liq., resuspend in second 10 mL sterile inoculum rinse, centrif. 1.5 min, and decant. Cells suspended in third 10 mL inoculum rinse are assay inoculum.

## 43.190

*Preparation of Exchange Resin and Column*

To 250 g Dowex AG 50W-X8 (100–200 mesh) in H form, add excess 6*N* KOH until supernate is blue to litmus. Let settle, decant, and rinse resin with H<sub>2</sub>O until supernate is clear. Add ca 600 mL 3*N* HCl, stir, and heat 0.5 hr in boiling H<sub>2</sub>O bath. Decant and repeat treatment with 3*N* HCl twice. Rinse resin until rinse H<sub>2</sub>O is neut. Add 6*N* KOH until pH is strongly basic and stir 1 hr. Rinse with H<sub>2</sub>O until rinse H<sub>2</sub>O is neut. Suspend in 2*M* KOAc and store in refrigerator until needed. Just before use, wash resin with H<sub>2</sub>O until H<sub>2</sub>O is green to bromothymol blue. Resin can be regenerated, beginning with 3*N* HCl treatment.

Prep. tubes by sealing capillary stopcock, 1.5 mm bore and 50 mm side arms, to 22 mm od × ≥400 mm tube. Pour 5–10 mL H<sub>2</sub>O into tube. Place glass wool plug in bottom of tube and remove bubbles from capillary and glass wool. Rinse measured 30 mL prep'd resin, settled out of H<sub>2</sub>O suspension, into tube with H<sub>2</sub>O. After resin settles in tube, place glass wool plug on top of resin. Rinse column with 50 mL hot H<sub>2</sub>O followed by two 50 mL portions hot 0.01*M* KOAc (pH 4.5). pH of last buffer rinse from column should be 4.5; otherwise, more rinsing with buffer is required. Do not permit liq. level on column to fall below top glass wool plug at any time.

## 43.191

*Preparation of Sample*

Weigh 1–2 g dry product into 500 mL erlenmeyer. For plant products, add 200 mL 0.44*N* HCl and for animal products, add 200 mL 0.055*N* HCl. Autoclave plant soln 2 hr at 121°, and animal soln 5 hr at 121°. Cool to room temp., adjust to pH 4.5 with 6*N* or sat'd KOH, and dil. to 250 mL with H<sub>2</sub>O in vol. flask. Filter thru Whatman No. 40 paper. Take 40–200 mL filtered aliquot for chromatgy.

## 43.192

*Chromatography*

Place desired amt of filtered ext on ion exchange column in ca 50 mL portions and let pass completely thru with no flow regulation. Wash beaker and column 3 times with ca 5 mL portions hot 0.02*M* KOAc (pH 5.5), followed by similar washing to column sides. Wash column with same soln until total of 100 mL 0.02*M* KOAc (pH 5.5) soln is used. Elute pyridoxal with two 50 mL portions boiling 0.04*M* KOAc (pH 6.0), using 100 mL vol. flask as receiver. Elute pyridoxine with two 50 mL portions boiling 0.1*M* KOAc (pH 7.0), using 100 mL vol. flask as receiver. Elute pyridoxamine with two 50 mL portions boiling KCl-K<sub>2</sub>HPO<sub>4</sub> (pH 8.0) soln, using 250 mL beaker as receiver. Adjust pH to 4.5. Dil. pyridoxine and pyridoxal eluates to 100 mL and pyridoxamine eluate to 200 mL with H<sub>2</sub>O unless otherwise desired.

For std pyridoxine, pyridoxal, and pyridoxamine, mix 10 mL each intermediate soln, neutze with KOH, and adjust to pH 4.5 with HOAc. Put this soln on column, wash, and elute fractions as above. Dil. eluted pyridoxine and pyridoxal stds to 100 mL and dil. eluted pyridoxamine, after pH is adjusted to 4.5, to 200 mL with H<sub>2</sub>O. Dil. eluted stds to 1.0 ng/mL with H<sub>2</sub>O.

## 43.193

*Assay*

Heat clean tubes and glass beads 2 hr at 260°. Place two 4 mm glass beads in each 16 × 150 mm screw-cap glass culture tube. For std curve, pipet into triplicate tubes appropriate freshly prep'd std working solns to give 0.0, 0.0, 1.0, 2.0, 3.0, 4.0, and 5.0 ng pyridoxine, pyridoxal, or pyridoxamine/tube. Similarly prep. set of tubes for eluted stds, omitting blanks. Dil. sample eluates from chromatgc column to contain ca 1 ng vitamin B<sub>6</sub> component/mL. Pipet 1, 2, 3, 4, and 5 mL dild eluates into triplicate tubes. Pipet H<sub>2</sub>O into all tubes to bring vol. to 5 mL/tube. Cap tubes with plastic caps with 3 mm (1/8") hole thru top. Autoclave entire set 10 min at 121°. Cool tubes to room temp. Using automatic pipet with sterilized delivery attachments, pipet 5 mL steamed medium, (o), thru hole in cap. Cover tubes with sterile cheesecloth and place in refrigerator. Remove from refrigerator 1 hr before inoculation. Aseptically inoculate thru cap of each tube, except first set of 0.0 level for std curves, with 1 drop assay inoculum of *S. uvarum* suspended cells. Take care to maintain uniform cell suspension, since cells may settle out during inoculation step. Incubate tubes on const rotary shaker 22 hr in temp.-regulated room (30°). Steam tubes in autoclave 5 min, cool, and remove caps. Read % *T* at 550 nm on spectrophtr. Set 100% *T* with H<sub>2</sub>O to read uninoculated blank. Set 100% *T* with uninoculated blank to read inoculated blank. Mix 9 inoculated blank tubes, and with this mixt. set at 100% *T* on instrument, read all other tubes.

Average readings of triplicate tubes and plot % *T* against ng eluted std pyridoxine, pyridoxal, or pyridoxamine/tube on semilog paper. Det. amt of pyridoxine, pyridoxal, or pyridoxamine/sample tube by interpolation. Report µg pyridoxine, pyridoxal, and pyridoxamine/g sample.

## BIOASSAY METHODS

Thiamine Hydrochloride (Vitamin B<sub>1</sub>) (29)43.194 ★ *Growth Method—Official Final Action* ★

See 39.108–39.115, 10th ed.

★ Surplus method—see inside front cover.

**Vitamin D (30)—Official Final Action**

(Not applicable to products offered for poultry feeding)

**43.195****Definitions**

*Assay group* means group of rats to which assay sample (vitamin D sample) is administered during assay period. *Assay sample* means sample under examination for vitamin D potency. *Assay soln* means soln of sample in oil prep'd for feeding after saponification. *Assay period* means interval in life of rat between last day of depletion period and eighth or eleventh day thereafter. *Assemble* means procedure by which rats are selected and assigned to groups for purposes of feeding, care, and observation. *Daily* means each of first 6 or 8 days of assay period. *Depletion period* means interval in life of rat between last day of preliminary period and first day of assay period. *Dose* means amt of ref. oil or of assay milk or other supplement to be fed daily to rat during assay period. *Feed* means make readily available to rat or administer to rat by mouth. *Group* means 7 or more rats maintained on same required dietary regime during assay period. *Preliminary period* means interval in life of rat between seventh day after birth and first day of depletion period.

**43.196****Reagents**

(a) *Ground gluten*.—Clean, sound product made from wheat flour by almost complete removal of starch, contg  $\leq 10\%$  H<sub>2</sub>O and, calcd on H<sub>2</sub>O-free basis,  $\geq 14.2\%$  N,  $\leq 15\%$  N-free ext (using protein factor 5.7), and  $\leq 5.5\%$  starch (det'd by diastase method, 7.081).

(b) *Reference oil*.—USP Ergocalciferol or Cholecalciferol Ref. Std.

(c) *Cottonseed oil*.—USP grade meeting following addnl requirements: Saponify 10 g oil as in 43.200, and dissolve unsaponifiable residue in 10 mL pet ether. In sep. container place 0.4 mL FeCl<sub>3</sub> soln (1+1000) and 12 mL soln of  $\alpha, \alpha$ -dipyridyl in absolute alcohol (1+6000), mix, and 5 min later read *A* in 1.0 cm cell at 520 nm, using suitable spectrophtr, against absolute alcohol. Then add 0.2 mL soln of unsaponifiable residue in pet ether to entire colored soln, and after 5 min read *A*. Difference between first and second *A* values is  $\geq 0.125$ .

(d) *Rachitogenic diet*.—Mix 76% whole yellow corn, ground to pass No. 30 sieve; 20% gluten, ground to pass No. 30 sieve; 3% CaCO<sub>3</sub>; and 1% NaCl.

**43.197****Preservation of Sample**

Store samples so as to minimize exposure to heat, light, and air. Deliver milk samples in original container immediately after collection or store under refrigeration in iced container until delivered. After delivery to assayer, preserve in homogeneous state by refrigeration at  $\leq 10^\circ$  for  $\leq 10$  days, or for  $\leq 30$  days by addn of 2 drops 10% HCHO soln to 1 qt milk in addn to refrigeration at  $\leq 10^\circ$ . Preserve evap'd and reconstituted milk in same manner as fluid milk. Soured or curdled sample is unsuitable for assay. Preserve sample of dried milk, after being opened by assayer, by refrigeration at  $\leq 10^\circ$ .

**43.198****Sample**

Sample shall consist of  $\geq 10$  g food, 10 capsules or tablets, or sufficient vol. of liqs to satisfy needs of entire assay.

If amt of vitamin D in sample is such that aliquot to be fed contains  $< 5$  mg P, sample may be fed directly. If aliquot contains  $> 5$  mg P, sample must be saponified.

All manipulations and dilns of vitamin sample must be made with materials known to be free of vitamin D.

**43.199****Preparation of Sample for Direct Feeding**

(a) *Feed concentrates and tablets*.—Thoroughly grind weighed sample. Promptly weigh aliquot of ground powder and grind it again with equal wt of edible vegetable oil. To this add amt of powd sucrose such that assay dose will be contained in 1–2 g. Mix thoroughly by grinding again and proceed as in assay period, 43.205.

(b) *Capsules*.—Open weighed capsules and transfer contents as completely as possible into container. Thoroughly mix combined contents and promptly weigh aliquot. Proceed as in (a). Obtain sample wt by subtracting wt empty ether-washed capsules from total wt capsules.

(c) *Oils*.—Add amt of edible vegetable oil that will produce diln contg assay dose in vol. equal to vol. ref. diln.

(d) *Water-miscible liquids*.—Dil. as for oils, using H<sub>2</sub>O, glycerol, or propylene glycol to facilitate feeding.

**43.200****Preparation of Sample by Saponification**

(Caution: See 51.011, 51.039, and 51.054.)

Weigh sample and transfer to saponification flask. (For milk, see 43.201.)

In case of capsules or tablets, place  $\geq 10$  in small reflux flask, add 10 mL H<sub>2</sub>O, and heat on steam bath ca 10 min. Crush each capsule or tablet with blunt glass rod and warm 5 min more. Add 2 mL cottonseed oil and vol. of KOH (50% w/w) soln representing 2.5 mL for each g total wt of sample plus cottonseed oil, but  $\geq 15$  mL. Add 50 mL alcohol and reflux vigorously 30 min in 100° bath. Cool soln and transfer to Squibb-type separator, using 50 mL H<sub>2</sub>O. Ext with four 30 mL portions peroxide-free ether (USP anesthesia ether is suitable), using more H<sub>2</sub>O or small portions alcohol to break any emulsions that may form. Wash combined ether exts 4 times with H<sub>2</sub>O as follows: (1) 100 mL with very gentle swirling; (2) 100 mL with gentle swirling; (3) 50 mL with gentle shaking; (4) 50 mL with vigorous shaking. Dry ether ext with two 75 mL portions sat'd NaCl soln, shaking vigorously both times. Transfer ether ext to beaker and evap. on steam bath to convenient vol. If H<sub>2</sub>O is present, dry with 3–5 g anhyd. Na<sub>2</sub>SO<sub>4</sub>. Decant into weighed container, rinse beaker and Na<sub>2</sub>SO<sub>4</sub> with 3–5 addnl portions ether, and combine all washings in weighed container. Evap. ether on steam bath until no ether odor is detectable, and weigh fat. Multiply by 1.10 to det. vol., and add amt of edible vegetable oil that will produce convenient final diln for feeding. Mix thoroughly (mag. stirrer is desirable).

**43.201****Preparation of Milk Samples**

Proceed as in 43.200 with following modifications: Use 50–100 mL alcohol and 10 g KOH pellets per 100 mL sample. Swirl until all KOH dissolves. Reflux 40–60 min. (To minimize bumping and scorching of sample, place several short pieces of glass stirring rod in saponification flask and use oil or H<sub>2</sub>O bath at 100°.) Use 50–100 mL ether for first extn. Only small part of butterfat is saponified, but fat may be fed without affecting results. Where unusually large amt ( $> 0.5$  g) of fat would have to be fed in every dose, ext from which ether has been evap'd may be resaponified as in 43.200.

**43.202****Preliminary Period**

Thruout preliminary period each rat must be raised under immediate supervision of, or according to directions specified by, assayer. Thruout preliminary period, keep rats on dietary regimen that provides for normal development in all respects, except to limit supply of vitamin D to such degree that rats weighing 40–60 g at age of 21–30 days and subsisting 18–25

days on suitable rachitogenic diet show evidence of severe rickets.

**43.203****Depletion Period**

Rat is suitable for depletion period when its age is  $\leq 30$  days, and its body wt is  $>44$  g but  $\leq 60$  g, provided it shows no evidence of injury, disease, or anatomical abnormality that might hinder growth and development. Thruout depletion period provide each rat with rachitogenic diet and  $H_2O$  or USP  $H_2O$  *ad libitum*, and permit no other dietary supplement to be available.

**43.204****Assembling Rats into Groups for Assay Period**

Assemble rats that are suitable for assay period into groups. For each sample provide  $\geq 1$  assay group. In assay of one sample at least one ref. group must be provided, but this ref. group may be used for concurrent assay of  $\geq 1$  assay sample. (Where 2 ref. groups are desired, dose levels must be selected so that ratio of higher to lower dose is not  $<1.5$  or  $>2.5$ . Dosage levels for samples based upon single assumed potency for each sample may be equiv. to ref. levels or at midlevel equal to sq root of product of the 2 dosage levels of the ref.) On any one day during interval of assembling rats into groups, total number of rats assigned to make up any one group must not exceed by  $>2$  the number of rats that have been assigned to make up any other group. When assembling of all groups is completed, total number of rats in each group must be same. Assign not  $>3$  rats from 1 litter to assay group unless equal number of rats from same litter is assigned to ref. group. There must be enough animals in each group to meet requirements specified in **43.208**.

**43.205****Assay Period**

Rat is suitable for assay period provided depletion period is  $>18$  days but  $\leq 25$  days, and provided rat shows evidence of rickets characterized by distinctive wobbly rachitic gait and enlarged joints. Presence of rickets may also be established by examination of leg bone of one member of litter by "line test," **43.206**, or by X-ray examination of animals selected for assay. Keep each rat in individual cage, provided with rachitogenic diet and  $H_2O$  *ad libitum*. On any calendar day of assay period, assay and ref. groups must receive rachitogenic diet compounded from same lots of ingredients.

Following optional methods of feeding ref. oil soln and sample soln are permissible, but both ref. oil soln and sample soln must be fed according to same method in any 1 assay. Supplements may be fed on first day of assay period, or in equal portions on first, third, and fifth days, or on first and third days, or on first and fourth days of 7 day or 10 day assay period, or on first 6 days of 7 day assay period, or on first 8 days of 10 day assay period; supplements may be fed admixed with amt of basal ration that will be consumed within first 5 days of 7 day assay period or within first 8 days of 10 day assay period. In each case make unsupplemented ration available during remainder of assay period.

Feed amt of ref. oil found by experience to cause extent and degree of calcification of rachitic metaphysis equiv. to 4 on line test chart. Feed that vol. of sample soln which is calcd to contain, on basis of claimed or assumed potency, same number of units of vitamin D as contained in amt of ref. oil fed.

After assay period, kill each rat and examine  $\geq 1$  leg bone for healing of rachitic metaphysis according to "line test," **43.206**.

Ref. oil may be dild with edible vegetable oil free from vitamins A and D before being fed. Dild oil must be stored in dark at temp.  $\leq 10^\circ$  for  $\leq 30$  days. Do not feed  $>0.2$  mL of dild oil as daily dose. During assay period, keep all conditions of environ-

ment (particularly physiologically active radiations) as uniform as possible with respect to assay and ref. groups.

**43.206****Line Test**

Make line test on proximal end of tibia or distal end of radius or ulna. Remove end of desired bone from animal and clean off adhering tissue. Make longitudinal median section thru end of bone with clean, sharp blade to expose plane surface thru junction of epiphysis and diaphysis. In any one assay use same bone of all animals and section thru same plane. Rinse both sections of bone in  $H_2O$  and immerse in 2%  $AgNO_3$  soln 1 min. Then rinse sections in  $H_2O$  and expose sectioned surfaces in  $H_2O$  to daylight or other source of actinic light until calcified areas have developed clearly defined stains without marked discoloration of uncalcified areas. Immediately record extent and degree of calcification of rachitic metaphysis of every section.

Staining procedure may be modified to differentiate more clearly between calcified and uncalcified areas. Suitable alternative procedure is to take freshly sectioned bone and proceed as follows: (1) Soak in ether-acetone mixt. (3+1)  $\geq 5$  min (at this stage, after bone sections are dry, they may be mounted for convenience and ease of handling on std microscope slides with aid of rubber cement and remainder of procedure performed in Coplin staining jars); (2) soak in alcohol 10 min; (3) soak in acetone 10 min; (4) soak 40 min in  $H_2O$  which is completely changed after 1, 10, 20, and 30 min; (5) stain with 2%  $AgNO_3$  soln 60 sec; and (6) wash 40 min with  $H_2O$  in dark with complete changes after 1, 10, 20, and 30 min. Expose stained sections in  $H_2O$  to daylight or other source of actinic light until stains have developed.

Score degree of calcification of rachitic metaphysis in each rat according to scale shown in Fig. 43:03. Because lines pictured in chart differ somewhat from line of healing being scored, it is necessary to visualize calcification as if it were compact and continuous in comparing it with appropriate figure in chart. Use of chart is illustrated by accompanying photographs of actual sections of radii, Fig. 43:04.

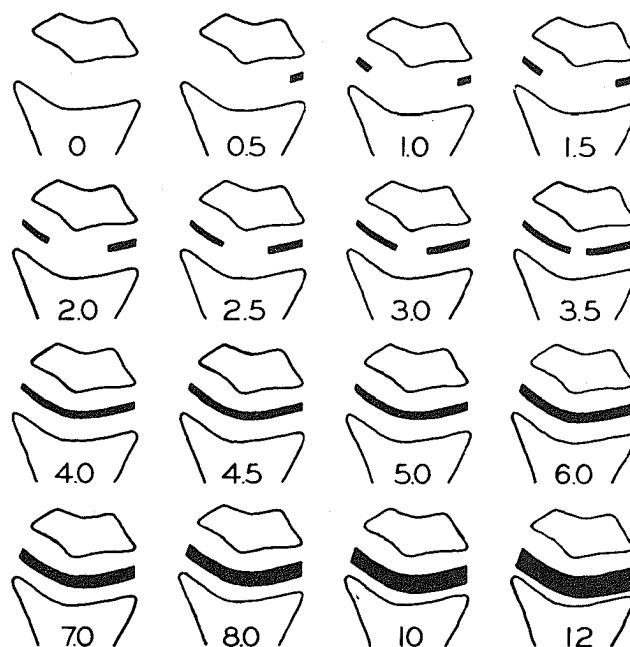

FIG. 43:03—Line test chart

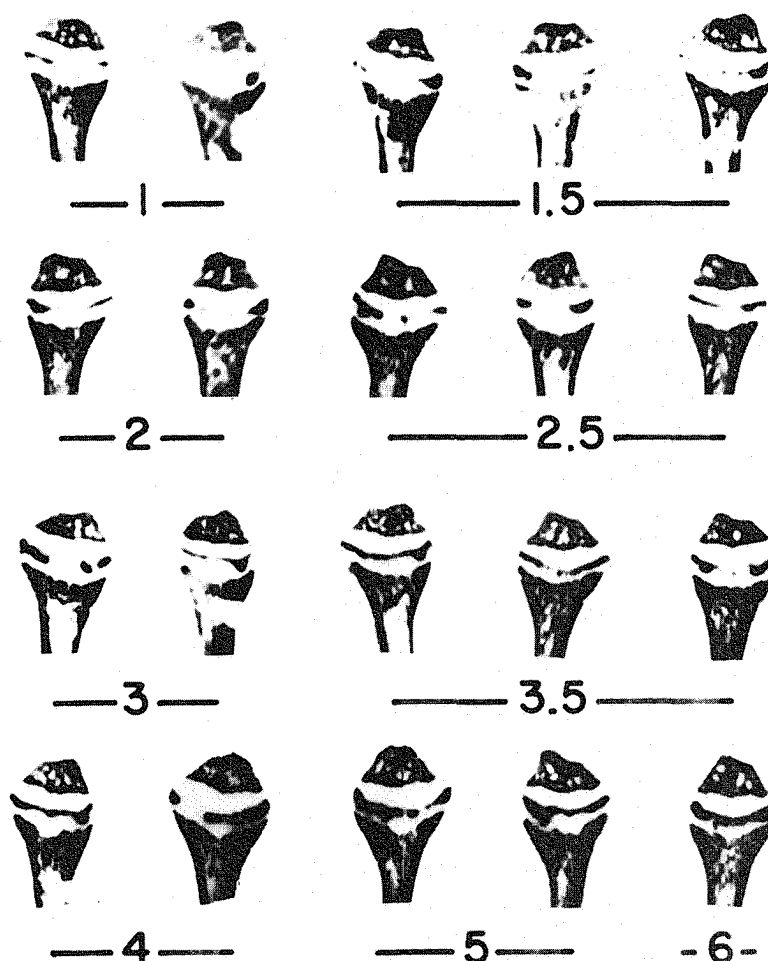

FIG. 43:04—Photographs of radii sections scored according to line test chart.  
For illustrative purposes only; should not be used as scoring scale

#### 43.207

##### Recording of Data

On day beginning assay period and on seventh or tenth day thereafter, depending on duration of assay period, record body wt of each rat. Keep record of amt of rachitogenic diet consumed/rat during assay period. Assign numerical values to extent and degree of calcification of rachitic metaphyses of bones examined by line test by comparison with line test chart so that it is possible to average performance of each group.

#### 43.208

##### Potency of Assay Sample

Consider data from rat valid for establishing vitamin D potency of assay sample only when wt of rat at termination of assay period equals or exceeds wt of rat on beginning day of assay period, and only when rat has consumed each prescribed dose of assay sample within 24 hr from time it was fed.

Consider data from ref. group valid for establishing vitamin D potency of assay sample when  $\geq \frac{2}{3}$  but not  $< \frac{1}{2}$  rats in ref. groups that meet wt criteria show degree of calcification of rachitic metaphysis  $\geq 0.5$  and  $\leq 8.0$  on line test chart.

Consider data from assay group valid for establishing vitamin D potency of assay sample when  $\geq 7$  rats in assay group meet wt criteria.

When av. response of assay group equals or exceeds av. response of ref. group, consider that vitamin D content of sample

fed during assay period equals or exceeds vitamin D content of ref. oil fed during assay period. When av. response of assay group is less than av. response of ref. group, and  $< \frac{1}{2}$  of rats in assay group show degree of calcification of rachitic metaphysis  $\geq 0.5$  on line test chart, consider vitamin D content of sample fed during assay period to be less than vitamin D content of ref. oil fed during assay period. When av. response of assay group (A) is less than av. response of ref. group (R) and if  $\geq \frac{1}{2}$  rats in assay group show degree of calcification of rachitic metaphysis  $\geq 0.5$  on line test chart, and:

(1) *Rats in assay and reference groups are unpaired by litter mates, then:*

$$t^2 = C_u(\bar{Y}_R - \bar{Y}_A)^2 / S_u^2$$

where:

$$C_u = n_A n_R / (n_A + n_R)$$

$$S_u^2 = (\sum Y^2 - n_R \bar{Y}_R^2 - n_A \bar{Y}_A^2) / (n_A + n - 2)$$

$\bar{Y}_R$  = av. score for ref. group,  $\bar{Y}_A$  = av. score for assay group,  $\sum Y^2$  = sum of squares of all individual scores,  $n_A$  = number of rats in assay group, and  $n_R$  = number of rats in ref. group. Find  $t^2$  in table, where d.f. = degrees of freedom =  $n_A + n_R - 2$ . Or:

(2) *Rats in assay and reference groups are paired by litter mates, subtract each response in assay group from associated litter mate response in ref. group. Maintain sign of difference.*

Then:

$$t^2 = n_p \bar{D}^2 / S_D^2$$

where:  $n_p$  = number of pairs,  $\bar{D}$  = square of av. difference,  $\bar{D}$  = av. of differences,  $S_D^2$  = variance of differences =  $(\sum D^2 - n_p \bar{D}^2) / (n_p - 1)$ , and  $\sum D^2$  = sum of squares of differences. Find  $t^2$  in Table 43:07, where d.f. =  $n_p - 1$ .

If calcd  $t^2$  exceeds  $t^2$  in table, consider vitamin D content of sample fed during assay period to be less than vitamin D content of ref. oil fed during assay period; otherwise consider that vitamin D content of sample equals or exceeds vitamin D content of ref. oil, provided  $S_D^2$  is  $<1.5$ , or  $S_D^2$  is  $<2.5$ . If  $S_D^2$  or  $S_D^2$  is  $>1.5$  or  $2.5$ , resp., data of this assay are inadequate to establish potency of assay sample. (Assay must then be extended or repeated.)

Calcn of  $t^2$  and  $S^2$  is illustrated as follows:

(1) For unpaired data:

Healing Scores		
	Reference	Assay
	3.62	4.00
	3.12	4.37
	6.00	2.37
	5.50	2.00
	4.25	3.75
	5.50	2.50
	4.75	4.00
Average = $\bar{Y}$	4.68	3.28

$$\sum Y^2 = 240.9901$$

$$C_u = (n_A \times n_R) / (n_A + n_R)$$

$$= (7 \times 7) / (7 + 7) = 3.5$$

$$S_u^2 = (\sum Y^2 - n_R \bar{Y}_R^2 - n_A \bar{Y}_A^2) / (n_A + n_R - 2)$$

$$= [240.9901 - 7(4.68)^2 - 7(3.28)^2] / 12$$

$$= 1.0304$$

$$t^2 = (C_u / S_u^2) (\bar{Y}_R - \bar{Y}_A)^2$$

$$= (3.5 / 1.0304) (4.68 - 3.28)^2 = 6.658$$

$$\text{d.f.} = n_R + n_A - 2 = 12$$

Tabular  $t^2$  for d.f. = 12 is 3.176

Calcd  $t^2$  (6.658) exceeds value in table for d.f. = 12 (3.176); therefore, vitamin D content of assay sample is less than vitamin D content of ref. oil. Since  $S_u^2$  (1.0304) is  $<1.50$ , assay is valid.

(2) For paired data:

Healing Scores			
Litter	Reference	Assay	Difference
1	4.02	4.40	- 0.38
2	3.52	4.77	- 1.25
3	6.40	2.77	+ 3.63
4	5.90	2.40	+ 3.50
5	4.65	4.15	+ 0.50
6	5.90	2.90	+ 3.00
7	5.15	4.40	+ 0.75
Average = $\bar{D}$			1.39
$\sum D^2$			36.9463

$$S_D^2 = (\sum D^2 - n_p \bar{D}^2) / (n_p - 1)$$

$$= [36.9463 - 7(1.39)^2] / 6 = 3.9036$$

$$t^2 = (n_p \bar{D}^2) / (S_D^2)$$

$$= 7(1.39)^2 / 3.9036 = 3.4647$$

$$\text{d.f.} = n_p - 1 = 6$$

Tabular  $t^2$  for d.f. = 6 is 3.775

Altho calcd value of  $t^2$ , 3.4647, is less than tabular value for d.f. = 6 of 3.775, indicating that vitamin D content of assay

Table 43:07  $t^2$  Values

d.f.	$t^2$	d.f.	$t^2$	d.f.	$t^2$
6	3.775	14	3.101	22	2.948
7	3.591	15	3.073	23	2.938
8	3.460	16	3.049	24	2.928
9	3.360	17	3.028	25	2.917
10	3.283	18	3.007	26	2.910
11	3.226	19	2.989	27	2.900
12	3.176	20	2.976	28	2.893
13	3.136	21	2.962	29	2.887
				30	2.880

sample equals or exceeds vitamin D content of ref. oil, assay must be repeated since value for  $S_D^2$  of 3.9036 is  $>2.5$ . Available data are inadequate to establish potency of sample.

(If desired, potency of vitamin D<sub>2</sub> may be calcd from multiple level assays by statistical procedure of USP XIX, p. 605, or corresponding procedure of USP XX.)

### Vitamin D<sub>3</sub> in Poultry Feed Supplements (31) Official Final Action

(Applicable to fish and fish liver oils and their exts, and to materials used for supplementing vitamin D content of feeds. Not applicable to irradiated ergosterol products or to irradiated yeast unless recommended for poultry. This assay is comparison, under conditions specified, of efficacy of product under assay with that of USP Cholecalciferol Ref. Std in controlling ash content of bones of growing chicks.)

#### 43.209

#### Basal Rachitic Ration

The basal ration is uniform mixt. in proportions designated of following ingredients, which have been finely ground:

	per cent
Yellow corn, ground	58
Wheat flour middlings or wheat gray shorts	25
Casein, crude, domestic, acid pptd	12
Calcium phosphate, tribasic	2
Salt, iodized (0.02% KI)	1
Yeast, non-irradiated (7% min. N)	2

To each kg of above mixt. add 0.22 g MnSO<sub>4</sub>·5H<sub>2</sub>O.

#### 43.210

#### Determination

Provide cages with screen bottoms and keep chicks away from sunshine or other source of actinic light that may influence calcification. Keep cages in rooms in which wide variations in temp. are prevented (const temp. preferred). Unless temp. of room is adequately controlled, provide each cage with suitable elec. heating device. Start all birds to be used in one assay on same day and keep all conditions of environment uniform for all groups in assay.

Make assay on groups of 1- or 2-day-old White Leghorn chicks as specified below. Provide for  $\geq 1$  neg. control group that receives no vitamin D,  $\geq 3$  pos. control groups that receive graduated levels of vitamin D from USP Vitamin D Ref. Std, and  $\geq 1$  assay group for each product to be assayed. Have pos. control and assay groups consist of  $\geq 20$  birds each, and neg. control consist of  $\geq 10$  birds.

Prep. rations for all groups in assay from one batch of basal ration. Add Ref. Std to basal ration in such amts as to produce measurable increase in % bone ash above that obtained in neg. control group (it is not possible to make comparisons if max. bone ash is obtained). Add assay product to basal ration in such amts as to permit direct comparison in response of assay and pos. control groups.

To basal ration of neg. control group add corn oil equal in amt to max. amt of oil fed to any group in assay, and add corn

oil to rations of other groups until total amt of corn oil and oil contg vitamin D is equal to amt of corn oil added to ration of neg. control group.

Feed chicks in respective groups prescribed ration and H<sub>2</sub>O (natural or distd) *ad libitum* 21 days. Discard all chicks that show abnormality or disease not related to vitamin D deficiency. At least 15 chicks must remain in each ref. or assay group used in calcg vitamin D potency of assay product.

Thruout any one assay, consistently use the specific method, (a) or (b), adopted for extg, drying, and ashing of bones.

(a) Kill chicks; remove left tibia of each bird and clean off adhering tissue. (To facilitate removal of adhering tissue, bones may be placed in boiling H<sub>2</sub>O ≤2 min. Bones may be preserved in alcohol for extn.) Completely ext bones with suitable fat solv. or solvs (20 hr with hot alcohol followed by 20 hr with ether is suitable, and bones should be crushed to facilitate extn). Dry extd bones to const wt at 95–100° under pressure <100 mm Hg (13.3 kPa) (ca 5 hr), cool in desiccator, and weigh. Ash H<sub>2</sub>O- and fat-free bones from each group of birds in furnace to const wt at any given temp. between 450 and 550°, or if preferred, 1 hr at ca 850°. (Ash detn may be made on individual bones if desired.)

(b) Alternatively, use toe ash measurement of response to vitamin D: Excise middle toe from each foot by cutting thru joint between second and third tarsal bones from distal end. Use entire toe for sample. Remove any dirt, but not tissue, and do not ext with solv. Composite samples of group, dry 8 hr at 100° in air oven, and ash 4 hr at 600° in furnace.

#### 43.211

#### Interpretation of Results

One international chick unit of vitamin D is equal in biological activity to one unit vitamin D in USP Vitamin D Ref. Std in this method of assay. Product under assay meets its declared vitamin potency in international chick units of vitamin D if % ash in H<sub>2</sub>O- and fat-free bone produced in assay groups by given number of units of vitamin D is equal to or is greater than % ash produced by same number of units of vitamin D from USP Ref. Std.

#### Biological Evaluation of Protein Quality (Protein Efficiency Ratio)(32)—Official Final Action

(Applicable to materials contg >1.80% N)

#### 43.212

#### Reagents

(a) *ANRC reference casein*.—Available from Humko Sheffield Chemical, PO Box 398, Memphis TN 38101.

(b) *Salt mixture USP*.—Either USP salt mixt. or salt mixt. having essentially same proportions of the elements. Prep. USP XIX (p. 612) salt mixt. (or corresponding USP XX item) as follows: Grind in mortar portion of 139.3 g NaCl with 0.79 g KI. Similarly grind together remainder of the NaCl with 389.0 g KH<sub>2</sub>PO<sub>4</sub>, 57.3 g MgSO<sub>4</sub> anhyd., 381.4 g CaCO<sub>3</sub>, 27.0 g FeSO<sub>4</sub>·7H<sub>2</sub>O, 4.01 g MnSO<sub>4</sub>·H<sub>2</sub>O, 0.548 g ZnSO<sub>4</sub>·7H<sub>2</sub>O, 0.477 g CuSO<sub>4</sub>·5H<sub>2</sub>O, and 0.023 g CoCl<sub>2</sub>·6H<sub>2</sub>O, finally adding the NaCl-KI mixt. Reduce entire mixt. to fine powder.

(c) *Vitamin mixture*.—

	mg/100 g ration
Vitamin A (dry, stabilized)	2000 (IU)
Vitamin D (dry, stabilized)	200 (IU)
Vitamin E (dry, stabilized)	10 (IU)
Menadione	0.5
Choline	200
p-Aminobenzoic acid	10
Inositol	10

Niacin	4
Ca D-pantothenate	4
Riboflavin	0.8
Thiamine.HCl	0.5
Pyridoxine.HCl	0.5
Folic acid	0.2
Biotin	0.04
Vitamin B <sub>12</sub>	0.003
Glucose, to make	1000

(d) *Cottonseed oil*.

(e) *Cellulose*.—Cellu Flour, Solka Floc, or equiv.

(f) *Protein evaluation basal diet*.—

Sample	X*
Cottonseed oil	$8 - \frac{X \times \% \text{ ether extract}}{100}$
Salt mixture USP	$5 - \frac{X \times \% \text{ ash}}{100}$
Vitamin mixture	1
Cellulose	$1 - \frac{X \times \% \text{ crude fiber}}{100}$
Water	$5 - \frac{X \times \% \text{ moisture}}{100}$

Sucrose or corn starch, to make 100

$$*X = \frac{1.60 \times 100}{\% \text{ N of sample}}$$

All % figures refer to sample. Proximate analysis is needed to adjust diet so that all comparisons between samples and ref. material shall be made with diets having same content of N, fat, ash, moisture, and crude fiber. These suggested levels of fat, ash, moisture, and crude fiber are desirable whenever proximate analysis of sample permits.

#### 43.213

#### Experimental Animals

Laboratory rats, males, shall be from same colony, and maintained during period before weaning upon diet and under environmental conditions that will provide for normal development in all respects; weaned; ≥21 days of age but ≤28 days of age; range of individual rat wts among animals used shall be ≤10 g. When animals are transported from breeding colony to test laboratory, acclimation period of ≥3 days but <7 should precede test.

#### 43.214

#### Assay Groups

Assemble groups of ≥10 rats. In assay of each material provide 1 group that will receive ANRC ref. casein. One ref. casein group may be used for concurrent assay of >1 assay material. When assembling of all groups is complete, total number of rats in each group must be the same, and av. wt of rats in any 1 group on day beginning assay period must not exceed by >5 g av. wt of rats in any other group.

#### 43.215

#### Assay Period

Throughout assay period keep each rat in individual cage and provide with appropriate assay diet and H<sub>2</sub>O *ad libitum*. During assay period maintain all conditions of environment as uniform as possible with respect to each of groups being compared to ANRC ref. casein. Record body wt of each rat on beginning day of assay period and body wt and food intake of each rat at regular intervals, not >7 days, and on 28th day after beginning of assay period.

## 43.216

**Calculation and Tabulation of Results**

Calc. av. 28 day wt gain and protein ( $N \times 6.25$ ) intake per rat for each group. Calc. Protein Efficiency Ratio (PER) (wt gain/protein intake) for each group. Det. ratio  $\times 100$  of PER for each assay group to PER for ANRC casein ref. group. Tabulate 28 day wt gains, protein intake, PER, and ratio  $\times 100$  of sample PER to ANRC Ref. Casein PER for each assay group. Report protein quality of sample as ratio  $\times 100$  of sample PER to ANRC Ref. Casein PER.

(e) *Drabkin's soln*.—Dissolve 1 g NaHCO<sub>3</sub>, 52 mg KCN, and 198 mg K<sub>3</sub>Fe(CN)<sub>6</sub> in H<sub>2</sub>O, and dil. to 1 L. Store in brown bottle in dark. Soln is stable indefinitely in dark. Discard when cloudiness occurs or ppt forms.

## 43.218

**Hemoglobin Determination**

Pipet 5 mL Drabkin's soln into colorimeter tubes and to each add 0.02 mL whole blood drawn from tail vein of rat. Rinse pipet several times with soln in tube. Mix by inverting. Reserve 1 tube for blank to zero instrument. Let stand 10 min. Set wavelength at 540 nm, place blank tube in instrument, and set at 100% *T*. Replace blank with sample soln and read % *T*. Use Table 43:08 to obtain concn of sample in g hemoglobin/100 mL blood.

## 43.219

**Assay**

Place male weanling rats,  $\leq 21$  days old, from fast growing strain on diet, (b). Keep diet and suitable H<sub>2</sub>O (naturally low in Fe or distd) before experimental animals at all times.

After rats have been on basal diet 4 weeks, check hemoglobin of blood of representative rats to det. that animals are anemic. (Rats are satisfactorily depleted when hemoglobin is  $< 6$  g/100 mL.) If animals are not depleted, continue basal diet and retest at intervals.

After animals are satisfactorily depleted, divide them into groups of  $\geq 8$  comparable animals each, house them in individual stainless steel cages or cages otherwise protected against readily available Fe, and place them on test diets. Use FeSO<sub>4</sub>.7H<sub>2</sub>O as ref. std. Place groups of test animals on 0, 6, 12, and 24 mg Fe/kg diet, supplied by ref. std FeSO<sub>4</sub>.7H<sub>2</sub>O. Place other groups on diets that contain levels of samples expected to give comparable responses.

Place 3 groups of depleted animals on each sample. Analyze test samples by 14.011–14.013 to det. Fe content so that known amts Fe can be added to test diets.

After 2 weeks on test diets, take individual blood samples and det. hemoglobin, 43.218.

Interpret results as parallel lines-type assay (Bliss and White, Chap. 2 in "The Vitamins," 2nd ed., Vol. 6, edited by P. Gyorgy and W. N. Pearson, Academic Press, New York, 1967, pp. 50–57). Report bioavailability of samples against FeSO<sub>4</sub>.7H<sub>2</sub>O = 100.

## NUTRITIONALLY RELATED COMPONENTS

## Sodium in Foods for Special Dietary Use

Ion Selective Electrode Method (34)  
Official Final Action(Applicable to foods contg  $\leq 100$  mg Na/100 g)

## 43.220

## Apparatus

(a) *Electrode*.—Sodium combination ion selective electrode (Model 96-11, Orion Research, Inc., or equiv.).(b) *Graph paper*.—Gran's plot paper, 10% vol. corrected (No. 90-00-90, Orion Research, Inc., or equiv.).(c) *Magnetic stirrer*.—See 7.110(b).(d) *pH meter*.—With expanded mv scale (Model 701/701A, Orion Research, Inc., or equiv.).

## 43.221

## Reagents

(a) *Buffer soln*.—pH 10.2. Total ionic strength adjustment buffer (TISAB), 0.5M triethanolamine. Dissolve 74.6 g triethanolamine in ca 900 mL H<sub>2</sub>O, adjust pH to 10.2 with HCl, and dil. to 1 L with H<sub>2</sub>O.(b) *Sodium std solns*.—(1) *Stock soln*.—10 mg/mL. Accurately weigh 2.5421 g NaCl, previously dried overnight at 100°, into 100 mL vol. flask. Dissolve and dil. to vol. with H<sub>2</sub>O, and mix. (2) *Working solns*.—0.1, 1.0, and 2.0 mg/mL. Pipet 1, 10, and 20 mL stock soln into sep. 100 mL vol. flasks, dil. each to vol. with buffer soln, and mix.

## 43.222

## Preparation of Sample

Blend entire contents of can, including H<sub>2</sub>O. Weigh 10.0 g sample and dil. to 100 mL with buffer soln. Mix and transfer to 150 mL beaker.

## 43.223

## Determination

(a) *For foods with 0–5 mg declared Na/100 g*.—Immerse electrode in sample beaker and stir mag. 2–5 min to equilibrate. Record mv potential on expanded mv scale. From 10 mL buret, add five 1.0 mL portions 0.1 mg Na/mL working std soln to beaker, stirring mag. 30 sec after each addn. Plot mv reading for 0, 1, 2, 3, 4, and 5 mL on graph paper, (b). Follow plotting instructions, 5.007(b), except plot most pos. mv reading at top of vertical axis. Draw best straight line thru points, extrapolate line to horizontal axis, and read mg Na in sample.

Perform blank detn on 100 mL buffer soln, adding five 1.0 mL portions 0.1 mg Na/mL working std soln, as above. Plot mv readings on graph paper, omitting 0 mL reading, such that 5 mL reading falls near top of paper. Draw best straight line thru points, extrapolate line to horizontal axis, and read mg Na in blank.

$$\text{mg Na/100 g food} = [(S - B) \times 100]/W,$$

where  $S$  = mg Na in sample,  $B$  = mg Na in blank, and  $W$  = g sample.(b) *For foods with 5–50 mg declared Na/100 g*.—Proceed as in (a), except use 1.0 mg Na/mL working std soln.(c) *For foods with 50–100 mg declared Na/100 g*.—Proceed as in (a), except use 2.0 mg Na/mL working std soln.

## Available Lysine (35)—Official Final Action

## 43.224

## Principle

1-Fluoro-2,4-dinitrobenzene (DNFB) reacts with free  $\epsilon$ -amino groups in proteins, forming DNFB- $\epsilon$ -amino lysine which is stable to acid hydrolysis. Sample is acid hydrolyzed and unavailable lysine is detd with amino acid analyzer; total lysine is detd on

untreated sample. Available lysine, which was bound by DNFB, is detd by difference.

## 43.225

## Reagents

(Use deionized H<sub>2</sub>O thruout.)(a) *Sodium citrate buffer*.—pH  $2.20 \pm 0.03$ . Dissolve 19.6 g Na citrate.2H<sub>2</sub>O in H<sub>2</sub>O, add 16.5 mL HCl, 5.0 mL thiodiglycol (TG), 1.0 g Brij-35 dissolved in H<sub>2</sub>O by heating, and 0.1 mL *n*-caprylic acid, and dil. to 1 L. Filter before using.(b) *Sodium citrate buffer*.—pH  $5.28 \pm 0.02$ . Dissolve 137.26 g Na citrate.2H<sub>2</sub>O in H<sub>2</sub>O, add 26.0 mL HCl, 4.0 g Brij-35 dissolved in H<sub>2</sub>O by heating, and 0.4 mL *n*-caprylic acid, and dil. to 4 L. Filter before using.(c) *Sodium citrate buffer with 2% n-propanol*.—pH  $5.28 \pm 0.02$ . Prep. as in (b), but add 80 mL *n*-propanol before diln to 4 L.(d) *Sodium acetate buffer*.—4N, pH  $5.51 \pm 0.03$ . Add 1088 g NaOAc.3H<sub>2</sub>O to 800 mL H<sub>2</sub>O. Stir while heating on steam or H<sub>2</sub>O bath until soln is complete and cool to room temp. Add 200 mL HOAc and stir. Add H<sub>2</sub>O to final vol. of 2 L, adjust pH, if necessary (1 g NaOH/2 L causes change of 0.02 pH), and filter before using.(e) *Regeneration reagent*.—Prep. 0.2N NaOH contg 1 g Brij-35/L.(f) *Ninhydrin reagent*.—Prep. and introduce into reservoir in absence of O. Bubble slow stream of N thru soln while mixing and stirring to displace any air. Use mag. stirrer with seamless Teflon bar, 0.5 × 3". Add 3 L filtered peroxide-free Methyl Cellosolve (colorless soln must be produced when 3 mL is mixed with 3 mL 4% KI soln) to 1 L filtered 4N NaOAc buffer soln, and stir mag. 15 min while bubbling N thru soln at ca 1 cu ft/hr. Add 80 g ninhydrin (*Caution*: Weigh in hood) and stir mag. with N bubbling until ninhydrin is completely dissolved (usually 6–10 min). Weigh exactly 1.600 g SnCl<sub>2</sub>.2H<sub>2</sub>O and add to soln, rinsing with Methyl Cellosolve to final vol. Reagent turns deep ruby red as SnCl<sub>2</sub> dissolves but color fades after ca 2 hr to yellow-green when fresh and yellow-brown later. Continue stirring with N bubbling until SnCl<sub>2</sub> dissolves completely (ca 3–8 min).

## 43.226

## Preparation of Protein Hydrolysate

Grind sample in Wiley mill with No. 20 screen and mix well. Weigh 0.1–1.0 g sample into No. 5/0 crucible (1.3 mL). (Calc. sample wt to give final concn of 0.72–0.88 mg protein/mL after diln with 100 mL Na citrate buffer, pH 2.2.)

$$\text{mg Sample to use} = (\text{final concn desired (mg/mL)})$$

$$\times 100 (\text{mL}) / (\% \text{ protein in sample}/100),$$

but do not use &gt;1 g.)

Place sample or sample and crucible in 500 mL boiling flask and add 4–5 glass beads. Add 10 mL freshly prepd 10% NaHCO<sub>3</sub> soln, 10 mL alcohol, and 0.4 mL dinitrofluorobenzene (DNFB). Stopper flask and shake mech. >3 hr. Carefully acidify with 6N HCl (ca 2 mL). Evap. to oily dryness at 40° in vac. rotary evaporator. Release vac. very slowly to avoid disturbing residue. Add 50–75 mL anhyd. ether, decant, and re-evap. in rotary evaporator at 40° without vac. Repeat washing with ether and evapn 3 addnl times. (*Caution*: See 51.011 and 51.054.)Add ca 125 mL 6N HCl. Heat carefully until all CO<sub>2</sub> is released, and then boil under reflux 18 hr, maintaining const stream of H<sub>2</sub>O-pumped or prepurified N thru Tygon capillary tube which comes to ca 2.5 cm of surface of soln. Cool 1 hr and wash down residue in condenser. Evap. to sticky paste in vac. rotary evaporator at 40°. Repeat addn of 100 mL H<sub>2</sub>O and evapn 4 addnl times, evapg to dryness during last evapn.

## 43.227

## Preparation of Protein Hydrolysate Without DNFB

Weigh sample to give final concn of 0.18–0.22 mg protein/mL after diln with 100 mL Na citrate buffer, pH 2.2, into 5/0 crucible.

Place sample or sample and crucible into 500 mL boiling flask and add 4–5 glass beads. Add 200 mL 6*N* HCl and distl off 100 mL. Hydrolyze under reflux 24 hr, maintaining const stream of N as in 43.226. Evap. to sticky paste in vac. rotary evaporator at 40°. Repeat addn of 100 mL H<sub>2</sub>O and evapn 5 addnl times, evapg to dryness during last evapn.

Proceed as in 43.228, except use protein concn of 0.18–0.22 mg/mL and 6 cm prepd column.

**43.228****Determination**

Pipet in 100 mL Na citrate buffer, pH 2.2. Stopper flask, shake 5 min, and filter thru Whatman No. 43 paper into storage bottle. Use 1.0 mL filtrate contg 0.72–0.88 mg protein/mL on 12 cm column of Beckman Custom Research Resin Type PA-35, regenerated after NH<sub>3</sub> peak of each sample with regeneration reagent and equilibrated with Na citrate buffer with 2% *n*-PrOH.

Operate automatic amino acid analyzer (Beckman Model 120C, or equiv.) in accordance with instructions of manufacturer. Identify lysine peak by comparison with calibration run with lysine or std calibration mixt. under same operating conditions as used in analysis.

Det. area under curve for lysine or use integrator, and compare areas of samples with those from calibration stds contg known concn of lysine (e.g., 2.500±0.004 µm/mL 0.1*N* HCl).

To calc. % available lysine, subtract % lysine of DNFB-treated sample from % lysine of non-DNFB-treated sample.

**Cholesterol in Multicomponent Foods****Gas Chromatographic Method (36)—Official Final Action****43.229****Principle**

Lipid is extd from sample by mixed solv. and saponified. Unsaponifiable fraction contg cholesterol and other sterols is extd with benzene. Sterols are derivatized to form trimethylsilyl (TMS) ethers which are detd quant. by GLC, using 5α-cholestane as internal std.

**43.230****Apparatus**

(a) *Centrifuge tubes*.—Pyrex No. 13, 15 mL. Silanize tubes as follows: Rinse clean tubes with anhyd. MeOH and dry 30 min at 110°. Transfer tubes to desiccator. Fill tubes with 10% soln of dimethyldichlorosilane (DMCS) in toluene, stopper tubes, and let stand 1 hr. Drain tubes and rinse thoroly with anhyd. MeOH. Dry in 110° oven before use. After use, clean tubes with MeOH, H<sub>2</sub>O, and MeOH, in that order. Dry tubes in 100° oven before use. Tubes can be re-used without silylation as long as strong alkali wash is avoided.

(b) *Gas chromatograph*.—With H flame ionization detector, on-column injection system, and 2.4 m (8') × 3 mm id U-shaped glass column packed with 0.5% Apiezon L (No. 08304, Applied Science Laboratories, Inc.) on 80–100 mesh Gas-Chrom Q (No. 02002, Applied Science Laboratories, Inc.). Alternative column: 1.8 m (6') × 4 mm id U-shaped glass column packed with 1% SE-30 on 100–120 mesh Gas-Chrom Q (No. 12409, Applied Science Laboratories, Inc.). Operating conditions: temps (°)—flash heater 275, detector 275, column 230; flow rates (mL/min)—N (ultra high purity grade) ca 50, to elute cholesterol in 9–11 min, H ca 35, air 350; electrometer sensitivity 1 × 10<sup>-9</sup> amp full-scale deflection with 1 mv recorder.

(c) *Homogenizer*.—Sorvall Omnimixer (IVA Sorvall, Inc., Norwalk, CT 06852), or equiv., for use with 12 oz (350 mL) wide-mouth screw-cap jars.

(d) *Magnetic stirrer-hot plate*.—With variable speed and heat controls.

(e) *Rotary evaporator*.—With glass condenser flask between concn flask and metal shaft.

(f) *Test tube mixer*.—Vortex-Genie mixer (No. 12-812, Fisher Scientific Co.), or equiv.

**43.231****Reagents**

(Caution: Silanes are toxic. Avoid contact with skin and eyes. Use effective fume removal device.)

(a) *Cholesterol std solns*.—Std cholesterol available as No. 21502, Applied Science Laboratories, Inc. (1) *Stock soln*.—1.0 mg/mL DMF. (2) *Working solns*.—Dil. stock soln with DMF to obtain concn range from 0.05 to 0.5 mg/mL.

(b) *5α-Cholestane internal std solns*.—Std 5α-cholestane available as No. 19505, Applied Science Laboratories, Inc. (1) *Stock soln*.—1.0 mg/mL *n*-heptane. (2) *Working soln*.—0.2 mg/mL. Dil. stock soln with *n*-heptane to obtain concn of 0.2 mg/mL.

(c) *Dimethyldichlorosilane*.—No. 18008, Applied Science Laboratories, Inc., or equiv.

(d) *Dimethylformamide*.—Distd in glass (Burdick & Jackson Laboratories, Inc.; Anspec Co., Inc., PO Box 7044, Ann Arbor, MI 48107; or equiv.).

(e) *Glass wool*.—Silane-treated (No. 14502, Applied Science Laboratories, Inc., or equiv.).

(f) *n-Heptane*.—Distd in glass (Burdick & Jackson Laboratories, Inc., Eastman Kodak Co., No. 2215, or equiv.).

(g) *Hexamethyldisilazane (HMDS)*.—No. 18006, Applied Science Laboratories, Inc., Pierce Chemical Co., or equiv.

(h) *Concentrated potassium hydroxide soln*.—Dissolve 60 g KOH in 40 mL H<sub>2</sub>O.

(i) *Reagent alcohols*.—EtOH-MeOH-isopropanol (90+5+5). Following reagent alcohols are satisfactory: No. 3945-1GL, Harleco, Division of American Hospital Supply Corp., 480 Democrat Rd, Gibbstown, NJ 08027; Wilkens-Anderson Co., 4525 W Division St, Chicago IL 60651; No. 7019 or No. 7006, Mallinckrodt Chemical Works.

(j) *Toluene*.—Nanograde, distd in glass (Mallinckrodt Chemical Works, or equiv.).

(k) *Trimethylchlorosilane (TMCS)*.—No. 18010, Applied Science Laboratories, Inc., or equiv.

(l) *Trimethylsilyl (TMS) reagent*.—HMDS-TMCS-pyridine (9+6+10).

**43.232****Preparation and Packing of Gas Chromatographic Column**

(Caution: See 51.025 and 51.062.)

Attach empty column to aspirator and draw thru 5% HF soln. Stop vac. with pinch clamp, quickly cap both ends of column with rubber stoppers, and let column stand filled with 5% HF soln 10 min.

Attach column to aspirator again, draw off 5% HF soln, and rinse with ca 150 mL H<sub>2</sub>O followed by 150 mL anhyd. MeOH. Finally, rinse column with 150 mL isooctane. Draw air thru column until dry. Fill column with TMS reagent, (l), by pulling it thru slowly with aspirator. Plug both ends of column and let stand 30 min. Draw TMS reagent thru and rinse immediately with 100 mL anhyd. MeOH, followed by 200 mL isooctane. Let column dry under vac.

Use com. prepd column packing of 0.5% Apiezon L on 80–100 mesh Gas-Chrom Q (Applied Science Laboratories, Inc.), or prep. as follows: Weigh 0.5 g Apiezon L into 100 mL beaker, add 80 mL toluene, stir mag. until it dissolves completely, and transfer to 500 mL erlenmeyer, rinsing beaker with four 5 mL portions toluene. Weigh 10 g 80–100 mesh Gas-Chrom Q and add to

Apiezon L soln. Stopper flask and shake to make slurry. Immediately pour slurry thru buchner-type fritted glass Pyrex filter (medium porosity) under vac., stirring continuously until all liq. is drawn off. Measure filtrate in graduate and det. amt Apiezon L adsorbed. Let stand under vac., stirring occasionally until almost dry. Transfer packing to porcelain evapn dish and dry completely in 110–120° oven. Store in glass bottle until ready to use.

Heat packing 15 min in 100° oven. Plug detector end of silanized column with 6 mm silanized glass wool and attach to aspirator. Add warm packing thru funnel attached to column and gently tap column. Finally, plug injection port end with silanized glass wool. Condition column 24 hr at 235° with N flow.

**43.233****Moisture Determination**

Accurately weigh ca 5.0 g sample into tared Al dish, place in circulating-type 100° air oven, and dry overnight or 3 hr at 110°. Cover, and let cool in desiccator. Weigh accurately and det. moisture content to adjust for H<sub>2</sub>O to be added in **43.234**.

**43.234****Extraction of Lipid**

(Caution: See **51.011**, **51.054**, **51.056**, **51.066**, and **51.074**.)

(a) *For foods other than dried whole egg solids, mayonnaise, and nonfat dry milk.*—Accurately weigh known amt sample contg ca 0.5–1 g fat and transfer quant. to homogenizer cup with 100.0 mL anhyd. MeOH. On basis of moisture detn, add enough H<sub>2</sub>O to bring total H<sub>2</sub>O content in extn to 40 mL. Add 50 mL CHCl<sub>3</sub> and blend 3 min at high speed. (Ratio of CHCl<sub>3</sub>-MeOH-H<sub>2</sub>O must be 50–100–40 in this single-phase extn.) Add addnl 50 mL CHCl<sub>3</sub> and blend 0.5 min at medium speed. Then add 50 mL H<sub>2</sub>O and again blend 0.5 min at medium speed. Filter homogenate under vac. into 1 L suction flask thru buchner fitted with Whatman No. 1 paper contg 2 g diat. earth, **36.002**. Pour filtrate into 500 mL graduate. Re-ext filter cake and paper with ca 90 mL CHCl<sub>3</sub> and filter ext without diat. earth. Rinse cup and filter cake with two 15 mL portions CHCl<sub>3</sub>. Add these rinses to original filtrate and let layers sep. (If emulsion develops, centr. filtrate 5 min at 2500 rpm.) Record vol. of CHCl<sub>3</sub> (lower) layer and aspirate aq. alcohol layer. (Total vol. of CHCl<sub>3</sub> layer should be ca 200 mL.) Proceed as in **43.235**.

(b) *For dried whole egg solids.*—Use acid hydrolysis, **17.012(b)**, and proceed as in **43.235**, par. 2.

(c) *For mayonnaise.*—Accurately weigh ca 1.2–1.5 g sample and transfer quant. to homogenizer cup with 100.0 mL anhyd. MeOH. Add 40 mL H<sub>2</sub>O and 50 mL CHCl<sub>3</sub> and blend 3 min at medium speed. Add addnl 50 mL CHCl<sub>3</sub> and blend 0.5 min at medium speed. Then add 50 mL H<sub>2</sub>O and again blend 0.5 min at medium speed. Transfer homogenate to 500 mL separator. Rinse cup with three 20 mL portions CHCl<sub>3</sub> and add these rinses to separator. Mix by gently rotating separator end to end. Let layers sep. Drain CHCl<sub>3</sub> (lower) layer into graduate. Rinse aq. MeOH layer with 40 mL CHCl<sub>3</sub>, add rinse to graduate, and mix. Record vol. of CHCl<sub>3</sub> layer. Proceed as in **43.235**, using 150 mL aliquot CHCl<sub>3</sub>-lipid ext and 250 mL beaker.

(d) *For nonfat dry milk.*—Accurately weigh ca 25 g sample and transfer quant. to 300 mL erlenmeyer contg 100 mL H<sub>2</sub>O. Stir to mix thoroly, and refrigerate overnight. Pour reconstituted milk into 1 L separator, add 100 mL reagent alcohol, (i), and shake 1 min. Add 100 mL ether and shake 1 min. Add 100 mL pentane and shake 1 min. Let layers sep. Drain aq. (lower) layer into second separator. Repeat extn with 100 mL ether and 100 mL pentane, shaking 1 min after each addn. If layers do not sep., add 40 mL reagent alcohol, gently rotate end over end 10 times, and let stand 5 min. Discard aq. layer. Filter combined

ether exts thru column of anhyd. Na<sub>2</sub>SO<sub>4</sub> into 600 mL beaker. Evap. to ca 10 mL under gentle N stream on 70° H<sub>2</sub>O bath. Transfer ext to 300 mL g-s erlenmeyer, rinsing beaker with pentane. Evap. to dryness under gentle N stream on steam bath, and proceed as in **43.235**, par. 2.

**43.235****Saponification and Extraction of Unsaponifiable Fraction**

(Caution: See **51.011**, **51.018**, **51.045**, and **51.073**.)

Filter 100 mL aliquot CHCl<sub>3</sub>-lipid ext thru glass funnel contg small pledget of glass wool and ca 25 g anhyd. Na<sub>2</sub>SO<sub>4</sub> into 150 mL beaker. Rinse Na<sub>2</sub>SO<sub>4</sub> with 15 mL CHCl<sub>3</sub> and evap. ext to dryness under gentle N stream on 90° H<sub>2</sub>O bath or steam bath. Dissolve residue in ca 70 mL pet ether and filter thru Whatman No. 1 paper contg ca 20 g anhyd. Na<sub>2</sub>SO<sub>4</sub> into 300 mL g-s erlenmeyer. Rinse beaker and Na<sub>2</sub>SO<sub>4</sub> with several 10 mL portions pet ether. Evap. to dryness under gentle N stream on steam bath.

Introduce mag. stirring bar into erlenmeyer and place on mag. stirrer-hot plate. With gentle stirring, slowly add 8 mL concd KOH soln, (h), and 40 mL reagent alcohol, (i). Attach condenser, turn on mag. stirrer-hot plate, and reflux soln 1 hr. Turn off heat and add 60 mL reagent alcohol thru condenser into saponified soln while stirring and cooling. When sample ceases to reflux, remove condenser, and pipet 100 mL benzene into sample while slowly stirring. Remove stirring bar, stopper flask, and shake vigorously 30 sec.

Pour into 500 mL separator without rinsing. Add 200 mL 1*N* KOH and shake vigorously 10 sec. Let layers sep. and discard aq. (lower) layer (will be turbid). Wash benzene layer with 40 mL 0.5*N* KOH, rotate gently end to end 10 sec, and discard aq. (lower) layer. Pour benzene layer into 250 mL separator. Back-wash benzene layer with 40 mL H<sub>2</sub>O by gently rotating separator end to end 10 times. Repeat H<sub>2</sub>O wash 3 more times. pH of last H<sub>2</sub>O wash should be ca 7. Pour benzene ext from top of separator, filtering thru Whatman No. 4 paper contg ca 15 g anhyd. Na<sub>2</sub>SO<sub>4</sub> into 125 mL g-s erlenmeyer. Add ca 20 g anhyd. Na<sub>2</sub>SO<sub>4</sub>; stopper and shake flask vigorously. Let stand 15 min.

Pipet 50 mL aliquot into 100 mL r-b g-s flask and evap. to dryness on rotary evaporator at 40°. Add 3 mL acetone and again evap. to dryness. Dissolve residue in 3 mL DMF.

**43.236****Derivatization of Cholesterol Standards and Gas Chromatographic Calibration**

Transfer 1.0 mL of each cholesterol working std soln, **43.231(a)(2)**, to 15 mL silanized centr. tube. (Keep DMCS-silanized centr. tubes clean and dry.) Add 0.2 mL HMDS and 0.1 mL TMCS. Stopper tube and shake vigorously on test tube mixer, (f), or by hand for 30 sec. Let soln stand undisturbed 15 min. Add 1.0 mL 5 $\alpha$ -cholestane internal std working soln, **43.231(b)(2)**, and 10 mL H<sub>2</sub>O to tube. Shake vigorously 1 min and centr. 2 min.

Inject duplicate 3  $\mu$ L or other appropriate vols (use same vol. thruout for all stds and samples) heptane layer into gas chromatograph. Adjust GLC parameters to give retention times of ca 5 min for 5 $\alpha$ -cholestane and 10 min for cholesterol. Det. area of each peak by using ht-width measurement or digital integrator. Divide cholesterol peak area by internal std peak area to obtain std response ratio. Average results for duplicate detns. Plot av. response ratio (y-axis) against cholesterol concn (mg/mL) (x-axis). Std response ratio plot should bracket sample response ratio.

**43.237 Derivatization and Analysis of Samples**

Transfer 1.0 mL sample soln, **43.235**, to 15 mL silanized centrif. tube and proceed as in **43.236**, beginning "Add 0.2 mL HMDS . . ." If GLC response is beyond scope of std calibration, dil. sample soln and derivatize again.

$$\text{mg Cholesterol/100 g sample} = \frac{(\text{mg/mL cholesterol in sample from std curve} \times 100)}{(\text{g/mL sample used for derivatization})}$$

## 44. Extraneous Materials: Isolation

### GENERAL

#### 44.001

#### Definition of Terms

(a) *Extraneous materials*.—Any foreign matter in product associated with objectionable conditions or practices in production, storage, or distribution; included are filth (see (b)–(f)), decomposed material (decayed tissues due to parasitic or non-parasitic causes), and miscellaneous matter such as sand and soil, glass, rust, or other foreign substances. Excluded are bacterial counts.

(b) *Filth*.—Any objectionable matter contributed by animal contamination of product such as rodent, insect, or bird matter; or any other objectionable matter contributed by insanitary conditions.

(c) *Suggested format for reporting identified filth*.—

*Method(s)*: AOAC (1980) method(s) used for analysis of product.  
*Code(s)*: Manufacturer's or distributor's identification marks.

*Subdivision numbers*: Use inspector's subdivision number when given

*Amount of subdivision examined*: Amt of sample portion analyzed.

*Findings*: Use only those captions that apply to findings.

(1) Whole insects or equiv. (total no.). Give identity of insects if known, and state whether alive or dead. Give size.

- (a) Adults including flies
- (b) Pupae
- (c) Maggots
- (d) Larvae, other than maggots
- (e) Adult heads
- (f) Larval heads
- (g) Pupal cast skins
- (h) Larval cast skins
- (i) Larval head capsules

(2) No. insect fragments, identified. Give size range and identity.

(3) No. insect fragments, unidentified. Give size range.

(4) No. insect eggs (give kind).

(5) No. aphids, thrips, psocids, spiders, scale insects, mites, etc.

Fragments of above.

(6) No. setae (if fly, state).

(7) No. insect excreta pellets (identify as to insect order if known).

(8) No. rat or mouse excreta pellets (state which or give length; give wt if from condimental seeds and spices).

(9) No. rat or mouse excreta pellet fragments.

(10) No. rat or mouse hairs and hair fragments (give sizes or range).

(11) No. other hairs (give size and kind, if known).

(12) No. feather fragments (give size).

(13) Other extraneous materials (describe).

(14) Rodent urine on bagging or food beneath (give dimensions of stain).

(15) Bird excreta on bagging or food beneath.

Except where total is called for, there should be no duplication in various elements. For example, setae are insect fragments but report only under setae. Similarly where fragments can be identified as from mites, aphids, thrips, and scale insects, report under that heading, not under insect fragments. It is important to report whether or not infestation is due to live insects and

whether or not sample was fumigated before shipment or upon receipt at laboratory.

(d) *Heavy filth*.—Heavier filth material sepd from product by sedimentation based on different densities of filth, food particles, and immersion liqs such as  $\text{CHCl}_3$ ,  $\text{CCl}_4$ , etc. Examples of such filth are insect and rodent excreta pellets and pellet fragments, sand, and soil.

(e) *Light filth*.—Lighter filth particles that are oleophilic and are sepd from product by floating them in an oil-aq. liq. mixt. Examples are insect fragments, rodent hairs, and feather barbules.

(f) *Sieved filth*.—Filth particles of specific size ranges sepd quant. from product by use of selected sieve mesh sizes.

#### 44.002

#### Apparatus

(Avoid use of polyethylene beakers, funnels, containers, etc., as insect fragments and rodent hairs adhere to app. made from this material.)

(a) *Aerator, water*.—For attachment to faucet to provide smooth-flowing, aerated  $\text{H}_2\text{O}$  stream. Remove lower screen. (Available from Fisher Scientific Co., No. 91-404, or Arthur H. Thomas Co., No. 4551-F10.)

(b) *Autoclave*.—(1) *Slow exhaust type*.—Set "slow exh" to lower pressure from 15 to 0 in 15–20 min. (2) *Non-slow exhaust*.—Let cool to 0 psi before opening or venting.

(c) *Blenders*.—(1) *High-speed*.—See "Definitions of Terms and Explanatory Notes," item (18). Use 1 L, 4-lobe jar fitted with 4-blade assembly, 2 blades tilted upward ca  $30^\circ$  with diam. 60 mm and 2 blades tilted downward ca  $25^\circ$  with diam. 55 mm. Operate at 3000–3500 rpm thru variable transformer. To measure speed, attach 1-hole No. 8 rubber stopper to sq rotor shaft and insert tachometer. (Later attachment of jar does not appreciably alter speed.) (2) *High-speed overhead*.—Alternative to high-speed blender: Mixer with 6 canted, sharp-edge stainless steel blades rotating on shaft of suspended motor and speed control. Blades rotate at bottom of stainless steel cup having 4 indentations, forming lobes. Sorvall Omni-Mixer (Ivan Sorvall, Inc., Newtown, CT 06470), or equiv., meets these requirements.

(d) *Blood counting cell*.—Depth 0.1 mm, preferably ruled in the Thoma or old Neubauer system. Cell with "improved" Neubauer system, equipped with optically worked cover glass, may also be used.

(e) *Bolting cloth*.—Silk cloth woven to std size opening and thickness which is used in flour mills. Number of silk specifies number of mesh/linear in. "X," "XX," or "XXX" after number refers to thickness of thread from which cloth is woven; this also affects size of opening in cloth. Therefore, follow designation exactly as to both number and "X" of bolting cloth. (Available from Tetko, Inc., 420 Saw Mill Rd, Elmsford, NY 10523.)

Prep. disks by boiling large squares of silk before cutting them into circles. Circles cut from unboiled silk shrink and become misshapen. Make rulings ca 5–7 mm apart with India ink or other permanent marking material, using fine pen, on boiled and pressed cloth marked off in circles ca 85 mm diam.

When needed, dye ruled cloth by placing in hot ( $80$ – $85^\circ$ ) soln of 50 mg FD&C Blue No. 1 in 1 L  $\text{H}_2\text{O}$  contg 2.5 mL HOAc, and holding at this temp. ca 15 min with frequent stirring. Rinse well and store in dark.

(f) *Butter stirrer*.—See Fig. 44:01.

(g) *Compound microscope*.—See (q)(1).

(h) *Cyclone*.—Laboratory cyclone or pulper consists of cylindrical perforated metal screen in which revolves paddle which forces soft material from food product out thru openings in screen. Tough materials such as seeds, skins, and stems are moved along and out opening in end of cylinder. Use as power source  $\frac{1}{4}$  horsepower, 110 v, 1725 rpm elec. motor. Screen is 22 gage material, 400 holes/sq in., each 0.027" diam. Screen is 2.5" id and length of effective screen is 3". Paddle has 2 fins, each  $\frac{25}{32}$ " wide, set alternately and extending  $1\frac{3}{16}$ " from center of shaft. Pulper is fed thru hopper which leads into basin 3.5" long and 2.5" id. Portion of paddle with fins inserted at 30° angle forces material from basin into screening compartment. Cyclone is so constructed that waste opening may be closed, as needed. Sieved material is caught in shield and delivered thru spout to container. Machine may be readily disassembled for washing. (Blueprints available from Div. Microbiology, Food and Drug Administration, Washington, DC 20204.)

(i) *Extraction vessels*.—(1) *Kilborn funnel*.—1 L, 3.5" od by 9.5" high, 8 mm opening at tip. Rubber tubing  $\frac{3}{8}$ " id and pinch clamp provides convenient cut-off.

(2) *Percolator*.—2 L, Corning Glass Works No. 7040, or equiv., conforming to following general size and shape: 115 mm id  $\times$  400 mm long, ca 90 mm id at 200 mm down from top, with 8–9 mm bore tip, with cut-off as in (1). Use stirring rod 370  $\times$  10 mm diam, when specified, to prevent compacting of sample in drain opening.

(3) *Trap flask*. (a) *Wildman*.—Consists of 1 or 2 L erlenmeyer into which is inserted close-fitting rubber stopper supported on stiff metal rod 5 mm ( $\frac{3}{16}$ ") diam. and ca 10 cm longer than ht

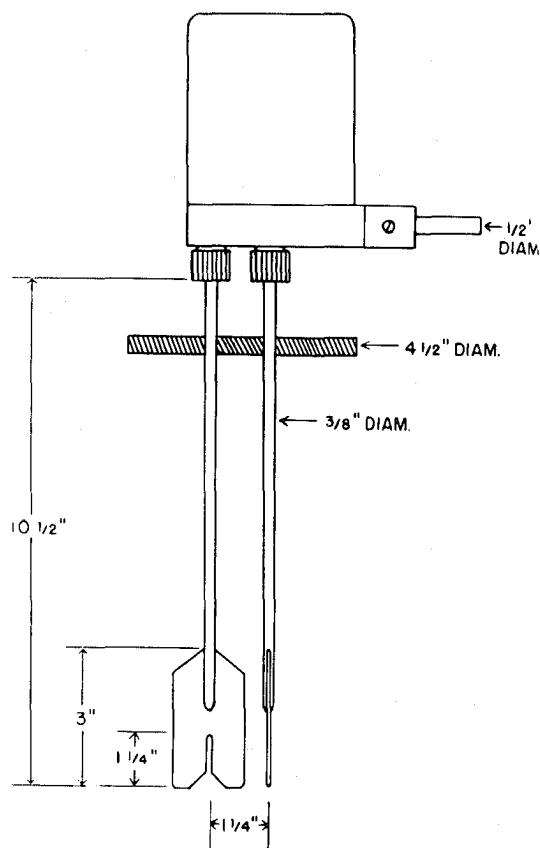

FIG. 44:01—Mechanical butter stirrer

of flask. (Rod of greater diam. is not desirable because of its greater displacement of liq.) Rod is threaded (#10–32) at lower end and furnished with nuts and washers to hold it in place on stopper. Countersink lower nut and washer in the rubber to prevent striking flask. See 44:004(a) and Fig. 44:02. Or: (b) *Wafer stopper*.—(Entomological Supplies, Inc., 5655 Oregon Ave, Baltimore, MD 21227).

(j) *Filter paper*.—Use smooth, high wet-strength, rapid-acting filter paper ruled with oil-, alcohol-, and water-proof lines 5 mm apart. S&S No. 8 is satisfactory.

(k) *Filter paper defatting cup*.—Center S&S 588 folded filter paper, or equiv., over bottom of smaller beaker specified in method. Partially shape paper over bottom of beaker and gently insert beaker and paper into larger specified beaker. Remove smaller beaker and transfer weighed sample into formed paper cup.

(l) *Funnels for filtration with suction*.—Use funnels with filter papers or bolting cloth cupped up on sides to eliminate loss of solids. Use rapid filter paper for filtration thru Hirsch funnel.

Use of wire screen or bolting cloth between perforated funnel plate and filter paper accelerates filtration and gives more uniform distribution of solids.

(m) *Greenough-type (widefield stereoscopic) microscope for filth examination*.—See (q)(2).

(n) *Illuminators for widefield stereoscopic microscopes*.—(1) *Filth examination*.—Illuminator for this purpose should have: compactness and flexibility; transformer or resistor to vary light intensity; focusing adjustment to give uniformly lighted field of view; blue-white color from cool low-voltage source. (2) *Rot fragment counting*.—Use small substage illuminator fitted with daylight or blue ground-glass filter and 15 watt bulb.

(o) *Howard mold-counting apparatus*.—(1) *Howard mold-counting slide*.—Glass slide of one-piece construction with flat plane circle ca 19 mm diam. or rectangle 20  $\times$  15 mm surrounded by moat and flanked on each side by shoulders 0.1 mm higher than plane surface. Cover glass is supported on shoulders and leaves depth of 0.1 mm between underside of cover glass and plane surface. Central plane, shoulders, and cover glass have optically worked surfaces. To facilitate calibration of microscope, newer slides are engraved with circle 1.382 mm diam. or with 2 fine parallel lines 1.382 mm apart.

(2) *Accessory disk for mold counting*.—Glass disk that fits into microscope eyepiece, ruled into squares each side of which

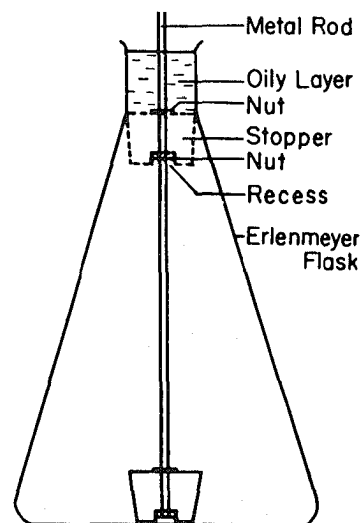

FIG. 44:02—Wildman trap flask

is equal to  $\frac{1}{6}$  of diam. of field. Since limiting diaphragm is eyepiece field stop, rulings equal  $\frac{1}{6}$  of this diaphragm opening. Field viewed on slide with mold-counting microscope has diam. of 1.382 mm at magnification of 90–125 $\times$ .

(3) *Method of illumination of compound microscope for mold counting.*—Unless microscope has built-in light source, fasten lamp and microscope securely to baseboard so that they are used and maintained as unit. Adjust mirror pivot so that it is not easily moved, and hold microscope in place by screws or cleats.

(p) *Magnetic stirring bar and stirrer-hot plate.*—Teflon-covered bars ca 47 mm long  $\times$  9 mm od; use with hot plate having independent, continuously variable heat and speed controls. See also 44.004(b).

(q) *Microscopes.*—(1) *Compound microscope.*—For mold counting and other filth and decomposition work, microscope should have following min. specifications: binocular body with inclined oculars; 4 parfocal achromatic objectives of ca 5, 10, 20, and 40 $\times$ ; revolving 4-place nosepiece; achromatic condenser with N.A. of 1.40 in centerable mount; 10 $\times$  Huygenian eyepieces; fine adjustment; mech. stage preferably with adjusting buttons at sides of stage (if photomicrographs are to be made, revolving stage is more satisfactory); stdzd field of view of 1.382 mm diam. at 90–125 $\times$ ; equipped with drop-in ocular disk ruled in squares, each of which is  $\frac{1}{6}$  of field diam.

(2) *Widfield stereoscopic microscope for filth and rot fragment examination.*—Microscope should have following min. specifications: binocular body with inclined oculars; sliding or revolving nosepiece to accommodate 3 objectives; 3 parfocal objectives 1 $\times$ , 3 $\times$ , and 6 or 7.5 $\times$ ; paired 10 $\times$  and paired 15 $\times$  widefield oculars; mounted on base and capable of illumination by transmitted or reflected light. 30 $\times$  is ordinarily used for routine examination of filter papers. Verification at higher magnification may be required.

(r) *Petri dishes.*—Use to hold filter papers, bolting cloths, etc., for microscopic examination; low-edge (10 mm high) type.

(s) *Pipet for tissue transfer.*—Use 1 mL measuring pipet with bore 3.0 $\pm$ 0.5 mm and tip cut off at 1.0 mL mark. In pipetting, draw material slightly above 0.5 mL mark and let it drop slowly to mark.

(t) *Rot fragment counting plate and cover preparation.*—Glass plate; 55  $\times$  100 mm, 1.5–4.0 mm thick with cover 50  $\times$  85 mm, ca 1.5 mm thick. Carefully paint on coat of resist over the entire surface, avoiding pinholes. Asphaltum varnish makes excellent resist; paraffin wax may also be used. Carefully scribe crosswise parallel lines, 4.5 mm apart with 15 mm space at each end, thru resist. If asphaltum varnish is used, lines may be scribed with new steel-wheel glass cutter.

Place coated scribed slides face down over HF in polyethylene container. Det. proper acid fume exposure by trial and error.

Following etching, remove resist by placing slide in H<sub>2</sub>O contg detergent. If resist is not easily scrubbed off, use toluene for cleanup.

Alternatively, use clear plastic plate; 55  $\times$  100 mm, 4–6 mm thick with glass cover 50  $\times$  85 mm, ca 2 mm thick. With sharp needle, carefully scribe crosswise parallel lines, 4.5 mm apart with 15 mm spaces at each end. Several slides can be made at one time by using strip of plastic 100 mm wide and any multiple of 55 mm long, allowing extra length to compensate for each cut of 2–3 mm thickness.

Fasten  $\frac{1}{2}$  of square cover slip, ca 22 mm on side and ca 0.25 mm thick, at each end of counting plate to raise cover plate above ruled plate. See Fig. 44:03. Glass slides are available on special order from Ace Glass, Inc.

(u) *Sieves.*—See "Definitions of Terms and Explanatory Notes," item (16). Sieves of No. 100 or finer should be "plain (not twill) weave" of stainless steel. Plain weave is woven with one wire alternately over and under next.

#### 44.003

#### Reagents

(a) *Acetic acid.*—Practical glacial HOAc is satisfactory.

(b) *Acetone.*—Practical acetone is suitable unless otherwise specified.

(c) *Acid-alcohol soln.*—HCl and 60% alcohol (1+9) or HCl and 40% isopropanol (1+9).

(d) *Alcohol.*—95% com. ethanol (not denatured) unless otherwise specified. Make all dilns by vol.

(e) *60% Alcohol-calcium chloride soln.*—To each 3 L 60% alcohol (amt for 1 analysis), add 200 g anhyd. CaCl<sub>2</sub>. Stir until salt dissolves. Cloudiness from traces of CaCO<sub>3</sub> will clear up during analysis when soln is acidified.

(f) *Algin soln for rot fragment determination.*—Proceed as for stabilizer solns, (gg); then adjust final mixt. to pH 7.0–7.5 with NaOH soln.

(g) *Antifoam soln.*—1 g Dow Corning Antifoam A compd dild with 20 mL EtOAc. Use supernate and keep tightly closed.

(h) *Borax.*—Household borax is satisfactory. This is usually Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·10H<sub>2</sub>O, which is not very sol. in cold H<sub>2</sub>O. If >5% borax soln is desired, it must be kept hot.

(i) *Calgon.*—Na hexametaphosphate (obtainable from Calgon Corp., PO Box 1346, Pittsburgh, PA 15230).

(j) *Carbon tetrachloride.*—Tech. grade is suitable unless otherwise specified.

(k) *Carob bean soln.*—Blend 0.75% carob bean gum in H<sub>2</sub>O. Boil 2 min and cool to 20–25°. Add 2 mL HCHO/100 mL and stir gently. Let settle and use clear supernate.

(l) *Castor oil.*—USP.

(m) *Chloral hydrate.*—Aq. soln (1+1) or see Hertwig's soln.

(n) *Chloroform.*—Tech. grade is suitable unless otherwise

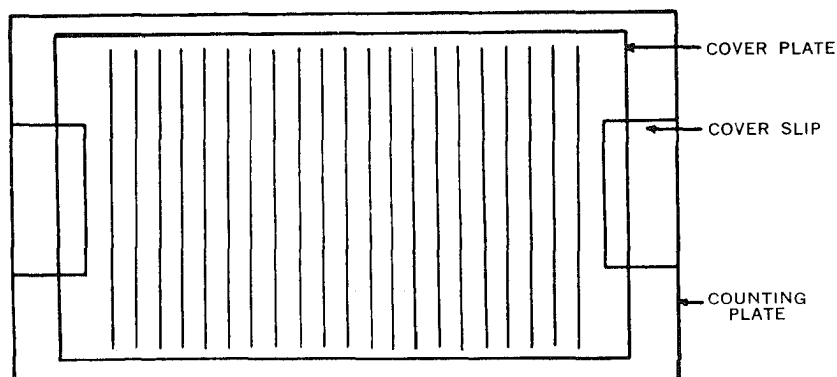

FIG. 44:03—Rot fragment counting slide

specified. Mixt. of pet ether and tetrachloroethylene ( $\text{CCl}_2\text{CCl}_2$ ), adjusted to sp gr of  $\text{CHCl}_3$ , 1.5, may be used instead of  $\text{CHCl}_3$  in sedimentation, but not in defatting, steps.

(o) *Chloroplatinic acid soln.*—Dissolve 5 g  $\text{H}_2\text{PtCl}_6$  in 100 mL  $\text{H}_2\text{O}$ .

(p) *Crystal violet soln.*—Dissolve 10 g dye (Colour Index 42555) in 100 mL alcohol and filter.

(q) *Detergent soln.*—Prep. aq. Na lauryl sulfate soln as required.

(r) *Emulsifiers.*—Nonionic,  $\text{H}_2\text{O}$ -sol. surfactants. (1) *Nonylphenoxypoly(ethyleneoxy)ethanol.*—Igepal CO-730 (GAF Corp.). (2) *Dialkylphenoxypoly(ethyleneoxy)ethanol.*—Igepal DM-710 (GAF Corp.). (3) *Nonylphenoxypoly(ethyleneoxy)ethanol.*—Igepal CO-630 (GAF Corp.).

(s) *Flotation liquid.*—Mineral oil, (y), and heptane, (u), (85+15).

(t) *Formaldehyde soln.*—Use USP reagent soln. Strength is expressed as % by vol. of USP soln.

(u) *Heptane.*—Com. *n*-heptane contg <8% toluene.

(v) *Hertwig's soln.*—Useful for clearing plant and insect materials; action continues on standing. Use only for temporary mounts, not for permanent slides. Dissolve 45 g chloral hydrate crystals in 25 mL HCl (1+8) and 10 mL glycerol.

(w) *Isopropanol saturated with heptane.*—To 600 mL isopropanol add 45 mL heptane and 430 mL  $\text{H}_2\text{O}$ , mix, and let stand overnight. Siphon from below interface.

(x) *Kerosene, deodorized.*—Refinol No. 9 (Standard Oil of Indiana), Dispersol (Shell Oil Co.), or equiv. insecticide grade.

(y) *Mineral oil.*—Paraffin oil, white, light, 125/135 Saybolt Universal Viscosity (38°), sp gr 0.840–0.860 (24°). Fisher Scientific Co. No. O-119, or equiv.

(z) *Pancreatin soln.*—Use USP or sol. pancreatin kept refrigerated at 10°. Use fresh soln. Mix at rate of 5 g/100 mL  $\text{H}_2\text{O}$  at  $\leq 40^\circ$ . Use special soln for cheese, 10 g/100 mL. Stir with malted milk unit or blender 10 min, or let stand 30 min with frequent shaking. Centrf. at 1500 rpm and filter supernate thru S&S No. 8 paper, or equiv. Alternatively, filter thru cotton pads 10–13 cm thick and then thru rapid No. 8 paper in Hirsch funnel with suction.

(aa) *Phosphoric acid.*—Tech. grade.

(bb) *Sodium carbonate.*—Tech. grade. If hydrated salt is used, calc. to anhyd. basis.

(cc) *Sodium chloride.*—Tech. grade.

(dd) *Sodium oleate.*—Tech. grade.

(ee) *Sodium phosphate soln.*—Tech. grade  $\text{Na}_3\text{PO}_4$ . Prep. 5% soln.

(ff) *Sodium sulfite.*—Tech. grade. If hydrated salt is used, calc. to anhyd. basis.

(gg) *Stabilizer solns.*—0.5% Na carboxymethylcellulose preferred (Cellulose Gum CMC-7H3SF, Hercules Inc., Cellulose and Protein Products Dept., Wilmington, DE 19899). Place 500 mL boiling  $\text{H}_2\text{O}$  in high-speed blender. With blender running, add 2.5 g Cellulose Gum and 10 mL HCHO, and blend ca 1 min. Alternatives: 3–5% pectin or 1% algin. Add required amt of stabilizer directly to  $\text{H}_2\text{O}$  while agitating in high-speed blender. Treat soln with vac. or heat to remove air bubbles. Add 2 mL HCHO/100 mL soln as preservative. (If blender is not available, mix dry stabilizer with alcohol to facilitate incorporation with  $\text{H}_2\text{O}$ .) Adjust to pH 7.0–7.5. Filter soln thru 8  $\mu\text{m}$  membrane filter (Millipore No. SCWP-047-00, or equiv.) using suitable vac. filtration app. (Millipore No. XX15-047-00, or equiv.).

(hh) *Tween 80—60% alcohol soln.*—To 40 mL polysorbate 80 (ICI United States, Inc.), add 210 mL 60% alcohol, mix, and filter. (Proportionate vols may be prepd.)

(ii) *Tetrasodium EDTA soln.*—Dissolve 5 g  $\text{Na}_4\text{EDTA}$  in 100 mL  $\text{H}_2\text{O}$ , add 150 mL alcohol, mix, and filter. (Proportionate vols may be prepd.)

(jj) *Wetting agents.*—(1) *Tergitol Anionic 7.*—Na heptadecyl sulfate (Union Carbide Corp.). (2) *Triton X-114.*—Alkylaryl polyether alcohol (Rohm & Haas Co.).

#### 44.004

#### Special Technics

(a) *Operation of Wildman trap flask.*—Unless otherwise directed in specific method, cool mixt. in flask to room temp. Bring vol. of liq. to ca 900 mL in 2 L flask and to ca 600 mL in 1 L flask. Add vol. of flotation liq. as stated in method by pouring down stirring rod. Tilt flask ca  $45^\circ$  from vertical and mix 1 min at rate of 200–250 strokes/min with brisk rotary motion so that liq. is brought to a roll. Avoid splashing thru surface of liq. with rubber stopper. Add enough liq. to bring flotation liq. well into neck of flask.

Unless otherwise stated, let mixt. stand 30 min, intermittently stirring bottom layer every 3–6 min during first 20 min of standing. Spin stopper to remove sediment and trap off by raising stopper as far as possible into neck of flask, being sure that oil layer and  $\geq 1$  cm of liq. below interface are above stopper. Hold stopper in place and pour off liq. into beaker. Rinse out material on rod and in neck of flask with liq. extn medium in which floating was performed and add to beaker.

Do not wash out neck of flask with 95% alcohol or other liq. which may interfere with surface relationships of the 2 phases; this will cause loss in recovery in subsequent trappings.

Filter trapped material and rinsings with suction thru rapid paper in Hirsch funnel. Add flotation liq. as specified to trap flask and stir vigorously. Add enough liq. extn medium to bring flotation liq. into neck of flask. Trap off again, rinse, and filter as above.

(b) *Operation of magnetic stirrer.*—To disperse flotation liq. thru sample, dil. liq. extn medium to vol. specified in method and bring to proper temp. Add mag. stirring bar, 44.002(p), and proper vol. of flotation liq. Slowly bring unit to max. speed that does not produce visible or audible splashing (central portion of stirring bar is usually just visible at bottom of vortex) and stir for time stated in method. Time stirring interval after achieving proper speed and vortex.

(c) *Tween 80- $\text{Na}_4\text{EDTA}$  extraction.*—Add 300 mL 60% alcohol to sample in 2 L trap flask. Successively, without interruption, add 250 mL Tween 80–60% alcohol soln, 44.003(hh); mix and quickly add 250 mL EDTA-60% alcohol soln, 44.003(ii), followed by 70 mL heptane, 44.003(u). Mix 1 min as in (a), and rapidly fill flask with 60% alcohol.

During first 20 min of standing, gently stir settled material occasionally. After 20 min, rotate rod to remove debris from stopper surface and clamp unrinsed rod so that stopper is above level of settled material. Let stand undisturbed 1 addnl hr. Trap off as in (a), without disturbing interface while manipulating rod. Rinse with 60% alcohol. Add 40 mL heptane, let stand 1.5 hr, and perform second trapping.

(d) *Filtration technic.*—(Treatment of trapped-off material.) If material trapped off in beaker contains appreciable starchy debris, add enough HCl to make soln 1–2% of HCl (1+99–49), bring to boil, and filter while hot. If fats or colloidal material retard filtration, hasten by playing stream of hot  $\text{H}_2\text{O}$  over paper during filtration.

(e) *Clearing of plant materials.*—With sedimentation or flotation procedures, some food material may be trapped off with filth particles. By proper clearing, filth may be made to stand out in contrast with white background of filter paper by one of following technics:

(1) For heavy filth, moisten paper with  $\text{H}_2\text{O}$  or 50% alcohol. (This method does not clear material completely, but it leaves rodent pellets and other filth soft and pliable.)

(2) For light filth examination, wet paper with glycerol-alcohol (1+1) immediately after filtering. Place enough liq. on paper to fill fibers but not enough to cause flowing of extd materials. This clearing agent does not harden filth material on paper, as do many oils which might be used as clearing agents.

(3) Clove oil can be used for clearing plant materials. This oil has high refractive index and clears more completely than does alcohol-glycerol soln.

(f) *Illumination for the widefield stereoscopic microscope.*—

(1) *By direct light.*—Focus and adjust light to strike paper at ca 70° angle from horizontal. Light may come from right or left.

(2) *By transmitted light.*—In cases where transmitted light is necessary, use mirror on microscope stand. Mirror with white surface instead of conventional silvered mirror is particularly useful.

In counting rot fragments, remove mirror and metal contrast plate and replace with box-type substage lamp. Place lamp, 44.002(n)(2), so that center of glass filter is directly below objective and within 2 cm of glass microscope plate.

(g) *Microscopic examination of filter papers.*—Make examination at 30× (unless otherwise specified), using widefield stereoscopic microscope, on properly cleared paper. Continually tease and probe particles while observing thru microscope. Turn over all large pieces of material, such as bran, which might obscure filth elements. Examine all doubtful pieces of material at 60–75×. At least twice magnification used in original examination is necessary to show new details not observable at lower power. If doubt still remains, mount piece, clear thoroly, and examine under compd microscope. *Thoro knowledge of appearance of authentic materials is assumed.*

## BEVERAGES AND BEVERAGE MATERIALS

### Carbonated and Noncarbonated Soft Drinks

#### 44.005 *Geotrichum* Mold (1)—Official First Action

Det. net vol.,  $v$ , of container and transfer contents to 3" No. 230 sieve, 44.002(u). Transfer residue from sieve to 50 mL graduated centrf. tube, and proceed as in 44.079(a) and (d).

Express results as mycelial fragments/350 mL (12 fl oz) = 7000  $S/v$ , where  $S$  = total no. mycelial fragments on the 2 slides.

### Cocoa, Chocolate, and Press Cake

#### Light Filth (2)—Official First Action

#### 44.006

#### Apparatus and Reagent

(a) *Hirsch porcelain funnel with plug.*—Size 0, fitted with fixed perforated filtering plate. Diam. at top, 94 mm; diam. of plate, 56 mm. Fit stem end of funnel with rubber tubing ca 10 cm (4") long which can be plugged with plastic or cork stopper.

(b) *Sodium hypochlorite soln.*—Approx. 0.25%. Dil. 5 mL com. NaOCl soln, 5.25% by wt, with 95 mL H<sub>2</sub>O. Prep. fresh daily.

#### 44.007

#### Determination

(a) *Cocoa.*—Mix 50 g cocoa into 500 mL hot (55–70°) 2% detergent soln, 44.003(q), or 500 mL hot 2% Igepal CO-630, 44.003(r)(3). Pour portionwise onto No. 230 sieve, 44.002(u), and wash with forcible stream of 55–70° tap H<sub>2</sub>O, using aerator, 44.002(a). Remove fat by tilting sieve ca 20° and play H<sub>2</sub>O thru liq. which collects at side. When fat and fine material have washed thru and foam is gone, transfer residue to 2 L trap flask, 44.002(i)(3), with H<sub>2</sub>O. Add ca 500 mL H<sub>2</sub>O and boil 10 min. Cool to room temp. and add H<sub>2</sub>O to total vol. of 1 L. Pour 50 mL

heptane, 44.003(u), down stirring rod. Lower mag. stirring bar, 44.002(p), into flask on stirring rod stopper. Raise rod above liq. and secure with clamp. Stir mag., 44.004(b), 5 min. After stirring, fill flask with H<sub>2</sub>O. Let stand 30 min, gently stirring bottom layer every 4–5 min with stirring bar for first 20 min. Trap off heptane. Add 35 mL more heptane, stir by hand gently 1 min, let stand 15 min, and again trap off. Filter combined trappings, using Hirsch funnel. Remove paper and examine microscopically. If debris on filter paper is excessive, proceed as in (d) after examining paper for hairs only.

(b) *Chocolate.*—Use 100 g finely shaven chocolate and proceed as in (a).

(c) *Press cake.*—(1) *Method I.*—Heat sample (usually very hard lumps) 2–3 hr at 60–70° and break into ≤0.5" (1 cm) pieces. Mix 50 g into 500 mL hot 2% detergent soln, 44.003(q), or 500 mL hot 2% Igepal CO-630, 44.003(r)(3), in 800 mL beaker. Stir with butter stirrer, 44.002(f), or mag. stirrer, at low speed 2–3 hr until completely dispersed, or let soak overnight. Stir thoroly, pour portionwise onto No. 230 sieve, 44.002(u), and proceed as in (a).

(2) *Method II (3).*—Break sample into ≤1 cm (0.5") pieces, using hammer or similar implement. Weigh 50 g into 1 L beaker and add 100 mL peanut oil. Add mag. stirring bar, and heat with gentle stirring to 150°. Transfer to cool mag. stirring unit and stir 10 min at speed where no splashing occurs. Add 500 mL aq. 5% Triton X-114 soln, 44.003(j)(2), and stir 5 min. Proceed as in (a), beginning "Pour portionwise onto No. 230 sieve, . . ." If oil drops are visible after completion of sieving, wash material on sieve with 2% aq. Triton X-114 soln by spraying from wash bottle. Continue sieving until surfactant is removed and proceed as in (a).

(d) *Bleaching technic (4).*—Return paper to Hirsch funnel in suction flask. Wash thoroly with H<sub>2</sub>O. (If paper contains alcohol and glycerol from examination for hairs, wash first with alcohol and then with H<sub>2</sub>O.) Apply vac. until paper appears dry, turn off vac., and plug rubber tubing with stopper. Cover paper with ca 3 mm (5–7 mL) NaOCl soln and let stand until bleaching of cocoa tissue is complete, but <30 min. Maintain level of soln entire period and do not let soln flow over rim of paper. Turn on vac., which will remove stopper. Wash paper with H<sub>2</sub>O. Examine microscopically for insect fragments and other extraneous materials other than hairs.

### Ground Coffee and Coffee Substitutes

(Caution: See 51.011, 51.040, and 51.056.)

#### 44.008 Filth—Official First Action

(a) *Heavy filth, sand, and soil.*—Weigh 100 g sample in 600 mL beaker, add 350 mL CHCl<sub>3</sub>, and boil 15 min, stirring occasionally. Wash down sides of beaker with CHCl<sub>3</sub>. Let mixt. cool and settle 15 min with occasional stirring of top layer. Carefully decant CHCl<sub>3</sub> and floating tissue onto smooth ca 15 cm filter paper in buchner without disturbing heavy residue on bottom of beaker. Repeat decanting with small amts of CHCl<sub>3</sub> until practically no plant tissue remains with residue on bottom of beaker. (Sp gr of CHCl<sub>3</sub> may be increased by addn of CCl<sub>4</sub>, if necessary to float plant tissue. Do not add CCl<sub>4</sub> beyond 1 part CCl<sub>4</sub> to 1 part CHCl<sub>3</sub>.) Transfer residue from beaker to ashless filter paper and examine for filth. If residue is appreciable, ignite filter and det. wt sand, soil, etc.

(b) *Light filth (ground coffee) (4).*—(Caution: See 51.056.) Make filter paper cup from 24 cm paper and 150 and 250 mL beakers, 44.002(k). Weigh 25 g sample into this cup. Add 100 mL CHCl<sub>3</sub> by pouring most of liq. outside paper cup into the 250 mL beaker. Press cup down into CHCl<sub>3</sub> and place on steam bath.

Boil gently 5 min, avoiding excessive loss of  $\text{CHCl}_3$ . Lift paper, clamp with clothespin, and let drain to slow drip. Discard solv. and repeat extn with two 100 mL portions  $\text{CHCl}_3$ . Position paper on Hirsch funnel and aspirate to apparent dryness. Complete by drying (1) overnight in hood, (2) 1 hr in  $80^\circ$  convection oven, or (3) 30 min in  $80^\circ$  vac. oven at  $>5"$  (13 cm, 16.9 kPa) vac.

Wash sample into 2 L trap flask with total of 400 mL  $\text{H}_2\text{O}$ . Boil gently 15 min, remove from hot plate, and set aside. Dil. to 600 mL with  $\text{H}_2\text{O}$ , add 400 mL undild isopropanol while stirring mag., heat to bp, and boil 2–3 min. Add 40 mL mineral oil, **44.003(y)**, and heat to vigorous boil. Transfer to cool stirrer and stir mag., **44.004(b)**, 5 min. Slowly fill flask with 40% isopropanol by letting liq. flow down rod while top of stopper is held just above contents. Stir with rotary swirl to resuspend solids, and trap off after 2 min. Filter onto ruled paper. Add 30 mL mineral oil, stir by hand 30 sec, and trap off after 5 min. Filter onto another ruled paper and examine papers microscopically.

If filter paper debris is excessive, examine for rodent hairs and then bleach as in **44.007(d)**.

(c) *Light filth (other substitutes except chicory)*.—Air dry decanted material on paper overnight or for 1 hr in oven at ca  $80^\circ$ , transfer dried material to 2 L trap flask, and add 400 mL hot  $\text{H}_2\text{O}$ . Boil 15 min and, if necessary, add small amts cold  $\text{H}_2\text{O}$  intermittently to prevent foaming. Cool mixt. to  $<20^\circ$ . Trap off twice, using 35 and 25 mL portions heptane, **44.003(u)**, resp. In first trapping, after stirring heptane, let stand 5 min before filling flask. Filter and examine microscopically.

(d) *Light filth (ground chicory) (5)*.—Add 50 g sample to 1 L beaker contg soln of 5 g Na lauryl sulfate and 10 g  $\text{NaHCO}_3$  in 500 mL  $\text{H}_2\text{O}$ . Stir and place in steam bath. Heat 20 min, stirring twice at 5 min intervals, and wash down sides with few mL  $\text{H}_2\text{O}$  after each stirring. Transfer to No. 230 sieve and wash until foam is gone. Rinse sieve retainings with ca 100 mL 40% isopropanol. Transfer (use of teaspoon suggested) to 2 L trap flask with 40% isopropanol. Dil. to 800–900 mL with 40% isopropanol. Boil 4 min with gentle stirring. Add 50 mL mineral oil and heat until boiling starts again. Move to cool mag. stirrer and stir 5 min. Fill trap flask with 40% isopropanol added down rod with stopper held just above liq. Stir immediately to resuspend settleings. Stir 2 more times at 3 min intervals. Raise rod; wash with few mL 40% isopropanol and clamp with stopper ca 75 mm below interface. Let stand 4 min. Trap off, rinse neck, and filter onto ruled paper. Add 25–30 mL mineral oil, stir by hand 45 sec at moderate speed, and add 15–20 mL  $\text{H}_2\text{O}$ . Let stand 20 min, trap off, rinse flask neck with undild isopropanol, and filter onto sep. ruled papers. Examine papers at 20–30 $\times$ .

#### Aphids in Hops

##### Light Filth (6)—Official First Action (AOAC-ASBC Method)

**44.009**

##### Reagents and Apparatus

- (a) *Flotation soln.*.—Satd  $\text{Na}_2\text{B}_4\text{O}_7$  soln, 100 g borax/L  $\text{H}_2\text{O}$ .
- (b) *Iodine stain.*.—Dissolve 0.5 g I and 1.5 g KI in 25 mL  $\text{H}_2\text{O}$ .
- (c) *Blender.*.—"Intensifier" Twin Shell Blender, Patterson-Kelley Co., Inc., 100 Burson St, East Stroudsburg, PA 18301, or equiv.

**44.010**

##### Preparation of Sample

Place sample in blender, using 4 qt (3.8 L) size shell for small samples or 8 qt (7.6 L) size shell for large samples. Activate blender and "intensifier" for 1 min intervals until blending and breakage of sprigs are complete. Draw off 10 g samples from bottom plate.

**44.011**

##### Determination

Mix 10 g representative sample in 100 mL satd borax soln in 2 L Wildman trap flask. Bring to *slow* boil. Keep mixt. from boiling onto sides of flask by keeping boiling to min. and by washing down sides with  $\text{H}_2\text{O}$ . Boil 1.5 hr, and cool to room temp. Fill flask to 1600 mL with  $\text{H}_2\text{O}$  and 35 mL heptane, **44.003(u)**, and stir vigorously 10 sec. Fill flask with  $\text{H}_2\text{O}$ , let stand 30 min, and trap off. Perform second trapping, using 25 mL heptane, stirring 10 sec, and letting flask stand 15 min. Wash neck of flask with isopropanol. Pour trappings onto ruled paper(s), add 10–12 drops I stain, and examine microscopically. If excess plant tissue is present in trappings, pour trappings thru 5" No. 10 sieve held over paper. Wash plant tissue on sieve with alcohol onto filter paper to remove any adhering insects.

Count as aphid any whole aphid or part contg head. Count individually aphid cast skins and other insects.

#### DAIRY PRODUCTS

##### Sediment Test on Milk (7)—Official Final Action

**44.014**

##### Apparatus and Materials

(a) *Tester.*.—Simply constructed, easily cleaned, and adjustable between samplings to permit sanitary removal of used disk and replacement with clean disk. Before using, check tester for reproducibility as in **44.015**. Milk or sediment must not bypass disk. Select type according to method of sampling:

(1) *For mixed sample method.*.—Pressure, gravity, or vac. type: (a) For 1 gal. sample use any suitable device that will filter sample thru disk with exposed area  $1\frac{1}{8}"$  diam. (b) For 1 pt sample, equip single-unit, off-bottom tester with No. 125 BNC 0.40" safety head (available from Sediment Testing Supply Co., 1512 Jarvis Ave, Chicago, IL 60626) having filtering area 0.40" diam., or use any suitable device having filtering area 0.40" diam.

(2) *For off-bottom method.*.—Single-unit type for intake of 1 pt on upstroke of plunger and discharge thru disk on down stroke, or 2-unit type, contg 1 unit for removal of 1 pt milk from bottom of can and another for filtering sample. Use sampling device long enough to permit reaching bottom of milk can, with filtering area  $1\frac{1}{8}"$  diam.

(b) *Cotton sediment disks.*.—Std lintine cotton disks or pads,  $1\frac{1}{4}"$  diam., for use over flat wire screen in tester to expose filtration area  $1\frac{1}{8}"$  diam. Disk must not contain phenolic resins or other chem that may contaminate milk.

Test sediment disks as follows: Filter 12 mg std sediment mixt. (60 mL aliquot (d)) thru pad, using clean flask to catch filtrate. Transfer filtrate to beaker, rinse flask 3 times with  $\text{H}_2\text{O}$ , and add rinsings to beaker. Filter filtrate thru 7 or 9 cm S&S White Ribbon paper (or equiv.) that has been washed with ca 200 mL  $\text{H}_2\text{O}$ , dried to constant wt at  $100^\circ$ , and cooled in covered dish in desiccator before weighing. Thoroughly rinse beaker and paper with  $\text{H}_2\text{O}$  and dry to const wt as above. Test  $\geq 3$  disks; av. wt sediment passing thru each disk should be  $\leq 2.8$  mg. In addn, std disk prepd from fine mixt. should not appear to have sediment buried beneath surface.

(c) *Sediment filtering apparatus.*.—(1) *For  $1\frac{1}{8}"$  diameter stds.*.—App. must hold  $1\frac{1}{4}"$  sediment disk and have effective

filtering area  $1\frac{1}{8}$ " diam. This  $1\frac{1}{8}$ " area must be unobstructed except for wire screen or wire screen and perforated plate support for filter disk. App. should be supported in filter flask so vac. can be used for rapid filtration or flask air outlet can be closed to stop filtration. App. should have ca 80° funnel with capacity of  $\geq 80$  mL but  $\leq 450$  mL. Test app. by filtering  $H_2O$  suspension of C thru std disk. Disk should have clean, sharply defined border. When sediment suspension is filtered, sediment should be evenly distributed over disk with no pattern formation. Figs 44:04 and 44:05 show suitable app.

(2) For 0.40" diameter stds.—Vac. type that holds  $1\frac{1}{4}$ " sediment disk and uses only 0.40" diam. filtering area. Test app. as in (1).

(d) Preparation of coarse std sediment disks.—Prep. uniform mixt. of oven-dried ( $100^\circ$ ) materials which meet following screening specifications. Grind all materials by hand with mortar and pestle.

	Per cent
Cow manure, thru No. 40 .....	53
Cow manure, thru No. 20, retained on No. 40 .....	2
Garden soil, thru No. 40 .....	27
Charcoal, thru No. 40 .....	14
Charcoal, thru No. 20, retained on No. 40 .....	4

Place 2.00 g above mixt. in 100 mL vol. flask, thoroly wet with 4–6 mL 0.1% *Aerosol OT soln* (prep. 1–2% soln in acetone and dil. with  $H_2O$ ) or other suitable wetting agent, add 46 mL 0.75% carob bean gum soln prepd as in 44.003(k), and bring level of liq. just into neck of flask by adding 50% (by wt) sucrose soln.

Let stand  $\geq 30$  min, add few drops alcohol, and dil. to vol. with the sucrose soln. Mix thoroly, pour into 250 mL beaker or other suitable container, and stir with mech. or mag. stirrer at speed (ca 200–300 rpm) such that mixt. is thoroly agitated but very little air is whipped into suspension. Observe with bright reflected light to see that suspension is uniformly stirred.

Transfer, while stirring, 10 mL portion (200 mg std sediment) with large-tip, graduated pipet to 1 L vol. flask, and dil. to vol. with the 50% sucrose soln. When thoroly mixed, each mL contains 0.2 mg sediment. Mix, pour into 1.5 L beaker, and stir as above. If particles accumulate on side of beaker, wash down with portions of sediment suspension or push under with tip of pipet. While stirring, pipet definite vols of sediment mixt. and add to  $\frac{3}{4}$  pt filtered sweet skim milk. Mix thoroly and pass mixt. thru std sediment disk in filtering app., (c)(1). Gently pour milk down side of filtering app. and filter with very little or no suction. Wash container promptly with  $\frac{1}{4}$  pt filtered skim milk. Let last portion of milk flow thru pad with no suction applied. If sediment does not appear to be evenly distributed over pad, add 15 or 20 mL skim milk and let it filter thru without suction. Repeat addn until sediment appears evenly distributed. Suck air thru disk ca 1 min to remove excess skim milk.

For permanent record, mount and spray disks with 40% HCHO soln or with alc. soln contg 2.5 g each of menthol and thymol in 100 mL. Alternatively, if most of milk is removed by thoro aspiration, no preservative is needed. Dried pads may be coated with colorless plastic cement dild with 1–3 vols acetone so that mixt. is thin enough to pour easily. If acetone dissolves pigment from paper and stains pads, place pads on flat glass plate for

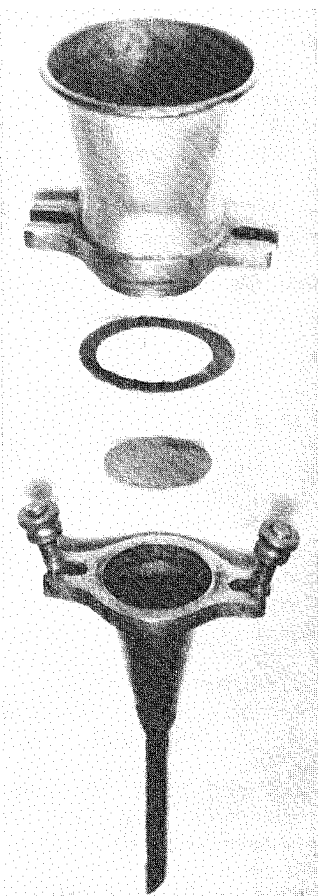

FIG. 44:04—Sediment filtering apparatus, unassembled

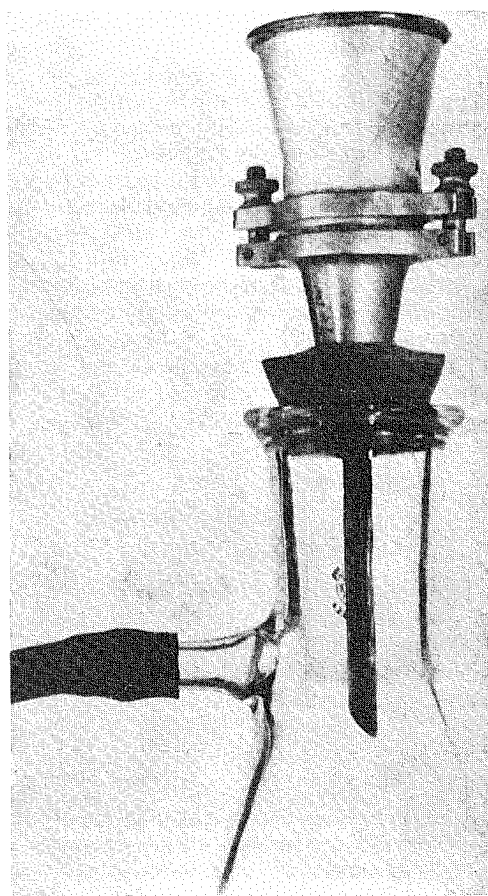

FIG. 44:05—Sediment filtering apparatus, assembled

treating with dild cement. Move pads while drying to prevent sticking to glass. When pads are almost dry, place light wt (e.g., petri dish) directly on them to prevent curling. Pads may be mounted with plastic cement. (Std disks made from manure contg large amt of chlorophyll cannot be coated with plastic cement, as solv. exts chlorophyll and stains pad green. Use this method of preserving pads only if there is no leaching of pigment from sediment on addn of dild plastic cement.)

Following above method, prep. series of disks contg sediment remaining from 0.0, 0.2, 0.5, 1.0, 2.0, 3.0, 4.0, 5.0, 6.0, 7.0, 8.0, 9.0, 10.0, 12.0, and 14.0 mg std mixt. Mark disks to show mg of sediment used to prep. each pad. Do not use as std any pad on which sediment is not evenly distributed.

For comparison with tests on samples, entire series of disks may be used, but usually it is more convenient to select few disks denoting variations in grade that are applicable to particular investigations being made. If grading charts are prepd and reports made, indicate on chart and report whether mixed or off-bottom sample was used. If stds are to be handled or used for appreciable length of time, place them under glass, transparent plastic sheets, or other suitable materials. In using stds, use either of following methods: (1) Grade sediment disk to nearest std disk regardless of whether actual amt of sediment is above or below std; or (2) grade sediment disk of sample as "more than — mg" or "less than — mg." Choose stds to fit method of grading. When grading disks, disregard gross pieces of material (whole flies, hairs, large chunks of dirt or manure, etc.) but if such matter is present, list each sep. on report.

(e) *Preparation of fine std sediment disks.*—(1)  $1\frac{1}{8}$ " diameter stds.—Grind oven-dried (100°) cow manure, garden soil, and wood charcoal (not powd) in impact mill, Wiley mill, or other suitable type, using fine screen in mill. Pass cow manure thru Wiley mill or similar type 2 or 3 times. Sift materials sep. in max. batches of 50 g as follows: Dry 25–50 g at 100° for 3–4 hr. While still warm, place in 8" No. 140 sieve nested over No. 230. Add cover and receiver. Shake nested sieves by hand 5 min at ca 120 strokes/min. Sep. sieves and brush off material adhering to underside of No. 230 and discard before emptying sieve. Dry material retained on No. 230 ca 2 hr (max. batch 20 g) and resift 5 min as above. Sep. sieves and brush off material adhering to underside of No. 230 before emptying. Use "on 230" fractions from second siftings and mix uniformly in following proportions: cow manure 66%, garden soil 28%, and charcoal 6%.

Combine above 2 "on 140" fractions of each of the 3 materials and resift as above, except use No. 120 sieve nested over No. 140. Resift new "on 140" fraction, retaining "on 140" fraction from second sifting. (Dry before each sifting and brush material from underside of No. 140 sieve before emptying.) Mix manure, soil, and charcoal in above proportions.

Place 1.80 g mixt. from "on 230" fractions and 0.20 g mixt. from "on 140" fractions in 100 mL vol. flask. Proceed as in (d), beginning "... thoroly wet with 4–6 mL 0.1% Aerosol OT soln ..." except use H<sub>2</sub>O instead of 50% sucrose soln for dilg 10 mL aliquot to 1 L.

Where (d) states "While stirring, pipet definite vols . . ." proceed as follows: Det. approx. funnel capacity of filtering app., (c)(1), by pouring H<sub>2</sub>O into assembled app. with filter flask air outlet closed. Include H<sub>2</sub>O that filters thru as part of funnel capacity. While stirring, pipet aliquots of sediment suspension into beakers. Add H<sub>2</sub>O to make total vol. 20–50 mL less than funnel capacity, using total vol. of  $\geq 60$  mL but  $\leq 400$  mL.

With filter flask air outlet closed to prevent filtration, mix dild aliquot and pour into app., (c)(1), fitted with wet std disk, (b). (Use alcohol or wetting agent if necessary to wet disk.) Add 20–50 mL H<sub>2</sub>O to beaker and rinse by swirling. Pour into funnel, keeping lip of beaker touching surface of H<sub>2</sub>O if possible. (Rinse

H<sub>2</sub>O should nearly fill funnel if capacity is  $\leq 450$  mL.) Open flask air outlet. After H<sub>2</sub>O has filtered thru pad, apply vac. and aspirate disk for ca 1 min. Remove pad and let dry in covered dish. If sediment is not evenly distributed, discard pad. After some practice, ca 75% of pads prepd should be acceptable. No preservative is required. Pads may be coated with dild plastic cement and used as in (d).

(2) *0.40" diameter stds.*—While stirring, pipet 100 mL above dild fine suspension into suitable container and dil. to 800 mL with H<sub>2</sub>O. Each mL contains 0.025 mg sediment and when filtered thru 0.40" diam. area is equiv. to 0.2 mg filtered thru  $1\frac{1}{8}$ " diam. area. Prep. series of stds by filtering suitable aliquots thru disks in app., (c)(2). Dil. each aliquot to 50–60 mL and filter with min. suction. Rinse beaker with small vol. H<sub>2</sub>O and add to funnel. Carefully rinse side of funnel with small vol. H<sub>2</sub>O. Use min. suction necessary to remove excess H<sub>2</sub>O from disk. Designate 0.40" diam. stds as "— mg equiv." and use in grading 1 pt mixed sample test disks in same manner as  $1\frac{1}{8}$ " diam. stds are used.

(f) *Photographic stds.*—Photographic stds (obtainable from Photography Div., Office of Information, US Dept. of Agriculture, Washington, DC 20250) may be used as guide in grading sediment pads, but it is preferable to use actual disks prepd as in (d) or (e). Std that more nearly resemble disk being graded should be used in each case. Do not use photographs that have become faded, stained, soiled, or otherwise damaged.

#### 44.015

#### Checking Sediment Testers

To check sediment testing devices, proceed as follows: Measure actual vol. of milk delivered to assure that 1 pt is withdrawn and passes thru disk. Transfer 10 mL 2% sediment suspension in sucrose soln, 44.014(d), using large-tip, graduated pipet, to 10 gal. clean filtered H<sub>2</sub>O in clean milk can. After thoroly agitating mixt., remove 1 pt with clean pt measure and filter thru  $1\frac{1}{8}$ " diam. area of sediment disk, 44.014(b), mounted on suitable funnel of correct size, e.g., 44.014(c)(1). After thoro agitation of contents of milk can, again remove pt sample with the sediment testing device and pass thru sediment disk in exactly same manner as for testing milk. Repeat this operation with the tester several times to det. whether all disks so obtained give same sediment as disk obtained by filtering thru funnel, 44.014(c)(1).

#### 44.016

#### Collection of Sample

(a) *Mixed sample method.*—For retail containers, 5 to 10 gal. cans, and storage tanks, use 1 pt or 1 gal. samples. Before mixing milk, transfer with small strainer any floating extraneous matter, such as flies, hairs, large chunks of debris, etc., to mounted disk, 44.017(a), or mount on sep. disk, properly identified. Thoroly mix milk in container before removing test portion. Avoid contamination of sample with foreign matter on stirrers or by any other means. For retail containers take 1 pt from mixed container or composite sufficient number to make 1 gal. Proceed as in 44.017(a).

(b) *Off-bottom method.*—For 5 to 10 gal. cans take pt sample with either type of off-bottom tester from unstirred can of milk. Before withdrawing sample, remove with small strainer any floating extraneous matter as in (a). Take sample  $\leq \frac{1}{4}$ " off bottom of unstirred can of milk by inserting sampler and, during upstroke of plunger, drawing head of instrument once across diam. of can bottom or around circumference if can has high center. Expel milk with gun in can and then with short stroke remove excess fluid from pad. Proceed as in 44.017(b).

#### 44.017

#### Determination

(a) *Mixed samples.*—Pass sample thru properly adjusted disk, 44.014(b), held in correct position in tester. Warm 1 pt sample

to 90–100°F and filter thru restricted area 0.40" diam., **44.014(a)(7)**. If single-unit off-bottom tester with special head is used, warm sample larger than 1 pt to 90–100°F and withdraw 1 pt with tester while stirring, or draw 1 pt into tester and warm milk by holding tester under running hot H<sub>2</sub>O before discharging milk thru disk.

Warm 1 gal. sample to 80–90°F or filter cold thru 1½" diam. area of disk, **44.014(b)**. If milk is filtered at temp. <90°F, rinse disk by filtering ca ½ pt sediment-free warm (90–100°F) H<sub>2</sub>O thru disk before removing from tester. If milk is to be salvaged, do not dil. with H<sub>2</sub>O. (Milk varies in its rate of flow thru disks; pasteurized milk may be more difficult to filter than raw milk. Other factors influencing rate of flow are temp., fat content, degree of clumping of fat globules, stage of lactation, presence of mastitic milk, and amt of sediment in sample.)

Remove disk from tester and mount on special sized paper or store in individual transparent waxed envelope. (If disk is placed on paper or in envelope while still moist, drying milk acts as adhesive.) Grade by comparison with std disks, **44.014(d)** or **(e)**, and indicate on report whether pad was graded wet or dry. (Character of sediment may be detd by microscopic examination.)

To prevent decomposition on storage, disk may be sprayed with HCHO soln or alc. menthol-thymol soln as in **44.014(d)**. Do not use glue to affix disk to paper; if disk becomes detached, moisten with few drops H<sub>2</sub>O and remount. Protect from contamination.

**(b) Off-bottom samples.**—Remove disk from tester, **44.016(b)**, and proceed as in **(a)**, third par., beginning "... mount on special sized paper ..."

**Filth in Butter, Cheese, Cheese Products,  
Dried Milk Products, and Dairy Products  
in General—Official First Action**

Use following methods independently or in various combinations. Weigh 225 g, except in **44.022**, into suitable container and use S&S ruled No. 8 paper for filtration. Cut hard cheese into small pieces.

**44.018**

**Butter**

Place container in H<sub>2</sub>O bath or oven at ca 80°. When fat seps, filter directly thru paper with suction, retaining most of curd and H<sub>2</sub>O in container. After fat passes thru, filter remaining material. To facilitate filtration of curd, wash paper with near boiling H<sub>2</sub>O during filtration. (For butter not filterable by this process, use **44.020**.) Examine paper microscopically.

**44.019**

**Evaporated Milk, Condensed Milk, Sweet Cream, Spray-Dried Whole or Skim Milk**

Reconstitute dried or concd products. Dil. reconstituted product with equal vol. hot H<sub>2</sub>O, hot 3% Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub> soln, or hot 2% Na<sub>2</sub>CO<sub>3</sub> soln, and filter with suction. During filtration, continually wash paper with stream of near boiling H<sub>2</sub>O to prevent accumulation of layer of particles which clogs paper. Examine paper microscopically.

**44.020**

**Soft and Semi-Soft Cheese and Sour Cream;  
Some Dried Whole and Skim Milks; and Butter  
That Cannot Be Filtered by 44.018**

Cut 225 g cheese into 6 mm cubes and add to 800–1000 mL boiling H<sub>3</sub>PO<sub>4</sub> (1+40) in 1.5–2 L beaker, stirring continuously with slow speed mech. stirrer, **44.002(f)**, or on mag. stirrer-hot plate, **44.002(p)**, with stirring bar ca 75 × 12 mm, until sample is dispersed (usually >20 min). Filter, without letting mixt.

accumulate on paper, and continually wash filter with stream of near boiling H<sub>2</sub>O to prevent clogging. When filtration is impeded, add H<sub>2</sub>O, dil. (1–5%) alkali, H<sub>3</sub>PO<sub>4</sub> (1+40), or hot alcohol, until paper clears; then resume addn of sample suspension and H<sub>2</sub>O. Examine paper microscopically.

**44.021**

**Hard Cheeses, Hard Skim, Part Skim Milk Cheeses  
(Romano, Ricotta, Feta, Pecorino, Sardo, Goats'  
Milk Cheeses, Sbrinz, Goya, Whey Cheeses, etc.) (8)**

(Not applicable to cheese contg herbs, spices, or molds thruout)

Prep. cheese for sampling by trimming and discarding thin layers to remove all "old" cut surfaces and to keep paraffin coating and mold out of sample. Cut and break up 225 g trimmed cheese into 4 L beaker. Add ca 700 mL ca 55° filtered H<sub>2</sub>O. Set beaker under mech. stirrer, **44.002(f)**, and stir 15 min, maintaining mixt. at 55°. Add 100 mL 20% aq. Na<sub>4</sub>EDTA soln, stir, and adjust mixt. to pH 8 with NH<sub>4</sub>OH or dil. HCl (1+2). Rinse sides of beaker free of adhering cheese particles with ca 60° H<sub>2</sub>O. Maintain pH 8 by addn of NH<sub>4</sub>OH and keep adding ca 60° H<sub>2</sub>O to dil. cheese mixt. to ca 3 L. If foaming occurs, place wet vegetable parchment Patapar paper, 27 lb wt (available from Paterson Parchment Paper Co., Bristol, PA 19007), or Parafilm M (Cat. No. 13-374, Fisher Scientific Co.), split to accommodate stirrer blades, over top of beaker to break foam. Continue stirring until cheese becomes finely dispersed.

Cool dispersion to 40° and adjust to pH 8 with NH<sub>4</sub>OH or HCl (1+2). Add 300 mL pancreatin soln, **44.003(z)**, (except use 600 mL pancreatin soln for ricotta). Let mixt. digest at ≤40° with continued stirring ca 1.5 hr. Maintain pH 8 by addn of NH<sub>4</sub>OH.

After digestion, place beaker on hot plate and heat to 65–68°, continuing mech. stirring. Adjust to pH 6.0±0.2 with HCl (1+2). Carefully adjust stirrer blades close to bottom of beaker to pick up any cheese particles which settle. Continue stirring 15 min or until cheese appears completely solubilized. Rinse inside of beaker, stirrer blades, etc., with ca 65° H<sub>2</sub>O and filter thru ruled paper, using ca 65° H<sub>2</sub>O and then alcohol to rinse beaker. If filtration becomes slow (e.g., cream cheese), let paper clear, wash with alcohol, and use addnl paper. Mixt. will filter more easily if No. 60 screen (ca 5 cm diam.) is placed under paper and small amt of mixt. is allowed to suck dry before filtering is continued. Examine paper microscopically.

**44.022**

**Casein (9)**

Weigh 50 g sample into 1 L beaker. Slowly stir in 170 mL 20% Na<sub>4</sub>EDTA soln until well mixed with sample. With constant stirring, bring vol. to 1 L with hot tap H<sub>2</sub>O (55–70°). Wet sieve on No. 230 sieve, **44.002(u)**, with forcible spray of hot tap H<sub>2</sub>O until foam subsides. Wash sieve retainings into beaker and pour onto ruled filter paper. Examine papers microscopically.

**44.023**

**Cheese Containing Mold, Plant Tissues, and Spices**

Disperse cheese by **44.020** or first par. of **44.021**. Pour thru No. 140 sieve, **44.002(u)**, washing thoroly with forcible stream of H<sub>2</sub>O. Transfer material retained on sieve to beaker. Add 200 mL H<sub>3</sub>PO<sub>4</sub> (1+49), boil until lumpy residue dissolves, and pour again thru No. 140 sieve, washing thoroly with forcible stream of hot H<sub>2</sub>O. Transfer material on sieve with ca 200 mL 60% alcohol to trap flask and cool. Trap off, using heptane, **44.003(u)**, and H<sub>2</sub>O, filter, and examine microscopically.

**44.024**

**Sediment in Cream, Butter, Cheese, Cheese Products,  
Dried Milk Products, and Dairy Products in General  
Official First Action**

**(a) Rapid method for sweet cream and cream in which curd**

is easy to disperse and in absence of mold.—Place 1 pt (500 mL) sample in beaker or pan of convenient size, ca 2 L, and add ca 500 mL hot H<sub>2</sub>O (70–90°). More or less H<sub>2</sub>O may be added so that mixt. when ready for filtration is at 45–60°. Remove whole flies or other large filth particles which float to surface and which would be broken up by stirrer. Place these on sediment pad when completed. Place pan under malted milk stirrer, and add, while stirring, 25 mL 40% Calgon soln, **44.003(i)**; if necessary, add more Calgon soln to make mixt. alk. to litmus. Stir 30–60 sec or until curd is broken up. Filter with vac. thru std sediment disk, **44.014(b)**. If pad clogs, filter remaining portion thru fresh disk. Rinse pan and funnel with hot H<sub>2</sub>O onto sediment disk.

(b) *Other dairy products*.—Proceed as in **44.020** or **44.021**, and filter thru std sediment disk, **44.014(b)**. Violent mech. agitation, such as is provided by malted milk stirrer, may be used to facilitate dispersion of product.

Compare with std sediment disks, **44.014(d)**, (e)(1), or (f).

#### **44.025 ★ Mold in Butter (10)—Official Final Action ★**

See **40.024**, 11th ed.

### **NUTS AND NUT PRODUCTS**

#### **Shelled Nuts (Except Pecans)**

#### **44.026 Light Filth (11)—Official First Action**

(Caution: See **51.039**, **51.040**, **51.055**, and **51.056**.)

*Nutmeats, all sizes, except pecans*.—Weigh 100 g sample into 1.5 L beaker. Add 600 mL CHCl<sub>3</sub>; boil 15 min. Prep. ≥24 cm paper for 100 mm plate diam. buchner by moistening with H<sub>2</sub>O and forming around base of 1 L beaker. Place 7 cm disk of bolting cloth, **44.002(e)**, (mesh size not critical) in buchner, insert paper, apply vac., and press moistened paper until good seal is obtained. Rinse paper with isopropanol. Quant. transfer nutmeats and CHCl<sub>3</sub> onto previously prepd paper. Maintain suction on nutmeats in buchner 5 min after visible dripping ceases. Release vac., add isopropanol until nutmeats are covered, let stand few min, and reapply vac. until dripping ceases. Repeat isopropanol wash step and aspirate 5 min after visible dripping ceases. Quant. transfer nutmeats on paper to 2 L trap flask, **44.002(i)(3)**. Scrape all fines from paper with spatula and finally rinse paper clean with 60% alcohol-CaCl<sub>2</sub> soln, **44.003(e)**. Bring vol. to 1 L with 60% alcohol-CaCl<sub>2</sub> soln and add 50 mL HCl. Add mag. stirring bar, **44.002(p)**, to flask, place flask on mag. stirring hot plate, and heat to *full boil* with gentle stirring. Immediately transfer flask to cool stirring unit and add 40 mL mineral oil, **44.003(y)**, by pouring down stirring rod. Stir mag., **44.004(b)**, 2 min.

Fill with 60% alcohol-CaCl<sub>2</sub> soln and gently stir 5–10 sec with stirring rod. Let stand 2 min and trap off. Add 25 mL mineral oil, hand stir gently 30 sec, and let stand 10 min. Repeat trapping. Wash flask neck thoroly with isopropanol, and transfer washings to beaker with trappings. Filter onto ruled paper and examine microscopically.

#### **Pecans, All Sizes—Official First Action**

#### **44.027 Light Filth (11)**

(Caution: See **51.040** and **51.056**.)

Form cup, using 32 cm paper with 1–1.5 L beaker, **44.002(k)**. Weigh 100 g sample into filter paper cup and place in 1.5 L beaker. Add 400 mL CHCl<sub>3</sub> and boil 5 min. After cooling few min, lift paper and drain. Repeat 5 min boil and drain with two

addnl 400 mL portions CHCl<sub>3</sub>. Proceed as in **44.026**, beginning "Place 7 cm disk of bolting cloth, . . ."

#### **44.028 Heavy Filth**

(Caution: See **51.011**, **51.039**, and **51.073**.)

Weigh 100 g sample into 600 mL beaker. Add ca 350 mL pet ether and boil gently 30 min, adding pet ether to maintain original vol. Decant solv., taking care not to lose any coarse nut tissue, and discard. Add ca 300 mL CHCl<sub>3</sub> to beaker and let settle 10–15 min. Pour off floating nutmeats and ca ⅓ of the CHCl<sub>3</sub>, and discard. Repeat sepn with smaller vols of mixt. of CHCl<sub>3</sub> and CCl<sub>4</sub> (1+1) until residue in beaker is relatively free of nutmeat particles. Transfer residue in beaker to ashless paper and examine for heavy filth. If appreciable amt of sand and soil is present, ignite paper in weighed crucible at ca 500° and weigh.

#### **44.029 Curculio Larvae in Pecan Pieces (12)**

Weigh 115 g (ca ¼ lb) sample into 1.5 L beaker and add mag. stirring bar, **44.002(p)**. Add 300 mL undild isopropanol and stir on mag. stirrer 5–10 sec. Add H<sub>2</sub>O (200 mL for midget pieces and 300 mL for small, small medium, medium, and mixed pieces) and stir 5–10 sec on stirrer. After few sec, gently agitate settled nutmeats with stirring rod to release any entrapped curculio. Remove all floating material and examine for curculio larvae. Reclaim flotation soln by pouring thru No. 12 sieve and use for one addnl sample.

### **Shredded Coconut**

#### **44.030 Filth—Official First Action**

(a) *Heavy filth*.—Proceed as in **44.043**, using 100 g sample in 800 mL beaker.

(b) *Light filth*.—Weigh 100 g sample into 1.5 or 2.0 L beaker. Add 1 L detergent soln, **44.033**. Heat in steam bath 10 min, stirring immediately and after ca 5 min.

Pour entire sample onto 8" No. 230 sieve, rinse beaker with hot H<sub>2</sub>O, and add rinse to sieve. Wash sieve with forcible stream of hot H<sub>2</sub>O until all foam is gone; then rinse well with 40% isopropanol and let drain. Place wide stem funnel in 2 L trap flask, and transfer bulk of sample to flask with spoon. Rinse remaining material to edge of sieve with aerator spray, and transfer quant. to trap flask with 40% isopropanol. Dil. to 1 L with 40% isopropanol, add mag. stirring bar, **44.002(p)**, and place on mag. stirrer-hot plate, **44.002(p)**. Add 40 mL mineral oil, **44.003(y)**, and stir vigorously 1 min. Turn stirrer to slow rate, add 50 mL HCl, and heat to vigorous boil (Caution: Soln may froth violently upon reaching bp with high heat input).

Place sample flask on cool stirrer and stir mag., **44.004(b)**, 3 min. Let stand 2 min; then slowly fill flask with 40% isopropanol added down stirring rod to bring oil interface 1 cm above fully raised stopper or wafer. Lower stopper to midpoint of flask, clamp, and let stand undisturbed 2 min. Trap off into beaker, rinsing neck of trap flask with 40% isopropanol. Add 25 mL flotation liq. **44.003(s)**, and stir vigorously by hand 1 min. Adjust oil level as above, and let stand undisturbed 10 min. Trap off into second beaker, rinsing neck of flask well with isopropanol.

Filter each trapped off layer onto sep. identified papers, rinsing beakers with isopropanol, and examine papers microscopically at 30×.

### **Peanut Butter**

#### **44.031 ★ Preparation of Sample ★ Official First Action**

See **40.031**, 11th ed.

★ Surplus method—see inside front cover.

**44.032 ★ Water-Insoluble Inorganic Residue ("WIIR") ★ and Excreta—Official First Action**

Defatting, floating off nut tissues, dissolving sol. minerals and NaCl in dil. HCl, and igniting residue. See 40.032, 11th ed.

**Light Filth (13)—Official First Action****44.033****Reagent**

*Detergent soln*—Dissolve sep. 20 g USP Na lauryl sulfate and 10 g tech.  $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$ , combine, and dil. to 1 L.

**44.034****Determination**

Weigh 100 g sample into 1.5 L beaker and heat on steam bath until softened. Add 1 L filtered hot detergent soln, and stir well. Heat 10 min in steam bath. Stir well, pour portionwise onto No. 230 sieve, 44.002(u), and wash with forcible stream of 55–70° tap  $\text{H}_2\text{O}$ , using aerator, 44.002(a). When foam is gone, transfer material on sieve to 2 L trap flask, 44.002(i)(3), with 55% alcohol (or 40% isopropanol) and bring vol. to 1 L. Add 50 mL HCl. Lower mag. stirring bar into flask on stirring rod stopper. Heat to bp and boil 10 min while slowly stirring on mag. stirring hot plate 44.002(p).

Transfer flask to unheated stirring unit and immediately add 40 mL mineral oil, 44.003(y), by pouring down stirring rod. Stir mag. 2 min. Fill with deaerated 55% alcohol (or 40% isopropanol) and gently stir 5–10 sec with stoppered rod. Let stand 5 min. Trap off. Add 25 mL mineral oil, stir by hand gently 30 sec, and let stand 5 min. Repeat trapping. Wash flask neck thoroly with isopropanol. Filter onto ruled paper and examine microscopically.

**44.035 ★ Rocks and Decomposed Peanuts in ★ Coarse Peanut Butter—Official First Action**

Floating off nut tissue and examining residue. See 44.035, 11th ed.

**44.036 ★ Glass—Procedure ★**

Dispersing sample with detergent soln, decanting, floating off nut tissue, and examining residue. See 40.036, 11th ed.

**GRAINS AND THEIR PRODUCTS****Grains and Seeds****44.037 Internal Insect Infestation—Official First Action**

Mix grain by passing 6 times thru Jones sampler, recombining sepns before each pass. Sep. slightly >100 g and weigh 100 g. Transfer weighed sample, small amt at time, to 5" or 8" No. 12 sieve, and with stiff bristle brush, work insects thru sieve as completely as possible.

Grind screened sample in cutting-type mill set at 0.061". (Dry damp or tempered grain in forced-draft oven 1 hr at 70–80° or 2 hr in oven without draft.) Transfer cracked grain, including any residue in mill, to 2 L trap flask, 44.002(i)(3), trap as in 44.004(a), using 60% isopropanol satd with heptane, 44.003(w), and heptane, 44.003(u), as solvs, and filter on 10XX bolting cloth, 44.002(e). If considerable starchy material is in ext, hydrolyze with HCl as in 44.004(d). Examine as in 44.004(g) except use 15× as lower limit of magnification. Count only whole insects, insect heads, cast skins, and head capsules.

**Unpopped Popcorn, Cereal Grains, Peas, Beans, Etc.****44.038 External Light Filth—Procedure**

Transfer 225 g sample to 2 L trap flask, 44.002(i)(3). Add 600

mL 40% alcohol and boil gently, with frequent stirring, 5 min. Cool, trap off, using heptane, 44.003(u), and 40% alcohol, filter, and examine microscopically.

**Popped Popcorn****44.039 Filth—Procedure**

Weigh 50 g sample into 2 L trap flask. Add 500 mL hot  $\text{H}_2\text{O}$ , boil 15 min, and cool to room temp. Add 35 mL heptane, 44.003(u), mix, and let stand 5 min. Fill with  $\text{H}_2\text{O}$ , trap off, filter, and examine microscopically.

**Brewer's Grits****44.040 Rodent Excreta—Procedure**

See 44.043.

**44.041 Light Filth—Official First Action**

See 44.044.

**White and Yellow Corn Meal, Cracked Wheat, and Rye, Pumpernickel, and Buckwheat Flours****44.042 Light Filth (14)—Official Final Action**

(Caution: See 51.011, 51.040, and 51.056.)

Weigh 25 g sample into 94 × 33 mm Soxhlet thimble and cover with pad of glass wool. Add ca 300 mL  $\text{CHCl}_3$  and 3–4 glass beads to 500 mL Soxhlet extn flask. Ext in Soxhlet extractor at medium rate ca 90 min (counting time from first overflow and siphoning ca every 5 min). Place extn thimble in 250 mL beaker and dry with air on steam bath until no  $\text{CHCl}_3$  odor remains.

Quant. transfer contents of thimble and any material adhering to glass wool, with spatula and acid-alcohol rinses, 44.003(c), to 1 L trap flask for trap flask method, (a), or to 1–1.5 L beaker for percolator method, (b).

Place trap flask or beaker on mag. stirrer, add stirring bar, and slowly add acid-alcohol soln, stirring constantly to form smooth slurry. Dil. to ca 600 mL with acid-alcohol soln and add ca 40 mL mineral oil, 44.003(y). Mag. stir mixt. 10 min, 44.004(b). Continue as in (a) or (b).

(a) *Trap flask method*.—At end of stirring period, fill flask with acid-alcohol soln and let stand 30 min; stir gently every 3–4 min for first 25 min. Trap off, rinsing neck of flask with acid-alcohol soln. Add ca 30 mL mineral oil and stir mag. ca 5 min. Let stand 30 min, stirring and trapping as above. Combine trappings in beaker and transfer quant. to Kilborn funnel, 44.002(i)(7) or percolator (2), contg ca 125 mL  $\text{H}_2\text{O}$ . Retain beaker. Add tap  $\text{H}_2\text{O}$  to ca 1 cm from top of funnel. Let oil layer sep. 5–10 min and drain until interface is ca 5 cm above constriction, discarding lower aq. layer. Repeat  $\text{H}_2\text{O}$  washes until lower phase is clear. Drain interface-oil layer into retained beaker, washing sides of funnel with ca 50–100 mL  $\text{H}_2\text{O}$ . If product residue is present in retained beaker contents, add ca 10 mL HCl. Boil ca 5 min on hot plate and filter thru ruled paper. After mineral oil layer has passed thru paper, rinse all glassware used (except trap flask) with alcohol followed by  $\text{H}_2\text{O}$ , then 5% detergent soln, 44.003(q), and finally with  $\text{H}_2\text{O}$ . Filter rinses thru original filter paper. Examine microscopically.

(b) *Corning percolator method*.—Place stirring rod in drain opening inside percolator, 44.002(i)(2). Add ca 250 mL  $\text{H}_2\text{O}$  to percolator. Quant. transfer beaker contents to percolator. Add acid-alcohol soln to ca 6 cm from top. Let stand ca 30 min;

★ Surplus method—see inside front cover.

gently stir contents with stirring rod every 3–4 min during first 25 min in such manner as to prevent product dropping into drain opening. After 30 min, raise stirring rod and drain, discarding lower layer but leaving ca 250 mL in percolator. Rinse stirring rod with acid-alcohol soln and add rinsings to percolator contents. Retain stirring rod for further rinsings.

Add acid-alcohol soln to percolator to ca 6 cm from top and let stand ca 30 min, stirring as before. Drain and discard lower layer as before to 250 mL. Add H<sub>2</sub>O to ca 6 cm from top and proceed as in (a), beginning "Let oil layer sep. 5–10 min . . ."

**Whole and Degerminated Corn Meal (for Rodent Excreta Only), Corn Grits, Rye Meal, Wheat Meal, Whole Wheat Flour, Farina, and Semolina**

**44.043 Rodent Excreta (15)—Official First Action**

(Caution: See 51.040, 51.049, and 51.056.)

Weigh 50 g sample in 250 mL hooked-lip beaker. Add CHCl<sub>3</sub> to within ca 1 cm of top, mix thoroly, and let settle ≥30 min, stirring surface layer occasionally. Carefully decant CHCl<sub>3</sub> and float tissue onto buchner, without disturbing heavy residue in bottom of beaker. Before decanting, take care that floating layer has not become so compact as to render this operation difficult. Add amt of CCl<sub>4</sub> equal to amt of CHCl<sub>3</sub> and tissue left in beaker, let settle again, and decant as before. Repeat this process with mixt. of equal parts CHCl<sub>3</sub> and CCl<sub>4</sub> until very little tissue remains in beaker. Do not decant any rodent excreta fragments that may be present. Wash residue in beaker onto 7 cm ruled paper with stream of CHCl<sub>3</sub> or CCl<sub>4</sub> and examine microscopically.

**44.044 Light Filth—Official First Action**

(Not applicable to whole and degerminated corn meal)

Draw air thru material in buchner, 44.043, until liq. evaps. Air dry overnight, or dry in oven at ca 80°. (Caution: In oven drying, phosgene is liberated and adequate ventilation must be provided.) Transfer residue to 1 L trap flask, 44.002(i)(3). Add 100 mL 60% isopropanol satd with heptane, 44.003(w), and mix thoroly. Wash down sides of flask with isopropanol-heptane soln until ca 400 mL is added, and soak 30 min. Trap off twice with 20–30 mL heptane, 44.003(u), for each trapping and 60% isopropanol satd with heptane as liq. extn medium. In first trapping, let stand 5 min after stirring in heptane before filling flask. Filter, and examine both trappings microscopically.

**White Flour**

**Light Filth (16)—Official First Action**

**44.045**

**Acid Digestion Method**

Digest 50 g flour in 2–2.5 L beaker with ca 600 mL HCl (3+97) by autoclaving 5 min at 121°. Immediately transfer digest to 1 L beaker, using HCl (3+97) at room temp. to assist in transfer. Add 50 mL mineral oil, 44.003(y), and stir mag., 44.004(b), 5 min. Quant. transfer to Kilborn funnel, 44.002(i)(1), or percolator, (2), retaining beaker. Let stand 30 min, stirring gently with long glass rod several times during first 10 min. Drain lower layer to ca 3 cm of interface, wash sides with cold tap H<sub>2</sub>O, and let layers sep. ca 2–3 min. Repeat drain and H<sub>2</sub>O wash until lower phase is clear. After final wash, drain oil layer into retained beaker, rinsing sides of funnel with H<sub>2</sub>O and alcohol. Add HCl to ca 3% (v/v) and boil 3–4 min on hot plate. Filter hot soln thru ruled paper, and thoroly rinse beaker and funnel with H<sub>2</sub>O, alcohol, and 5% detergent soln, 44.003(q). Filter each rinse sep. thru same paper. Examine microscopically.

**Corn Flour**

**Light and Heavy Filth—Official First Action**

**44.046**

**Pancreatin Digestion Method**

(a) *Light filth*.—Weigh 50 g flour into 600 mL beaker; stir into smooth slurry with 50 mL pancreatin soln, 44.003(z), dild with 100 mL H<sub>2</sub>O. Dil. with H<sub>2</sub>O to total vol. of ca 400 mL, and adjust to pH 8 with Na<sub>3</sub>PO<sub>4</sub> soln, 44.003(ee). Readjust pH after ca 15 min and again in ca 45 min. Add, with stirring, 3 drops HCHO soln and digest 16–18 hr at room temp. or ≤40°. Transfer to 2 L trap flask and extn as in 44.004(a), using 30 and 20 mL deodorized kerosene, 44.003(x), and H<sub>2</sub>O as solvs. Combine trappings and rinsings in beaker, transfer to 2 L trap flask, and trap off as above. If considerable starchy material is in extn, hydrolyze with HCl as in 44.004(d). Examine papers microscopically.

(b) *Rodent excreta*.—Proceed as in 44.043.

**44.047**

**Acid Hydrolysis Method (17)**

*Light filth*.—Disperse 50 g flour in 1 L beaker with ca 400 mL HCl (5+95) and 20 mL mineral oil, 44.003(y). Place on hot plate, bring to rolling boil with stirring, and boil 10 min. Remove from heat and transfer quant. to extn vessel, 44.002(i)(1) or (2). Rinse beaker and rod with ≤50 mL hot H<sub>2</sub>O, transfer rinsings to extn vessel, and retain beaker and rod. Fill extn vessel with cold H<sub>2</sub>O to ca 3 cm from top. Let settle 30 min, and drain carefully without forming vortex, until upper layer is ca 5 cm from bottom. Add 25 mL kerosene, 44.003(x), to extn vessel and drain oil layer into retained beaker. If excessive starchy material has sepd with oil layer, hydrolyze with 100–200 mL HCl (5+95) before continuing. Wash sides of extn vessel with 5% detergent soln, 44.003(q), in wash bottle, and collect washings in retained beaker. Filter entire contents of beaker thru ruled paper, 44.002(j), in Hirsch funnel. Rinse beaker with 5% detergent soln, and filter. Examine microscopically at 30×.

**Soy Flour**

**44.048 Light Filth (18)—Official First Action**

Weigh 50 g sample into 500 mL beaker and add ca 50 mL isopropanol, with stirring. Add mag. stirring bar and, with stirring, slowly add 300 mL satd NaCl soln at room temp. Stir to thin slurry and transfer in small increments to No. 230 sieve, 44.002(u). Wash residue with forceful stream of cold H<sub>2</sub>O, using aerator, 44.002(a), until effluent is clear and foaming has subsided. Let residue drain in sieve. Wash residue with isopropanol and let drain. Transfer residue to 1.5 L beaker with 40% isopropanol and dil. to 800 mL with 40% isopropanol. Heat to bp with mag. stirring, and add 50 mL mineral oil, 44.003(y). Stir mag., 44.004(b), 3 min while continuing to boil.

Transfer quant. to 2 L percolator, 44.002(i)(2). Retain 1.5 L beaker as vessel to fill percolator with H<sub>2</sub>O during refill cycles. Fill percolator with 40% isopropanol to within 3 cm of top. Let stand 5 min and drain contents to within 3 cm of bottom of oil layer. Repeat drain and refill steps at 3 min intervals with hot tap H<sub>2</sub>O (55–70°) until aq. phase is clear. Drain most of aq. phase and discard. Drain oil layer into 400 mL beaker. Wash percolator with alternate washes of H<sub>2</sub>O and isopropanol, and collect washings in 400 mL beaker. Filter onto ruled paper and examine microscopically.

**44.049 Insect Eggs (19)—Official First Action**

Transfer 50 g flour to No. 100 sieve (if >ca 0.1 g residue is obtained, No. 60 or No. 80 sieve should be used to prevent slow filtration after digestion) and sift gently until no more flour

passes thru. Transfer residue on sieve to 250 mL beaker and wet with 2–3 mL alcohol. Add 30 mL  $\text{H}_2\text{SO}_4$  (1+19), cover beaker, and heat on steam bath 10 min. Filter thru paper on suction funnel, using min. suction necessary to filter. Keep beaker partially inverted over funnel and rinse with  $\text{H}_2\text{O}$ . Turn off suction. Add 15–20 mL ca 0.1N I to paper in funnel. Allow 10–15 sec for I to stain contents. Apply gentle suction. After I passes thru filter, wash paper with 25–30 mL 1%  $\text{H}_2\text{SO}_4$ , followed by several small  $\text{H}_2\text{O}$  washes. Transfer paper to petri dish and examine at once under 20 $\times$  magnification.

#### 44.050 Insect Excreta (20)—Official First Action

(a) *Optional for 1–4 samples.*—Weigh 0.20 g flour on weighed flat glass disk 7–7.5 cm diam. Add clove oil and spread mixt. into thin uniform layer. (Enough oil should be present to clear flour and present smooth surface of oil, but not so much that mixt. flows off disk.) Place wire grid over disk and examine microscopically with dark background and intense reflected light. Depending upon size of plate, larger amts of flour and ruled glass plate can be used and oil-flour mount covered with glass, e.g., use 0.5 g flour on tomato rot count plate, 44.002(t). Weigh flour in counterbalanced scoop or directly on plate. Thoroughly sat. flour on counting plate, cover with glass, and count insect excreta. To move or turn suspected particles, gently apply pressure or move cover slightly while observing thru microscope.

(b) *Optional in multiple-sample schedule.*—Tare 2–8 small numbered vials on each balance pan and weigh by shifting weights from one side to other. (If desired, larger portion may be weighed in beaker and some of flour floated off in  $\text{CHCl}_3$ -ether or  $\text{CHCl}_3$ -toluene mixt., sp gr 1.40, before transferring to filter paper.) Rinse contents of each vial onto smooth-surface, ruled paper in Hirsch funnel with  $\text{CHCl}_3$  or  $\text{CCl}_4$ . Transfer paper to petri dish, flood with clove oil, and examine with dark background and intense reflected light.

#### *Wheat Germ, Raw or Processed*

#### Light Filth (21)—Official Final Action

(Caution: See 51.040 and 51.056.)

#### 44.051

#### Determination

Form paper cup, using 32 cm paper and 250 and 400 mL beakers, 44.002(k). Tare 400 mL beaker and paper, weigh 50 g sample into filter paper in beaker, and add ca 150 mL  $\text{CHCl}_3$ . Boil on steam bath 5 min, occasionally rinsing down sides of filter paper with  $\text{CHCl}_3$  to maintain original level. Remove from heat. Carefully lift paper contg sample from beaker so as to prevent any loss of sample. Let most of  $\text{CHCl}_3$  drain into beaker; then discard drainings. Repeat operation 2 addnl times beginning "... add ca 150 mL  $\text{CHCl}_3$ ." After last  $\text{CHCl}_3$  defatting, place paper contg sample in buchner. Apply vac. until draining slows to drip. Rinse sides of paper and sample with undild isopropanol and apply vac. until draining has ceased. Turn off vac. Add ca 50–60 mL undild isopropanol to sample. Let stand 2 min; then apply vac. until dripping ceases and sample appears dry.

Transfer sample from paper to 1 L beaker with hot tap  $\text{H}_2\text{O}$  (55–70°). Fold filter paper in half and rub together; then wash with hot tap  $\text{H}_2\text{O}$  into beaker. Repeat several times until paper appears clean. Discard paper and bring vol. of hot  $\text{H}_2\text{O}$  to 600 mL. Add 30 mL HCl and 1 mL antifoam, 44.003(g). Boil on stirrer-hot plate, 44.002(p), 10 min with const stirring; then remove from heat. Pour contents of beaker onto No. 230 sieve, 44.002(u), and wash with forcible hot  $\text{H}_2\text{O}$  spray (55–70°), 44.002(a), until all starchy material has passed thru and only bran remains (color of sample will change from light tan to dark

brown). Transfer material from sieve to 2 L trap flask with 55% alcohol or 40% isopropanol, dil. to ca 1 L, and add 50 mL HCl. Heat to 60–70° on hot plate (do not boil), remove flask from heat, and add 50 mL mineral oil, 44.003(y). Stir mag., 44.004(b), 3 min. Fill flask with same dil. alcohol used previously, stir gently by hand 1 min, let flask stand 10 min, and trap off, rinsing neck of flask with same dil. alcohol used previously. Perform second extn, using 25 mL mineral oil. Stir gently by hand 1 min, let stand 15 min, and trap off. Rinse neck of flask with undild isopropanol or alcohol. Filter trappings thru ruled paper and examine microscopically.

#### *Wheat Gluten*

#### 44.052 Light Filth (22)—Official First Action

Add 900 mL 40% isopropanol, 100 mL HCl, and mag. stirring bar to 2 L trap flask, 44.002(i)(3). Using mag. stirrer, without heat, stir at max. speed where no splashing occurs, and slowly add 50 g sample thru long-stem funnel with wide diam. bore to avoid getting sample on stoppered rod or sides of trap flask. Stir 3 min, and then boil 15 min with gentle stirring on mag. stirrer-hot plate. Immediately transfer flask to cool stirring unit and add 40 mL light mineral oil, 44.003(y). Stir mag., 44.004(b), 3 min. Slowly fill flask with 40% isopropanol by letting liq. flow down stoppered rod while top of stopper is maintained just above flask contents. After filling flask, gently stir settled material 5–10 sec with stoppered rod. Let stand undisturbed 5 min and immediately trap off. Add 25 mL light mineral oil, stir gently by hand 30 sec, and let stand 10 min. Repeat trapping. Wash flask neck thoroly with isopropanol and transfer washings to beaker contg trappings. Filter onto ruled paper and examine microscopically.

#### *Starch*

#### 44.053 Light Filth (23)—Official First Action

Weigh 225 g sample into 2 L beaker, add 1.2 L cold  $\text{H}_2\text{O}$ , and stir well to disperse lumps. Pour onto No. 230 sieve, 44.002(u), and wash with forcible stream of cold tap  $\text{H}_2\text{O}$ , using aerator, 44.002(a). (If excessive residue remains on sieve, wash into beaker with  $\text{H}_2\text{O}$ , add HCl to make to (1+9), bring to bp, and repeat sieving.) Quant. transfer sieve retainings to beaker, filter onto ruled paper, and examine microscopically.

#### BAKED GOODS

#### *High Bran Content Breads (24)*

#### 44.054 Light Filth—Official First Action

*Post-milling contamination.*—Add 225 g sample to 2 L beaker contg ca 1 L  $\text{H}_2\text{O}$  and 50 mL HCl. Stir well. Add 1 mL antifoam soln, 44.003(g). Autoclave ca 20 min as in 44.002(b)(1) or ca 15 min as in (2). Transfer digest in small portions onto No. 140 sieve, 44.002(u), with hot tap  $\text{H}_2\text{O}$  (55–70°) until amt of residue remains const. Place sieve in pan, cover residue to depth of ca 2 cm with alcohol or isopropanol, let stand 5 min, and drain. Repeat this step 3 times with  $\text{CHCl}_3$ , then twice more with alcohol or isopropanol, and drain completely. Promptly transfer sieve retainings quant. to 1 L beaker with acid-alcohol, 44.003(c), dilg contents to ca 600 mL with acid-alcohol. Add 50 mL mineral oil, 44.003(y), and stir mag., 44.004(b), 5 min.

Completely transfer beaker contents to percolator, 44.002(i)(2), or Kilborn funnel, (1), retaining beaker. Let stand 30 min, stirring gently ca every 5 min with long glass stirring rod for first 20 min; drain contents to ca 250 mL. Add acid-alcohol to ca 3 cm of top and let stand 30 min, stirring as before. Again drain to ca 250 mL. Fill funnel with cold tap  $\text{H}_2\text{O}$ , let settle ca 1.5 min, and

drain to ca 250 mL. Continue drain and refill cycles until lower aq. phase is clear and free of suspended material.

After last wash, drain oil-H<sub>2</sub>O interface into retained beaker. Promptly wash sides of percolator with 50–100 mL portions hot tap H<sub>2</sub>O, isopropanol or alcohol, and 5% detergent soln, **44.003(q)**, if necessary. Filter thru ruled paper, washing sides of beaker as above, using rubber policeman, if necessary. Examine microscopically.

### **Baked Goods with Fruit and Nut Tissues**

#### **Light Filth—Official First Action**

#### **44.055**

#### **Pancreatin Digestion Method**

*Post-milling contamination.*—Weigh 225 g sample into 2 L beaker, add enough hot H<sub>2</sub>O to soften and sat. material, and proceed as in (a). If lumps persist or if H<sub>2</sub>O is not immediately absorbed uniformly thru entire mass, proceed as in (b).

(a) Adjust mixt. to pH 7–8 with ca 5% Na<sub>3</sub>PO<sub>4</sub> soln. Stir and break up material as much as possible. Cool to 40° and add 100 mL pancreatin soln, **44.003(z)**. Stir thoroly and readjust to pH 7–8. Let stand 30 min, stir, and readjust pH.

(b) Est. vol. of mixt. and add HCl to ca 1 + 49 concn. Boil until solids become finely divided and so digested that mixt. will not froth over when covered during boiling. Neutze to ca pH 6 with NaOH soln; then add Na<sub>3</sub>PO<sub>4</sub> soln to pH 8 and continue as in (a).

For white flour products, add 0.2 mL or 4 drops HCHO and digest overnight. For products made from whole wheat and rye flours and from similar materials of high bran content, digest only 2–3 hr.

Pour digested material thru 5" or 8" No. 140 sieve, **44.002(u)**. While pouring, play forcible stream of hot H<sub>2</sub>O from tap on this material. Wash well with large stream of hot H<sub>2</sub>O. After complete washing (no starchy material visible unattached to bran), wash twice alternately with alcohol and CHCl<sub>3</sub> in that order, and then rinse thoroly with alcohol and finally with H<sub>2</sub>O.

Transfer material to filter paper if little residue remains or to 1 or 2 L trap flask, **44.002(i)(3)**, if large amt remains. Transfer bulk of material with spoon. Rinse residue from screen with 60% alcohol from wash bottle. Wash screen with forcible stream of hot H<sub>2</sub>O, collecting final residue at one edge of screen and transferring to trap flask with stream of 60% alcohol as above. Add 400 or 900 mL 60% alcohol, depending on size of trap flask.

Boil 20 min. Cool to <20° and add 20 or 40 mL heptane, **44.003(u)**; fill flask with 60% alcohol, and trap off twice. Use care in stirring and adding alcohol to prevent emulsions or inclusion of air. If residue in flask tends to rise, stir material down 2 or 3 times. Filter trapped-off material and examine microscopically.

#### **44.056**

#### **Acid Hydrolysis Method (25)**

(Rapid method; also applicable to flours)

*Post-milling contamination.*—Add 225 g sample to 2 L beaker contg ca 1 L H<sub>2</sub>O and 30 mL HCl. Wet product completely and, for flour, stir until slurry is practically lump-free. Add antifoam soln, **44.003(g)**, cover with watch glass, and heat 15–20 min in autoclave at 121°. Let pressure fall to 0 before opening vent valve. Transfer digest in small portions to 5" or 8" No. 140 sieve, **44.002(u)**, washing thoroly between addns with needle spray from aerator. After all sample has been transferred, continue washing until there is no further reduction in amt of residue. Proceed as in **44.055**, par. 5, beginning "After complete washing ..."

#### **44.057 ★ Pre- and Post-Milling Contamination ★**

Direct trapping. See **44.056**, 12th ed.

### **White Breads and High-Fat Products**

#### **44.058 Light Filth (26)—Official First Action**

Add 1 L hot (55–70°) tap H<sub>2</sub>O to 2 L beaker. Add 20 mL emulsifier, **44.003(r)(2)**, and 5 mL (r)(1), and mix well. Add 225 g sample, breaking any crust to <1 sq in. Stir well. Proceed with either autoclave, (a), or steam bath, (b), digestion.

(a) *Autoclave.*—Add 30 mL HCl with stirring. Add 1 mL antifoam soln, **44.003(g)**. Autoclave as in **44.002 (b)(1)** or (b)(2) for 30 min at 121°.

(b) *Steam bath.*—Add 90 mL HCl with stirring. Heat in steam bath 10 min. Add 1 mL antifoam soln. Boil 15 min on mag. stirrer-hot plate, **44.002(p)**, keeping beaker covered with watch glass.

Wet sieve on No. 230 plain weave sieve, **44.002(u)**, with hot H<sub>2</sub>O (55–70°). Sieve until effluent is clear and foam is gone. Transfer sieve retainings to original beaker. (*Caution:* Do not allow sample in beaker or sieve to cool.) Add 30 mL HCl and dil. to 1 L with H<sub>2</sub>O. Stir on stirrer-hot plate, and bring to bp. Boil 6 min, add 50 mL mineral oil, **44.003(y)**, and continue heating until boiling resumes. Transfer beaker to cool mag. stirrer and stir mag., **44.004(b)**, 3 min.

Promptly transfer beaker contents to percolator, **44.002(i)(2)**, contg ca 250 mL H<sub>2</sub>O. Rinse beaker into percolator and bring vol. to 1700 mL mark with H<sub>2</sub>O. After 1 min, stir percolator contents with glass rod. Place rod in beaker and set aside to receive final oil drain. Let stand 2 min. Drain oil to 250 mL mark and discard drainings. Refill percolator with H<sub>2</sub>O. Continue drain and refill cycles until lower aq. phase is almost clear. Drain oil to 250 mL mark. Drain oil into original beaker. Wash percolator sides with min. of 50 mL H<sub>2</sub>O and alcohol or isopropanol. If sides do not appear clean, follow with H<sub>2</sub>O and 5% detergent wash, **44.003(q)**. Filter onto ruled paper and examine microscopically.

### **Breading of Frozen Food Products (27)**

#### **Official First Action**

#### **44.059**

#### **Light Filth**

Remove breading from product as in **18.002**. Weigh 50 g sepd breading in 1 L beaker. Add ca 300 mL hot tap H<sub>2</sub>O (55–70°), 5 mL emulsifier CO-730, **44.003(r)(1)**, 20 mL emulsifier DM-710, **44.003(r)(2)**, and 60 mL HCl. Fill beaker to 600 mL with hot tap H<sub>2</sub>O, stir well, and heat beaker in steam bath 20 min, stirring at 5 min intervals. Add 1 mL antifoam soln, **44.003(g)**. Boil 15 min on preheated hot plate, keeping beaker covered with watch glass. Wet-sieve on No. 230 plain weave sieve, **44.002(u)**, with hot H<sub>2</sub>O, until effluent is clear and foam has dispersed. Transfer sieve retainings to original beaker with HCl-60% alcohol soln (1+9), and bring vol. to ca 600 mL. Add 50 mL mineral oil, **44.003(y)**, and stir mag., **44.004(b)**, 10 min. Place stirring rod in drain opening of percolator, **44.002(i)(2)**, and add ca 250 mL acid-alcohol soln. Quant. transfer beaker contents to percolator. Add acid-alcohol soln to ca 6 cm from top, let stand 5 min, resuspend solids with stirring rod, and let stand addnl 5 min. Drain to ca 250 mL mark, refill percolator to original vol. with acid-alcohol soln, and repeat previous steps until lower aq. phase is almost clear. Drain oil to 250 mL mark and transfer to original beaker. Wash percolator sides with 50 mL H<sub>2</sub>O, and alcohol or isopropanol. If sides do not appear clean, follow with

★ Surplus method—see inside front cover.

H<sub>2</sub>O and 5% detergent wash, **44.003(q)**. Filter onto ruled paper and examine microscopically.

### Alimentary Pastes

#### 44.060 Light Filth (28)—Official First Action

Weigh 225 g sample into 1.5–2.0 L beaker. Add 1 L HCl (30+970) and 0.3 mL antifoam soln, **44.003(g)**. (For spaghetti, break into lengths that will not lie flat on bottom of beaker.) Autoclave 30 min at 121° as in either **44.002(b)(1)** or **(2)**.

Wet sieve on No. 230 sieve, **44.002(u)**, with hot tap H<sub>2</sub>O (50–70°) to remove all original liq. and major portion of fine material.

Return sieve retainings to original beaker with hot H<sub>2</sub>O (60–100°), dilg to ca 1 L. Add 30 mL HCl, mag. stirring bar, and 50 mL mineral oil, **44.003(y)**.

Stir mag., **44.004(b)**, 6 min. Promptly transfer to percolator, **44.002(i)(2)**, contg ca 250 mL H<sub>2</sub>O. Rinse beaker into percolator with hot tap H<sub>2</sub>O to bring to 1700 mL. After 3 min, drain oil interface to 250 mL. Discard drainings and refill by pouring hot tap H<sub>2</sub>O down percolator sides to loosen adhering material and refill to 1700 mL mark. After 2–3 min, drain and refill for 2 more cycles. (Lower layer should be almost free of suspended material after last refill; if not, continue thru ≥1 recycles.) Finally, drain oil-H<sub>2</sub>O interface to 250 mL mark, change to original beaker, and drain. Promptly wash down sides successively with ≥50 mL portions hot tap H<sub>2</sub>O, isopropanol or alcohol, and hot tap H<sub>2</sub>O. Use 5% detergent soln, **44.003(q)**, if necessary.

Transfer beaker contents to ruled filter paper with min. of 50 mL washes of hot H<sub>2</sub>O, alcohol or isopropanol, and H<sub>2</sub>O or detergent, using rubber policeman if necessary to clean sides of beaker.

### BREAKFAST CEREALS

#### Corn and Rice, Ready-to-Eat and Corn Chip Products

#### 44.061 Light Filth (29)—Official First Action

(Caution: See 51.039.)

(a) *Cereals and food products containing no fats or oils.*—(Check ingredient label.) To 1–1.5 L beaker (depending on bulk of product), add 50 g sample, 500 mL hot (55–70°) tap H<sub>2</sub>O, and 40 mL HCl. Bring mixt. to full boil on mag. stirrer-hot plate, **44.002(p)**, using slow stirring speed. Boil 20 min and wet sieve immediately on No. 230 sieve, **44.002(u)**, with forceful hot (55–70°) H<sub>2</sub>O spray until residue no longer passes thru sieve and H<sub>2</sub>O is clear. Wash sieve retainings either into 2 L Wildman trap flask, **44.002(i)(3)**, or back into original beaker if Kilborn, **(i)(1)**, or percolator, **(i)(2)**, is to be used, using 40% isopropanol.

(1) *Trap flask.*—Bring vol. to 800 mL with 40% isopropanol and add 30 mL HCl. Raise stirring rod plunger and secure above liq. with clamp. Add mag. stirring bar, **44.002(p)**, and stir at slow speed while bringing mixt. to bp. Boil 5 min. Add 50 mL mineral oil, **44.003(y)**, and stir mag., **44.004(b)**, 3 min.

Remove from heat and fill with 40% isopropanol. Let stand 10 min and trap off, rinsing neck of flask and rod with isopropanol or alcohol. Filter trappings thru ruled paper.

(2) *Kilborn or percolator.*—Bring vol. in original beaker to 600 mL with 40% isopropanol and add 25 mL HCl. Bring to bp with slow stirring, boil 5 min, add 50 mL mineral oil, and stir mag. 3 min, **44.004(b)**.

Transfer from beaker to separator, rinsing beaker into separator with 40% isopropanol. If residue in separator is heavy, resuspend with glass rod. Rinse rod into separator.

Let stand 3 min and drain contents to within 3 cm of bottom of oil layer. Refill with hot (55–70°) tap H<sub>2</sub>O. Repeat drain and

refill steps with 3 min intervals, until H<sub>2</sub>O phase is free of plant material. Discard drainings. Drain oil layer into original beaker, rinsing sides of separator alternately with isopropanol or hot H<sub>2</sub>O and alcohol, using rubber policeman to clean sides. Filter contents of beaker thru ruled paper.

(b) *Cereals and food products containing natural and synthetic fats or vegetable oils.*—Proceed as in (a), beginning "... 500 mL hot (55–70°) tap H<sub>2</sub>O, ..." but also add to this mixt. 20 mL emulsifier, **44.003(r)(2)**; then proceed as in (a) with no further changes.

### Whole Wheat

#### 44.062 Light Filth (30)—Official First Action

Weigh 50 g sample into 1 L beaker. Add 500 mL H<sub>2</sub>O and 40 mL HCl. Boil 20 min with mag. stirring to keep solids from scorching. Immediately after boiling, wet-sieve on No. 230 sieve, **44.002(u)**, with hot (55–70°) tap H<sub>2</sub>O until effluent is clear. Transfer sieve retainings with isopropanol to preshaped filter paper cup, using ≥24 cm paper and 150 and 250 mL beakers, **44.002(k)**. Transfer paper and retainings to Hirsch funnel. Apply vac. to apparent dryness. Turn vac. off, add 150 mL isopropanol, and vac. dry. Repeat isopropanol washing and vac. drying 2 more times.

Transfer filter paper retainings with 40% isopropanol to 2 L trap flask contg 25 mL oleate soln (10 g Na oleate, **44.003(dd)**, dild to 100 mL with 40% isopropanol and stirred in at room temp.). Bring vol. of flask to 800 mL with 40% isopropanol. Boil 5 min with mag. stirring. Cool contents of flask to 23±2° with either air or H<sub>2</sub>O cooling. Add 50 mL flotation liq., **44.003(s)**, and stir mag. 3 min, **44.004(b)**. Fill flask with 40% isopropanol by slowly running isopropanol down rod onto top of stopper, held ca 3 mm above liq. Let stand 3 min and trap off. Add 50 mL flotation liq. and stir ca 15 sec. Add 40% isopropanol as needed to fill flask. Let stand 20 min and perform second trapping. Combine trappings. Filter thru ruled filter paper and examine microscopically.

### EGGS AND EGG PRODUCTS (31)

#### OFFICIAL FIRST ACTION

(Eggs may be contaminated with chicken excrement, dirt, sand, metal fragments, hairs, and feathers, depending upon condition of the eggs, method of manufacture, and storage conditions. Method of isolation of contaminants depends upon nature of product (whole, whites, or yolks) and physical state (fresh, frozen, or dried).)

#### 44.063

#### Reagents

(a) *Anionic surfactant.*—Na *N*-methyl-*N*-tall oil acid taurate, Igepon TK-32 (GAF Corp.), or equiv.

(b) *Phenolphthalein soln.*—Prep. 5% soln in alcohol, dil. with equal vol. H<sub>2</sub>O, and filter.

(c) *Disodium phosphate soln.*—Filtered satd soln (ca 100 g anhyd. salt/L), and filtered 6% (anhyd. basis) aq. soln.

(d) *Trisodium phosphate soln.*—Filtered satd soln.

(e) *Tetrasodium EDTA soln.*—10% filtered aq. soln of Na<sub>4</sub>-EDTA.

#### 44.064 Light and Heavy Filth and Other Extraneous Materials

(a) *Whole eggs or yolks.*—Thaw frozen sample at room temp. or in cold running H<sub>2</sub>O. Weigh 100 g thawed sample into 250 mL centrf. bottle. Add 30 mL 6% Na<sub>2</sub>HPO<sub>4</sub> and stir. Shake vigorously 1.5–2.0 min, add adnl 30 mL 6% Na<sub>2</sub>HPO<sub>4</sub>, and shake ca 2 min. Dil. with 6% reagent to fill bottle and centrf. whole eggs 5 min at 1500 rpm and yolks 5 min at 800 rpm. Decant ca 2/3 liq. into

1.5 or 2.0 L beaker and isolate light filth as in (b). Add ca equal vol. 6%  $\text{Na}_2\text{HPO}_4$  soln to residue in bottle, shake well, and recentrif. Decant closely. To sediment in bottle add ca  $\frac{1}{2}$  vol.  $\text{H}_3\text{PO}_4$  and warm on steam bath. Transfer to 250 mL beaker, boil 3–5 min, and filter while boiling. Examine at  $30\times$  for metal and glass fragments, and chicken excrement. Check amorphous white material for uric acid as in 44.177.

(b) *Egg whites*.—Use decanted whole egg or yolk material from (a) or weigh 100 g thawed whites into 1.5 or 2.0 L beaker and add ca 300 mL 6%  $\text{Na}_2\text{HPO}_4$  soln in small portions with thoro stirring. Add 16 mL  $\text{Na}_4\text{EDTA}$  soln, (e), then 12 mL phthln, (b). Let stand 10 min; then adjust to pH 7.6–8.0, using  $\text{H}_3\text{PO}_4$  (1+9) or  $\text{Na}_3\text{PO}_4$  soln as needed. Add 2 mL surfactant, (a), and readjust to pH 7.6–8.0, using short range pH paper. Add 200 mL pancreatin soln, 44.003(z), and readjust to 7.6–8.0.

Place in 37–38°  $\text{H}_2\text{O}$  bath to ca depth of digestion mixt.; stir, and adjust to pH 7.6–8.0 at ca 15 min intervals for ca 2 hr. Add 2 mL surfactant and dil. to 1.0–1.2 L with  $\text{H}_2\text{O}$ . Adjust to pH 8.0 and place in incubator at 37° overnight. Readjust to pH 8.0 and let stand 15–20 min without stirring. Decant in small portions onto ruled paper, using full suction, while washing paper with hot tap  $\text{H}_2\text{O}$ . Examine paper microscopically.

(c) *Dried egg yolks*.—Defat egg yolks as follows: Weigh 25 g sample into 150 mL tall-form beaker, add 50 mL pet ether, and stir thoroly (until smooth). While stirring, add solv. to almost fill beaker. Stir top again after 1 min, let stand 1 min, and decant solv. into larger beaker. Repeat defatting step twice more with pet ether. Filter combined washes thru smooth textured paper, air dry paper thoroly, and hold for pancreatin digestion. Discard solv. (Caution: See 51.011.) Place 150 mL beaker on steam bath and remove solv. completely from residue with continuous stirring to prevent bumping. Transfer dried residue in beaker and dried residue on paper, using spatula, to 600 mL beaker and proceed as in (d).

(d) *Dried whole eggs*.—Weigh 25 g sample into 600 mL beaker, or continue with dried yolk residue from (c). Add mixt. of 90 mL satd soln of  $\text{Na}_2\text{HPO}_4$  and 10 mL alcohol in small portions with stirring. (Suspension must be smooth and finely divided at this point.) With stirring, add 12 mL  $\text{Na}_4\text{EDTA}$  soln, (e), then 5 mL phthln, (b). If intense red develops, discharge with  $\text{H}_3\text{PO}_4$  (1+9). Adjust to pH 7.6–8.0 with satd  $\text{Na}_3\text{PO}_4$  soln, using short range indicator paper. Add 200 mL pancreatin soln, 44.003(z), to suspension. Continue as in (b), beginning "Place in 37–38°  $\text{H}_2\text{O}$  bath . . ."

(e) *Dried whites*.—Weigh 25 g sample into 250 or 400 mL beaker. Dil. 4.5 mL surfactant, (a), to 35 mL with  $\text{H}_2\text{O}$  and add to beaker in portions of 5 mL, rotating and shaking beaker until sample absorbs each portion. Let soak 10–15 min; then add 20 mL  $\text{H}_2\text{O}$  in 4–5 portions with thoro stirring after each addn. Stir to smooth slurry. (Material must be finely dispersed before proceeding.) Add 7 mL  $\text{Na}_4\text{EDTA}$  soln, (e), then 3 mL phthln, (b). Transfer to 1.5 or 2 L beaker and dil. with  $\text{H}_2\text{O}$  to 700–800 mL. Adjust to pH 7.2–7.6 and add 200 mL pancreatin soln, 44.003(z). Continue as in (b), beginning "Place in 37–38°  $\text{H}_2\text{O}$  bath . . ."

#### 44.065 Sedimentation Method for Chicken Excrement and Heavy Filth

(a) *Frozen whole eggs or yolks*.—Examine by 44.064(a).

(b) *Dried egg yolk*.—Add 25 g sample in small portions with continuous stirring to mixt. of 75 mL  $\text{H}_3\text{PO}_4$  (1+9) and 5 mL surfactant, 44.063(a), in 150 mL tall-form beaker. Stir to smooth paste and add  $\text{H}_3\text{PO}_4$ , few mL at time, to fill beaker while stirring. Stir top layer 1 min and let stand 5 min. Decant ca  $\frac{2}{3}$  vol. into 250 mL beaker and add  $\text{H}_3\text{PO}_4$  (1+9) to both beakers equal to vol. present. Stir contents of both beakers 1 min and let stand

5 min. Again stir top layers 1 min and slowly add  $\text{H}_3\text{PO}_4$  with stirring to fill both beakers. Let stand 5 min and repeat stirring and standing. Decant both beakers closely into 1 L beaker.

Dil. material in 1 L beaker with  $\text{H}_2\text{O}$ , stirring continuously, until full. Stir top layer 1 min and let stand 5 min, and repeat stirring and standing. Decant closely, discarding supernates. Composite all residues in 250 mL beaker by transferring with  $\text{H}_3\text{PO}_4$  (1+9) from wash bottle. Decant acid and floating egg material and transfer residue to ruled paper with  $\text{H}_2\text{O}$ , using min. suction. Wash residue with two 30 mL portions  $\text{H}_2\text{O}$ , using min. suction. Examine microscopically, keeping paper moist. Check amorphous white material for uric acid as in 44.177.

### POULTRY, MEAT, AND FISH AND OTHER MARINE PRODUCTS

#### 44.066 ★ Filth and Sand in Chicken Giblet Paste ★ Procedure

See 40.063, 11th ed.

#### 44.067 ★ Glass in Meat Scraps—Procedure ★

Floating off tissues and examining residue. See 40.065, 11th ed.

#### Shellfish

#### 44.068 Shell in Canned Crabmeat (32)—Official First Action

Weigh 57 g (2 oz) representative sample into 400 mL beaker. Add 150 mL 1.5%  $\text{NaOH}$  soln and stir to break up lumps. Add 10 drops 1% aq. *Alizarin Red S* indicator. Heat until meat has been digested (10 min at ca 80°), stirring 3 or 4 times. Pour on No. 12 sieve nested in No. 60 sieve, 44.002(u), and wash with  $\text{H}_2\text{O}$ . Wash shell from both sieves onto weighed paper, dry at 100°, and cool to room temp. Weigh and count shell. Report shell as number of pieces and wt/lb.

#### 44.069 Light Filth in Canned Crabmeat (33) Official First Action

Transfer entire contents of  $\leq 7$  oz (200 g) can (or 7 oz portion of larger sample) to 2 L trap flask, 44.002(i)(3). Thoroly wash can (and parchment, if present) with tap  $\text{H}_2\text{O}$  and add washings to flask. Add ca 800 mL hot (55–70°) tap  $\text{H}_2\text{O}$ . With mag. stirring, 44.004(b), heat to bp. Add 50 mL mineral oil, 44.003(y), and stir mag. 3 min while continuing to boil. Remove flask from heat, fill with hot tap  $\text{H}_2\text{O}$ , and let stand 30 min, stirring gently by hand at 10 and 20 min. Trap off into 400 mL beaker. Add 30 mL mineral oil to trap flask. With stirring bar spinning at max. speed, disperse oil thruout aq. (lower) phase, stirring by hand. Stir mag. 5 min at max. speed. Fill flask with hot tap  $\text{H}_2\text{O}$  and let stand 20 min, stirring gently by hand at 10 min. Trap off into same beaker. Wash mouth of trap flask with isopropanol and decant washings into beaker.

Transfer to 2 L percolator, 44.002(i)(2), contg ca 250 mL  $\text{H}_2\text{O}$ . Rinse beaker into percolator and bring vol. to ca 1700 mL with  $\text{H}_2\text{O}$  at room temp., ca 20°. Let stand 3 min. Drain oil to 250 mL mark and discard drainings. Repeat fill and drain cycle  $\geq 2$  more times. Drain remaining oil and  $\text{H}_2\text{O}$  into original 400 mL beaker. Wash percolator sides with 1% detergent soln, 44.003(q), and isopropanol, and collect washings in beaker. Filter onto ruled paper and examine microscopically. If filtering action slows, use new filter paper.

★ Surplus method—see inside front cover.

#### 44.070 Shell in Canned Clams and Oysters (32) Official First Action

Weigh 57 g (2 oz) representative sample into 600 mL beaker. Continue as in **44.068**, except digest by boiling ca 15 min.

#### Canned Fish and Fish Products

##### 44.071 Light Filth (34)—Official First Action

For  $\leq 8$  oz (225 g) samples, transfer entire contents of can (or 8 oz portion of larger sample) to 1.5 L beaker and break up lumps with spatula. Wash can thoroly with small amt of isopropanol and add washings to beaker. Add 50 mL HCl and H<sub>2</sub>O to make 800 mL. With mag. stirring, heat to bp and boil 20 min. (If product foams, add H<sub>2</sub>O occasionally.) Add 50 mL mineral oil, **44.003(y)**, and stir mag., **44.004(b)**, 5 min while continuing to boil.

Transfer to 2 L percolator, **44.002(i)(2)**, contg ca 250 mL H<sub>2</sub>O. Retain the 1.5 L beaker to fill percolator with H<sub>2</sub>O during refill cycles. Fill percolator with hot tap H<sub>2</sub>O (55–70°) to within 3 cm of top. Let stand 3 min and drain contents to ca 3 cm of bottom of oil layer. (If large amt of suspended solids is present, let stand longer to permit sepn of oil.) Repeat drain and refill steps at 3 min intervals until aq. phase appears clear. Finally, slowly drain percolator to min. vol. of aq. phase without loss of oil phase. Drain oil layer into 600 mL beaker. Wash percolator with warm H<sub>2</sub>O, 5% detergent soln, **44.003(q)**, H<sub>2</sub>O, and isopropanol in sequence, using ca 50 mL per wash, and collect washings in 600 mL beaker. Filter onto ruled paper and examine microscopically.

#### Canned Shrimp

##### 44.072 Light Filth (35)—Official First Action

For shrimp  $< 2.5$  cm long, place entire contents of can into 2 L beaker contg mag. stirring bar. For larger shrimp, skewer on probe, and wash each shrimp with hot (55–70°) H<sub>2</sub>O from plastic squeeze bottle over 2 L beaker contg stirring bar. Discard shrimp. Wash can thoroly, pouring washings into beaker. Bring H<sub>2</sub>O level in beaker to ca 925 mL with hot tap H<sub>2</sub>O. Add 25 mL HCl and 50 mL light mineral oil, **44.003(y)**. Boil and stir mag., **44.004(b)**, 3 min. Transfer promptly to percolator, **44.002(i)(2)**, which has its rubber hose fitting clamped shut as close to tubulation opening as possible and contg ca 200 mL hot tap H<sub>2</sub>O. Reserve beaker. Add ca 800 mL addnl hot tap H<sub>2</sub>O. Let stand 10 min. Drain oil layer to ca 7.5 cm from bottom, using rod to force shrimp tissue thru tubulator, if necessary. Remove rod, and wash with hot H<sub>2</sub>O into reserved beaker. Reserve rod for further washings. Drain percolator to 300 mL mark, let stand 1 min and slowly drain and discard remaining aq. phase until min. vol. remains. Do not let vortex form, as it may cause loss of oil. Drain oil layer into reserved beaker. Filter thru ruled paper. Wash paper with 55–70° hot tap H<sub>2</sub>O. Alternately wash percolator and rod with 5% detergent soln, **44.003(q)**, and hot tap H<sub>2</sub>O. Filter onto the ruled filter paper and examine microscopically.

#### Uncooked Pork Sausage and Ground Beef or Hamburger

##### 44.073 Enzyme Digestion Method (36) Official First Action

Grind sausage, using meat grinder with end plate having  $\frac{3}{16}$ " holes. Weigh 225 g sample into 1.5–2 L beaker. Add 980 mL warm H<sub>2</sub>O and 20 mL emulsifier, **44.003(r)(1)**, and stir 5 min.

Add 20 mL HCl and stir 1 min. Proceed with overnight digestion, (a), or rapid digestion, (b).

With ground beef, use only overnight digestion with 5.0 g 1:10,000 or 10 g NF pepsin. In flotation, (c), omit addn of 50 mL HCl and subsequent boiling. After addn of light mineral oil, let stand 20 min, instead of 10 min.

(a) *Overnight digestion*.—Add 0.5 g 1:10,000 pepsin (Difco Laboratories, or equiv.) or 2.0 g NF pepsin and stir 1 min. Digest in 50° H<sub>2</sub>O bath or incubator 18 hr. Add 5 mL Triton X-114, **44.003(jj)(2)**, and stir 1 min. Keep all samples at digestion temp. in bath until ready to sieve. Sieve portionwise on No. 230 sieve with hot H<sub>2</sub>O spray. Transfer to ruled filter paper if small amt residue remains on sieve or proceed with flotation, (c).

(b) *Rapid digestion*.—Add 2.0 g 1:10,000 pepsin or 10 g NF pepsin and stir 1 min. Digest in 62° H<sub>2</sub>O bath 2 hr. Add 5 mL Triton X-114, **44.003(jj)(2)**, and stir 1 min. Keep all samples at digestion temp. until ready to sieve. Sieve portionwise on No. 230 sieve. Proceed with flotation, (c).

(c) *Flotation*.—Wet residue on sieve with 40% isopropanol and immediately transfer quant. to 2 L trap flask, using 40% isopropanol. Bring vol. to 1 L with 40% isopropanol and add 50 mL HCl. Add mag. stirring bar, **44.002(p)**, and, with gentle stirring, boil 10 min on mag. stirrer-hot plate. Cool to room temp. in cold H<sub>2</sub>O bath and add 40 mL flotation liq., **44.003(s)**. Stir mag. 3 min, **44.004(b)**. Let oil phase sep. 1 min, and slowly fill flask with 40% isopropanol by letting liq. flow down stoppered rod while top of stopper is maintained just above flask contents. After filling flask, gently stir settled plant material with stoppered rod 5–10 sec. Let stand undisturbed 5 min and immediately trap off. Add 25 mL light mineral oil, **44.003(y)**, stir gently by hand 30 sec, and let stand 10 min. Repeat trapping. Wash flask neck thoroly with isopropanol and transfer washings to beaker contg trappings. Filter onto ruled paper and examine microscopically.

##### 44.074 Alternative Method for Sausages (37) Official First Action

(Caution: See **51.056**.)

(a) *Bulk or link sausages that are easily teased apart*.—Weigh 225 g sample into 1.5–2 L beaker. Add 1 L 10% Tergitol soln, **44.003(jj)(1)**, and 75 × 12 mm stirring bar; stir mag., 5 min, or until thoroly dispersed. Sieve portionwise on No. 230 sieve, **44.002(u)**. Form filter paper around 1 L beaker, **44.002(k)**, moistening with H<sub>2</sub>O to make paper pliable. Insert paper into buchner, 91 mm id plate, wash with isopropanol, and aspirate to near dryness.

Wet residue on sieve with isopropanol and quant. transfer to filter paper cup with isopropanol. Add enough isopropanol to cover residue and, after 1 min, apply vac. until dripping ceases. Transfer paper cup to 1 L beaker and add 300 mL CHCl<sub>3</sub>. Boil on steam bath 5 min. Let soln cool few min, lift paper, drain, and transfer to 300 mL fresh CHCl<sub>3</sub>. Repeat 5 min boil and drain. Return paper cup to buchner and apply vac. until dripping ceases. Cover residue with isopropanol for 1 min, reapply vac., and continue to aspirate 5 min. Quant. transfer residue to 2 L trap flask, using 40% isopropanol, and proceed as in **44.073(c)**, second sentence.

(b) *Link sausages compressed into casings so that product is not easily teased apart*.—Remove casing and weigh 225 g sample into 2 L beaker. Add 1 L 10% Tergitol soln, **44.003(jj)(1)**, and stir with mech. stirrer, **44.002(f)**, at max. speed at which no splashing occurs, 15 min or until thoroly dispersed. Proceed as in (a), beginning, "Sieve portionwise on No. 230 sieve, . . ."

## FRUITS AND FRUIT PRODUCTS

*Apple Butter***44.075 Rot—Official Final Action**

Make mold count as in **44.096**, after first dilg 50 mL well-mixed sample with 50 mL stabilizer soln, **44.003(gg)**.

**44.076 Light Filth—Official First Action**

Weigh 100 g well mixed sample into 400 mL beaker, add enough cold H<sub>2</sub>O to obtain uniform dispersion, and transfer to 2 L trap flask, **44.002(i)(3)**. Add 35 mL heptane, **44.003(u)**, and stir. Add cold H<sub>2</sub>O to bring heptane into neck of flask. Let stand 30 min with occasional stirring, and trap off. Transfer trapping to second flask contg ca 1 L H<sub>2</sub>O, stir, fill flask with H<sub>2</sub>O, and let stand 15 min with occasional stirring. Trap off, filter onto ruled paper, and examine paper microscopically.

★ *Dried Apple Chops—Official First Action* ★**44.077 Heavy Filth**

See **40.069**, 11th ed.

**44.078 Insects and Light Filth**

See **40.070**, 11th ed.

*Canned Fruits and Juices***44.079 Geotrichum Mold (1)—Official First Action**

(Applicable to products where mold is not masked by large amts of tissues)

Det. net wt (g) of can contents. Drain contents 3 min on 8" No. 8 sieve, **44.002(u)**, in pan. Remove fruit from sieve with spoon and discard. Wash can and sieve with ca 300 mL H<sub>2</sub>O from wash bottle, saving liq. and washings. Quant. transfer combined liq. and washings onto 5" No. 16 sieve resting in 2 L beaker. Wash residue on sieve with ca 50 mL H<sub>2</sub>O, and discard residue. Quant. transfer combined liq. and washings onto 5" No. 230 sieve, tilted at ca 30° angle, and discard liq. and washings. Wash tissue to lower edge of sieve with H<sub>2</sub>O.

With wash bottle and spatula, transfer residue from sieve to 50 mL graduated thick-walled centr. tube with min. vol. H<sub>2</sub>O. For vols ≤ 10 mL, use (a); > 10 mL but ≤ 30 mL, use (b); and > 30 mL, use (c).

(a) Dil. to 10 mL. Add 1 drop crystal violet staining soln, **44.003(p)**, and mix thoroly. Add 10 mL stabilizer soln, **44.003(gg)**, to bring total vol. to 20 mL. Proceed as in (d).

(b) Dil. to 40 mL. Add 3 drops crystal violet soln. Mix well. Centr. ca 6 min at ca 2200 rpm, **44.082**. Decant and discard supernate. Bring vol. of sediment in centr. tube to nearest 5 mL graduation by adding H<sub>2</sub>O. Note combined vol. of sediment and H<sub>2</sub>O, add equal vol. stabilizer soln, and mix thoroly but gently. Record mL total vol. of mixt. in centr. tube, (V). Proceed as in (d).

(c) Transfer to 100 mL g-s graduate. Dil. to 100 mL and mix well. Quickly pour off two 25 mL aliquots into sep. centr. tubes and proceed as in (b). Keep final vols equal; V = sum of vol. in both tubes.

(d) Pipet 2 sep. 0.5 mL portions, using pipet, **44.002(s)**, and apply as streak ca 4 cm long to each of 2 rot fragment counting slides, **44.002(t)** (4 in case of (c)). With transmitted diffused light, examine each slide at 30–45×, using stereoscopic microscope. Count recognizable *Geotrichum* mycelial fragments (usually ≥ 3

characteristic hyphal branches) on each of 2 slides. Record total on 2 slides.

(e) *Calculations*.—Calc. mycelial fragments/500 g product:  $N = [S \times V \times 500]/W$ , where S = total mycelial fragments on 2 slides; V = mL total vol. of mixt. in centr. tube; and W = net wt product sample in g.

*Blackberries, Blueberries, Loganberries, Raspberries, and Cherries; Fresh, Canned, and Frozen***44.080 Rot in Blackberries, Raspberries, and Other Drupelet Berries—Official Final Action**

(a) *Frozen with or without sugar*.—Pulp berries thru cyclone, **44.002(h)**, and mix thoroly. Mix 25 g pulp with 50 mL stabilizer soln, **44.003(gg)**. Make mold count as in **44.096**.

(b) *Frozen in sirup, canned in sirup or water*.—Drain berries 2 min on No. 20 sieve. Pulp, dil., and make mold count as in (a).

**44.081 Maggots in Blueberries and Cherries—Procedure**

Weigh 567 g (20 oz) fresh fruit or use No. 2 can of processed fruit. Add 100 mL H<sub>2</sub>O to fresh or frozen fruit and boil 5 min, with frequent stirring. (Omit this step with canned fruit.) Transfer 1 cm layer of fruit to No. 6 sieve immersed in pan of H<sub>2</sub>O. Shake loose maggots and debris thru sieve. Carefully mash fruit under H<sub>2</sub>O to rub any remaining maggots thru sieve. Rinse and discard any pulp and seeds. Repeat process with another portion of fruit.

After all fruit is screened, transfer mixt. to black-bottom pan. (With cherries, transfer first to No. 6 sieve resting in ca 3 cm H<sub>2</sub>O, shake sieve until maggots drop thru, and discard pulp on sieve.) Slowly decant H<sub>2</sub>O and pulp from pan. Add more H<sub>2</sub>O and repeat decantation. Pick out and count maggots by examination of contents of pan. Transfer contents of this pan to white-bottom pan and count maggots in pan.

*Citrus and Pineapple Juices, Canned, Single Strength***44.082 Mold Count—Official Final Action**

Pour contents of can into beaker and mix thoroly by pouring back and forth between beaker and can ≥ 12 times. After mixing, transfer 50 mL juice to graduated 50 mL conical-bottom centr. tube. Centr. 10 min at 2200 rpm, using International type SB, size 1 centr., (Damon/IEC Div., 300 Second Ave, Needham Hts, MA 02194) with 8-place No. 240 head (distance from center of centr. head to center of cups (at rest) is 5¼"), or other centr. giving equiv. centrifugal force as computed by following formula:  $N_1^2 r_1 = N_2^2 r_2$ , where N = rpm, and r = radius of centr. arm. Check speed with tachometer, since rheostat does not necessarily indicate speed in rpm.

Spontaneously let centr. come to complete stop before removing tubes and read vol. sediment in centr. tube. Remove tube and decant supernate without disturbing sediment. With pineapple juice, add 0.5 mL HCl (to dissolve oxalate crystals). Add H<sub>2</sub>O to tube to bring level to 10 mL mark and then add 5 mL stabilizer soln, **44.003(gg)**. Thoroly mix sediment, H<sub>2</sub>O, and stabilizer soln and pour into small beaker. Mix by pouring back and forth between beaker and tube ≥ 6 times. Stir mixt. thoroly in beaker and proceed as in **44.096**. In addn to checking microscopic fields, indicate those fields positive due to *Geotrichum candidum*.

**44.083 Fly Eggs and Maggots—Official First Action**

Filter 250 mL thoroly mixed sample thru buchner fitted with 10XX bolting cloth, **44.002(e)** (wire mesh screen under bolting

★ Surplus method—see inside front cover.

cloth facilitates filtration). Pour juice slowly to avoid accumulation of excess pulp on cloth (2 or 3 cloths may be necessary). Examine filters microscopically.

#### 44.084 Light Filth—Official First Action

To 250 mL juice in 2 L trap flask add 15 mL castor oil, **44.003(l)**, and fill with enough hot H<sub>2</sub>O (ca 70°), stirring vigorously, to bring oil layer into neck of flask. Let stand 30 min. Trap off, filter, and examine.

#### Cranberry Sauce

#### 44.085 Mold—Official Final Action

(a) *Strained sauce*.—Immerse unopened can of sauce in boiling H<sub>2</sub>O bath 30–45 min to facilitate breaking gel. Remove can from bath and open carefully to avoid loss of sauce thru sudden release of pressure. Transfer contents into beaker (1 L for No. 2 can). Stir sauce to break gel. (Slow-speed mech. mixer (350–450 rpm) may be used.) Thoroughly mix 50 g stirred sauce with 50 g stabilizer soln, **44.003(gg)**. Make mold count of mixt. as in **44.096**.

(b) *Whole sauce (seeds and skins included)*.—Pulp contents of container (if considerably >1 lb (500 g), such as No. 10 can, remove well-mixed aliquot of 1 lb) thru cyclone to remove skins and seeds, and prep. homogeneous pulp. Mix 50 g of this pulp with 50 g stabilizer soln, **44.003(gg)**. Make mold count as in **44.096**.

#### Fig and Fruit Paste

#### 44.086 Light and Heavy Filth (38)—Official First Action

(a) *Light filth*.—Weigh 100 g paste into 1 L beaker. Add 400 mL boiling H<sub>2</sub>O and mag. stirring bar. Boil on mag. stirrer-hot plate, **44.002(p)**, until all lumps are disintegrated. Wet sieve mixt. on 8" No. 140 sieve, **44.002(u)**, with hot tap H<sub>2</sub>O to remove fine and sol. material. Transfer residue from sieve to 2 L trap flask, **44.002(i)(3)**, with H<sub>2</sub>O. Add H<sub>2</sub>O to bring vol. to ca 900 mL, and ext twice with 35 and 25 mL kerosene, **44.003(x)**, as in **44.004(a)**. Examine papers microscopically as in **44.004(f)(1)** and (g).

(b) *Heavy filth*.—Empty remaining trap flask contents and rinsings onto 8" No. 140 sieve. Wet sieve with hot tap H<sub>2</sub>O to remove kerosene as completely as possible. Transfer material from sieve to 1 L beaker and add hot H<sub>2</sub>O to ca 400 mL. Boil vigorously 15 min, frequently adding 10% Na<sub>2</sub>EDTA soln to keep pH ca 8. (Check with pH paper.) Transfer hot mixt. to 8" No. 140 sieve. Wet sieve until seeds are completely sepd from fig tissue. Return residue on sieve to the 1 L beaker. Add H<sub>2</sub>O to ca 300 mL, swirl, and quickly decant suspended fig tissue and filth elements onto ruled paper in Hirsch funnel, retaining seeds in beaker. Add H<sub>2</sub>O and repeat decanting, changing paper as necessary. Examine papers for heavy filth elements at ca 30×.

#### 44.087 Alternative Method for Light Filth (39) Official First Action

Weigh 100 g paste into 1 L beaker. Break paste into small lumps. Add 400 mL boiling H<sub>2</sub>O and mag. stirring bar. Boil and stir on mag. stirrer-hot plate, **44.002(p)**, until all lumps are disintegrated. Wet-sieve mixt. on 8" No. 140 sieve, **44.002(u)**, with hot tap H<sub>2</sub>O to remove fine and sol. material. Transfer residue from sieve to 2 L trap flask, **44.002(i)(3)**, with H<sub>2</sub>O. Add H<sub>2</sub>O to bring vol. to ca 900 mL, add 35 mL kerosene, **44.003(x)**, and ext as in **44.004(a)**. Make second extn with 25 mL kerosene.

If trapped material is relatively free of plant tissue, filter on ruled paper. Examine microscopically for whole and equiv.

insects only, as in **44.001(c)(1)**. Det. insect head count for fig paste from number of whole or equiv. forms of lepidoptera and coleoptera.

If trapped material contains excessive plant tissue, transfer with ca 150 mL H<sub>2</sub>O to percolator, **44.002(i)(2)**, contg ca 250 mL H<sub>2</sub>O. Fill percolator to within 5 cm of top, let kerosene layer sep., and drain slowly to 250 mL mark. Repeat refill and drain cycle if necessary. Drain remaining liq. into original beaker, rinsing percolator alternately with H<sub>2</sub>O and acetone; filter and examine as above.

#### Jam and Jelly

#### 44.088 Light Filth—Official First Action

(a) *Jam*.—Empty contents of jar into dish and mix thoroly. Weigh 100 g into beaker, add 200 mL H<sub>2</sub>O (ca 50°), transfer to 1 L trap flask, **44.002(i)(3)**, add 10 mL HCl, and boil ca 5 min. Cool to room temp., add 25 mL heptane, **44.003(u)**, and stir thoroly. Trap off, filter, and examine microscopically.

(b) *Jelly*.—Empty contents of jar into dish and mix thoroly. Weigh 100 g into beaker and add 300–400 mL hot H<sub>2</sub>O; warm beaker, with stirring, until jelly dissolves, filter, and examine microscopically.

When so-called "jellies" contg small amts of fruit tissue will not filter thru paper, proceed as in (a).

#### Raisins

#### 44.089 Light Filth (40)—Official First Action

(Caution: See **51.040** and **51.056**.)

Add 500 mL CHCl<sub>3</sub> to 225 g sample in 1 L beaker and boil on steam bath 10 min, keeping CHCl<sub>3</sub> vol. at ca 500 mL. Decant CHCl<sub>3</sub>, holding back raisins with glass rod, onto 7.5 cm ruled filter paper in Hirsch funnel. Retain paper. Repeat 10 min CHCl<sub>3</sub> boil and decant. Using H<sub>2</sub>O, wash filter retainings from paper back into beaker contg raisin tissue. Bring vol. in beaker to 700 mL with hot H<sub>2</sub>O (55–70°) and rehydrate in steam bath 30 min. Sieve portionwise onto 8" No. 8 sieve nested in 8" No. 140 sieve, **44.002(u)**. Thoroughly wash each portion with stream of hot H<sub>2</sub>O while gently rubbing raisins over sieve with fingers. Microscopically examine any decomposed raisins for fly eggs and maggots.

Wet retainings on No. 140 sieve with 25% isopropanol, transfer to 2 L trap flask, **44.002(i)(3)**, with 25% isopropanol, and bring vol. to 1 L. Add 70 mL HCl and mag. stirring bar to flask, heat to boiling, and continue for 10 min, slowly stirring on mag. stirrer-hot plate, **44.002(p)**. Cool to <25° in cold H<sub>2</sub>O bath. Add 40 mL flotation oil (mix kerosene, **44.003(x)**, and mineral oil, **44.003(y)**, (1+2)) and stir mag., **44.004(b)**, 5 min. Let stand 1 min after gentle 10–15 sec stir with stoppered rod (see **44.004(a)**). Fill with deaerated 25% isopropanol by slowly running alcohol down rod onto top of stopper maintained ca 3 mm above liq. Let stand 15 min, gently stirring mixt. 2–3 times during first 10 min. Trap; filter first and second extns sep. Add 25 mL flotation oil and gently hand stir 1 min. Let stand 1 min; gently disturb oil-alcohol interface with several up-and-down strokes of stoppered rod to cause fine plant material to settle. Let stand 10 min. Perform second trapping. Thoroughly wash flask neck with isopropanol. Pour trappings onto ruled filter paper and examine at 30×. If second extn is difficult to filter, pour onto No. 230 sieve, **44.002(u)**, and wash twice alternately with undil isopropanol and hot H<sub>2</sub>O. Wash sieve retainings into 400 mL beaker with hot H<sub>2</sub>O and add 7 mL HCl/100 mL H<sub>2</sub>O. Boil 10 min and pour onto ruled filter paper.

**Strawberries (Frozen)****44.090 Mold—Official Final Action**

Pulp thawed berries thru cyclone and mix thoroly. (Pour juice thru cyclone last.) If necessary, remove air bubbles with suction or by mixing ca 100 g pulp with 3–5 drops *capryl alcohol*. Again mix thoroly and make mold count as in **44.096**.

**Acid-Insoluble Residue (Soil) (41)****Official Final Action**

(Applicable to frozen fruits and vegetables)

**44.091****Determination**

Remove frozen sample from container. Place in weighed plastic bag, reweigh, and seal tightly with rubber band. Thaw sample by immersing bag in hot H<sub>2</sub>O and transfer contents to high-speed blender, washing inside of bag. Blend until sample is disintegrated and transfer to 2 L beaker. Nearly fill beaker with H<sub>2</sub>O and mix contents thoroly by swirling. Let stand 10 min and decant supernate into second 2 L beaker. Refill first beaker with H<sub>2</sub>O and repeat mixing. Fill second beaker with H<sub>2</sub>O and mix by swirling. After 10 min, decant second beaker into third and first into second. Continue operation, decanting from third beaker into sink until vegetable material is washed from sample. If many seeds settle, float them off with hot 15% NaCl soln, increasing NaCl concn if necessary to complete flotation. Remove NaCl residue with hot H<sub>2</sub>O. Collect mineral residue from the 3 beakers on ashless filter paper, and discard filtrate. Ignite paper in weighed porcelain crucible over medium Bunsen flame and place in furnace 1 hr at ca 600°. Cool, add 5 mL HCl, and heat to bp. Cool, add 10 mL H<sub>2</sub>O, and reheat to bp. Filter and wash free from acid. Ignite, ash as before, and weigh to det. acid-insol. residue. Calc. % insol. residue = wt acid-insol. residue (g) × 100/net wt sample (g).

**SUGARS AND SUGAR PRODUCTS****Candy****44.092 Filth—Official First Action**

(a) *In hard candy, gum drops, gum, starch, or pectin-base candies.*—Dissolve in boiling HCl (1+70), filter thru rapid paper on Hirsch funnel, and examine microscopically.

(b) *In hard candy difficult to filter by (a) (e.g., licorice candy).*—Proceed as in (c).

(c) *All water-insoluble candy except those containing confectioners corn flakes, wheat bran, or other cereal fillers, and those whose major constituent, excluding chocolate coating, consists primarily of finely ground nutmeats (e.g., peanut butter, almond paste, etc.).* (42)—Weigh 225 g sample into 1.5–2 L beaker. Add 1 L 5% soln of Tergitol, **44.003(jj)**(1), and heat in steam bath 10 min. Stir 5–10 min on mag. stirrer-hot plate. Sieve portionwise on No. 230 sieve, **44.002(u)**. If residue on sieve is small, transfer directly to ruled filter paper; otherwise, transfer quant. to 2 L trap flask, using 40% isopropanol. Bring vol. to 1 L with 40% isopropanol and add 50 mL HCl. Gently stir on mag. stirrer-hot plate while heating to full boil. Immediately transfer flask to cool stirring unit and add 40 mL light mineral oil, **44.003(y)**. Stir mag., **44.004(b)**, 2 min. Let stand 1 min; then slowly fill flask with 40% isopropanol by running liq. down stoppered rod while top of stopper is maintained just above liq. After filling flask, gently stir settled plant material 5–10 sec with stoppered rod. Let stand undisturbed 2 min and immediately trap off. Add 25 mL light mineral oil, stir by hand gently 30 sec, and let stand 10 min. Repeat trapping. Wash flask neck thoroly with isopropanol and

transfer washings to beaker contg trappings. Filter onto ruled paper and examine microscopically.

(d) *Water-insoluble candies containing confectioners corn flakes, wheat bran, or other cereal fillers, and those whose major constituent, excluding the chocolate coating, consists primarily of finely ground nutmeats (e.g., peanut butter, almond paste, etc.).* (42)—[Caution: See **51.011**, **51.040**, and **51.056**.] Proceed as in (c) thru sieving on No. 230 sieve. Wash residue on sieve with isopropanol. Form filter paper around 600 mL beaker, **44.002(k)**, moistening with H<sub>2</sub>O to make paper pliable. Insert paper into 91 mm buchner, wash with isopropanol, and aspirate to near dryness. Quant. transfer residue on sieve to filter paper cup with isopropanol and add enough isopropanol to cover residue. After 1 min, apply vac. until dripping ceases. Place paper cup contg sieved residue in 1 L beaker, add 200 mL CHCl<sub>3</sub>, and boil 5 min on steam bath. After few min of cooling, lift paper, drain, and transfer to 200 mL fresh CHCl<sub>3</sub>. Repeat 5 min boil and drain. Return paper cup to buchner and apply vac. until dripping ceases. Cover residue with isopropanol 1 min, reapply vac., and continue to aspirate 5 min after visible dripping ceases. Proceed as in (c), beginning with "... transfer quant. to 2 L trap flask, using 40% isopropanol." Continue as in (c), except after bringing contents of flask to full boil, cool to room temp. in cold H<sub>2</sub>O bath, and use flotation liq., **44.003(s)**, in place of mineral oil.

(e) *In chocolate candy coating.*—Heat 400 mL CH<sub>2</sub>Cl<sub>2</sub> in 800 mL beaker to 30–35° and keep at this temp. Place portion of candy in wire basket (ca 8 cm diam. × 3 cm high) made from No. 8 screen and with wire handles. Move basket up and down thru CH<sub>2</sub>Cl<sub>2</sub> until chocolate coating dissolves. Rinse each candy center with fine stream of CH<sub>2</sub>Cl<sub>2</sub> from wash bottle and save center. Repeat with balance of sample. Stir CH<sub>2</sub>Cl<sub>2</sub>-chocolate suspension and pour thru No. 140 sieve. Transfer residue from sieve to filter paper and examine microscopically. Examine candy centers by appropriate method, (a), (b), (c), or (d).

**Chewing Gum****44.093 ★ Filth—Procedure ★**

See **44.082**, 11th ed.

**Sirups, Molasses, and Honey****44.094 Filth—Official First Action**

(a) Mix sample thoroly and dissolve 200 g in 200 mL hot H<sub>2</sub>O acidified with 5 mL HNO<sub>3</sub>. Filter at once thru rapid paper in Hirsch funnel. Wash with min. amt of hot H<sub>2</sub>O and examine microscopically.

(b) *Alternative method.*—Dissolve 200 g in 500 mL hot H<sub>2</sub>O. Filter at once thru 10XX bolting cloth in Hirsch funnel. Wash with min. amt of hot H<sub>2</sub>O and examine microscopically.

**Sugars****44.095 Filth—Official First Action**

Dissolve 100 g sample in ca 200 mL hot H<sub>2</sub>O. Boil, and filter at once thru rapid paper in Hirsch funnel. Examine microscopically.

**VEGETABLES AND VEGETABLE PRODUCTS****Tomato Products (Not Dehydrated)****44.096 Molds (43)—Official Final Action**

In making mold counts of tomato products, use juice as it comes from container. For catsup, place 50 mL stabilizer soln,

★ Surplus method—see inside front cover.

**44.003(gg)**, in 100 mL graduate, add 50 mL well mixed catsup sample by displacement, and mix thoroly. In case of puree and paste, add H<sub>2</sub>O to make mixt. with tomato sol. solids content that gives refractive index of 1.3448–1.3454 at 20° (1.3442–1.3448 at 25°). Add 2–6 drops capryl alcohol to each 100 mL mold count prepn to reduce or eliminate air bubbles on Howard mold counting slide.

Clean Howard cell, **44.002(o)(1)**, so that Newton's rings are produced between slide and cover glass. Remove cover and with knife blade or scalpel, place portion of well mixed sample upon central disk; with same instrument, spread evenly over disk, and cover with glass so as to give uniform distribution. Use only enough sample to bring material to edge of disk. (It is of utmost importance that portion be taken from thoroly mixed sample and spread evenly over slide disk. Otherwise, when cover slip is put in place, insol. material, and consequently molds, may be more abundant at center of mount.) Discard any mount showing uneven distribution or absence of Newton's rings, or liq. that has been drawn across moat and between cover glass and shoulder.

Place slide under microscope and examine with such adjustment that each field of view covers 1.5 sq mm. (This area, which is essential, may frequently be obtained by so adjusting draw-tube that diam. of field becomes 1.382 mm. When such adjustment is not possible, make accessory drop-in ocular diaphragm with aperture accurately cut to necessary size. Diam. of area of field of view can be detd by use of stage micrometer. When

instrument is properly adjusted, vol. of liq. examined per field is 0.15 cu mm.) Use magnification of 90–125×. In those instances where identifying characteristics of mold filaments are not clearly discernible in std field, use magnification of ca 200× (8 mm objective) to confirm identity of mold filaments previously observed in std field. See Figs. **44:06–44:08**.

From each of ≥2 mounts examine ≥25 fields taken in such manner as to be representative of all sections of mount. Observe each field, noting presence or absence of mold filaments and recording results as pos. when aggregate length of ≤3 filaments present exceeds ⅓ of diam. of field. Calc. proportion of pos. fields from results of examination of all observed fields and report as % fields contg mold filaments.

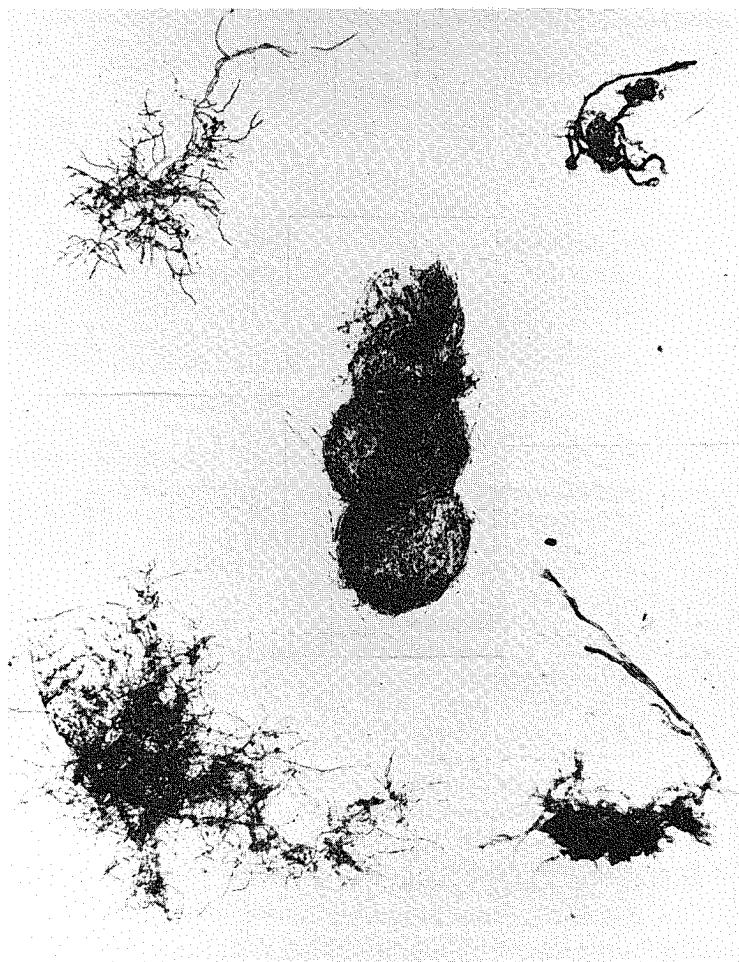

**44.097 ★ Yeasts and Spores—Official Final Action ★**

See **40.086**, 11th ed.

**44.098 Rot in Canned Tomatoes—Official Final Action**

Drain contents of can 2 min on No. 2 sieve. For containers of <3 lb net wt, use 8" diam. sieve; for containers of ≥3 lb net wt, use 12" sieve. Examine drained tomatoes and record number and size of any rotten portions present. Pass drained tomatoes thru laboratory cyclone, **44.002(h)**. Make mold counts on both drained juice and pulped tomatoes as in **44.096**.

★ Surplus method—see inside front cover.

**FIG. 44:06—Rot fragments from tomato puree. 40×**

**44.099 Rot Fragments in Comminuted Tomato Products (44)—Official Final Action**

Weigh 10 g juice or 5 g catsup or sauce, and transfer with 100 mL H<sub>2</sub>O to 400 mL beaker. In case of puree or paste add H<sub>2</sub>O to make mixt. of tomato sol. solids content that gives refractive index of 1.3448–1.3454 at 20° (1.3442–1.3448 at 25°). Use 5 g mixt. for sample.

Add 10 drops crystal violet soln, **44.003(p)**, stir, and let stain 3 min. Add 200 mL H<sub>2</sub>O and spread evenly over surface of 3" No. 60 sieve. Rinse beaker with 200 mL H<sub>2</sub>O, and pour H<sub>2</sub>O evenly over tomato tissue on sieve. Tilt sieve to ca 30° angle and wash tissue to lower edge with H<sub>2</sub>O. Let tissue drain, and transfer with spatula to bottom of graduated tube ca 12 × 3 cm. Transfer remaining tissue by washing down with H<sub>2</sub>O from dropper and immediately taking up tissue in wash H<sub>2</sub>O before it has run thru sieve. Bring vol. of H<sub>2</sub>O and tissue to 10 mL with H<sub>2</sub>O. Add stabilizer soln, **44.003(gg)**, to bring vol. to 20 mL and mix well. Pipet 2 sep. 0.5 mL portions and spread evenly over 2 counting slides, **44.002(t)**, using pipet, **44.002(s)**. Let material flow slowly onto slide, spreading uniformly in center of slide to cover area ca 6 × 2 cm. Touch lower end of pipet to slide several times to ensure complete removal of material. Blow out last drop if necessary. Examine each slide at 30–45×, using transmitted light. Count number of rot fragments on each of the 2 slides, add results, and multiply by 2 (for 10 g sample) or 4 (for 5 g sample) to obtain number of rot fragments per g juice,

catsup, sauce, or dild puree or paste. Rot fragment is defined as particle of tomato cellular material with one or more mold filaments attached. Some may appear as almost solid masses of mold. See Figs. **44:06–44:08**.

**44.100 Fly Eggs and Maggots—Official First Action**

(a) *Comminuted products*.—Thoroughly mix sample and transfer 100 g to 2 L separator. Add 20–30 mL heptane and shake thoroughly, releasing pressure as necessary. Fill separator with H<sub>2</sub>O in such manner as to produce max. agitation. Place separator in ring stand and let settle; at 15 min intervals during 1 hr, drain 15–20 mL from separator, and gently shake separator with rotary motion to facilitate settling out of fly eggs and maggots. If drained liq. contains seeds, pass it thru No. 10 sieve, and thoroughly rinse seeds and sieve, recovering both liq. portion and rinse H<sub>2</sub>O in beaker. Filter thru 10XX bolting cloth, pretreated and dyed as in **44.002(e)**, in Hirsch funnel. Examine for eggs and maggots at ca 10×. If fly eggs or maggots are found in this examination, continue sepg and draining, as above, addnl hr.

(b) *Canned tomatoes*.—Pulp entire contents of can in such way that min. number of eggs and maggots are crushed or broken. (This may be done by passing material thru No. 6 or No. 8 sieve and adding seeds and residue remaining on sieve to pulp.)

Place 500 g of the well mixed pulped tomatoes in 6 L separator. Add 125–150 mL heptane, **44.003(u)**, and ca 1 L H<sub>2</sub>O and shake

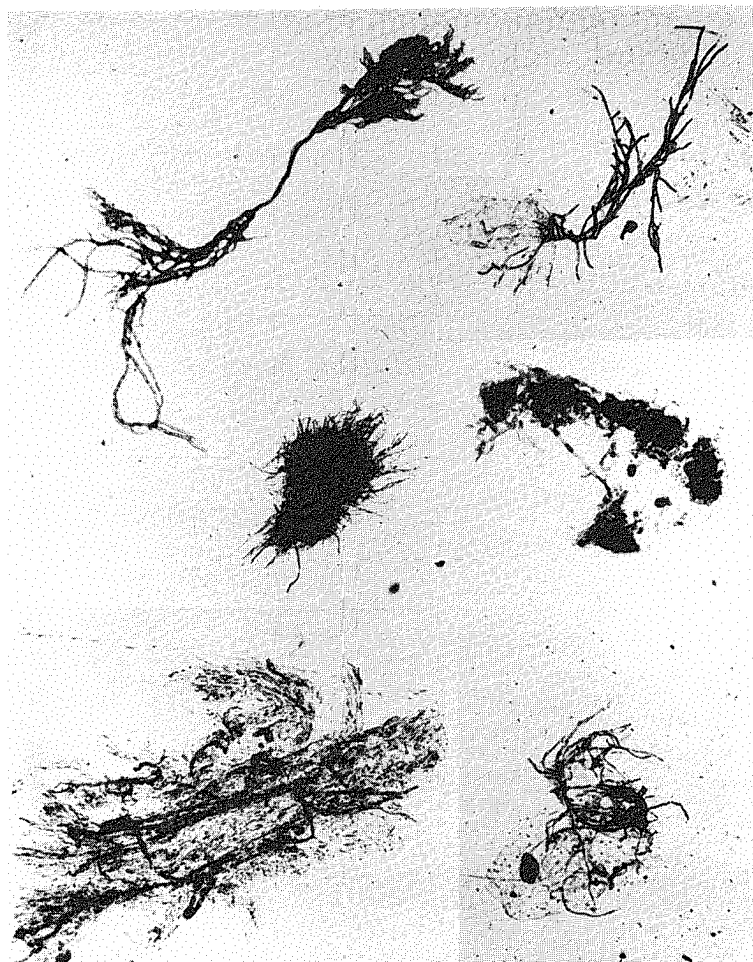

FIG. 44:07—Rot fragments from tomato puree. 40×

vigorously, releasing pressure as necessary. Fill separator with H<sub>2</sub>O. Place separator in ring stand and let layers sep. At 15 min intervals during 1 hr, drain 25–30 mL from bottom of separator, and gently shake separator with rotary motion to facilitate settling of fly eggs and maggots. Each portion may be examined at once or combined with subsequent portions. Pass drained portions thru No. 10 sieve and thoroly rinse seeds and sieve, recovering both liq. portion and rinse H<sub>2</sub>O in beaker. Filter thru 10XX bolting cloth in Hirsch funnel. Examine cloth for eggs and maggots at ca 10×. If fly eggs or maggots are found in this examination, continue sepg and draining, as above, addnl hr.

#### 44.101 Light Filth

(a) *Comminuted products (Official First Action)*.—Place 200 g of any tomato product except paste (where 100 g is used) in trap flask, 44.002(i)(3), with 20 mL castor oil and mix well. Add enough hot tap H<sub>2</sub>O (ca 70°) to fill flask. (At first, bubbles of air tend to bring up tomato tissues, but after several stirrings these begin to settle out, leaving H<sub>2</sub>O layer near oil fairly clear.) Let stand with occasional gentle stirring 30 min; then trap off into

beaker. Wash out neck of flask with heptane to remove adhering castor oil. Add little more hot H<sub>2</sub>O to flask, stir, let stand 10 min, and then trap off again. (Occasionally it may be necessary to transfer trapped-off material to another trap flask and rewash to eliminate tomato tissue.) Filter trapped-off portion; thoroly wash beaker, sides of funnel, and paper with heptane to dissolve oil and speed filtration. Examine paper at 20–30×.

(b) *Canned tomatoes (Procedure)*.—Drain entire can on No. 6 sieve, saving drained juice. (For cans contg <3 lb use 8" sieve; use larger sieve for larger cans or drain and rinse portionwise.) Rinse portion on sieve with hot H<sub>2</sub>O (ca 70°) from wash bottle and transfer drained juice, fragments, and washings to 1 or more 2 L Wildman trap flasks (max. 900 mL/flask; No. 10 cans require ≥2). Bring vol. in flasks to ca 900 mL with H<sub>2</sub>O (70°) and add 20–25 mL castor oil. Tilt flask to ca 45° and mix 1 min with brisk rotary motion (200–250 strokes/min). Avoid splashing thru surface with stopper. Add hot H<sub>2</sub>O to bring oil layer into neck and let stand 30 min with occasional stirring. Trap off into beaker oil-H<sub>2</sub>O layer and any debris that rises. Wash out oil in neck with heptane. Add ca 10 mL hot H<sub>2</sub>O to flask, stir, let stand 10 min, and trap into same beaker. Add 25–30 mL heptane to

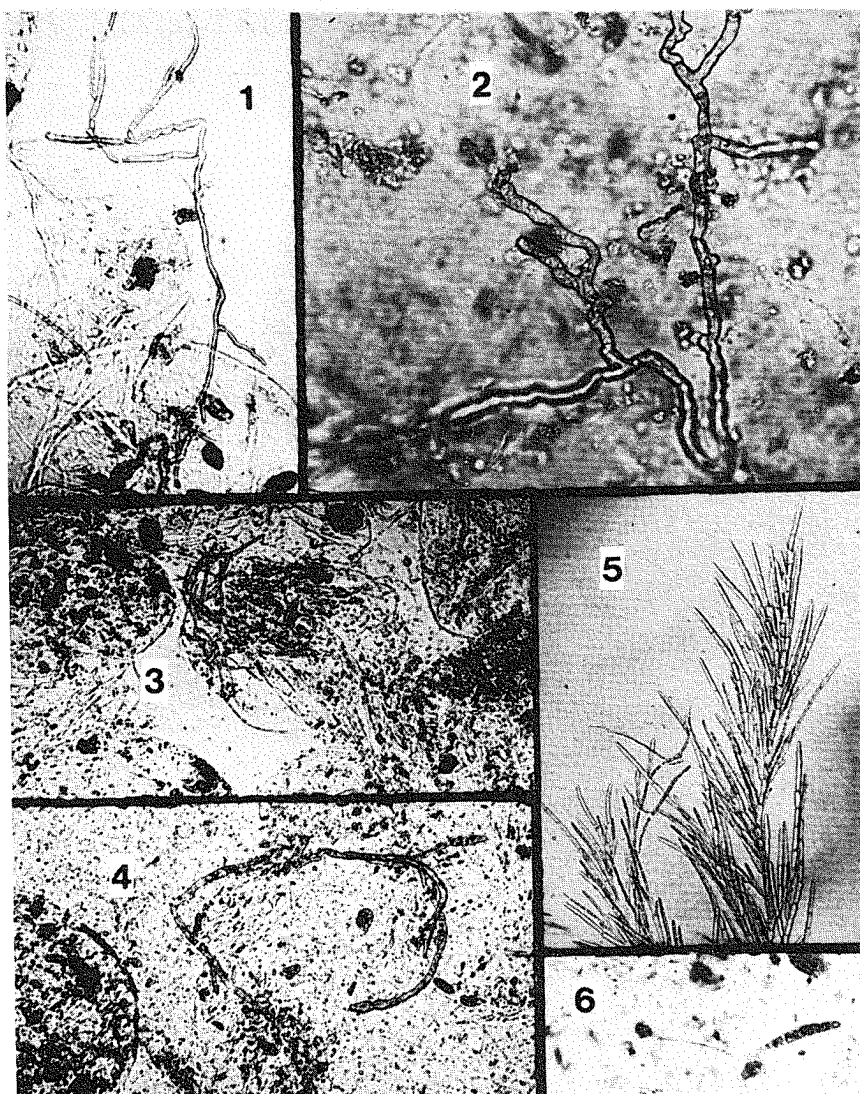

FIG. 44:08—Mold filaments in tomato products (100×). 1, branching mold and tomato cells. 2, coarse mold showing nonparallel and parallel walls, branching, granulation, and blunt tips. 3, very fine mold. 4, mold showing beginning of sporulation at end of hypha. 5, *Geotrichum* mold showing cross walls and feathery appearance characteristic of slimy machinery. 6, *Alternaria* spore with attached hypha.

beaker and stir to dissolve oil. Filter thru paper (use hot H<sub>2</sub>O or heptane if necessary) and examine paper microscopically.

**Tomato Soup, Canned Spaghetti, Pork and Beans, and Other Similar Products Containing Tomato Sauce**

**44.102 Mold—Official Final Action**

(a) *Tomato soup*.—Place unopened can in hot H<sub>2</sub>O and heat until contents are thoroly warmed; then open. Transfer 10 mL thoroly mixed soup to 50 mL centr. tube and add 3 mL NaOH soln (1+1). If starch is absent, omit the NaOH. Stir until starch dissolves and tissues clear. Add enough H<sub>2</sub>O to fill tube, and centr. (Time required to centr. sample varies greatly. With centr. arm length of 5¼" and speed of ca 1600 rpm, ca 20 min is required for av. sample. In heavy soups, gelatinizing of much starch sometimes interferes with proper settling out of solids during centrfg. If liq. remains cloudy, it may be necessary to discard sample and start again by adding 3 mL NaOH soln to only 5 mL soup.) When supernate is clear, pour off; if not entirely clear, check supernate for mold before discarding. Add enough H<sub>2</sub>O to residue in tube to bring to original vol. of soup, mix, and count mold as in **44.096**.

(b) *Tomato sauce in pork and beans, spaghetti, ravioli, chili con carne, tamales, etc.*—Place unopened can in hot H<sub>2</sub>O and heat until contents are thoroly warmed. Open can and transfer contents onto No. 6 sieve. Drain until major portion of liq. passes thru. (With some products, sauce runs thru at once, but in case of some beans and spaghetti, ≥10 min may be required.) Mix sauce thoroly, place 10 mL in centr. tube, and proceed as in (a). Use care in counting products contg meat so as not to confuse mold filaments and muscle fibers that superficially resemble each other; muscle fibers are usually much thicker and striations are often visible.

(c) *Tomato sauce packing medium on fish*.—Place unopened can in hot H<sub>2</sub>O (ca 90–95°) until contents are thoroly warmed. Open can and drain contents on No. 6 sieve until major portion of sauce and oil passes thru. Mix liq., place up to 50 mL in 50 mL centr. tube, and centr. as in (a). Record vol. of lower oil-free sauce layer, and discard oil and part of mold-free aq. layer. Add H<sub>2</sub>O to bring to recorded vol., mix, and count mold as in **44.096**, removing bits of fish tissue from slide, if necessary, before counting.

(d) *Tomato powder, dehydrated (Official First Action) (45)*.—Weigh 17.0 g thoroly mixed sample into high-speed blender, **44.002(c)**, contg 150 mL H<sub>2</sub>O to produce mixt. equiv. to tomato puree. Blend 30 sec and, with rubber policeman, rub down any material adhering to walls. Rinse walls with 50.0 mL H<sub>2</sub>O to bring total vol. to 200 mL, and blend 1 min. Add 2 drops capryl alcohol to break foam and count mold as in **44.096**.

**Pureed Infant Food**

**44.103 Molds—Official Final Action**

Proceed as in **44.096**. Add ca 0.2 g NaOH to ca 6 g product before counting, and stir thoroly until NaOH is dissolved.

**44.104 Light Filth—Official First Action**

Transfer contents of 2 cans or jars (ca 250 g) of food to 1 L trap flask, **40.002(i)(3)**, previously rinsed with H<sub>2</sub>O. Thoroly mix in ca 20 mL of the oil. Fill with deaerated H<sub>2</sub>O either at room temp. or at 50–70°. Let mixt. stand 30 min, stirring 4–6 times during this period to release filth from layer of food. Trap off and examine microscopically.

Use type of oil and temp. indicated in following table:

Food	Oil	Temp.
All fruits	Light mineral oil	Room
Asparagus		
Beets		
Carrots		
Green beans		
Peas	Light mineral oil	50–70°
Spinach		
Squash	Castor oil	50–70°

**44.105 Fly Eggs and Maggots—Official First Action**

Transfer residue in trap flask, **44.104**, to 2 L separator. Add ca 100 mL heptane, **44.003(u)**, and shake vigorously. Let material settle ca 2 hr, occasionally stirring surface layer to permit any eggs and maggots to settle out. Withdraw ca 200 mL from bottom of separator and filter this material thru 10XX bolting cloth, **44.002(e)**, using several cloths if there is large accumulation of sediment. Examine microscopically at 15–20×

**44.106 Geotrichum Mold in Canned Vegetables and Vegetable Juices—(1)—Official First Action**

See **44.079**.

**Peas and Beans**

**44.107 Weevils—Official First Action**

*Microscopic examination*.—If peas or beans are canned and of normal texture, pour on No. 8 sieve in pan filled with enough H<sub>2</sub>O to stand 2–3 cm above mesh of sieve. Mash peas thru sieve with fingers. After as much as possible of material has been worked thru, remove sieve from pan and shake excess H<sub>2</sub>O back into pan. Transfer material retained on sieve to 2 L beaker. Pour material that passed thru No. 8 sieve onto No. 40 sieve, discarding that which passes thru. Let material on sieve drain few min, and shake lightly to remove free H<sub>2</sub>O from solid material. (If peas are unusually hard, or have tough skins, pass contents of can thru meat or food chopper directly onto No. 40 sieve.) Discard any excess H<sub>2</sub>O passing thru this sieve. Cook dried or frozen peas before maceration.

Add material retained on the No. 40 sieve to the beaker. Add ca 130 mL heptane, **44.003(u)**, to this material and mix thoroly with large spoon. Rinse any material remaining on sieve into beaker with H<sub>2</sub>O. Stir material in beaker and pick out any insects that may rise to top of H<sub>2</sub>O layer. Repeat stirring and searching several times until no more larvae are recovered.

Add enough H<sub>2</sub>O to bring contents of beaker to within 1–2 cm of top. Pick out any larvae visible at surface. Stir again, and let mixt. stand ca 5 min; then skim off heptane and upper part of H<sub>2</sub>O layer with spoon and place in trap flask, **44.002(i)(3)**, previously filled ca ¼ full of H<sub>2</sub>O. Add 90–100 mL heptane to material remaining in beaker, and stir vigorously. Let stand ca 5 addnl min, skim off heptane and upper part of H<sub>2</sub>O layer as before, and add to material already in trap flask.

Fill flask with H<sub>2</sub>O. Trap off as much heptane as possible and filter into Hirsch funnel. Lower stopper into flask, and, to rinse sides of trap flask, apply vac. ca 5 min by fitting large rubber stopper and glass tube over mouth of flask. (As ordinary erlenmeyer collapses under vac. of 20" of Hg (50 cm; 67.7 kPa), use either less vac. or heavy-wall flask.) Release vac., add H<sub>2</sub>O, and trap off. Add trapped-off portion to that already on filter. Examine microscopically.

**Potato Chips****44.108 Filth—Official First Action**

Weigh 100 g sample into 1.5 L beaker. Crush chips into small pieces and cover with pet ether. Let stand ca 5 min and decant thru filter. Add pet ether and decant again thru filter. Let pet ether evap. from chips. Transfer to 2 L trap flask, add 500 mL 60% alcohol, and boil ca 30 min, replacing alcohol lost by evapn. Cool, add 35 mL heptane, **44.003(u)**, mix, let stand ca 5 min, and fill with 60% alcohol. Let stand, trap off twice, and filter as usual. Examine papers microscopically.

**Dehydrated Potato Products****44.109 Light Filth (46)—Official First Action**

Weigh 50 g sample into 1.5–2 L beaker. Add 1 L hot HCl (1+9) and mag. stirring bar. Boil 10 min with gentle stirring on mag. stirrer-hot plate, **44.002(p)**. Sieve portionwise on No. 230 sieve, **44.002(u)**. Wet residue on sieve with 40% isopropanol and transfer quant. to 2 L trap flask, **44.002(i)(3)**, using 40% isopropanol. Bring vol. to 1 L with 40% isopropanol and add 50 mL HCl. Add mag. stirring bar, heat, and boil 10 min with gentle mag. stirring. Immediately transfer flask to cool stirring unit and add 40 mL mineral oil, **44.003(y)**. Stir mag., **44.004(b)**, 3 min. Slowly fill flask with 40% isopropanol by letting liq. flow down stoppered rod while top of stopper is held just above liq. After filling flask, gently stir settled plant material by hand 5–10 sec with stoppered rod. Let stand undisturbed 5 min and immediately trap off. Add 25 mL mineral oil, gently stir by hand 30 sec, and let stand 10 min. Repeat trapping. Wash flask neck thoroly with undild isopropanol and transfer washings to beaker contg trappings. Filter onto ruled paper and examine microscopically.

**Frozen Green Leafy Vegetables****44.110 Light Filth (47)—Official Final Action**

Thaw and accurately weigh 100 g sample. Chop into ca 2.5 cm (1") pieces and mix thoroly. Transfer to 2 L trap flask, **44.002(i)(3)** for collard and mustard greens or beaker for other products. Add 1% *anhyd.*  $\text{Na}_2\text{SO}_4$  soln to cover product to depth of 2.5 cm, cover, and boil 30–40 min. Add  $\text{H}_2\text{O}$  as required to maintain original vol. Remove from heat, add 1%  $\text{Na}_2\text{SO}_4$  soln to ca 1.2–1.4 L, and add 35 mL light mineral oil, **44.003(y)**. Stir mag. 10 min, **44.004(b)**. Proceed as in (a) or (b).

(a) *Percolator method.*—Quant. transfer contents to percolator, **44.002(i)(2)**, and reserve beaker. Stir gently with long glass stirring rod at 5 and 10 min. Let stand *undisturbed* 5 min; then drain to ca 250 mL. Add ca 1 L 1%  $\text{Na}_2\text{SO}_4$  soln, and repeat drain and refill cycles until lower aq. phase is clear and free of suspended material.

After last cycle, drain oil- $\text{H}_2\text{O}$  interface into reserved beaker. Immediately wash sides of percolator with 100–200 mL portions hot tap  $\text{H}_2\text{O}$ , isopropanol or alcohol, and 5% detergent soln, **44.003(q)**, if necessary. Filter thru ruled paper, washing sides of beaker as above and using rubber policeman if needed. Examine paper microscopically.

(b) *Trap flask method.*—After mixing, add trap flask rod and fill flask slowly with 1%  $\text{Na}_2\text{SO}_4$  soln, letting soln run down rod. Let stand 10 min, stirring gently with rod several times during first 5 min. Secure rod above settled debris during last 5 min. Trap as in **44.004(a)**, and rinse neck of flask with  $\text{H}_2\text{O}$ . Add 25 mL light mineral oil and clamp rod above settled debris. Stir mag. 30 sec and repeat trapping. Make final trap after 10 min, rinsing flask neck with alcohol or isopropanol. Filter thru ruled paper and examine microscopically.

**44.111 Acid-Insoluble Residue (Soil) in Frozen Spinach (47)—Official Final Action**

See **44.091**.

**44.112 Light Filth in Canned Leafy Greens (48) Official First Action**

(Applicable to whole or chopped kale, turnip, mustard, and collard greens.)

Drain can contents on No. 8 sieve 2 min and reserve brine. Immediately take 100 g from sieve. If pieces are  $\leq 1$  cm in length, place in 2 L trap flask. Cut larger pieces on small cutting board to this size to avoid interference with mag. stirring. Wash residue from cutting into trap flask with 40% isopropanol. Add 40% isopropanol to fill trap flask to 1 L mark. Add mag. stirring bar (13 × 76 mm). Add 50 mL light mineral oil, **44.003(y)**. Place flask on mag. stirrer, **44.004(b)**. Slowly bring stirrer to max. speed at which stirring bar is just visible at bottom of vortex, avoiding visible or audible splashing. Proper stirring will produce vertical rolling of contents. Stir 5 min, remove flask from stirrer, and let stand 1 min. Add 40% isopropanol down rod to fill flask. Manually stir material in bottom of flask with rotary motion ca 15 sec. Repeat stirring at two 5 min intervals. Raise stirring rod from bottom of flask and clamp. Let stand addnl 10 min and trap off into beaker. Repeat trapping with 35 mL oil, stirring manually 1 min. Filter onto ruled papers.

Filter reserved brine on sep. papers. Examine papers for aphids and other extraneous materials at 10–30X. Det. number of aphids, etc. in 100 g of drained greens and add to this number in proportionate amt of drained liq. calcd as follows:

$$\frac{100 \text{ g sample}}{\text{total g drained wt}} \times \text{total number aphids, etc. in liq.}$$

**44.113 Canned Broccoli—Official First Action**

(a) *Insects.*—Transfer contents of can to pan of suitable size and chop up leaves into pieces 2–5 cm long. Weigh 100 g well mixed sample into 1 L beaker. Add 500–600 mL  $\text{H}_2\text{O}$  and boil 5 min. Pour  $\text{H}_2\text{O}$  and sample into 2 L trap flask, **44.002(i)(3)**. Add 35 mL heptane, **44.003(u)**, and stir thoroly to ensure contact between heptane and all portions of leaves. Fill flask with deaerated  $\text{H}_2\text{O}$ , let stand 30 min, trap off heptane layer, filter, and examine microscopically. Add 40 mL heptane to flask and repeat extrn.

If plant tissue rises to interface, place No. 8 sieve, 6–8" diam., in suitable size evapg dish contg enough  $\text{H}_2\text{O}$  to cover screen ca 1 cm. Pour entrapped heptane from trap flask onto sieve as it is held under the  $\text{H}_2\text{O}$ . Move sieve gently up and down to let insects pass thru into the  $\text{H}_2\text{O}$ . Remove screen and filter contents of dish. Repeat washing to free any insects left on greens on screen, and filter washings. Examine papers microscopically.

(b) *Aphids and Thrips.*—Det. drained wt of contents of canned greens as in **44.098**, reserving drained liquor. Chop drained leaves into pieces 2–5 cm long and weigh 100 g well mixed sample into 1 L beaker. Add  $\text{H}_2\text{O}$  to cover adequately, followed by 25 g neut.  $\text{Pb}(\text{OAc})_2 \cdot 3\text{H}_2\text{O}$  crystals (or equiv. soln of  $\text{Pb}(\text{OAc})_2$ ) and 10 mL HOAc. Boil on hot plate 5–10 min, cool, and transfer to 2 L trap flask, **44.002(i)(3)**. Add 35 mL heptane, **44.003(u)**, and mix thoroly to ensure contact between heptane and all portions of leaves. Fill flask with deaerated  $\text{H}_2\text{O}$ . Let settle few min for most of vegetable matter to sink to bottom. To force any tissue that rises (probably held by entrapped globules of heptane) to sink, pivot lower end of trap-rod on bottom of flask, and rotate upper part of rod around neck of flask to knock globules from vegetable tissue without at same time breaking interface and

thus rewetting tissue with heptane. Again let flask stand, trap off heptane layer, and filter.

Re-ext with 20 mL heptane, trap off, and filter (usually possible on same paper). Det. total number of aphids or other light filth in entire liquor drained from can by subjecting it to heptane flotation as usual. (Normally liquor does not present any difficulty and use of  $\text{Pb}(\text{OAc})_2$  is unnecessary.) Count total number of aphids and thrips including parts contg heads. Count cast skins and other insects sep. Calc. on basis of 100 g of drained material.

#### 44.114 Heavy Filth—Official First Action

Recover heavy filth such as soil, maggots (especially those of spinach leaf miner), and rodent excreta, that sink to bottom of trap flask, as follows: Transfer contents of trap flask, **44.113(a)** or **(b)**, by rinsing with  $\text{H}_2\text{O}$  into 4–6 L pail. Add  $\text{H}_2\text{O}$  to pail until ca full. Stir, let stand short time, and decant ca half pail contents. Refill pail with  $\text{H}_2\text{O}$  and repeat operation until most of floating greens are removed. Wash heavy filth left in pail into black shallow pan and examine visually for larvae, stones, and other debris, picking material out with forceps.

#### Sauerkraut

#### 44.115 Filth—Official First Action

Use entire contents of container of <2 lb (900 g). Use 24 oz (700 g) well mixed sample from larger containers. Wash small portion at time on nested 8" Nos. 8, 20, and 140 sieves, **44.002(u)**. Wash material remaining on No. 20 sieve with washings passing thru No. 140 sieve. Transfer material on No. 20 sieve to paper and examine at ca 10 $\times$  for whole insects or large body parts. Transfer material remaining on No. 140 sieve to paper and examine microscopically.

#### Mushrooms

#### Canned, Fresh, Frozen, Freeze-Dried, and Dehydrated (49) Official First Action

(For maggots, mites, etc.)

#### 44.116

#### Insects

(a) *Canned mushrooms*.—Pour contents of can evenly over weighed No. 8 sieve. Use 8" sieve, for containers of net wt <3 lb (1.4 kg) and 12" sieve for larger containers. Drain 2 min, and reweigh sieve and mushrooms to det. drained wt mushrooms.

Rinse container, and use rinsings and several addnl portions  $\text{H}_2\text{O}$  to rinse mushrooms on sieve (ca 500 mL total). Combine drained liq. with rinsings and filter thru ruled paper. Examine residue on paper microscopically and det. total number of maggots in liq.

Place 100 g drained mushrooms in high-speed blender, **44.002(c)**. Add 300 mL  $\text{H}_2\text{O}$  and blend 30–45 sec at ca 3000 rpm. Attain proper speed quickly by using setting of 1.5–2 $\times$  final setting on variable transformer for few sec at start. Fragments of mushrooms after blending should be  $\leq 3$ –5 mm long. Pour mixt. into nested set of 8" Nos. 20, 40, and 140 sieves, **44.002(u)**. Rinse tissue 2–3 min with spray of tap  $\text{H}_2\text{O}$  from aerator, **44.002(a)**. Discard material on No. 20 sieve. Transfer residue from No. 40 sieve to 600 mL beaker with  $\text{H}_2\text{O}$  and bring total vol. to ca 100 mL. Add 5 mL sat. aq. crystal violet soln and heat to bp. Pour stained mixt. into No. 40 sieve. Wash mushroom tissue, and maggots, if any, to edge of sieve and remove excess stain with tap  $\text{H}_2\text{O}$  from aerator. Using wash bottle contg com. 5.25%  $\text{NaOCl}$  soln, and gentle spray of tap  $\text{H}_2\text{O}$  from aerator,

alternately spray tissue with  $\text{H}_2\text{O}$  and  $\text{NaOCl}$  soln until stain has been removed from mushroom tissue. Wash tissue into 600 mL beaker and transfer to ruled paper, using vac. Avoid obscuring maggots with mushroom tissues. (Not more than 2–3 papers should be necessary.)

Transfer residue from No. 140 sieve to 600 mL beaker with  $\text{H}_2\text{O}$  and repeat staining, bleaching, and filtering as above.

Examine papers for maggots and other extraneous materials at 10–30 $\times$ . Maggots are stained dark violet. Det. number of maggots in 100 g drained mushrooms and add to this value the number in proportionate amt of drained liq. calcd as follows:

$(100/\text{total g drained mushrooms}) \times \text{total number of maggots in liq.}$

(b) *Fresh, frozen, freeze-dried, and dehydrated mushrooms*.—

For fresh and frozen mushrooms weigh 170 g sample, and for dried mushrooms weigh 15 g sample, into suitable container, and add enough  $\text{H}_2\text{O}$  to immerse mushrooms. Soften mushroom tissue by soaking several hours or, alternatively, by heating on steam bath or simmering 1½–2 hr as necessary, followed by cooling 30–60 min to fully rehydrate. Quant. transfer contents to high-speed blender and proceed as in (a), beginning "... blend 30–45 sec at ca 3000 rpm."

#### Dried (Not Powdered)

#### 44.117

#### Light and Heavy Filth—Procedure

Thoroughly mix sample and weigh 100 g portion. Transfer mushrooms to trap flask, **44.002(i)(3)**, add  $\text{H}_2\text{O}$ , and let soak several hr, preferably overnight on steam bath, or boil 30 min. Cool to room temp., add 30 mL heptane, **44.003(u)**, and churn contents by hard, rapid pounding of mushrooms against bottom of flask, using vertical movement of rubber plunger. Trap off twice, filter, and examine microscopically.

#### Canned Whole and Cream-Style Corn (50) Official First Action

#### 44.118 Macroscopic and Microscopic Examination

Place 200 g well mixed sample in 1.5 L beaker and add 1 L 40% isopropanol. Bring to bp, stirring mag., **44.004(b)**, add 50 mL mineral oil, **44.003(y)**, and boil and stir 3 min more. Transfer immediately to percolator contg ca 100 mL 40% isopropanol and glass or metal rod for forcing corn thru spout. Retain stirring bar in beaker. Rinse bar with undild isopropanol. Add ca 900 mL 40% isopropanol to beaker, stir, and add to percolator, **44.002(i)(2)**. Reserve beaker. After ca 5 min standing, drain percolator to within 8 cm of bottom onto 8" No. 20 sieve nested in large white enamel tray of ca 2 L capacity. Use rod to force corn thru percolator drain spout. Withdraw rod after removing corn from percolator and wash with small amt of undild isopropanol into reserved beaker. Discard isopropanol collected in tray. Leave sieve in place with retained corn material. Using reserved beaker, add ca 1.5 L hot tap  $\text{H}_2\text{O}$  (50–70°) to percolator. Let phases sep. ca 3 min and make final drain. Discard all but last 5 cm oil-aq. phase. Drain into 600 mL beaker. Wash sides of percolator with alternate isopropanol and  $\text{H}_2\text{O}$  rinses, and collect in same beaker. Add rest of corn from can to corn retained on sieve, sieve portionwise if necessary, and wash with tap  $\text{H}_2\text{O}$  to remove starch and fine particles. Reverse sieve into white enamel tray. Wash corn into tray with forceful spray of  $\text{H}_2\text{O}$  (ca 22°) to 3 cm depth in tray. Let corn settle and examine under  $\text{H}_2\text{O}$  for worm-eaten or rotten kernels and whole worms, heads, or large fragments. Add these to trappings previously obtained from percolator. Tip tray and slowly decant  $\text{H}_2\text{O}$  while carefully observing flowing  $\text{H}_2\text{O}$  for insect fragments. Refill tray with 3 cm  $\text{H}_2\text{O}$  (ca 22°) and repeat decantation, examining closely

for objectionable material. Discard pan contents. Filter beaker contents thru ruled filter paper and examine microscopically. If filtration is impeded by excessive starch material, proceed as in 44.004(d).

### SPICES AND OTHER CONDIMENTS

*Ground Allspice, Anise, Curry Powder, Dill Seed, Fennel, Fenugreek, Poppy Seed, Savory, and Condiments; Heavy Filth Only: Caraway Seed, Cardamon, Celery Seed, Cloves, Coriander, Cumin, Ginger, Mace, Marjoram, Mustard, Oregano, Rosemary, Sage, and Thyme*

#### 44.119 Gross Contamination—Official First Action

Sift 200–400 g ground spice thru No. 20 sieve. Transfer any insects or other filth retained on sieve to suitable dish and examine with Greenough microscope.

#### 44.120 Heavy and Light Filth for Products Lacking Specific Method—Official First Action

(Caution: See 51.011, 51.039, 51.040, 51.056, and 51.073.)

(a) *Heavy filth and sand*.—Weigh 10 g sample into 250 mL beaker. Add 150 mL pet ether and boil gently 15 min on steam bath in hood. Occasionally add pet ether to keep vol. const. Decant pet ether onto smooth 7 cm paper in buchner. Add 150 mL  $\text{CHCl}_3$  to beaker and let stand 30 min with occasional stirring. Decant spice and  $\text{CHCl}_3$  onto funnel, leaving heavy residue of sand and soil, if any, in beaker. If appreciable spice tissue remains on bottom of beaker, add successive portions of  $\text{CHCl}_3$  mixed with  $\text{CCl}_4$  to give increasingly higher sp gr until practically all spice tissue is floated off. Transfer residue from beaker to ashless paper and examine microscopically. If there is appreciable amt of residue, place paper in weighed crucible, ignite, and weigh sand and soil.

(b) *Light filth*.—Thoroughly dry material in buchner and transfer, including fine material that must be scraped from paper, to 1 L trap flask, 44.002(i)(3). Add ca 150 mL  $\text{H}_2\text{O}$ , heat to bp, and simmer 15 min, with stirring; wash down inside of flask with  $\text{H}_2\text{O}$ ; and cool to  $<20^\circ$ . Add 25 mL heptane, 44.003(u), mix thoroly, and let stand 5 min; then fill flask with  $\text{H}_2\text{O}$  and let stand 30 min. Stir every 5 min, trap off, and filter. Add ca 15 mL heptane and mix thoroly; trap off and filter second time after 15 min. If second extn yields appreciable amt of filth, decant most of liq. from flask, add 15 mL heptane, and make third extn. Examine papers microscopically.

#### Light Filth (57)—Official First Action

(See Table 44:01 for applicability and parameters for specific spices.)

#### 44.121

#### Reagents

(a) *Tween 80–40% isopropanol*.—To 40 mL polysorbate 80 (ICI United States, Inc.) add 210 mL 40% isopropanol, mix, and filter. (Proportionate vols may be prep'd.)

(b) *Tetrasodium EDTA soln*.—Dissolve 5 g  $\text{Na}_4\text{EDTA}$  in 100 mL  $\text{H}_2\text{O}$ , add 150 mL isopropanol, mix, and filter. (Proportionate vols may be prep'd.)

#### 44.122

#### Pretreatment

(Caution: See 51.056.)

Form filter paper cup, 400 mL–1 L, 44.002(k), and weigh sample into cup.

(a) *Isopropanol extraction*.—Add 400 mL isopropanol to sample beaker contg cup, and boil gently on hot plate 10 min.

Transfer cup to buchner and aspirate to slow drip. Repeat twice with 400 mL isopropanol. Proceed with isolation step specified in Table 44:01.

(b) *Chloroform-isopropanol extraction*.—Add 400 mL  $\text{CHCl}_3$  to cup in sample beaker, and boil gently on hot plate in fume hood 10 min. Transfer cup to buchner and aspirate to slow drip. Repeat twice with 400 mL  $\text{CHCl}_3$ . Turn off vac., cover sample with isopropanol, and let stand 1 min. Aspirate to slow drip. Repeat isopropanol extn. Proceed with isolation step specified in Table 44:01.

(c) *For crushed red peppers*.—Weigh 25 g sample into filter paper cup formed in 250 mL beaker. Place in  $80\text{--}85^\circ \text{H}_2\text{O}$  bath or on top of steam bath. Add 100 mL isopropanol and heat 5 min. Lift paper cup and let drain. Discard drainings, avoiding contact with liq.

Add 100 mL isopropanol and repeat extn and draining. Place cup in Hirsch funnel and wash with ca 100 mL isopropanol. Aspirate to near dryness.

(d) *For ground mace and ground caraway seed*.—Add 400 mL  $\text{CHCl}_3$  to cup in sample beaker, and boil gently on hot plate in fume hood 10 min. Transfer cup to buchner and aspirate to slow drip. Return cup to empty beaker, add 400 mL isopropanol, and boil gently 5 min. Transfer cup to buchner and aspirate to slow drip.

#### 44.123

#### Isolation

(a) *Mineral oil-n-heptane (85+15)*.—Quant. transfer sample to 2 L trap flask, 44.002(i)(3), with 40% isopropanol. Dil. to 400 mL with 40% isopropanol and boil gently 10 min with mag. stirring. Cool in  $\text{H}_2\text{O}$  bath to  $20\text{--}25^\circ$ . Add mixt. 50 mL Tween 80, 44.121(a), and 50 mL  $\text{Na}_4\text{EDTA}$ , 44.122(b), slowly down stirring rod. (Omit for parsley, rosemary, and bay leaves.) Hand stir 1 min, using gentle rotary motion, and let stand 5 min. Dil. to 800 mL with 40% isopropanol, add 50 mL flotation liq., 44.003(s), and stir mag., 44.004(b), 5 min. Fill flask with 40% isopropanol, and let stand 30 min with intermittent stirring.

Trap off, rinsing neck of flask with 40% isopropanol. Add 35 mL flotation liq. Hand stir solids on bottom with vigorous rotary motion. Fill flask with 40% isopropanol. Let stand 20 min. Trap off, rinse neck with isopropanol, and filter onto ruled paper. Examine microscopically at  $30\times$ .

(b) *Mineral oil*.—Place filter cup with sample in No. 230 sieve, 44.002(u), and wash sample into sieve with gentle stream of hot tap  $\text{H}_2\text{O}$ . Sieve with forceful spray of hot ( $55\text{--}70^\circ$ ) tap  $\text{H}_2\text{O}$  until rinse is clear. Wet residue on sieve with 40% isopropanol and transfer quant. to 2 L trap flask, 44.002(i)(3), using 40% isopropanol. Dil. to 400 mL with 40% isopropanol and boil gently 10 min with mag. stirring. Remove from heat and immediately add mixt. 50 mL Tween 80, 44.121(a), plus 50 mL  $\text{Na}_4\text{EDTA}$ , 44.121(b), slowly down stirring rod. Hand stir 1 min with gentle rotary motion. Let stand undisturbed 5–10 min. Dil. to 800 mL with 40% isopropanol, add 50 mL mineral oil, 44.003(y), and stir mag., 44.004(b), 3 min. Fill flask with 40% isopropanol, and let stand 30 min with intermittent stirring. Trap off, and repeat as in (a), using 35 mL mineral oil for second trapping.

(c) *For crushed red peppers*.—Transfer bulk of sample directly to 2 L trap flask, 44.002(i)(3), by scraping from paper with spatula. Complete transfer by rinsing paper with 40% isopropanol, and finally dil. to ca 800 mL. Stir and heat to vigorous boil for ca 5 min (Caution: Watch for excessive foaming! Control with cold  $\text{H}_2\text{O}$  from wash bottle.). Transfer to cooling bath until temp. drops to  $20\text{--}25^\circ$ .

Add 40 mL flotation liq., 44.003(s), and stir mag., 44.004(b), 5 min. Let stand 5 min while mixing 50 mL Tween 80, 44.121(a), and 50 mL  $\text{Na}_4\text{EDTA}$ , 44.121(b), with 200 mL of 40% isopropanol.

Slowly add mixt. down rod with top of stopper held just *below* top of liq. Gently swirl upper portion of liq. using particular care not to disturb settlements at this time.

Let stand 5 min. Raise rod and spin stopper with gentle rotary motion to free suspended material. With top of stopper just *above* oil phase, slowly fill flask with 40% isopropanol. Swirl top portion of liq. gently, avoiding any disturbance of settled material.

Clamp rod and stopper about midpoint of flask. Let stand 5 min, spin stopper to dislodge material on it, and let stand 20–30 min undisturbed. Trap off and rinse neck with 40% isopropanol.

Add 35 mL flotation liq. and swirl rapidly to suspend plant material without incorporating air. Let stand ca 20 min. Trap off and filter onto ruled paper. Examine microscopically at 30×.

(d) *For ground mace and ground caraway seed.*—Proceed as in (b), except after adding 50 mL mineral oil, stir mag. 5 min.

#### Ground Cinnamon

#### 44.124 Heavy and Light Filth—Official First Action

(a) *Heavy filth and sand.*—Weigh 2 g sample into 50 mL centr. tube and add ca 45 mL CCl<sub>4</sub>. Centrf. 5 min at 800 rpm in International size I, type SB, centr., using No. 240 head with arm length of 5.25", or equiv. Stir layer at top of liq. and repeat centrfg. Decant ca 2/3 of liq. and floating layer, and add fresh CCl<sub>4</sub> up to 45 mL. Mix thoroly and again centr. Decant as much of liq. and floating layer as possible without disturbing residue in centr. tube. Wash residue onto 11 cm ashless paper with

Ref. JAOAC; (1): 58, 447(1975); (2): 58, 445(1975); (3): 58, 451(1975); (4): 59, 827(1976).

CCl<sub>4</sub>. Examine under low-power microscope for filth. If there is appreciable residue, place paper in weighed crucible, ignite, and weigh sand and soil.

(b) *Light filth (52)*.—(Where alcohol and 60% alcohol are specified, isopropanol and 40% isopropanol, resp., may be substituted. Use same alcohol thruout method.) Weigh 50 g sample into 800 mL beaker. Add 500 mL hot (55–70°) tap H<sub>2</sub>O and 50 mL HCl. Stir several min with stirring bar at high speed on mag. stirrer-hot plate, **44.004(b)**, holding temp. without boiling until gel is dispersed (suspension will become less viscous and vortex will become more pronounced). Sieve portionwise onto No. 230 sieve, **44.002(u)**, with forceful stream of hot tap H<sub>2</sub>O, using aerator, **44.002(a)**. After fine material has passed thru sieve, wash residue alternately with alcohol and hot tap H<sub>2</sub>O until most foam and color have passed thru.

Transfer residue to 1.5 L beaker with 60% alcohol, using spoon to transfer bulk of material. Dil. to 1 L with 60% alcohol. Add 50 mL HCl and heat (do not boil) while stirring with mag. stirrer to prevent charring. When mixt. is hot (ca 55°), add 50 mL mineral oil, **44.003(y)**, and stir mag., **44.004(b)**, 4 min. Transfer beaker contents to 2 L percolator, **44.002(i)(2)**, rinse beaker well with 60% alcohol, and add rinsings to percolator. Bring vol. in percolator to ca 1.7 L with 60% alcohol. Resuspend material in percolator by vigorously stirring with glass rod, and rinse rod into percolator with 60% alcohol. Let settle 3 min, and immediately drain material in percolator to within several cm of bottom of mineral oil layer. Refill percolator with hot tap H<sub>2</sub>O, adding H<sub>2</sub>O rapidly to thoroly resuspend material in percolator. Let settle 3 min, and drain again. Repeat hot H<sub>2</sub>O rinses until aq. medium is practically free of suspended matter with max. of 7 rinses. Discard hot H<sub>2</sub>O rinses. Drain mineral oil layer into 800 mL beaker and rinse sides of percolator with alternate rinses of 95% alcohol and hot (55–70°) tap H<sub>2</sub>O (use rubber policeman if necessary). Pour mineral oil and final rinses onto ruled paper and examine microscopically.

#### *Ground Black and White Pepper*

#### **44.125 Heavy Filth and Sand—Official First Action**

(Caution: See 51.040 and 51.049.)

Weigh 50 g sample into 600 mL beaker. Add 400 mL CCl<sub>4</sub> and let beaker stand ≥1 hr with occasional stirring. Decant pepper and solv. onto 15 cm paper in buchner, leaving heavy residue of sand and soil in beaker. Repeat decantation with CCl<sub>4</sub> if necessary to secure practically complete sepn of spice materials from any heavy residue. Transfer residue from beaker to ashless paper and examine for filth. If there is appreciable residue, place paper in weighed crucible, ignite, and weigh sand and soil.

#### **44.126 Light Filth (Ground Black Pepper Only) (53) Official First Action**

Weigh 50 g sample (or use floated material from **44.125** before ignition) into 400 mL beaker and add enough hot H<sub>2</sub>O (55–70°) to make thin slurry. Pour slurry onto No. 230 sieve, **44.002(u)**, and wash residue with forceful stream of hot H<sub>2</sub>O, using aerator, **44.002(a)**, until effluent is clear. Wash sieve residue with ca 100 mL isopropanol and let drain. Transfer residue from sieve with 40% isopropanol into 2 L trap flask. Dil. to 800 mL with 40% isopropanol. Bring to rolling boil with mag. stirring. Cool to room temp. in H<sub>2</sub>O bath. Add 40 mL flotation liq., **44.003(s)**, and stir mag. 3 min, **44.004(b)**. Let oil phase sep. 5 min and then fill flask with 40% isopropanol by letting liq. flow down stirring rod. Let stand 20 min, with gentle stirring at 5 min intervals, and trap off. Repeat trapping with 20 mL flotation liq.; stir gently

after addn to avoid disturbing bottom layer. Let stand 10 min and trap off. Filter onto ruled paper and examine microscopically.

#### *Ground Cardamon, Celery Seed, Coriander, Ginger, and White Pepper*

#### **44.127 Light Filth (54)—Official First Action**

Weigh 10 g sample (25 g for white pepper) into 800 mL beaker contg 400 mL isopropanol. Add mag. stirring bar, place on stirrer, **44.002(p)**, and stir mag. 6 min, keeping all solids in motion. Pour mixt. onto No. 230 sieve, **44.002(u)**, and wash residue with H<sub>2</sub>O until washings are clear. Transfer residue from sieve with 40% isopropanol into 2 L trap flask, **44.002(i)(3)**. Add 760 mL 40% isopropanol and 40 mL HCl. Bring to vigorous boil on hot plate with mag. stirring. Cool to 20–25° in cold H<sub>2</sub>O bath. Add 40 mL flotation liq., **44.003(s)**, and stir mag., **44.004(b)**, 5 min. Let stand 5 min and then slowly fill flask with 40% isopropanol by letting liq. flow down stirring rod with top of stopper just below oil layer. Resuspend material at bottom of flask without disturbing oil (upper) layer. Let stand 20 min, stirring bottom occasionally, and trap off. Add 30 mL flotation liq., and stir mag., **44.004(b)**, 30 sec while pushing oil into aq. (lower) layer; continue stirring 4.5 min. Let stand 15 min, trap off, filter onto ruled paper, and examine microscopically at 30×. If filtering action slows, use new filter paper.

#### **Filth in Ground Nutmeg (55)—Official First Action**

#### **44.128**

#### *Pretreatment*

Form 32 cm filter paper defatting cup, 400–800 mL, **44.002(k)**. Weigh 10 g sample into cup, add 400 mL CHCl<sub>3</sub>, and simmer 10 min. Drain or aspirate and discard CHCl<sub>3</sub>. Return cup to beaker, add 400 mL isopropanol, and heat to vigorous boil.

#### **44.129**

#### *Isolation*

Immediately wet-sieve on No. 230 sieve, **44.002(u)**, until washings are clear. Rinse material on sieve with 40% isopropanol and let drain. Quant. transfer to 2 L trap flask, **44.002(i)(3)**, with 40% isopropanol and dil. to 800 mL. Add stirring bar, **44.002(p)**, and heat to vigorous boil while stirring. Add 40 mL mineral oil, **44.003(y)**, and continue heating to vigorous boil.

Transfer flask to cool stirrer, and mag. stir, **44.004(b)**, 5 min. Set aside and fill with 40% isopropanol down stirring rod to bring oil just into neck of flask. Stir to suspend settlings. Stir after 5 min and clamp wafer at ca midpoint of flask. After 5 min adjust oil level to 1 cm above fully raised stopper, and swirl interface. Let stand 5 min and trap off into beaker. Rinse neck with 40% isopropanol and add rinse to trappings.

Add 30 mL mineral oil and hand stir 1 min. Let stand 10 min and trap off. Rinse neck of flask with isopropanol and add rinse to beaker. Filter onto ruled paper(s). Examine papers at 30X.

#### *Ground Onion and Garlic Powders*

#### **44.130 Heavy and Light Filth—Official First Action**

(Caution: See 51.040 and 51.049.)

(a) *Heavy filth and sand*.—Weigh 50 g sample into 250 mL hook-lip beaker. Add 200 mL CCl<sub>4</sub>, stir thoroly, and let stand 30 min with occasional stirring. Decant plant tissue onto 15 cm paper in buchner, add 100 mL CCl<sub>4</sub>, and repeat decantation until practically no plant tissue remains with sand and soil on bottom of beaker. Transfer residue in beaker to ashless paper with stream of CCl<sub>4</sub> from wash bottle and examine for filth. If there is appreciable residue, place paper in weighed crucible, ignite, and weigh sand and soil.

(b) *Light filth*.—Dry residue of plant tissue from buchner, (a), overnight or in oven 1 hr at 80°, and transfer to 2 L trap flask, **44.002(i)(3)**. Add 250 mL Tween 80–60% alcohol soln, **44.003(hh)**, mix well, and let stand 15–30 min. Add 60% alcohol to 800 mL and trap off twice in 60% alcohol with 75 and 35 mL heptane, **44.003(u)**, resp., as in **44.004(a)**. Let stand 1–1.5 hr for each extn and avoid stirring except for few circular upward strokes immediately after filling flask with 60% alcohol. Filter, and examine microscopically.

#### Garlic Powder

#### 44.131 Rot (Based on Mold Count) (56) Official First Action

Proceed as in **44.136**.

#### Ground Capsicums (Red and Cayenne Pepper, Chili Powder, etc.)

#### 44.132 Heavy Filth—Official First Action

(Caution: See **51.040** and **51.049**.)

(a) *Heavy filth and sand*.—Isolate gross filth such as large larvae, adult insects, clumps of webbing, and insect and rodent excreta pellets by sifting pepper thru No. 10 sieve.

Weigh 50 g sifted sample into 600 mL beaker and add 400 mL pet ether. Boil gently 30 min, occasionally adding pet ether to keep vol. constant. Decant pet ether onto smooth 15 cm paper in buchner. Add 400 mL CCl<sub>4</sub> and let stand 30 min with occasional stirring. Decant pepper and solv. onto same 15 cm paper in buchner, leaving heavy residue of sand and soil in beaker. Repeat decantation with CCl<sub>4</sub> if necessary to secure practically complete sepn of spice tissues from heavy residue. Transfer residue from beaker to ashless paper and examine for filth. If there is appreciable residue, place paper in weighed crucible, ignite, and det. sand and soil.

#### Light Filth in Ground Capsicums Excluding Paprika (57) Official First Action

(Complete analysis without overnight interruptions.)

#### 44.133 Reagent

*Premixed Tween 80–alcohol–tetrasodium EDTA soln*.—Measure 840 mL 60% alcohol in 1 L graduate. Add 160 mL Tween 80 (polysorbate 80, ICI United States, Inc.) to 250 mL g-s graduate. Invert 250 mL graduate over 3 L beaker and drain briefly. Rinse 250 mL graduate with several portions of the 840 mL 60% alcohol, pouring each into beaker. Add rest of 60% alcohol to beaker and start mag. stirring. Add 20 g Na<sub>4</sub>EDTA to beaker while stirring rapidly. Add 1 L 60% alcohol and stir until uniform. Store in nonmetal containers. Mixed reagent is stable several weeks.

#### 44.134 Pretreatment

Proceed as in **44.122(a)**, using 25 g sample.

#### 44.135 Isolation

Wet-sieve on No. 230 sieve with warm tap H<sub>2</sub>O until drainings are clear. Transfer sample with spoon thru wide-stem funnel into 2 L trap flask, **44.002(i)(3)**. Rinse remaining material to edge of sieve and transfer quant. to trap flask with 60% alcohol. Dil. to 600 mL with 60% alcohol.

Simmer 10 min on hot plate. Alternatively, place on preheated hot plate, bring to boil, and then transfer to 3–4 cm deep boiling H<sub>2</sub>O bath for 10 min and simmer. This technic avoids severe

frothing encountered in hot plate boiling. Cool to ≥20° but <25°. Remove from bath and add 40 mL flotation liq., **44.003(s)**. Dil. to 800 mL with 60% alcohol and stir mag. 5 min, **44.004(b)**. Set aside, add 100 mL premixed Tween 80–alcohol–Na<sub>4</sub>EDTA soln, and mix thru liq. by gently swirling stopper (wafer) 1 min. Let stand 3 min. Slowly add 60% alcohol down trap rod, maintaining stopper above oil layer, until oil just reaches neck of flask. Swirl stopper thru lower portion of trap flask to suspend settleings (dark material may rise halfway up in trap flask). Add 60% alcohol down rod to bring bottom of oil layer to level 1 cm above fully raised stopper.

Clamp rod with stopper at ca midpoint of flask. Let stand 15 min; then gently swirl stopper thru upper half of liq. to hasten rising of oil droplets. Let stand 15 min undisturbed and trap off into beaker, rinsing neck of flask with 60% alcohol. Filter onto labeled ruled paper.

Add 30 mL flotation liq. and stir manually 1 min. Clamp rod at midpoint and let stand 10 min. Swirl gently thru upper half of liq. and adjust oil level. Let stand 15 min and trap off. Rinse neck of flask with 95% alcohol or isopropanol. Filter onto second ruled paper and examine papers at 30×.

#### 44.136 Rot (Based on Mold Count)—Official Final Action

Weigh 10 g thoroly mixed sample of ground capsicums and transfer to high-speed blender. Add 200 mL 1% NaOH soln in 3 or 4 successive portions, stirring after each addn, washing down with final portion any material that may stick to walls of blender. Agitate mixt. in blender 1 min at ca 13,000 rpm. With rubber policeman, rub down into mixt. any material sticking to walls and repeat blending 2 min longer. Add 2 or 3 drops *capryl alcohol* to break foam. Mix 100 g of this mixt. with 50 g stabilizer soln, **44.003(gg)**, and count with Howard mold-counting slide, **44.002(o)(1)**, as in **44.096**.

Occasionally blended mixt. contains particles of seed tissue that make it difficult to obtain Newton's rings in prep slide for mold counting. Clamp devised for holding cover slip in place to obviate this difficulty consists of metal plate with circular opening, 2.5 cm diam., in center of plate; 2 clips attached to edge of plate hold cover slip in position when slide is placed on plate.

#### Paprika—Official First Action

#### 44.137 Gross Contamination

See **44.119**.

#### Light Filth in Ground Paprika (58)

#### 44.138 Reagents

See **44.121(a)**, (b), and in addn:

*Premixed Tween 80–40% isopropanol–tetrasodium EDTA soln*.—Mix 250 mL Tween 80–40% isopropanol, **44.121(a)**, and 250 mL Na<sub>4</sub>EDTA soln, **44.121(b)**. Mixed reagent is stable several weeks. Store in nonmetal containers.

#### 44.139 Pretreatment

Form 32 cm filter paper (rapid flow) cup around 400 mL beaker, as in **44.002(k)**. Remove paper, place in 1 L beaker, and add 25 g sample.

Pour 400 mL isopropanol into the 1 L beaker, distributing liq. equally inside and outside cup. Place on preheated hot plate and boil gently exactly 10 min. (Alternatively, bring to boil on hotter hot plate; then set aside in steam bath opening for 10 min boil.) Remove cup from beaker without delay, and let drain or place on buchner and aspirate to slow drip. Discard liq.

Replace cup in 1 L beaker and repeat twice with 400 mL isopropanol.

**44.140****Isolation**

Wash sample from cup into No. 230 sieve, **44.002(u)**, with gentle H<sub>2</sub>O stream, avoiding splashing and loss of sample. Wet sieve with forceful stream of warm H<sub>2</sub>O from aerator until washings are clear. (Ignore foam or froth produced by action of strong spray on paprika.)

Add 400 mL 40% isopropanol to wash bottle. Place wide-stem powder funnel in trap flask. Transfer bulk of sieved sample to trap flask, using portion of 40% isopropanol. Wash remaining material on sieve to edge with warm H<sub>2</sub>O and complete quant. transfer to trap flask with 40% isopropanol. Wash walls of flask with 40% isopropanol. Pour remainder of 400 mL 40% isopropanol into trap flask.

Place on hot plate and boil gently 10 min; swirl to rinse material from walls of flask. (Do not allow material to accumulate and dry on flask walls.) Remove from hot plate and immediately add 100 mL premixed Tween 80–40% isopropanol-Na<sub>4</sub>EDTA soln, **44.138**. Stir gently ca 1 min. Let stand 10 min. Dil. to 800 mL with 40% isopropanol added slowly down stirring rod, positioned with stopper just above liq. level. Add 50 mL mineral oil, **44.003(y)**, and stir mag., **44.004(b)**, 3 min, with stopper located above liq. level.

Add 40% isopropanol slowly down stirring rod to bring oil into neck of flask. Let stand ca 10 min. Raise stopper to middle of flask and swirl gently to cause movement of upper liq. and hasten rising of oil droplets. Rinse rod with 40% isopropanol and clamp so that stopper is at midpoint of flask. Add 40% isopropanol down rod to bring bottom of oil layer to level 1 cm above fully raised stopper. Let stand 10 min and swirl gently again. Let stand 10 min undisturbed and trap off into beaker.

Add ca 35 mL mineral oil and hand stir 1 min at speed sufficient to keep oil moving thru trap flask. Add ca 20 mL 40% isopropanol, stir gently at ca 5 min intervals for 20–25 min, then let stand undisturbed 5–10 min. Trap off into second beaker and rinse neck of trap flask with alcohol or undiluted isopropanol.

Filter solns from both beakers onto sep. ruled filter papers in Hirsch funnel, rinsing each beaker carefully with isopropanol. Examine microscopically at 30×.

★ **Whole Spices** ★**44.141 Filth by Flotation—Official First Action**

See **40.115**, 11th ed.

*Whole, Cracked, or Pieces of Allspice, Anise, Caraway, Celery Seed, Cloves, Coriander, Cumin, Dill Seed, Fennel Seed, Fenugreek, Ginger, Mace, Marjoram, Mixed Pickling Spice, Mustard, Nutmeg, Black Pepper, White Pepper, Poppy Seed, Savory, and Turmeric*

**44.142 Filth—Official First Action**

Weigh 25 g sample into 400 mL beaker and proceed as in **44.120(a)** and **(b)**, except use more reagent, and where necessary, 2 L trap flask, and add 400 mL hot H<sub>2</sub>O and 20 mL HCl; also use 35 mL heptane, instead of 25 mL.

**Unground Cinnamon, Crude and Reconditioned****44.143 Light Filth (59)—Official First Action**

If sample is reconditioned or if pieces are not rolled and are 8 cm (3") long, weigh 100 g sample directly into 1.5 L beaker.

★ Surplus method—see inside front cover.

If sample consists of quills, break open quills into lengths of ≤8 cm and transfer broken pieces, including dust and small particles, to 1.5 L beaker. Add 1 L hot tap H<sub>2</sub>O and 50 mL HCl. Heat on hot plate to ca 60°. Pour portionwise onto No. 6 over No. 230 sieve, **44.002(u)**, and rinse well with forcible stream of hot tap H<sub>2</sub>O, using aerator, **44.002(a)**, while turning larger pieces with glass rod. Discard material on No. 6 sieve and transfer residue on No. 230 sieve to 2 L trap flask, **44.002(i)(3)**, with hot tap H<sub>2</sub>O, using spoon if necessary. Fill trap flask to 1 L with H<sub>2</sub>O and add 50 mL HCl. Heat with stirring to ca 60–70°. Add 50 mL mineral oil, **44.003(y)**, and stir mag., **44.004(b)**, 2 min. Fill with H<sub>2</sub>O, let stand 5 min, and trap. Add 25 mL mineral oil, gently stir with stopper 1 min, let stand 5 min, and again trap. Rinse neck of flask with alcohol or isopropanol. Filter trappings onto ruled filter paper and examine for insects and other arthropods, hairs, excreta, etc.

**Nutmegs, Reconditioned (60)—Official First Action****44.144 Light Filth**

(Caution: See **51.011**, **51.040**, and **51.056**.)

Weigh 100 g sample into 1.5 L beaker (50 g if finely ground product is used). Add 400 mL CHCl<sub>3</sub> and boil 5 min. Prep. 32 cm folded S&S 588 filter paper, by moistening with H<sub>2</sub>O and forming around base of 1 L beaker. Place 7 cm disk of bolting cloth (mesh size not critical) in 10 cm plate diam. buchner, insert paper, apply vac., and press moistened paper until good seal is obtained. Rinse paper with isopropanol, and aspirate until nearly dry. Quant. transfer nutmeg to paper, and aspirate off CHCl<sub>3</sub>. Transfer paper contg spice tissue back to original beaker, add 400 mL fresh CHCl<sub>3</sub>, and boil 5 min. After cooling few min, lift paper, and drain and discard CHCl<sub>3</sub>. Replace paper in beaker, add 400 mL CHCl<sub>3</sub>, and repeat 5 min boiling third time.

Replace paper in buchner and aspirate off CHCl<sub>3</sub>, maintaining suction ca 5 min after visible dripping ceases. Release vac.; add isopropanol until spice is covered, let stand few min, and reapply vac. until visible dripping ceases. Repeat isopropanol wash step and aspirate ca 5 min after visible dripping ceases.

Quant. transfer retained spice to 8" diam. No. 230 sieve, **44.002(u)**, with copious rinses of hot tap H<sub>2</sub>O. Wash material on sieve with forceful stream of hot H<sub>2</sub>O from aerator, **44.002(a)**, until no more spice tissue passes sieve. Transfer most of sieve contents with spoon and quant. transfer remaining material to 2 L trap flask with 60% alcohol-CaCl<sub>2</sub> soln, **44.003(e)**, from wash bottle. Add mag. stirring bar, bring vol. to 1 L with 60% alcohol-CaCl<sub>2</sub> soln, add 50 mL HCl, and place flask on mag. stirrer-hot plate, **44.002(p)**. Heat to *full boil* with gentle stirring. Immediately transfer flask to cool stirring unit and add 40 mL light mineral oil, **44.003(y)**, by pouring down stirring rod. Stir 2 min with mag. stirrer, **44.004(b)**. Fill with 60% alcohol-CaCl<sub>2</sub> soln and gently stir 5–10 sec with stirring rod. Let stand 2 min and trap off. Add 35 mL light mineral oil, stir by hand gently 30 sec, and let stand 10 min. Repeat trappings. Wash flask neck thoroly with isopropanol and transfer washings to beaker with trappings. Filter onto ruled paper and examine microscopically.

**Unground Oregano****Light Filth (61)—Official First Action****44.145****Reagents**

(a) *Polysorbate 80-tetrasodium EDTA mixture (1+1)*.—Prep. from Tween 80–60% alcohol soln, **44.003(hh)**, and Na<sub>4</sub>EDTA–60% alcohol soln, **44.003(ii)**.

(b) *15% Alcohol*.—Prep. ca 1700 mL/sample prior to analysis.

**44.146****Determination**

Weigh 10 g sample into 2 L trap flask, **44.002(i)(3)**, add 400 mL 60% alcohol, and boil gently 10 min, occasionally swirling flask gently and/or using plunger to prevent material from accumulating on wall of flask above surface of liq. Immediately add 100 mL Tween 80- $\text{Na}_4\text{EDTA}$  mixt., and swirl few sec, again using plunger to clear material from wall of flask. Let stand 10 min in cold  $\text{H}_2\text{O}$  bath. Dil. to 800 mL with 15% alcohol. Add 50 mL mineral oil, **44.003(y)**, and stir mag., **44.004(b)**, 2 min. Fill with 15% alcohol and hand stir every 2–3 min for 20 min. Clamp stirring rod in place so that plunger is held above sediment at bottom of flask. Leave flask undisturbed 10 min. Trap, filter onto ruled paper, and examine microscopically.

★ **Unground Fermented Crushed Peppers** ★**44.147 Light and Heavy Filth—Official First Action**

See **40.121**, 11th ed.

★ **Pepper Sauce** ★**44.148 Light and Heavy Filth—Official First Action**

See **40.122**, 11th ed.

**Prepared Mustard****44.149 Light Filth (62)—Official First Action**

Weigh 100 g well mixed sample into 1 L beaker, and slowly add 400 mL  $\text{HCl}$  (3+97) and 20 mL mineral oil, **44.003(y)**, with constant stirring until smooth slurry forms. Place on hot plate and bring to *rolling boil*; hold at *rolling boil* ca 10 min. Transfer quant. to Kilborn funnel, **44.002(i)(1)**; retain beaker and stirring rod for rinsing. Fill separator to ca 1 cm from top with cold  $\text{H}_2\text{O}$ .

After 1.5–2 min, gently stir contents of separator; let oil layer sep. again ca 1.5–2 min, and slowly drain and discard lower layer until interface is ca 5 cm above constriction. Fill separator with cold  $\text{H}_2\text{O}$  to ca 1 cm from top; let oil sep. 1.5–2 min, and slowly drain and discard lower aq. layer until interface is ca 5 cm above constriction. Repeat  $\text{H}_2\text{O}$  wash until lower layer is clear.

Filter mineral oil and  $\text{H}_2\text{O}$  retained in separator thru ruled paper, **44.002(j)**, using Hirsch funnel. After mineral oil layer has passed thru paper, rinse all glassware thoroly with alcohol, followed by  $\text{H}_2\text{O}$ , then 5% detergent soln, **44.003(q)**, and cold  $\text{H}_2\text{O}$ . Filter each rinse sep. thru same paper. Rinse final papers with enough alcohol to remove yellow color. Examine papers at 30 $\times$ .

**Light Filth in Rubbed Sage (63)—Official First Action****44.150****Pretreatment**

Form 32 cm filter paper cup over 400 mL beaker and insert into 1 L beaker, **44.002(k)**. Place 25 g sample into cup. Add 400 mL  $\text{CHCl}_3$ , ca equally between cup and beaker. Boil gently 10 min in hood. (Alternatively, bring to bp on hot plate and continue heating 10 min total on steam bath.) Transfer cup to buchner and aspirate to slow drip. Return cup to beaker and repeat extn with two 400 mL portions  $\text{CHCl}_3$ . After third  $\text{CHCl}_3$  aspiration, turn off vac., cover sample with isopropanol, let stand 1 min, and aspirate to slow drip. Repeat isopropanol extn once.

**44.151****Isolation**

Transfer sample from paper cup to No. 230 sieve, **44.002(u)**, with gentle stream of hot tap  $\text{H}_2\text{O}$ . Sieve with forceful spray of *hot* (55–70°) tap  $\text{H}_2\text{O}$  until rinse is clear. Wash residue to edge

of sieve and let drain momentarily. Rinse sieve with ca 100 mL of alcohol delivered from wash bottle. Let stand 1 min. Again wash sieve residue with hot tap  $\text{H}_2\text{O}$  until drainings are colorless; then wet well with 40% isopropanol.

Add mag. stirring bar, **44.002(p)**, to 2 L trap flask, **44.002(i)(3)**. Place wide stem funnel in flask opening and transfer bulk of sample with spoon. Rinse remaining material to edge of sieve with aerator spray and quant. transfer to flask with total of 400 mL 40% isopropanol. Stir gently while boiling 10 min on hot plate. (Alternatively, bring to boil on hot plate and continue heating 10 min in ca 40 mm boiling water bath.) Remove from heat and immediately add 100 mL premixed Tween 80- $\text{Na}_4\text{EDTA}$ , **44.133**, slowly down rod and mix by gentle swirling 1 min.

Cool in  $\text{H}_2\text{O}$  bath at 20–25°. Add 50 mL mineral oil, **44.003(y)**. Dil. to 800 mL with 40% isopropanol added slowly down stirring rod to avoid mixing or agitation of flask contents.

Stir mag., **44.004(b)**, 5 min, and let stand 3 min. Add 100 mL premixed Tween 80- $\text{Na}_4\text{EDTA}$  and very gently swirl thru top of liq. 1 min.

Fill flask with 40% isopropanol, added slowly down stirring rod to minimize agitation of liq. Let stand 20 min *undisturbed*. Trap off, rinsing neck of flask with 40% isopropanol, and add to trappings in beaker.

Add 35 mL mineral oil and hand stir 1 min. Let stand ca 1 min. Slowly fill flask with 40% isopropanol. Let stand 7 min, spin stopper to free of settleings, adjust oil level to ca 1 cm above fully raised stopper and let stand 8 min. Trap off into beaker, rinsing neck of flask well with isopropanol. Transfer trappings to ruled filter paper, rinsing beaker well with isopropanol. Examine papers at 30 $\times$ .

**Condimental Seeds****44.152 Rodent and Insect Excreta—Official First Action**

Prep. liq. with sp gr of 1.16–1.19 by mixing  $\text{CHCl}_3$  or  $\text{CCl}_4$  with alcohol or pet ether. Mix 200 g sample with 500–700 mL of the liq. in 1 qt (1 L) drug percolator. Let stand 30 min, stirring at ca 5 min intervals. Trap sediment in lower end of percolator with cork plug and remove lower cork so as to deliver all sediment into beaker. Lift upper cork slightly and rinse tube and cork by letting small amt of liq. pass. After stirring top layer, make 2 more seps at 5 min intervals. Transfer contents of beaker to filter paper, drain liq., and examine. Sep. rodent excreta and insect excreta, air dry, and weigh each sep. to nearest mg.

**Ground Annatto****44.153 Light Filth—Official First Action**

See **44.133–44.135**.

**44.154 ★ Whole Tamarind Pulp ★**

See **40.125**, 11th ed.

**Whole Pickles****44.155 Filth—Official First Action**

Pour entire contents of jar onto No. 8 sieve nested in No. 140 sieve, **44.002(u)**. Wash jar thoroly to remove any filth adhering to sides, and pour washings thru sieves. Wash pickles thoroly with stream of hot  $\text{H}_2\text{O}$ , turning from time to time. Transfer material on No. 140 sieve directly to ruled paper and examine microscopically.

★ Surplus method—see inside front cover.

**Chopped Pickles and Relish****44.156 Filth—Official First Action**

Add 200 mL H<sub>2</sub>O to 100 g sample in trap flask or beaker, boil 15 min, and cool. If boiling is done in beaker, transfer to trap flask, **44.002(i)(3)**. Trap off twice, using 25 and 15 mL heptane, **44.003(u)**. Filter, and examine microscopically.

**Dressings for Food**

(Salad dressing, french dressing, and related products)

**44.157 Filth—Official First Action**

Weigh 200 g sample into 800 mL beaker, stir in 50 mL H<sub>3</sub>PO<sub>4</sub>, and mix thoroly. Thin with ca 600 mL H<sub>2</sub>O, and again mix thoroly. If possible, filter thru S&S No. 8 ruled paper with suction; otherwise thru No. 140 sieve, **44.002(u)**, and transfer to ruled paper. Examine papers microscopically.

**Prepared Horseradish (64)—Official First Action****44.158****Determination**

Weigh 100 g sample into 600 mL beaker. Add 200 mL H<sub>2</sub>O and transfer to 2 L trap flask with H<sub>2</sub>O. Dil. to 1 L, add 50 mL HCl, and stir few sec. Add mag. stirring bar, **44.002(p)**, and 50 mL flotation liq., **44.003(s)**, and stir mag., **44.004(b)**, 3 min. Slowly fill flask with distd H<sub>2</sub>O by running liq. down stoppered rod while stopper is maintained just above liq. After filling flask, gently stir settled material 5–10 sec with stoppered rod. Let stand undisturbed 5 min; then trap off. Add 35 mL flotation liq., stir gently by hand 30 sec, and let stand 10 min. Repeat trapping. Wash flask neck thoroly with isopropanol and transfer washings to beaker contg trappings. Filter onto ruled paper and examine microscopically.

**ANIMAL EXCRETIONS****Urine Stains on Foods and Containers (65)****Official First Action****44.159 Preliminary Examination with Ultraviolet Light**

(Caution: See 51.016.)

Examine suspected stains in dark room under long wave UV light (366 nm). (Dried urine on textiles usually fluoresces blue-white, but color varies somewhat, depending upon natural color of textile and type of lamp and filter used.) Run check patches with known types of urine. For microchem. analysis, outline stained area with pencil under the UV light. When odor of urine is detected, report this finding.

**44.160 Urease Test for Urea**

Cut out portion of stained area and transfer 1 or 2 threads to 5 mL crucible or beaker. Save balance of cloth to confirm urine by **44.162–44.164**. Leach 10 min in just enough warm H<sub>2</sub>O to cover material. Remove threads and squeeze out as much liq. as possible with clean, flat-tip forceps.

Transfer 2 or 3 drops to microculture slide with deep cylindrical depression. Add small drop *urease mixt.* (suspension of ¼ of 25 mg urease tablet in 0.5–0.7 mL H<sub>2</sub>O). Place small drop 10% H<sub>2</sub>PtCl<sub>6</sub> soln on cover slip and invert over the depression, with hanging drop at center of depression opening. (Cover slip may be sealed on with petrolatum if only minute amts of urea are suspected.)

With evolution of NH<sub>3</sub>, brilliant, highly refractive, octahedral crystals of (NH<sub>4</sub>)<sub>2</sub>PtCl<sub>6</sub> are formed in hanging drop. Time required for crystals to form varies from few sec to 30 min, or even longer in some instances, according to conditions. Crystals may be visible to naked eye and are readily detected under microscope

at 100×. Certain org. compds that are volatile and H<sub>2</sub>O-sol. may yield crystals in the hanging drop, and if reagent soln is too concd, H<sub>2</sub>PtCl<sub>6</sub> may crystallize. However, crystal habits of these substances are different from those of (NH<sub>4</sub>)<sub>2</sub>PtCl<sub>6</sub>. (Stained patches of the food material can be tested by method similar to above.)

**44.161 Xanthydrol Test for Urea (66)****Official First Action**

(Not applicable in presence of dried skim milk)

Place portion of stained cloth, ca 3 mm sq (stain located by fluorescence) on microscope slide. Add drop of HOAc (2+1) and stir. (Or instead of cutting out a patch of cloth, rinse stained material with H<sub>2</sub>O or other suitable solv. such as HOAc, acetone, or hot alcohol, evap. soln to dryness, dissolve residue in little HOAc (2+1), and place drop on slide.)

Transfer droplet with stirring rod to another place on slide and dil. with drop of HOAc (2+1). To both drops add very small amt of *xanthydrol* and stir into soln. If urea is present, crystals of dioxanthylurea form very shortly. Examine with magnification of ca 100–120× (higher power may be used for closer examination if crystals formed are quite small). Use of polarizing microscope is desirable but not essential.

Crystals may be either or both of 2 kinds, depending on concn of urea present: (a) most prevalent are clusters of narrow feather-blades of low birefringence which form thruout soln at ca 1:200 to 1:25,000 concn (under low power they may appear to be needles or threads); (b) straight needles, often in sheaves or clusters, of much greater birefringence, forming chiefly at or near edge as drop evaps, at concns from 1:50 to 1:1,000. Both kinds have neg. elongation (observed with polarizing microscope, using red plate). Crystals should be noted before drop dries, but remain when it dries. Response is given by fresh urine solids content of ≥4 µg in drop. Test material from portion of sample other than fluorescent spot as blank.

**TLC Method (67)—Official First Action****44.162****Apparatus**

(a) *Thin layer apparatus.*—See **29.006** and **29.007(c)**.

(b) *Blender.*—High-speed, with stainless steel semi-micro jar (Arthur H. Thomas Co., No. 3392-G15, or equiv.).

**44.163****Reagents**

(a) *Urea std soln.*—20 mg/mL H<sub>2</sub>O.

(b) *Allantoin std soln.*—2 mg/mL H<sub>2</sub>O.

(c) *Indoxyl sulfate (indican) std soln.*—Approx. 0.1 mg/mL H<sub>2</sub>O (Sigma Chemical Co.). Store in dark.

(d) *Tryptophan soln.*—1 mg/mL 50% aq. acetone (used as longwave fluorescent marker with R<sub>f</sub> approx. that of urea in developing solv.).

(e) *p-Dimethylaminobenzaldehyde (pDAB) spray.*—Mix 75 mL MeOH and 25 mL HCl, and cool to 70°. Add 2 g reagent grade pDAB to cooled mixt. and dissolve with stirring. (Caution: Spray reagent is toxic and corrosive. See 51.017.)

(f) *Sodium acetate spray.*—Satd aq. soln.

(g) *Developing solvent.*—*n*-BuOH-HOAc-H<sub>2</sub>O (10+5+5); prep. fresh daily.

(h) *Cellulose powder.*—TLC grade, MN300 (Brinkmann Instruments, Inc., No. 66 00 100-8).

**44.164****Determination**

On previous day prep. plates for overnight drying. Equilibrate tanks ca 1 hr before extg samples.

(a) *Preliminary examination.*—Check samples as in **44.159** for fluorescent areas. Mark fluorescent spots as well as nearby equiv. nonfluorescent areas as controls. Transfer selected spots to test tubes.

(b) *Extraction.*—Add 10 mL acetone to test tube, place in hot H<sub>2</sub>O bath, and simmer 5 min, avoiding excess loss of solv. Decant acetone into 13 or 15 mL conical centr. tube preheated in beaker of hot H<sub>2</sub>O on steam bath. Repeat extn and transfer 3 addnl times, keeping centr. tubes hot to avoid bumping. Conc. final soln to 0.1–0.15 mL. Chromatograph without appreciable delay, holding ext in dark until ready to spot.

(c) *Preparation of TLC tank.*—Add ca 150 mL satd NaHSO<sub>4</sub> soln to lined tank; then add ca 15 g addnl solid NaHSO<sub>4</sub> to bottom of tank. Place empty solv. trough in bottom of tank and cover tank.

(d) *Preparation of thin layer plates.*—(1) *Brinkmann-DeSaga.*—Add 15 g cellulose to 100 mL H<sub>2</sub>O in blender operating at ca 90 v setting of variable transformer. Use small spatula to work powder into H<sub>2</sub>O. Turn variable transformer to 120 v (line voltage) and blend ≥1.5 min. Apply slurry as 0.375 mm layer to 5 plates and air dry plates overnight.

(2) *Quickfit plate leveler and spreader.*—Add 12 g cellulose to 75 mL H<sub>2</sub>O in blender operating at 90 v setting of variable transformer. Use small spatula to work powder into H<sub>2</sub>O. Turn transformer to 120 v (line voltage), add 15 mL H<sub>2</sub>O, and blend ≥1.5 min. Using 0.50 mm slot, spread slurry on 5 plates and air dry plates overnight.

(3) *Prepared plates.*—Plates prepd from MN300 cellulose (Analtech, Inc., 75 Blue Hen Dr, Newark, DE 19711) have been found satisfactory.

(e) *Spotting of plates.*—Spot on TLC plate placed directly on heated surface (70°). (Det. surface temp. as follows: Add 125 mL glycerol to 250 mL conical flask. Thru hole in cork stopper insert 76 mm (3") immersion thermometer until tip contacts bottom.) Spot sample conc. ca 25 mm from edge of plate at ca 15 mm intervals. Keep sample spots to min. size. Add 50 µL acetone to tube, shake well, and transfer to sample spot.

(f) *Cleanup.*—If there is appreciable color and/or other visible material, clean up with benzene. Line TLC chamber with heavy blotting paper, or equiv. Add 40–60 mL benzene to bottom of tank and cover. (For frequent use, coat ground glass surfaces of tank with high viscosity silicone grease.) Add 20–25 mL benzene to trough in tank. Place spotted plate in trough and let rise ca 25 mm above spotting line. Remove, fan dry, and repeat rise and drying. Place plate in tank third time and let rise ca 13 cm to carry most of interfering material above 10 cm line. Remove from tank and scratch wide line in layer at 10 cm above spotting line.

(g) *Development of plates.*—Dry washed plate 5 min in 80° forced-draft oven. Promptly place warm plate in empty solv. trough of TLC tank. Let stand 20 min. Slide cover aside just enough to place tip of long-stem funnel in solv. trough. Slowly add 20 mL developing solv., (g), to trough, close lid, and develop in dark to 10 cm line (65–70 min). Dry plate 5 min in 80° forced-draft oven.

(h) *Color development.*—Spray plate with pDAB reagent until distinctly moist but not shiny wet and again heat 5 min in 80° forced-draft oven. Strong yellow-to-orange area at  $R_f$  0.75–0.80 is urea. Pale yellow smaller spot at  $R_f$  0.45–0.50 is allantoin. Mark each area as color develops, since colors fade from one step to next. Place under longwave black light, **29.007(c)**, in darkened room and check for pale yellow fluorescent area between urea and allantoin. Spray satd NaOAc soln (ca 1–2 mL/plate) in space between urea and allantoin until yellow of both has faded. Let plate air dry ca 10 min in hood (do not heat), and check plate under longwave black light. Weak fluorescent

pink-to-orange color against very pale blue fluorescent background confirms presence of urinary indican.

#### *Urine in Grain (68)—Official First Action*

**44.165**

#### *Principles*

Grain is sprayed with Mg uranyl acetate soln. If rodent urine is present, its Na content reacts to cause greenish fluorescence on kernel when sample is viewed under short-wave UV light.

**44.166**

#### *Reagents*

(a) *Magnesium uranyl acetate soln.*—Prep. reagents **3.027(a)** and (b) in 1/10 amts, mix, add 22 mL glycerol, mix, and filter thru washed, dried paper.

(b) *Urease soln.*—Wet 0.2 g urease powder with small amt of H<sub>2</sub>O, stir into paste, and dil. to 10 mL with H<sub>2</sub>O.

(c) *Bromothymol blue soln.*—Rub 0.15 g indicator powder in mortar with 2.4 mL 0.1N NaOH soln. After indicator dissolves, wash mortar and pestle with H<sub>2</sub>O, and dil. to 50 mL with H<sub>2</sub>O. Soln should be green; pH ca 7.0.

(d) *Urease-bromothymol blue test paper.*—Mix 10 mL indicator soln, (c), with 10 mL urease soln, (b). Pour mixt. into watch glass. Using clean tweezers, dip pieces of heavy filter paper (Whatman No. 5, S&S No. 598, or 589 green ribbon have been found satisfactory) in soln. (To avoid uneven distribution of indicator and enzyme, wet entire paper at once by laying it on surface of soln.) Hang paper to dry in place free from NH<sub>3</sub> fumes, strong air currents, or heat. Paper should be orange when dry. Store dry paper in well-stoppered, dark glass bottle in cool place.

(e) *Xanthydrol.*—Eastman Kodak Co. No. 1559, crystals.

**44.167**

#### *Apparatus*

(a) *Ultraviolet lamp.*—Short wave, 253.7 nm, with filters to eliminate most visible light.

(b) *Chromatographic sprayer.*—250 mL, to deliver fine spray from air supply (Kontes Glass Co., K-422500, or equiv.). Hand-operated atomizer is satisfactory if it delivers fine spray.

**44.168**

#### *Ultraviolet Test*

Spread 50 g grain in shallow tray, or on sheet of waxed paper on tray. Place in hood or well ventilated area, and spray evenly with Mg uranyl acetate reagent, making several sweeps horizontally and vertically across sample. Let stand 1–3 min, and examine under short-wave UV light. With clean tweezers, transfer kernels showing greenish fluorescent areas to spot plate. (Avoid prolonged exposure to UV light and do not touch grains with bare fingers (use gloves). Perspiration may cause false fluorescence.)

Use as blanks 1 or 2 kernels showing no green fluorescence under UV light.

**44.169**

#### *Urease-Bromothymol Blue Test*

Add 1–4 drops H<sub>2</sub>O to each suspect kernel on spot plate. Let stand 3–5 min. Place strip of test paper, (d), on glass microscope slide, transfer drop of ext to paper with stirring rod, and cover with second slide. Blue spots, slowly developing over 2–4 min, indicate urea. (As reagent is slightly acid, color may not appear for several min, depending on how heavily grain was sprayed.)

**44.170**

#### *Confirmatory Test*

Transfer 1–2 drops aq. ext of suspect kernels to microscope slide and evap. to dryness. Add drop of HOAc (2+1) and very small amt of xanthydrol crystals. If urea is present, characteristic

crystals of dioxanthylurea form quickly, and are visible at 60 $\times$  or lower with wide-field stereoscopic microscope.

#### Bromothymol Blue-Agar Test (69)—Official First Action

44.171

##### Apparatus

(a) *Disposable trays*.—Microtiter® plates, flexible vinyl, flat-bottom (Dynatech Laboratories inc., 900 Slaters Ln, Alexandria, VA 22314), or equiv.

(b) *Culture tubes*.—6 (od)  $\times$  50 mm.

44.172

##### Reagents

(a) *Bromothymol blue (BTB) indicator soln.*—Sol. form (Fisher Scientific Co., B-100, or equiv.). Transfer 50 mg BTB to 20 mL g-s test tube and add 10 mL H<sub>2</sub>O. Add 1 drop H<sub>3</sub>PO<sub>4</sub> (1+9) and dissolve completely by stirring. Add ca 0.1N NaOH dropwise to dark green (pH 5.8–6.0). (This prepn is enough for 1 batch of test agar.)

(b) *Urease suspension*.—Grind 0.30 g urease in small mortar, add few mL H<sub>2</sub>O, and continue grinding. Slowly dil. to 15 mL with stirring.

(c) *Test agar*.—Add 0.75 g bacteriological grade agar and 0.30 g Na benzoate to 300 mL cold H<sub>2</sub>O with vigorous stirring, and place on mag. stirrer-hot plate, 44.002(p); heat with stirring and boil gently 1 min. Cool to 45–48°, add BTB soln, (a), and adjust to pH 5.5 (yellow-green), using 0.9–1.1N NaOH or H<sub>2</sub>SO<sub>4</sub>. Add urease suspension to pH-adjusted, 45–48° agar and readjust pH, if necessary. Divide agar into 2 equal portions in beakers. To one portion add 0.5 mL 0.1N AgNO<sub>3</sub>. To other portion add 0.1N H<sub>2</sub>SO<sub>4</sub> (ca 0.2 mL) to adjust to match color shade or pH of first portion. Mix each portion thoroly and let stand ca 5 min.

*Agar sensitivity test*.—Prep. known urea-contaminated seeds by spotting each seed with 0.5  $\mu$ L 0.25% aq. soln of urea and let dry. Test these known samples as in 44.173. If no color response is obtained with known grains, either obtain new lot of urease or increase urease content after checking activity as in 7.033(b) and 7.034 so that suspension contains enough urease to convert 0.80 g urea, and repeat sensitivity test.

44.173

##### Test

Initially check sample for free alkali, using test agar contg AgNO<sub>3</sub> soln (45–48°), by (a) or (b) below:

(a) *For immediate use*.—Add grain, or unknown sample, to wells of disposable tray, 44.171(a), and, using dropping pipet, add agar until object is covered.

(b) *For storage and/or intermittent use*.—Add agar to culture tubes, 44.171(b), to  $\frac{1}{2}$  ht. Transfer tubes to heat-sealable plastic bags, seal, and store at 4 $\pm$ 1°. Agar can be stored  $\leq$ 120 days. To use, let stand 1 hr at room temp. Use small glass rod to force test object below surface of agar. Remove rod and shake down agar. Observe frequently for color change near surface of object.

If test for free alkali is neg. (no color change of indicator), proceed with AgNO<sub>3</sub>-free test agar, analyzing sample in similar manner. (Grains must be totally immersed during test.) Color change of indicator is yellow  $\rightarrow$  green  $\rightarrow$  blue, depending on concn of NH<sub>3</sub> produced. Reaction usually requires 1–3 min to give detectable color. Time varies inversely with urea concn. Spots from higher levels of urea continue to develop and enlarge for 10–12 min and then fade gradually.

#### TLC Method (70)—Official Final Action

44.174

##### Apparatus

See 44.162 and following:

(a) *Soxhlet extractor*.—250 mL extn flask; extn chamber 39 (id)  $\times$  115 mm with top joint  $\frac{3}{4}$  45/50 and bottom joint  $\frac{3}{4}$  24/40;

35  $\times$  90 mm thimbles; condenser joint  $\frac{3}{4}$  45/50 (Arthur H. Thomas Co., No. 4406-E34, or equiv.).

(b) *Kuderna-Danish concentrator*.—See 29.005(e).

44.175

##### Reagents

See 44.163.

44.176

##### Determination

(Caution, See 51.011, 51.039, and 51.046.)

On previous day prep. plates for overnight drying. Equilibrate tanks ca 1 hr before extg samples.

(a) *Soxhlet extraction*.—Ext 18 g sample with 60 mL acetone 1 hr at 3–4 min/siphon. Transfer ext to 100 mL g-s graduate, dil. to vol., and take aliquot equiv. to 9 g sample. Conc. as in (c).

(b) *Alternative extraction*.—Place 18 g sample in 50 mL beaker or erlenmeyer. Add 1 mL acetone/g sample and boil gently 5 min, avoiding excessive loss of acetone. Decant thru glass wool pad into 100 mL g-s graduate. Repeat acetone boil and decanting 3 addnl times, and dil. to 100 mL. Conc. aliquot equiv. to 9 g as in (c).

(c) *Concentration*.—Conc. aliquot to ca 0.2 mL in Kuderna-Danish concentrator as in 29.009(b); or, alternatively, place empty 13 mL graduated conical centr. tube in beaker of boiling H<sub>2</sub>O. When tube is hot, slowly transfer portions ext, using syringe fitted with long needle, to evapn tube. Let each portion evap. before next is added. Evap. to ca 0.20 mL. Chromatograph without appreciable delay.

(d) *Preparation of tank and plates*.—See 44.164(c) and (d).

(e) *Spotting of plates*.—Spot sample conc. as band ca 25 mm long on line 15 mm up and 15 mm in from edge of plate. Wash sides of evapn tube with ca 50  $\mu$ L acetone and transfer wash to sample band area. Repeat 50  $\mu$ L washings and transfers until last transfer is colorless (ca 4 transfers). Spot 1  $\mu$ L each of std solns (a)–(d) ca 10 mm apart along line 15 mm to left of center of plate and 15 mm from edge of plate.

(f) *Development of plates*.—Place plate in trough contg ether in lined tank presatd with ether. Let ether travel to top of plate. Remove plate and let air dry. Immediately draw intersecting lines to divide plate into 4 equal sqs. Dry plate 5 min in 80° forced-draft oven. Remove plate from oven and promptly place in dry solv. trough in TLC tank with spotted band down. Close tank and let stand 20 min. Slide top aside just enough to introduce long-stem funnel into solv. trough. Slowly add 20 mL developing solv., (g), to trough. Close lid and develop in dark to line of first direction. Dry plate 5 min in 80° forced-draft oven.

Rotate warm plate to place chromatographed stds in upper left quarter of plate and promptly place in dry trough in tank. Let stand 20 min without touching any liq. in closed tank. Then slide cover aside just enough to introduce long-stem funnel into solv. trough and slowly add 20 mL developing solv. Let front move to line in this second dimension. Dry plate 5 min in 80° forced-draft oven.

(g) *Color development*.—Proceed as in 44.164(h).

#### Bird Excrement in Food and Containers (71) Official Final Action

44.177

##### Test for Uric Acid

(Not suitable for minute residues from suspect areas of food containers)

Transfer white, amorphous, grainy particles to depression of spot plate preheated to ca 100° on hot plate or in oven. Add small drop of HNO<sub>3</sub> (1+1) to sides of depression so that it will run down to wet particles; then evap. to dryness in 0.5–1.0 min.

Heat 1–3 min. If particles turn orange-red to deep red with heat, uric acid and/or its salts may be present.

*To confirm:* Cool plate until there is no perceptible heat to back of hand; then streak across colored area with small glass rod wetted with 50% NaOH soln. Intense purple will develop almost immediately.

*Modification for particles less than 1 mg.*—Position microscope or strong magnifying glass to observe 18 mm No. 2 cover glass placed on metal surface heated to ca 110–120°. Place suspect particle on glass, add 5–10  $\mu$ L HNO<sub>3</sub>, evap. to dryness, and heat in oven 5–7 min at 135–140°. Remove to cool white surface under magnifier and observe baked reaction residue. Pos. reaction shows yellow-orange to orange-red ring.

*To confirm:* With 1 mm glass rod place small drop 50% NaOH soln on edge of cover glass. Wipe rod and transfer small portion of drop to edge of baked residue. *Do not flood.* Purple-violet color develops promptly with uric acid or its salts.

### Insect Excrement

#### Uric Acid in Flour (72)—Official Final Action

(Applicable to levels  $\geq 4$  mg/100 g)

#### 44.178

#### Apparatus

- (a) *Spectrophotometer.*—Beckman Model DU, or equiv.
- (b) *Centrifuge.*—Desk centrf. with multiple head to hold 15 mL polyethylene test tubes.
- (c) *Incubator or water bath.*—Capable of maintaining temp. of  $37 \pm 1^\circ$ .

#### 44.179

#### Reagents

- (a) *Uric acid std soln.*—100  $\mu$ g/mL. Dissolve 100 mg uric acid in 1 L 5% NaOAc soln. (If necessary, warm in H<sub>2</sub>O bath at 60–70°.) Filter and store in brown bottle; discard after 1 week. (Do not use com. uric acid std solns, as they may contain uricase inhibitors.)
- (b) *Sodium borate buffer.*—0.01M, pH 9.2. Dissolve 3.8 g Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·10H<sub>2</sub>O in H<sub>2</sub>O and dil. to 1 L.
- (c) *Sodium acetate soln.*—5%. Dissolve 100 g anhyd. NaOAc in H<sub>2</sub>O and dil. to 2 L. If necessary, adjust pH to 8.8–9.2 with HOAc or NaOH.
- (d) *Glutathione soln.*—10 mg/mL in H<sub>2</sub>O. Use within 30 min.
- (e) *Uricase soln.*—Prep. suspension of 10 mg dried uricase in 50 mL 0.01M Na borate buffer. Use within 1 hr. (Clean all glassware that comes in contact with uricase enzyme with chromic acid soln; adsorbed uricase on glass surface produces low results.)

#### 44.180

#### Preliminary Tests

- (a) *Test for purity of reagents.*—Dil. 5.0 mL uric acid std soln to 25 mL with 5% NaOAc soln. Place 5 mL in each of 3 test tubes. To 1 tube add 5 mL Na borate buffer, invert several times, and measure *A* at 292 nm. *A* should be  $\geq 0.72$ , which corresponds to 0.072 *A* unit/ $\mu$ g uric acid/mL final soln. Test std uric acid soln daily.
- (b) *Test for efficiency of uricase soln.*—Label remaining 2 tubes in (a) as No. 1 and No. 2; label a third test tube No. 3. Add 5 mL uricase soln to tubes No. 1 and No. 3. Close mouth of tube No. 1 with piece of cellophane sheet under thumb and invert. Stopper all 3 tubes with clean rubber stoppers and incubate 2 hr at 37°. After incubation, mix contents of tubes No. 2 and No. 3 by repeatedly pouring (6 times) from one tube to other, and immediately (within 60 sec) read *A* of combined solns at 292 nm, using soln in tube No. 1 as blank. *A* should be  $\geq 0.648$  for  $\geq 90\%$  of theoretical efficiency of uricase. If efficiency is

$< 90\%$ , incubate 4 hr. If increased incubation does not increase efficiency to 90%, discard uricase sample.

#### 44.181

#### Preparation of Standard Curve

Pipet 0.0, 2.5, 5.0, 10.0, and 15.0 mL uric acid std soln into 5 beakers (corresponds to 0.0, 1.0, 2.0, 4.0, and 6.0  $\mu$ g uric acid/mL in final soln, resp.), and perform all steps as in 44.182, except omit flour.

#### 44.182

#### Determination

Add 25 mL 1N HCl and 5 mL glutathione soln to 4 g flour in 250 mL beaker. Mix well with glass rod and let stand overnight ( $\geq 16$  hr). Add 25 mL 1N NaOH with stirring and adjust pH to 9.0–9.3 with 1N NaOH or 1N HCl. Transfer to 100 mL g-s graduate, carefully scraping all material sticking to sides of beaker with glass rod. Rinse beaker with 6 small portions 5% NaOAc and dil. to 100 mL with 5% NaOAc. Shake *gently* by inverting graduate several times every 10 min for 1 hr. (Vigorous shaking tends to produce turbid soln.) Transfer aliquot to 15 mL polyethylene test tube and centrf. 30 min at 3000 rpm. Decant supernate into small erlenmeyer, mix well, and pipet 4 mL into each of 2 test tubes, No. 1 and No. 2. To each tube, add 1 mL Na borate buffer and mix by rotating between palms of hands. (Mix soln with Na borate buffer within 15 min to avoid turbid soln.) Label third tube as No. 3. Add 5 mL uricase soln to tubes No. 1 and No. 3. Mix contents of tube No. 1 as in 44.180(b). Stopper all 3 tubes with rubber stoppers and incubate 2 hr at 37°. Combine solns in tubes No. 2 and No. 3, as in 44.180(b), and read *A* immediately (within 60 sec) at 292 nm against soln No. 1 (blank). (If flour ext appears very turbid after centrfg, dil. centrfd ext 1 + 4 with Na borate buffer and pipet 5.0 mL into each of 2 test tubes, No. 1 and No. 2. Add 5 mL uricase to each tube (No. 1 and No. 3) and proceed with detn as above.)

Reading, *A*, corresponds to amt of uric acid present in 4 mL portions of centrfd soln; amt of uric acid obtained from std curve  $\times$  diln factor = amt of uric acid in sample.

### Uric Acid from Bird and Insect Excreta

#### Thin Layer Chromatographic Method (73) Official First Action

(Applicable to suspect material not suitable for detn by 44.177 and/or to confirmation of 44.177 when adequate material is available.)

#### 44.183

#### Apparatus and Reagents

- (a) *Thin layer cellulose plates.*—See 44.164(d)(1)–(3).
- (b) *Cellulose powder.*—See 44.163(h).
- (c) *Detection sprays.*—(1) *Spray reagent A.*—Prep. satd aq. soln of Na<sub>3</sub>PO<sub>4</sub>, and filter. (2) *Spray reagent B.*—Weigh 50 g Na<sub>2</sub>WO<sub>4</sub> into 500 mL  $\frac{3}{4}$  24/40 boiling flask, add 10 g anhyd. Na<sub>2</sub>HPO<sub>4</sub> and 100 mL H<sub>2</sub>O, and heat until solids are dissolved. Add 50 mL cool (room temp.) H<sub>2</sub>SO<sub>4</sub> (1+3) very slowly with swirling in the tungstate soln. Reflux 1 hr, cool to room temp., and dil. to 250 mL.
- (d) *Developing solvent.*—*n*-BuOH-MeOH-H<sub>2</sub>O (4+4+3). Measure vols sep. and mix well to form stable single phase. To 30 mL this soln add fresh daily 1 mL HOAc, and mix well.
- (e) *Dye mixture.*—Dissolve 8 mg each of FD&C Red No. 2 and FD&C Yellow No. 6 in 250 mL H<sub>2</sub>O, and mix well.
- (f) *Lithium carbonate soln.*—1 mg/mL H<sub>2</sub>O.
- (g) *Phenolphthalein soln.*—1% in alcohol-H<sub>2</sub>O (1+1).
- (h) *Uric acid std soln.*—(1) *Stock soln.*—1 mg/mL. Dry 105 mg uric acid in 100° oven overnight, and cool to room temp. in desiccator. Accurately weigh 60 mg Li<sub>2</sub>CO<sub>3</sub> and transfer to 100

mL vol. flask. Accurately weigh 100 mg cool uric acid and transfer quant. to the 100 mL vol. flask with ca 50 mL H<sub>2</sub>O. Place in 60° H<sub>2</sub>O bath and agitate until soln clears. Cool immediately under tap H<sub>2</sub>O to room temp. and dil. to vol. with H<sub>2</sub>O. For short term use (<3 days), store in refrigerator; for extended use, place portions in small containers and store hard frozen. (2) *Working soln.*—100 µg/mL. Pipet 10 mL stock soln into 100 mL vol. flask and dil. to vol. with H<sub>2</sub>O. Prep. fresh daily.

**44.184****Preparation of Sample**

(a) *Insect excreta.*—Transfer material to small test tube, crush with glass rod, and add 0.05–0.1 mL Li<sub>2</sub>CO<sub>3</sub> soln, (c). Let soak ca 10 min, and centrif. Obtain clear supernate, and proceed as in 44.185.

(b) *Paper bags or cartons.*—Cut ca 5–6 mm diam. portion from suspect area, and place in small test tube. Add ca 0.1 mL Li<sub>2</sub>CO<sub>3</sub> soln, (c), and agitate with small stirring rod. Let soak ca 10 min, and proceed as in 44.185.

(c) *Other suspect material.*—Transfer small portion to test tube, add ca 0.1 mL Li<sub>2</sub>CO<sub>3</sub> soln, (c), and stir with glass rod. Let soak ca 10 min, and centrif. Obtain clear supernate, and proceed as in 44.185.

**44.185****Determination**

(a) *Spotting of plates.*—Place coated plate on heated metal slab (see 44.164(e)). Place infrared lamp or forced hot air source (hair dryer, etc.) above the plate to speed drying of spots. Spot 1 µL uric acid working std soln, (h)(2), at each edge and at center of plate ca 15–20 mm up from bottom. Overspot each of 3 working std spots with 1 µL dye mixt., (e). Spot samples along same line at ca 10 mm intervals. Keep spots to min. size by drying well between successive small addns.

(b) *Development of plates.*—Develop in conventional tank without pre-equilibration or, alternatively, form sandwich chamber with uncoated plate and develop. Dry plate on heated metal slab or in forced draft oven ca 5 min at 75–80°. Along line parallel to origin, place two 1 µL spots phthln soln, (g), between each upper and lower set of dye spots.

(c) *Color development.*—Observe plate under shortwave (254 nm) black light in darkened room, marking quenching (dark) spots with circle. High levels of uric acid should appear as 4–5 mm areas at  $R_f = 0.40 \pm 0.05$ , depending upon conditions of development. Spray plate in hood with spray reagent A, (c) (1), until strong phthln spots appear and background darkens slightly. (Caution: See 51.017.) Spray with spray reagent B, (c) (2), until plate is damp or just shiny wet. Place immediately in horizontal position, and dry as in (b). If all spots have not responded, respray again with spray reagent A until strong phthln spots appear. Pale blue color at  $R_f$  of std, which darkens slightly upon heating, confirms presence of uric acid. Prolonged heating fades color.

**MISCELLANEOUS****Plant Gums, Crude****44.186 Light Filth (74)—Official First Action**

(If av. particle is ≤5 mm, proceed with method. If particle size is >5 mm, break into pieces by hand or by dropping small amts at a time into high-speed blender until desired size is reached. Where 95% and 40% alcohol are specified, isopropanol and 30% isopropanol, resp., can be substituted.)

Weigh 50 g sample into 2 L beaker, add 1.2 L H<sub>2</sub>O and 15 mL HCl, and stir well. Autoclave 1 hr at 121°. Slow vent. (Arabic and guar gums will completely dissolve in 15–30 min in 1.2 L H<sub>2</sub>O + 25 mL HCl when placed on mag. stirrer-hot plate or in steam

bath.) Sieve portionwise on No. 230 sieve, 44.002(u), using forcible stream of hot (55–70°) tap H<sub>2</sub>O from aerator, 44.002(a), until all gum has passed thru. Transfer directly to ruled filter paper if negligible amts of plant tissue remain on sieve. If large amts of plant debris remain on sieve, transfer to 1 L trap flask with 40% alcohol. Bring vol. to 500 mL with 40% alcohol and add 25 mL HCl. Heat to ca 60° on mag. stirrer-hot plate with stirring. Add 25 mL mineral oil, 44.003(y), and stir mag. 2 min, 44.004(b). Fill flask with 40% alcohol and gently swirl contents with stopper. Let stand 10 min and perform first trapping. Add 25 mL mineral oil, and gently stir with stopper 1 min. Let stand 5 min and perform second trapping. Rinse neck of flask with 95% alcohol and pour trappings onto ruled filter paper. Examine at 30×.

**Leafy Crude Drugs—Official First Action****44.187 Gross Contamination**

See 44.119.

**44.188 Heavy and Light Filth**

See 44.120.

**Papain, Crude and Refined****44.189 Light Filth (75)—Official First Action**

Weigh 50 g sample into 1.5 L beaker. (Caution: Weigh under effective fume removal device to avoid breathing dust. Avoid skin contact.) Add 1 L hot H<sub>2</sub>O and small amt of Antifoam A spray. Boil 20 min with stirring. Wet sieve forcefully on No. 230 sieve until all whitish material passes thru sieve and only plant debris and extraneous materials remain. If small amt of material remains on sieve, transfer directly to ruled filter paper. If large amt of plant tissue remains, transfer to 1 L trap flask with 40% isopropanol or 55% alcohol (use same alcohol thruout method). Bring vol. to 500 mL with alcohol and add 25 mL HCl. Boil 5 min, add 25 mL mineral oil, 44.003(y), stir mag. 2 min, 44.004(b), fill with alcohol, and trap off after 10 min. Perform second trapping, using 15 mL mineral oil, stir by hand 1 min, and trap off after 10 min. Filter trappings thru ruled paper and examine microscopically.

**44.190 Direction of Insect Penetration thru Packaging Materials (76)—Official First Action****(a) Entrance Characteristics**

(1) *Kraft paper, paper box.*

(a) *Surface fraying.*—Consists of paper fibers cut and lifted from surface of packaging material by mandibular activity. Represents first activity of hole formation. May occur at random on "entrance" surface of packaging materials. See Fig. 44:09(B).

(b) *Terraced depression.*—Consists of "step effect" formed when secondary depression is superimposed on initial depression; see Fig. 44:09(D). This terracing may be present around entire perimeter of final hole or at one or more points around it.

(c) *Tapered hole.*—Diam. of hole is greater on entrance side than exit side. This feature is most obvious on thicker packaging materials. See Fig. 44:09(E).

(2) *Foil, Cellophane, polyethylene plastic, waxed paper.*

(a) *Mandibular scratches.*—Found on Al foil, Cellophane, and polyethylene plastic. Consists of small, short surface scratches or grooves formed by pincerlike action of mandibles. Frequently observed around perimeter of hole or in localized groups at random on entrance surface. See Fig. 44:09(F).

(b) *Upturned edges.*—Present around perimeter of holes in

Al foil and polyethylene plastic materials. Appear as continuous irregularly upturned edge in foil (Fig. 44:09(G)) and generally as upturned fraying of plastic (Fig. 44:09(H)) in polyethylene materials. Not observed on waxed paper and Cellophane materials.

(c) *Roughened surface*.—Observed around perimeter of holes or randomly on surface of polyethylene plastic and waxed paper. Consists of surface fraying or pulled up tufts resulting from mandibular action on material. Distinct mandibular scratches may be observed around or in roughened areas.

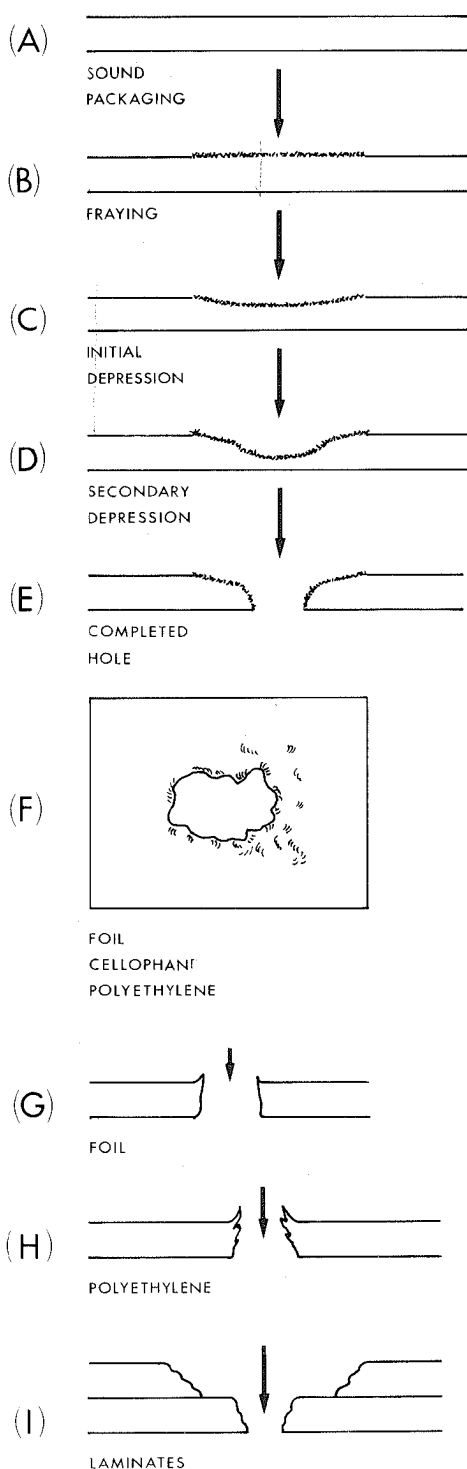

FIG. 44:09—Insect penetration of packaging.

(3) *Foil/paper, foil/plastic, or other laminates*.

(a) *Entrance characteristics*.—See specific materials.

(b) *Terracing of laminates*.—Quite common on entrance side of these materials. Observed as larger hole bored in laminate material on entrance surface and smaller hole in exit side of material. See Fig. 44:09(I).

(b) *Exit Characteristics*

All types of packaging materials.

(1) Clean-cut hole perimeter.

(2) Diam. of hole smaller than on entrance side.

(3) No surface fraying, scratches, or depressions (see Fig. 44:09(E)).

## 45. Forensic Sciences

### Latent Fingerprints

#### *Powder Brushing Method (1)—Official Final Action*

(Applicable to development of latent images deposited on nonporous surfaces within 120 hr and not subjected to extreme temp. or humidity changes)

45.001

#### *Determination*

Pour small amt fingerprint powder (Hi-Fi Volcano, Sirchie Fingerprint Laboratories, Inc., Gravelly Hollow Rd, Medford, NJ 08055, or equiv.) into shallow dish or onto piece of paper. Pick up small amt with end of camel hair brush. Hold brush over surface to be dusted, and tap handle lightly to permit powder to drift onto surface. Brush surface lightly until image begins to appear. Continue with light strokes, following ridge direction in pattern as it forms. Apply addnl powder, if necessary, to obtain good contrast, but retain ridge detail. When sufficient detail and contrast are obtained, remove excess powder with ostrich feather duster. Preserve image by photographing and then taping over, leaving tape in place if practical. If not, pull off tape slowly and evenly, and place on 3 × 5" card of contrasting color.

#### *Chemical Development Method (2)—Official First Action*

(Applicable to forced development of latent images deposited on bond and newsprint papers)

45.002

#### *Apparatus and Reagent*

(a) *Steam iron*.—With heat indicator.

(b) *Ninhydrin soln.*—0.5%. Dissolve 0.5 g 1,2,3-indantrione  $\text{H}_2\text{O}$  in 100 mL acetone, mix, and let stand 15 min.

45.003

#### *Pretreatment*

(If evidence contains handwriting, printing, or typewriting to be examined by document examiner, protect area by brushing pretreatment, allowing for migration of ninhydrin soln. In general, spray large objects.)

Perform one of following pretreatments on papers:

(a) *Dipping*.—Pour small vol. ninhydrin soln into flat dish, pick up paper with tweezers, submerge paper in soln until satd, hold paper above dish, letting excess liq. drip into dish, and place paper on clean blotter to air dry.

(b) *Brushing*.—With paint brush or cotton swab on wooden stick, pick up small vol. ninhydrin soln from flat dish, paint paper until surface is coated, transfer to clean blotter, and let air dry.

(c) *Spraying*.—Pour ca 30 mL ninhydrin soln into spraying cannister. Use com. compressed air or inert gas, or compressed air from laboratory line as propellant. Place papers in exhaust hood or similar cabinet. Hold spraying cannister upright ca 8–10" (20–25 cm) from paper and spray until paper is coated. Transfer paper to blotter and let air dry.

Discard ninhydrin soln in flat dish. Return ninhydrin spraying soln to supply bottle for future use.

45.004

#### *Development*

Fill steam iron with  $\text{H}_2\text{O}$  and turn heat indicator to "Steam". Place papers on clean blotter. When steam is being ejected from sole plate holes, hold iron ca 1" (2.5 cm) above papers and move iron around to distribute heat and steam evenly. Vary ht above paper with rate steam is being projected beneath iron. Steam should just reach papers before rising to sole plate. Wipe sole plate frequently to prevent condensate from dripping on paper.

Images will begin to develop in ca 45 sec and continue to intensify until plum or purple color is obtained. Move paper to clean blotter and let air dry; as alternative, after steam development of prints, shut off steam, wipe bottom of iron free of moisture, and then lightly pass iron over developed prints to enhance images. (Use caution not to burn or scorch papers.) Continue with each paper until all have been treated. When papers are dry, place each in appropriately labeled envelope or plastic protector, handling with tweezers.

### Characterization and Matching of Glass Fragments by Dispersion Microscopy

#### *Double Variation Method (3)—Official Final Action*

45.005

#### *Principle*

Refractive indices ( $n$ ) of glass and stdzd liqs are matched at different wavelengths by varying temp. of mixt. The  $n$  of glass remains relatively const with temp. change; those of liqs decrease with increasing temp. Plot of wavelength, where  $n$  of glass and liq. match, against temp. for specific stdzd liq., is characteristic of particular glass.

45.006

#### *Apparatus*

(a) *Microscope*.—Compd, transmitted light type, with illumination system capable of restricted substage aperture or, preferably, phase contrast optics which permits easier matching, with provision for long working distance.

(b) *Hot stage*.—Capable of attaining, holding, and indicating temp. accurately ( $\pm 0.1^\circ$ ) and permitting use of required illumination (Mettler FP-5, Mettler Instrument Corp., 20 Nassau St, Princeton, NJ 08540, or equiv.).

(c) *Monochromatic light source*.—Accurately calibrated ( $\pm 1$  nm at 486) with sufficient intensity in small beam of low angular aperture over range at least 460–680 nm (continuous interference filter, 400–700 nm, band width ca 15 nm, No. 50 09 00, Carl Zeiss, Inc., 444 Fifth Ave, New York, NY 10018, is satisfactory).

(d) *Graph paper*.—Hartmann net (linear temp., nonlinear wavelength resulting in straight line) preferable; available from Walter C. McCrone Associates, Inc., 2820 S Michigan Ave, Chicago, IL 60616. If unavailable, use ordinary graph paper.

45.007

#### *Reagents*

(a) *Refractive index liquids*.—Calibrated immersion liqs, range 1.50–1.65 (R. P. Cargille Laboratories, 55 Commerce Rd, Cedar Grove, NJ 07009), or NBS SRM 1823 silicone liqs. Use high dispersion set with most glasses.

(b) *Collodion soln.*—Dil. 1 mL 3% collodion, flexible (Fisher Scientific Co., No. C-409), to 100 mL with amyl acetate.

45.008

#### *Preparation of Samples*

(All particles examined must be  $\leq 100 \mu\text{m}$  in major dimension.)

(a) *Single small flake*.—Arrange 3 small (2–3 mm) cover slip flakes at corners of ca 1 cm triangle near end of  $\frac{5}{8} \times 3$ " microscope slide and cement in place by placing drop of dild collodion soln outside of triangle and drawing soln to each fragment in turn with fine tungsten needle. With very small drop of dild collodion soln, cement test fragment on slide within

triangle, near 1 of fragments as locator. Avoid touching collodion cementing cover slip fragments. Second fragment can be cemented close by for simultaneous and direct comparison. Excessive collodion interferes with index readings; if necessary, thin collodion around test fragment with amyl acetate. Place cover slip on the 3 supports, and place small drop of liq. of known  $n$  at edge to be drawn around fragments by capillary attraction. After  $n$  measurement, clean slide, if necessary to change liq., by removing cover slip and rinsing tilted slide held over waste containers with drops of benzene added from dropper.

(b) *Many small flakes.*—Obtain many small flakes by crushing in anvil-striker type hammer mill. Place few flakes on slide without cementing, cover with cover slip, and add small drop of liq. at edge of cover slip. New prepn may be used for each liq. or slide may be cleaned by removing cover, pushing particles to side with razor cut edge of filter paper, adding drop of new liq., pushing again to side, and adding drop of fresh liq.

#### 45.009

#### Determination

Choose immersion liq. which matches  $n$  of glass at far red end of spectrum at temp. slightly above room temp., ca 30°. With such match, all subsequent temp.-wavelength matches will be <60°, requiring small temp. corrections. Use narrow beam of light parallel to optic axis passing thru closed down substage aperture, but open enough to see Becke lines. (There will be best iris setting for each wavelength.) Place mounted sample on hot stage set at lowest even degree temp. at which wavelength match is observed (ca 660 nm). Darkened room and intense illumination are advantageous. Record av. of several

Reprinted with permission of Ann Arbor Science Publishers Inc., Ann Arbor, MI.

matching wavelengths for that temp. Set temp. at successively higher even degree intervals, let equilibrate 30 sec, and read wavelength. Repeat match several times and det. av. Continue increasing temp. until no match can be obtained (ca 450 nm). Let hot stage cool, and recheck 1–2 of lower temp. matches. Difference indicates change in liq. at high temp. and requires repeat of second half of data at higher temp. with fresh liq. Rate should be 1 data point/min. Plot data on Hartmann net or ordinary graph paper.

#### 45.010

#### Calculations

From graph, read temp. corresponding to 486.1 (F), 589.3 (D), and 656.3 (C) nm. From Table 45:01, obtain  $n$  of liq. used at these wavelengths and temp. coefficient to be used in correcting table values at 25° to actual matching temp. Report matching temp. and corrected refractive index ( $n'$ ) for each of the 3 wavelengths specified.

Example: Using Cargille liq. 1.520:

Wavelength	Matching temp. from graph	$n$ at this wavelength (Table 45:01) at 25°	Calcd $n$ at matching temp.
486	42.8	1.53030	1.52354
589	33.6	1.52000	1.51673
656	29.6	1.51603	1.51428

Calcd  $n$  is obtained by using  $dn/dt = 0.00038/^\circ$  in equation:  
 $n' = n_{25} - (\text{matching temp.} - 25)(dn/dt)$

$$n_{486} = 1.53030 - (42.8 - 25)(0.00038) \\ = 1.53030 - 0.00676 = 1.52354.$$

Repeat for 589 and 656 nm.

#### Mineral Wool Insulation (4) Interim Official First Action

#### 45.011

#### Apparatus and Reagents

(a) *Microscopes.*—(1) Phase contrast, with provision for long working distances; (2) Low power inspection type.

(b) *Illuminators.*—White and UV (253.7 nm) incident light sources.

(c) *Monochromator.*—See 45.006(c), or High Intensity Monochromator (Bausch & Lomb, Inc.), or equiv, for transmitted light illumination.

(d) *Hot Stage.*—See 45.006(b).

(e) *Graph paper.*—See 45.006(d).

(f) *Annealing oven.*—650°. Controlled temp. muffle furnace.

(g) *Refractive index liquids.*—See 45.007(a).

#### 45.012

#### Microscopic Examination

Compare known and unknown source materials under low power microscope in incident light to det. color of resin, if any, and disposition of resin on fibers (e.g. evenly coated, in globs, etc). Compare diams of fibers, and relative abundance of slugs and shot.

#### 45.013

#### Annealing

Place known source and unknown source fibers and slugs in porcelain crucibles with covers and heat to 650° (1200°F) in controlled temp. muffle furnace. Hold at 650° ≥10 min; then lower temp. at rate of ca 28° (50°F)/30 min to ca 365° (690°F) when rate of cooling becomes immaterial.

**45.014****Comparison of Properties**

(a) *Fluorescence*.—If enough material is available, compare fluorescence of annealed fibers under UV light, (b). Note color and brightness of fluorescence.

(b) *Solubility in acid*.—Place annealed fibers on glass slide under low power microscope, add drop HCl (1+3), and note solubility. Repeat, if indicated, with concd HCl.

(c) *Optical properties*.—Place representative fibers and slugs from annealed known and unknown source materials on microscope slides under cover slips. Introduce refractive index liq., (g), under cover slip. Insert on hot stage and adjust temp. until fibers essentially disappear when viewed thru phase microscope and monochromator set near red end of visible spectrum (near 656 nm). Note temp. and monochromator setting. Increase temp. in 5° (9°F) increments to find  $\geq 3$  match points of glass and oil within 656–486 nm range. Plot results on graph paper, (e), on which oil dispersion curves have been plotted and calibrated. If variations along fibers or among fibers and slugs have been observed, curve for material is best expressed by band covering all match points observed.

Because of wide variation of  $n$  among mineral wool insulations, it may be necessary to make several trials before appropriate oil is found. If fibers are clearly visible in all wavelengths of light at temps between 35 and 90°, choose different oil. Repeat trial-and-error procedure until oil is found in which fibers match oil at 3 different wavelengths between 656 and 486 nm.

Compare properties of known and unknown source materials.

**Voice Print Identification (5)—Official Final Action****45.015****Principle**

Voice print method of speaker identification consists of aural and visual comparison of one or more known voices to unknown or questioned voice. Aural examination detects if acoustic properties of known and unknown voices exhibit preponderance of similarities or differences. Visual analysis with speech spectrograms compares spectrographic features of similar sounds in both known and unknown voices.

**45.016****Apparatus**

(a) *Sound spectrograph*.—Model 4691 or 700 from Voice Identification, Inc., PO Box 714, Somerville, NJ 08876, or Voice Scan Spectrograph Model LGK 100 from Audio Intelligence Devices, PO Box 23130, Ft Lauderdale, FL 33307, or equiv.

(b) *Tape recorders*.—(1) Model 110 Sony cassette (ac capability, 115–120 v, 60 Hz; frequency response, 50–10,000 Hz), or equiv. (2) Multitrack, for aural evaluation (optional).

(c) *Patch cord*.

(d) *Spectrograph paper*.

**45.017****Determination**

Record unknown and known voices onto spectrograph. Use patch cord to record speech samples from cassette recorder to spectrograph. Adjust signal peaks to zero volume units (VU) for proper record level, and monitor recording.

Listen to known and questioned voices until familiar with context of each call and each speaker's voice. Set spectrograph modes for normal (bar), wide-band, expanded linear frequency scale with high shaping. Adjust scan playback level to zero VU for production of each spectrogram. Label unknown spectrogram by call number. Label known spectrogram by name given for each speaker. Properly label all speech sounds produced on each spectrogram.

Aurally compare questioned and known voices, using multi-track recorder, or 2 recorders. Visually examine similar sounds between unknown and known voices as displayed in speech spectrograms. Conduct aural and visual examinations simultaneously in arriving at conclusion, without limitations on time or restrictions on number of speech samples necessary.

Make 1 of 5 alternative judgments: (1) positive identification; (2) positive elimination; (3) probable identification; (4) probable elimination; (5) unable to arrive at conclusion. Base all positive judgments on  $\geq 10$  pairs of like sounds in known and unknown voices.

## EXAMINATION OF EGGS AND EGG PRODUCTS (1)

("Compendium of Methods for the Microbiological Examination of Foods." Prepd by the APHA Intersociety/Agency Committee on Microbiological Methods for Foods. 1976. Marvin L. Speck, Ed., should be used as guide for further study of microorganisms obtained in culturing technics described.)

### Sampling—Official Final Action

#### 46.003

#### Equipment

(a) *Liquid eggs*.—Sampling tube or dipper, sterile sample containers with tight closures (pt (500 mL) Mason jars or friction top cans are most practical), alcohol, alcohol lamp or other burner, absorbent cotton, clean cloth or towel, and H<sub>2</sub>O pail.

(b) *Frozen eggs*.—Elec. (high-speed) or hand drill with 1 × 16" auger, hammer and steel strip (12×2×0.25"), or other tool for opening cans; tablespoon, hatchet or chisel, precooled sterile containers, etc., as in (a).

(c) *Dried eggs*.—Grain trier long enough to reach to bottom of containers to be sampled. Clean sample containers with tight closures (pt (500 mL) Mason jars or paperboard cartons), clean cloth or towel, and tablespoon.

#### 46.004

#### Methods

Take samples from representative number of containers in lot, **17.001**. Sterilize sampling tube or dipper, auger, spoon, and hatchet by wiping with alcohol-soaked cotton and flaming over alcohol lamp or other burner. Between samplings, thoroly wash instruments, dry, and resterilize. Open and sample all containers under as nearly aseptic conditions as possible.

(a) *Liquid eggs*.—Thoroly mix contents of container with sterile sample tube or dipper, and transfer ca 400 mL (0.75 pt) to sterile sample container. Keep samples at <5° but avoid freezing. Observe and record odor of each container sampled as normal, abnormal, reject, or musty.

(b) *Frozen eggs*.—Remove top layer of egg with sterilized hatchet or chisel. Drill 3 cores from top to bottom of container: first core in center, second core midway between center and periphery, and third core near edge of container. Transfer drillings from container to sample container with sterile spoon. Examine product organoleptically by smelling at opening of fourth drill-hole made after removal of bacteriological sample. (Heat produced by elec. drill intensifies odor of egg material, thus facilitating organoleptic examination.) Record odors as normal, abnormal, reject, or musty. Refrigerate samples with solid CO<sub>2</sub> or other suitable refrigerant if analysis is to be delayed or sampling point is at some distance from laboratory.

(c) *Dried eggs*.—For small packages, take entire parcel or parcels for sample. For boxes and barrels, remove top layer with sterile spoon or other sterile instrument, and with sterile trier remove ≥3 cores as in (b). (Samples should consist of ca 400 mL (0.75 pt).) Aseptically transfer core to sample container with sterile spoon or other suitable instrument. Store samples under refrigeration or in cool place.

### Culture Media—Official Final Action

#### 46.005

#### Standard Methods Media

(a) *Dilution water*.—To prep. stock soln, dissolve 34 g KH<sub>2</sub>PO<sub>4</sub> in 500 mL H<sub>2</sub>O, adjust to pH 7.2 with 1N NaOH (ca 175 mL), and dil. to 1 L with H<sub>2</sub>O. To prep. buffered H<sub>2</sub>O for dilns, dil. 1.25 mL stock soln to 1 L with boiled and cooled H<sub>2</sub>O. Autoclave 15 min at 121°.

(b) *Buffered glucose broth (MR-VP medium)*.—For Me red-Voges Proskauer (MR-VP) tests. Dissolve 7.0 g proteose peptone, 5.0 g glucose, and 5.0 g K<sub>2</sub>HPO<sub>4</sub> in ca 800 mL H<sub>2</sub>O with gentle heat and occasional stirring. Filter, cool to 20°, and dil. to 1 L.

Dispense 10 mL portions into test tubes and autoclave 12–15 min at 121°. Max exposure to heat should be ≤30 min. Final pH, 6.9±0.2.

(c) *Endo medium*.—Suspend 3.5 g K<sub>2</sub>HPO<sub>4</sub>, 10.0 g peptone, 20.0 g agar, and 10 g lactose in 1 L H<sub>2</sub>O. Boil to dissolve, add H<sub>2</sub>O to original vol., and clarify if necessary. Dispense in 100 mL portions and autoclave 15 min at 121°. Final pH, 7.4±0.1. Before use, melt and add 0.25 g Na<sub>2</sub>SO<sub>3</sub> and 1.0 mL filtered 5% alc. soln basic fuchsin.

(d) *Eosin methylene blue agar (Levine)*.—Dissolve 10.0 g peptone, 2.0 g K<sub>2</sub>HPO<sub>4</sub>, and 15.0 g agar in 1 L H<sub>2</sub>O. Boil to dissolve and add H<sub>2</sub>O to original vol. Dispense in 100 or 200 mL portions and autoclave 15 min at 121°. Final pH, 7.1±0.1. Before use, melt and to each 100 mL add 5 mL sterile 20% lactose soln, 2.0 mL 2% aq. Eosin Y soln, and 1.3 mL 0.5% aq. methylene blue soln.

(e) *Koser's citrate broth*.—Dissolve 1.5 g NaNH<sub>4</sub>HPO<sub>4</sub>·4H<sub>2</sub>O, 1.0 g K<sub>2</sub>HPO<sub>4</sub>, 0.2 g MgSO<sub>4</sub>·7H<sub>2</sub>O, and 3.0 g Na citrate·2H<sub>2</sub>O in 1 L H<sub>2</sub>O. Dispense in 10 mL portions into test tubes and autoclave 15 min at 121°. Final pH, 6.7±0.1.

(f) *Lactose broth*.—Dissolve on H<sub>2</sub>O bath, with stirring, 3.0 g beef ext and 5.0 g polypeptone or peptone in 1 L H<sub>2</sub>O. Add 5.0 g lactose. Dispense into fermentation tubes and autoclave 15 min at 121°. Max. exposure to heat should be ≤30 min. Final pH, 6.9±0.2.

(g) *Plate count agar (tryptone glucose yeast agar)*.—Suspend 5.0 g peptone-tryptone (pancreatic digest of casein), 2.5 g yeast ext, 1.0 g glucose, and 15.0 g agar in 1 L H<sub>2</sub>O. Heat and boil until all ingredients are dissolved. Autoclave 15 min at 121°. Final pH, 7.0±0.1.

(h) *Tryptophane broth*.—Dissolve by heating, with stirring, 10.0 g tryptone or trypticase in 1 L H<sub>2</sub>O. Dispense in 5 mL portions into test tubes and autoclave 15 min at 121°. Final pH, 6.9±0.2.

#### 46.006

#### Other Media

(a) *Malt agar*.—Dissolve by boiling 30 g malt ext (Difco) and 15.0 g agar in 1 L H<sub>2</sub>O. Autoclave 15 min at 121°. Just before use, melt malt agar and acidify with 85% lactic acid to pH 3.5. Do not reheat medium after addn of acid.

(b) *Milk protein hydrolysate glucose agar*.—BBL dehydrated, or prep. from 9.0 g milk protein hydrolysate, 1 g glucose, 15 g agar, and 1 L H<sub>2</sub>O; adjust to pH 7.0. Autoclave 15 min at 121°, cool to room temp., and readjust pH to 7.0, if necessary.

(c) *Physiological salt soln*.—Dissolve 8.5 g NaCl in 1 L H<sub>2</sub>O. Autoclave 15 min at 121° and cool to room temp.

(d) *Veal infusion agar*.—Mix 500 g ground lean veal and 1 L H<sub>2</sub>O. Infuse overnight in refrigerator and strain thru cheesecloth without pressure. Dil. to original vol. with H<sub>2</sub>O and skim off any fat. Steam in Arnold sterilizer 30 min and filter thru paper. Add 10.0 g peptone (Difco), 5.0 g NaCl, and 15.0 g agar.

Steam in Arnold sterilizer to dissolve ingredients. Adjust to pH 7.6 and steam in Arnold sterilizer 15 min. Filter thru buchner with paper pulp mat, with suction. (Use egg albumen for clarification when necessary. Add fresh white of 1 egg previously beaten with 50 mL medium or its equiv. in desiccated egg white (1.5 g) to each L of medium before adjusting pH and after cooling to 50°. Shake thoroly to ensure soln of egg white. Let stand 20 min. Heat in Arnold sterilizer 15 min to coagulate egg white. Shake vigorously and reheat. Filter, adjust to pH 7.6, steam in Arnold sterilizer 15 min, and filter.)

Place 10 mL portions in test tubes or 80 mL portions into bottles. Autoclave 20 min at 121°; final pH, 7.4.

For hemolytic tests, cool melted agar to 45° and add 5% defibrinated horse, sheep, or rabbit blood prior to pouring plates (0.5 mL blood/10 mL medium).

**Operating Technic (2)****46.007 Preparation of Sample—Official Final Action**

(a) *Liquid eggs*.—Thoroughly mix sample with sterile spoon or sterile mech. stirrer and prep. 1:10 diln by aseptically weighing 11 g egg material into sterile wide-mouth g-s or screw-cap bottle; add 99 g sterile diln H<sub>2</sub>O, **46.005(a)**, or sterile physiological salt soln, **46.006(c)**, and 1 tablespoonful sterile glass shot. Thoroughly agitate 1:10 diln to ensure complete soln or distribution of egg material in diluent by shaking each container rapidly 25 times, each shake being up-and-down movement of ca 30 cm, time interval not exceeding 7 sec. Let bubbles escape. Transfer representative portion from 1:10 diln for higher serial dilns as needed. Proceed as in **46.008–46.012(a)**. Pour all plates and inoculate other media within 15 min after prepn of first diln to avoid growth or death of microorganisms.

(b) *Frozen eggs*.—Thaw frozen egg material as rapidly as possible to avoid increase in number of microorganisms present and at temp. low enough to prevent destruction of the microorganisms ( $\leq 45^{\circ}$  for  $\leq 15$  min). (Frequent rotary shaking of sample container aids in thawing frozen material. Thawing temp. may be maintained by use of H<sub>2</sub>O bath or bacteriological incubator.) Proceed as in (a).

(c) *Dried eggs*.—Thoroughly mix sample with sterile spoon or spatula. Prep. 1:10 diln as in (a). If material is relatively insol. (stored samples), use 0.1N LiOH as diluent. Prep. serial dilns as in (a) and proceed as in **46.008–46.012(b)**.

**46.008 Plate Counts—Official Final Action**

Inoculate one set of petri plates with 1 mL portion of each suitable diln. Pour plates with tryptone glucose yeast agar or milk protein hydrolysate glucose agar previously cooled to 42–45°. Incubate inoculated plates 3 days at 32°. Count plates with aid of Quebec colony counter, if available. Express final results as number of viable microorganisms/g egg material.

**46.009 Incidence of Coliform Group—Official Final Action**

(a) Inoculate 1.0 mL portions from suitable dilns of egg material into fermentation tubes of lactose broth. Incubate 24–48 hr at 35°. Streak eosin methylene blue or Endo medium plates from all lactose broth cultures showing gas production. Incubate plates 24–48 hr at 35°. Examine plates of differential media for colonies of microorganisms of coliform group. Record number of coliform bacteria/g egg material as reciprocal of highest diln showing pos. confirmation on differential media.

(b) *Biochemical reaction (optional)*.—Inoculate from colonies of coliform types of bacteria appearing on differential agar plates to agar slants, **46.005(g)** or **46.006(b)**. Incubate 24 hr at 35°. Purify cultures for further study. Obtain IMViC biochem. reactions of purified cultures by following tests:

*Kovac test* (indole production), **46.016(a)**;

*Acid production in Me red indicator*, **46.016(b)**;

*Acetylmethylcarbinol production*, **46.016(b)**;

*Koser sodium citrate test* (utilization of Na citrate as sole source of C), **46.016(c)**.

*Note*: Follow methods for biochem. reactions recommended in "Standard Methods for Examination of Water and Waste Water," 14th ed., 1976, American Public Health Association, 1015 18th St NW, Washington, DC 20036.

**46.010 Incidence of Hemolytic Staphylococci and Streptococci—Procedure**

Inoculate petri plates with 1 mL portions of suitable dilns of sample. Pour plates with veal infusion agar contg 5% defibrinated horse, sheep, or rabbit blood (0.5 mL blood/10 mL

medium). Cool agar to 45° and add blood just before pouring plates. Incubate plates 24 hr at 35°. Confirm presence of coccus types of microorganisms by microscopic examination of smears taken from representative colonies and stained by Gram method. Express final results as number/g.

**46.011 Tests for Fungi—Procedure**

Inoculate petri plates with 1 mL portions of suitable dilns of sample. Pour inoculated plates with malt agar, **46.006(a)**, previously cooled to 42–45°. Incubate plates 5 days at 20° or at room temp., if 20° incubator is not available. Express final results as number of fungi/g egg material. Confirm yeast colonies by microscopic examination of smears stained by Gram method.

**46.012 Direct Microscopic Counts—Official Final Action**

*North aniline oil-methylene blue stain*.—Mix 3.0 mL aniline oil with 10.0 mL alcohol, and slowly add 1.5 mL HCl with const agitation. Add 30.0 mL satd alc. methylene blue soln, dil. to 100.0 mL with H<sub>2</sub>O, and filter.

(a) *Liquid and frozen eggs*.—Place 0.01 mL undild egg material on clean, dry microscopic slide and spread over area of 2 sq cm (circular area with diam. of 1.6 cm suggested). Let film prepn dry on level surface at 35–40°. Immerse in xylene  $\leq 1$  min; then immerse in alcohol  $\leq 1$  min. Stain  $\geq 45$  sec in North aniline oil-methylene blue stain (10–20 min preferred; exposure up to 2 hr does not overstain). Wash slide by repeated immersions in H<sub>2</sub>O and dry thoroughly before examination. Observe subsequent operations and precaution as in "Standard Methods for Examination of Dairy Products," 14th ed., 1978, American Public Health Association. Express final result as number of bacteria/g egg material (double microscopic factor, since 2 sq cm area is used).

(b) *Dried eggs*.—Place 0.01 mL of 1:10 or 1:100 diln of dried egg material on clean, dry microscopic slide and spread over 2 sq cm.

*Note*: 0.1N LiOH may be used as diluent and is preferred for samples that are relatively insol. Circular area with diam. of 1.6 cm is preferable. Addn of drop of H<sub>2</sub>O to each film facilitates uniform spreading.

Proceed as in (a). Double microscopic factor, since area of 2 sq cm is used, and multiply count by 10 or 100, depending on whether film was prepd from 1:10 or 1:100 diln.

**EXAMINATION OF FROZEN, CHILLED, PRECOOKED, OR PREPARED FOODS (3)—OFFICIAL FIRST ACTION**

(For the detn of aerobic plate count, most probable number of coliform bacteria and *Escherichia coli*, and staphylococcus in products such as frozen cooked meat, poultry, and vegetable products; cooked and/or breaded seafood; bakery products; salads; tree nut meats; and ingredients of food samples collected during sanitation inspections of food producing establishments, unless specific directions are given for that product.

**46.013 Media and Reagents**

Ingredients and reagents used to prep. following media may be product of any manufacturer if comparative tests show that satisfactory results are obtained. Use pure carbohydrates suitable for biological use; ACS reagent grade inorg. chemicals; and dyes certified by "Biological Stain Commission" for use in media.

For convenience, dehydrated media of any brand equiv. to formulation may be used. Test each lot of medium for sterility and growth-promoting qualities of suitable organisms (e.g., inoculate media contg lactose with coliform bacteria, staphylococcus media with staphylococcus, etc.).

Det. pH before autoclaving with pH meter stdzd against std

buffers, **50.007**. Adjust pH, when necessary, by adding 1N NaOH or 1N HCl so that stated final pH results after autoclaving.

Use sterile glass or plastic, 100 × 15 mm, petri dishes.

(a) *Plate count agar*.—See **46.005(g)**.

(b) *Lauryl sulfate tryptose broth*.—Dissolve 20.0 g trypticase or tryptose (pancreatic digest of casein), 5.0 g NaCl, 5.0 g lactose, 2.75 g  $K_2HPO_4$ , 2.75 g  $KH_2PO_4$ , and 0.1 g Na lauryl sulfate in 1 L  $H_2O$  with gentle heat, if necessary. Dispense 10 mL portions into 20 × 150 mm test tubes contg inverted fermentation tubes 10 × 75 mm. Autoclave 15 min at 121°. Final pH, 6.8±0.1.

(c) *Brilliant green lactose bile (BGLB) broth*.—Dissolve 10.0 g peptone and 10.0 g lactose in ca 500 mL  $H_2O$ . Add soln (pH 7.0–7.5) of 20 g dehydrated oxgall or oxbile in 200 mL  $H_2O$ . Dil. to 975 mL and adjust pH to 7.4. Add 13.3 mL 0.1% soln of brilliant green, and dil. to 1 L with  $H_2O$ . Filter thru cotton and dispense 10 mL portions into 20 × 150 mm test tubes contg inverted 10 × 75 mm fermentation tubes. Autoclave 15 min at 121°. Final pH, 7.2±0.1.

(d) *Eosin methylene blue agar (Levine)*.—See **46.005(d)**.

(e) *Baird-Parker medium (egg tellurite glycine pyruvate agar, ETGPA)*.—(1) *Basal medium*.—Suspend 10.0 tryptone, 5.0 g beef ext, 1.0 g yeast ext, 10 g Na pyruvate, 12.0 g glycine, 5.0 g  $LiCl \cdot 6H_2O$ , and 20.0 g agar in 950 mL  $H_2O$ . Heat to bp with frequent agitation to dissolve ingredients completely. Dispense 95 mL portions into screw-capped bottles. Autoclave 15 min at 121°. Final pH, 7.0±0.2 at 25°. Store ≤1 month at 4±1°.

(2) *Enrichment*.—Bacto EY tellurite enrichment (Difco Laboratories) or prep. as follows: Soak fresh eggs ca 1 min in diln of satd  $HgCl_2$  soln (1+1000). Aseptically crack eggs and sep. yolks from whites. Blend yolk and physiological saline soln, **46.006(c)**, (3+7, v/v) in high-speed blender ca 5 sec. To 50 mL egg yolk emulsion add 10 mL filter sterilized 1% K tellurite soln. Mix and store at 4±1°.

(3) *Complete medium*.—Add 5 mL warmed enrichment to 95 mL molten basal medium cooled to 45–50°. Mix well, avoiding bubbles, and pour 15–18 mL into sterile 100 × 15 mm petri dishes. Store plates at room temp. (≤25°) for ≤5 days before use. Medium should be densely opaque; do not use nonopaque plates. Dry plates before use by 1 of following methods: (a) in convection oven or incubator 30 min at 50° with lids removed and agar surface downward; (b) in forced-draft oven or incubator 2 hr at 50° with lids on and agar surface upward; (c) in incubator 4 hr at 35° with lids on and agar surface upward; or (d) on laboratory bench 16–18 hr at room temp. with lids on and agar surface upward.

(4) *Interpretation*.—Colonies of *S. aureus* are typically circular, smooth, convex, moist, 2–3 mm in diam. on uncrowded plates, gray-black to jet-black, frequently with light-colored (off-white) margin, surrounded by opaque zone (ppt) and frequently with outer clear zone; colonies have buttery to gummy consistency when touched with inoculating needle. Occasional non-lipolytic strains may be encountered which have same appearance, except that surrounding opaque and clear zones are absent. Colonies isolated from frozen or desiccated foods which have been stored for extended periods are frequently less black than typical colonies and may have rough appearance and dry texture.

(f) *Trypticase (tryptic) soy broth with 10% sodium chloride*.—Add 95 g NaCl to 1 L of soln of 17.0 g trypticase or tryptose (pancreatic digest of casein), 3.0 g phytone (papaic digest of soya meal), 5.0 g NaCl, 2.5 g  $K_2HPO_4$ , and 2.5 g glucose. Heat gently if necessary. Dispense into 16–20 mm diam. tubes to depth of 5–8 cm. Autoclave 15 min at 121°. Final pH, 7.3±0.2.

(g) *EC broth*.—Dissolve 20.0 g trypticase or tryptose (pancreatic digest of casein), 1.5 g Bacto bile salt No. 3 or bile salt mixt., 5.0 g lactose, 4.0 g  $K_2HPO_4$ , 1.5 g  $KH_2PO_4$ , and 5.0 g NaCl

in 1 L  $H_2O$ . Dispense 8 mL into 16 × 150 mm test tubes contg inverted 10 × 75 mm fermentation tube. Autoclave 15 min at 121°. Final pH, 6.9±0.1.

(h) *Brain-heart infusion*.—See **46.054(r)**. Dispense into bottles or tubes for storage and autoclave 15 min at 121°.

(i) *Desiccated coagulase plasma (rabbit) with EDTA*.—Reconstitute according to manufacturer's directions. If not available, reconstitute *desiccated coagulase plasma (rabbit)* and add  $Na_2H_2EDTA$  to final concn of 0.1% in reconstituted plasma.

(j) *Tryptophane broth*.—See **46.005(h)** but dispense in 10 mL portions.

(k) *Buffered glucose broth*.—See **46.005(b)**. BBL, Division of Bioquest, or Difco dehydrated medium may be used.

(l) *Koser's citrate broth*.—See **46.005(e)**.

(m) *Butterfield's buffered phosphate diluent*.—(1) *Stock soln*.—Dissolve 34.0 g  $KH_2PO_4$  in 500 mL  $H_2O$ , adjust to pH 7.2 with ca 175 mL 1N NaOH, and dil. to 1 L. Store in refrigerator. (2) *Diluent*.—Dil. 1.25 mL stock soln to 1 L with  $H_2O$ . Prep. diln blanks with this soln, dispensing enough to allow for losses during autoclaving. Autoclave 15 min at 121°.

#### 46.014

#### Preparation of Sample

(Prep. all decimal dilns with 90 mL sterile diluent plus 10 mL previous diln unless otherwise specified. Shake all dilns 25 times in 30 cm arc. Pipets must accurately deliver required vol. Do not use to deliver <10% of their total vol. For example, to deliver 1 mL, do not use pipet >10 mL; to deliver 0.1 mL, do not use pipet >1 mL.)

(a) *Frozen and/or prepared foods*.—Use balance with capacity of ≥2 kg and sensitivity of 0.1 g to aseptically weigh 50 g unthawed (if frozen) sample into sterile high-speed blender jar. Add 450 mL diluent, (m)(2), and blend 2 min. (If necessary to temper frozen sample to remove 50 g portion, hold ≤18 hr at 2–5°.) Not >15 min should elapse from time sample is blended until all dilns are in appropriate media.

If entire sample consists of <50 g, weigh portion equiv. to ½ sample and add vol. of sterile diluent required to make 1:10 diln. Total vol. in blender jar must completely cover blades.

(b) *Tree nut halves and larger pieces*.—Aseptically weigh 50 g sample into sterile jar. Add 50 mL diluent, (m)(2), and shake vigorously (50 times thru 30 cm arc) to obtain 10° diln. Let stand 3–5 min and shake just before making serial dilns and inoculations.

(c) *Nut meal*.—Aseptically weigh 10 g sample into sterile jar. Add 90 mL diluent, (m)(2), to obtain 10<sup>-1</sup> diln.

#### 46.015

#### Aerobic Plate Count

Seed duplicate petri dishes in dilns of 1:10, 1:100, 1:1000, etc., using plate count agar, (a). Ordinarily 1:100 thru 1:10,000 are satisfactory. Place 1 mL appropriate diln in each plate, and add molten agar (cooled to 42–45°) within 15 min from time of original diln. Incubate 48±2 hr at 35° and count duplicate plates in suitable range (30–300 colonies). If plates do not contain 30–300 colonies, record diln counted and note number of colonies found. Average counts obtained and report as aerobic plate count/g.

#### 46.016

#### Coliform Group and *E. coli* Official Final Action for Tree Nut Meats

Seed 3-tube most probable number (MPN) series into lauryl sulfate tryptose broth, (b), using 1 mL inocula of 1:10, 1:100, and 1:1000 dilns, with triplicate tubes at each diln. (For nut meats (halves and larger pieces), begin MPN detn with 10° diln;

for nut meal, begin with  $10^{-1}$  diln.) Incubate  $48 \pm 2$  hr at  $35^\circ$  for gas formation as evidenced by displacement of liq. in insert tube or by vigorous effervescence when tubes are shaken *gently*. Examine tubes for gas formation at 24 and 48 hr intervals. Transfer, using 3 mm loop, from gassing tubes to BGLB, (c) (omit this transfer for tree nuts), and EC broth, (g), at time gas formation is noted.

Incubate BGLB broth  $48 \pm 2$  hr at  $35^\circ$ . Using MPN Table 46:01, compute MPN on basis of number of tubes of BGLB broth producing gas by end of incubation period. Report as MPN of coliform bacteria/g.

Incubate EC broth  $48 \pm 2$  hr at  $45.5 \pm 0.05^\circ$  in covered  $H_2O$  bath. Submerge broth tubes in bath so that  $H_2O$  level is above highest level of medium. Examine tubes for gas formation at 24 or 48 hr intervals. Streak gas-pos. tubes on Levine's eosine methylene blue agar plates, (d), and incubate plates  $24 \pm 2$  hr at  $35^\circ$ .

Pick 2 or more well isolated typical colonies from Levine's eosine methylene blue agar plates and transfer to agar slants prep'd from agar medium, (a). Incubate 18–24 hr at  $35^\circ$ . If typical colonies are not present, pick 2 or more colonies most likely to be *E. coli*. Pick  $\geq 2$  from every plate.

Transfer growth from plate count agar slants into following broths for identification by biochem. tests:

(a) *Tryptophane broth*, (j).—Incubate  $24 \pm 2$  hr at  $35^\circ$  and test for indole by adding 0.2–0.3 mL Kovacs reagent, 46:055(a), to 24 hr culture. Test is pos. if upper layer turns red.

(b) *MR-VP medium*, (k).—Incubate  $48 \pm 2$  hr at  $35^\circ$ . Aseptically transfer 1 mL culture to  $13 \times 100$  mm test tube to test for acetylmethylcarbinol. Add 0.6 mL 5% alc.  $\alpha$ -naphthol soln, 0.2 mL KOH soln (4+10), and few crystals of creatine. Shake and let stand 2 hr. Test is pos. if eosin pink develops. Alternatively, see 46:062(c)(1).

Incubate remainder of MR-VP medium for addnl 48 hr and test for Me red reaction by adding 5 drops Me red soln to culture. Test is pos. if culture turns red; neg., if yellow. (Prep. Me red soln by dissolving 0.1 g Me red in 300 mL 90% alcohol and dilg to 500 mL with  $H_2O$ .)

(c) *Koser citrate broth*, (l).—Incubate 96 hr at  $35^\circ$  and record growth as + or –.

(d) *Lauryl sulfate tryptose broth*, (b).—Incubate  $48 \pm 2$  hr at  $35^\circ$ . Examine tubes for gas formation.

(e) *Gram stain*.—Perform Gram stain on 18 hr agar slant (Standard Methods for the Examination of Water and Waste Water, 14th ed., 1976). Coliform organisms will stain red (neg.); Gram-pos. organisms will stain blue-black.

(f) *Classification*.—Classify biochem. types as follows:

Indole	MR	VP	Citrate	Type
+	+	–	–	Typical <i>E. coli</i>
–	+	–	–	Atypical <i>E. coli</i>
+	+	–	+	Typical Intermediate
–	+	–	+	Atypical Intermediate
–	–	+	+	Typical <i>Enterobacter aerogenes</i>
+	–	+	+	Atypical <i>Enterobacter aerogenes</i>

Other groupings may appear; in such cases cultures are usually mixed. Restreak to det. their purity.

Compute MPN of *E. coli*/g, considering Gram neg., nonspore-forming rods producing gas in lactose and producing + + – – or – + – – IMViC patterns as *E. coli*.

#### 46.017

#### *Staphylococcus aureus*—Official Final Action

(Applicable to detection and enumeration of small numbers of *S. aureus* in raw food ingredients and non-processed foods expected to contain large population of competing species.)

Inoculate 3 tubes of trypticase soy broth with 10% NaCl, (f), at each test diln with 1 mL aliquots of decimal dilns of sample. Max. diln of sample must be high enough to yield neg. end point. Incubate 48 hr at  $35$ – $37^\circ$ .

Using 3 mm loop, transfer 1 loopful from each growth-pos. tube to dried Baird-Parker medium plates, (e)(3). Streak so as to obtain isolated colonies. Incubate 45–48 hr at  $35$ – $37^\circ$ .

From each plate showing growth, pick  $\geq 1$  colony suspected to be *S. aureus*, (e)(4). Transfer colonies to tubes contg 0.2 mL brain heart infusion (BHI) broth, 46:054(r), and emulsify thoroly. Withdraw 1 loopful of resulting culture suspension and transfer to agar slant contg any suitable maintenance medium, e.g., 4:037(b). Incubate BHI culture suspensions and slants 18–24 hr at  $35$ – $37^\circ$ . Retain slant cultures at room temp. for ancillary or repeat tests, in case coagulase test results are questionable.

To BHI cultures add 0.5 mL reconstituted coagulase plasma with EDTA, (i), and mix thoroly. Incubate at  $35$ – $37^\circ$  and examine periodically over 6 hr interval for clot formation. Any degree of clot formation is considered pos. reaction. Small or poorly organized clots may be observed by gently tipping tube so that liq. portion of reaction mixt. approaches lip of tube; clots will protrude above liq. surface. Coagulase-pos. cultures are considered to be *S. aureus*. Test pos. and neg. controls simultaneously with cultures of unknown coagulase reactivity. Recheck doubtful

Table 46:01 Most Probable Numbers (MPN) per 1 g of Sample, Using 3 Tubes with Each of 0.1, 0.01, and 0.001 g Portions

Positive Tubes				Positive Tubes				Positive Tubes				Positive Tubes

0	3	3	19.	1	3	3	29.	2	3	3	53.	3	3	3	>1100.

coagulase test results on BHI cultures which have been incubated at 35–37° for >18 but ≤48 hr.

Report most probable number (MPN) of *S. aureus*/g from tables of MPN values, Table 46:01.

#### COMMERCIAL STERILITY OF LOW ACID CANNED FOODS (4) OFFICIAL FINAL ACTION

(Personnel with beards, mustaches, or sideburns below ear lobe should not perform sterility examination unless these are completely covered with sterile caps and masks. Wear clean laboratory coat for examination.)

##### 46.018

##### Principle

"Low acid foods" means any food with finished equilibrium pH value >4.6. Method applies only to containers which show no distention of either end. Incubate containers ≥10 days at 21–35° before examination.

Com. sterility is defined as that condition achieved by application of heat which renders food free of viable forms of microorganisms having public health significance, as well as microorganisms not of health significance capable of reproducing in the food under normal non-refrigerated conditions of storage and distribution.

##### 46.019

##### Media and Reagents

See also 46.013.

(a) *Tryptone broth*.—(Aerobic medium.) Dissolve 10.0 g tryptone or trypticase, 5.0 g glucose, 1.25 g  $K_2HPO_4$ , 1.0 g yeast ext, and 2.0 mL 2% alc. soln of bromocresol purple in 1 L  $H_2O$  with gentle heat, if necessary. Dispense 10 mL portions into 20 × 150 mm screw-cap test tubes and autoclave 20 min at 121°. Do not exhaust before using.

(b) *Modified PE-2 medium*.—(Anaerobic medium.) Dissolve 20.0 g peptone, 3.0 g yeast ext, and 2.0 mL 2% alc. soln of bromocresol purple in 1 L  $H_2O$  with gentle heat, if necessary. Dispense 19 mL portions into 20 × 150 mm screw-cap test tubes contg 8–10 untreated Alaska seed peas (Rogers Brothers Co., Seed Div., PO Box 2188, Idaho Falls, ID 83401, No. 423; Northrup King Seed Co., 1500 NE Jackson St, Minneapolis, MN 55413; or hardware store). Autoclave 30 min at 121°. If not freshly prepd, heat to 100° and cool to 55° before using.

(c) *Glucose starch agar*.—(Aerobic medium; Difco dehydrated, or equiv.) Dissolve 15.0 g proteose peptone No. 3, 2.0 g glucose, 10.0 g sol. starch, 5.0 g NaCl, 3.0 g  $Na_2HPO_4$ , 20.0 g gelatin, and 10.0 g agar in 1 L  $H_2O$ , heat to bp, and autoclave 15 min at 121° in erlenmeyer. Aseptically pour into sterile petri dishes and allow to solidify.

(d) *Nutrient agar*.—(Aerobic medium for spore production; Difco dehydrated, or equiv.) Dissolve 3.0 g beef ext, 5.0 g peptone, and 15.0 g agar in 1 L  $H_2O$ , heat to bp, and autoclave 30 min at 121°.

(e) *Detergent sanitizer soln*.—pHisoHex (3% hexachlorophene), or equiv.

##### 46.020

##### Apparatus

(a) *Can opener*.—Bacti-Disc Cutter (Wilkins-Anderson Co., 4525 W Division St, Chicago, IL 60651, No. 10810-01), bacteriological can opener (Marmora Machine Co., 1956 N Latrobe Ave, Chicago, IL 60639), or equiv.

(b) *Caps*.—Disposable, operating room-type (American Hospital Supply Corp., 1450 Waukegan Rd, McGaw Park, IL 60085, No. 47315-110, or equiv.).

(c) *Pipets*.—Straight wall, 200–250 mm long × 7 mm id, 9 mm od (Scientific Products, Inc., No. G6100–9, cut and fire polished, or equiv.).

##### 46.021

##### Sampling

Conduct test in clean room. (If necessary, open room may be used but outside windows must be closed and direct drafts across work area must be eliminated.) If available, use laminar flow cabinet. Strip labels from cans, examine cans for external defects, and record descriptions. Wash cans with soap (or detergent sanitizer soln) and  $H_2O$ , and dry with clean paper towels. Wipe counter top with 100 ppm Cl soln (e.g., Clorox or dild NaOCl soln) immediately before placing washed and dried can on it. Place code end of can in down position and number cans in ink or with  $CuSO_4$  marking soln to right of side seam.

Wash hands and face with soap, and rewash hands and face with detergent sanitizer soln. Completely cover hair with clean disposable operating room cap.

Hold noncoded end of can over large Meker burner, just above blue portion of flame. Heat this end of can until all condensation is evapd; then return can to table in former position. Clean handle and blade of special can opener, (a), with paper towel moistened with 70% alcohol, flame metal portion enough to destroy all microorganisms, and use it to make 4 cm (1.5") diam. hole in noncoded, heated end of can. Immediately and without moving can, use straight-wall sterile glass pipet, (c), to transfer ca 2 g food to sep. tubes, 2 each of aerobic and 2 of anaerobic media (4 total). (No other transferring tool may be substituted.) Preloosen screw cap and hold it between little and ring fingers while transfer is being made. Flame lips of media tubes both before and after addn of food. When transferring food to anaerobic tubes, food must be inoculated into lower portion of medium. Tighten screw caps after inoculation, incubate tubes 72 hr at 35°, and observe daily. Record results for each tube sep.

Remove addnl ≥10 g food sample from each container with sterile pipet and place in sterile 25 × 200 mm screw-cap test tube. Use pipet like spatula, if necessary, for this operation (thermophilic contamination unlikely). Number tube to correspond to can and refrigerate for later testing, if necessary.

##### 46.022

##### Contamination Control

Use sterile loop or glass rod to streak plate of glucose starch agar, (c). On table, open plate of glucose starch agar for time equal to longest duration that any medium tube or plate is exposed. Incubate plates 72 hr at 35°, and observe daily.

##### 46.023

##### Microscopic Examination

With pair of metal cutting shears, enlarge hole in can and record odor. Microscopically (oil immersion) examine heat-fixed thin smear of food, stained 10 sec with 1% gentian (or crystal) violet and washed in running tap  $H_2O$ , or, alternatively, examine wet mounts with phase contrast microscope. If food contains appreciable fat, xylol should be dripped across food smear while it is still hot from heat fixing. Compare stained smear with one made from normal product, if possible.

##### 46.024

##### pH Determination

Det. pH with pH meter, using ref. buffer near normal pH of food. Record both ref. buffer pH and sample pH. Compare to normal can of food, if available.

##### 46.025

##### Confirmation of Results

If there is any abnormal odor, abnormal appearance, abnormal pH, numbers of bacteria on microscopic examination, and/or growth in media from any can of food, subculture corresponding refrigerated tube as follows: Flame lip of tube and, with straight-wall sterile glass pipet, (c), transfer ca 2 g food to 2 tubes each of aerobic and anaerobic media (4 total). Flame lips of media

tubes both before and after addn of food. Tighten caps after inoculation, incubate tubes 72 hr at 55°, and observe daily. Record results for each tube sep.

Any organisms isolated from normal cans having obvious vac. which produce gas in anaerobic medium at 35° should immediately be suspected as being from laboratory contamination. Aseptically inoculate growing organism into another normal can, close hole with solder, and incubate 14 days at 35°. Any swelling of container indicates that organism was not in original sample. Record as laboratory contamination and review results of addnl cans to verify finding of contamination.

Growth in aerobic medium at 35° from normal cans indicates either non-com. sterility or laboratory contamination. Unless there is abnormal odor, abnormal appearance, abnormal pH, and/or numbers of bacteria on microscopic examination from product in original can, record results as laboratory contamination and review results of addnl cans to verify finding of contamination. Otherwise, observe subculture results at 55°. Growth at 35° and absence of growth at 55° confirm nonsterility of original container. Check growth under aerobic conditions on nutrient agar plates, (d), at 55° and confirm for spores after 72 hr. Confirmation indicates nonsterility due to flat sour spoilage. Record growth at 55° under anaerobic conditions with gas production as com. sterile. Growth is caused by dormant spores incapable of growth at normal temps of storage and distribution.

If only one of duplicate tubes is pos. after incubation and streaked glucose starch agar is also neg., record as laboratory contamination. Growth on air control plate of glucose starch agar also indicates potential laboratory contamination.

#### THERMOPHILIC BACTERIAL SPORES IN SUGARS (5) OFFICIAL FIRST ACTION

(Sugar, both beet and cane, may carry spores of all 3 groups of thermophilic bacteria that are important as spoilage agents in low-acid canned foods, i.e., flat sour bacteria (*Bacillus stearothermophilus*), thermophilic anaerobes not producing H<sub>2</sub>S (*Clostridium thermosaccharolyticum*), and sulfide spoilage bacteria or thermophilic anaerobes producing H<sub>2</sub>S (*C. nigrificans*). These bacteria are not of health significance, but excessive numbers may survive com. heat processes.)

#### 46.026

#### Sampling

Take 225 g (0.5 lb) samples from 5 sep. bags or barrels of shipment or lot, place in clean containers, and seal.

Sample liq. sugar by drawing 5 sep. 200–250 mL (6–8 oz) portions during pumping transfer from tank trucks to storage tanks or at refinery during filling of tank trucks.

Number of samples will vary in relation to size of shipment or lot. If there is significant variability in lot, this fact will become evident, in majority of cases, thru individual tests on the 5 samples.

#### 46.027

#### Preparation of Sample

(a) *Dry sugar*.—Place 20 g sample in sterile 150–250 mL erlenmeyer marked to indicate 100 mL. Add sterile H<sub>2</sub>O to 100 mL mark. Bring rapidly to bp, and boil 5 min. Replace liq. evapd with sterile H<sub>2</sub>O.

(b) *Liquid sugar*.—Add sample contg 20 g dry sugar, detd on basis of °Brix (e.g., 29.41 g 68° Brix (%) liq. sugar is equiv. to 20 g dry sugar), to sterile 250 mL flask and proceed as in (a).

#### 46.028

#### Culture Media

(a) *Glucose tryptone agar*.—For detection of flat sour bacteria. Use com. stdzd dehydrated medium (Bacto-Dextrose Tryptone Agar) preferably, or prep. as follows: Suspend 10.0 g tryptone, 5.0 g glucose, 15.0 g agar, and 0.04 g bromocresol purple in 1

L H<sub>2</sub>O, and mix thoroly. Final pH, 6.7±0.1. Autoclave 30 min at 121° and cool to 55°.

(b) *Liver broth*.—For detection of thermophilic anaerobes not producing H<sub>2</sub>S (*C. thermosaccharolyticum*). Mix 500 g chopped beef liver with 1 L H<sub>2</sub>O. Slowly boil mixt. 1 hr, adjust to ca pH 7.0, and boil addnl 10 min. Press boiled material thru cheesecloth and dil. liq. to 1 L. To broth, add 10.0 g peptone and 1.0 g K<sub>2</sub>HPO<sub>4</sub>, and adjust to pH 7.0. To test tube, add 1–2 cm previously boiled ground beef liver and 10–12 mL broth. Sterilize 20 min at 121°. Before using medium, unless freshly prepd, exhaust by subjecting to flowing steam ≥20 min, and, after inoculation, stratify with 5–6 cm layer of plain nutrient agar (common formula) that has been cooled to 50°.

(c) *Sulfite agar, modified*.—For detection of sulfide spoilage bacteria. Suspend 10.0 g tryptone, 1.0 g Na<sub>2</sub>SO<sub>3</sub>, and 20.0 g agar in 1 L H<sub>2</sub>O, and mix thoroly. At time agar is added to tube, place clean iron strip or nail in each tube. No adjustment of reaction is necessary. Prep. medium and Na<sub>2</sub>SO<sub>3</sub> soln, if used in place of solid Na<sub>2</sub>SO<sub>3</sub>, fresh weekly. Autoclave medium 20 min at 121° and cool to 55°.

#### 46.029

#### Culture Technic

(a) *Flat sour spores*.—Into 5 sep. p-etri dishes, pipet 2 mL boiled sugar soln. Cover, and mix inoculum with glucose tryptone agar. Incubate plates 35–48 hr at 55° and, to prevent drying of agar, humidify incubator. Combined count from 5 plates represents number of spores in 2 g original sugar. Multiply this count by 5 to express results in terms of number of spores/10 g sugar.

Characteristic colonies are round, 1–5 mm in diam., with typical opaque central "spot," and, usually, surrounded by yellow halo in field of purple. This halo may be insignificant or missing with certain low acid-producing types or if plate is so thickly seeded that entire plate has yellow tinge. Typical subsurface colonies are compact and may approach "pin point" conditions.

If identity of subsurface colonies is doubtful, observe nature of surface colonies. If they show reasonable purity of formed flora, assume that subsurface colonies have been formed by similar bacterial groups. If plate is heavily seeded, counts may not be accurate and colony structure and size may be atypical. If plates are so heavily seeded that counting is impractical, dil. original soln and repeat procedure.

To det. if typical subsurface colonies are flat sour organisms, apply streak from colonies to agar plates to det. surface characteristics.

(b) *Thermophilic anaerobes not producing hydrogen sulfide*.—Divide 20 mL boiled sugar soln equally among 6 liver broth tubes and stratify liq. medium with plain nutrient agar. After agar has solidified, preheat to 55° and incubate 72 hr at that temp.

Thermophilic anaerobes not producing H<sub>2</sub>S are identified by splitting of agar, presence of acid, and, occasionally, cheesy odor. Method is suitable as qual. test but provides only rough estn; results cannot be expressed as number of spores/unit wt sugar.

(c) *Sulfide spoilage bacteria*.—Divide 20 mL boiled sugar soln equally among 6 freshly exhausted tubes contg modified sulfite agar. Incubate 48 hr at 55°.

In sulfite agar, sulfide spoilage bacteria form characteristic blackened spherical areas. Due to solubility of H<sub>2</sub>S and its fixation by Fe, no gas is noted. Some thermophilic anaerobes not producing H<sub>2</sub>S generate relatively large amts of H, which splits agar and reduces sulfite, thereby causing general blackening of medium. This condition, however, is readily distin-

guishable from restricted blackened area mentioned above. Count blackened areas to obtain quant. results.

**46.030****Reporting Results**

Report flat sour and sulfide spoilage results as number of spores/10 g sugar. Report thermophilic anaerobes not producing H<sub>2</sub>S as number of tubes pos. or neg. (+ or -).

**CLOSTRIDIUM PERFRINGENS (6)  
OFFICIAL FINAL ACTION**

(Applicable to examination of outbreak foods in which relatively large numbers of vegetative cells are expected to be present)

**46.031****Apparatus**

(a) *Pipets*.—1.0 mL serological with 0.1 mL graduations and 10.0 mL with 1.0 mL graduations.

(b) *Colony counter*.—Quebec, or equiv., dark field model.

(c) *High-speed blender*.—Waring Blendor, or equiv., multi-speed model, with low-speed operation at 13,000 rpm, and 1 L glass or metal blender jars with covers. One jar is required for each sample.

(d) *Anaerobic jars*.—BBL Gas-Pak jars equipped with Gas-Pak H + CO<sub>2</sub> generator envelopes are recommended. Anaero-jar (Pfizer Diagnostics, 1407 N Dayton St, Chicago, IL 60622) with replacement of air by purified N or N-CO<sub>2</sub> (9+1) is satisfactory.

(e) *Freezer, ultra-low temperature*.—REVCO Model ULT-107 (REVCO, Inc., 1100 Memorial Dr, W Columbia, SC 29169), or equiv., capable of maintaining temp. of -68°.

(f) *Shipping container*.—Heavy duty styrofoam, including hermetically sealable metal canister (friction-fit paint can is satisfactory).

**46.032****Reagents**

(a) *Peptone dilution water*.—Dissolve 2.0 g peptone (Difco B118) in 2 L H<sub>2</sub>O for each sample, and adjust to pH 7.0±0.1. Dispense enough vol. in 175 mL (6 oz) bottles to give 90±1 mL and in 750 mL erlenmeyers to give 450±5 mL after autoclaving 15 min at 121°.

(b) *Nitrite test reagents*.—(1) *Reagent A*.—Dissolve 8 g sulfanilic acid in 1 L 5N HOAc (2+5). (2) *Reagent B*.—Dissolve 5 g  $\alpha$ -naphthol in 1 L 5N HOAc.

(c) *Buffered glycerol-salt soln*.—Dissolve 4.2 g NaCl in 900 mL H<sub>2</sub>O. Add 12.4 g anhyd. K<sub>2</sub>HPO<sub>4</sub>, 4.0 g anhyd. KH<sub>2</sub>PO<sub>4</sub>, and 100 mL glycerol. Mix well to dissolve, and adjust pH to 7.2. Autoclave 15 min at 121°. For double-strength glycerol soln (20%), use 200 mL glycerol and 800 mL H<sub>2</sub>O.

**46.033****Culture Media**

(Sizes of culture media containers (test tubes, flasks, and petri dishes) are specified for each medium. All media except tryptose-sulfite-cycloserine (TSC) agar are incubated in air at 35°. Media not used  $\leq$  4 hr after prep must be heated 10 min in boiling H<sub>2</sub>O or flowing steam to expel O and cooled rapidly in tap H<sub>2</sub>O without agitation just before use.)

(a) *Tryptose-sulfite-cycloserine agar*.—15.0 g tryptose, 20.0 g agar, 5.0 g soytone, 5.0 g yeast ext, 1.0 g Na metabisulfite, and 1.0 g ferric ammonium citrate (NF Brown Pearls) dild to 1 L with H<sub>2</sub>O (SFP agar base, Difco 0811-01, is satisfactory). Adjust to pH 7.6±0.1, dispense 250 mL portions into 500 mL flasks, and sterilize 15 min at 121°. Before plating, add 20.0 mL 0.5% filter-sterilized soln of D-cycloserine to each 250 mL sterile melted medium at 50°. To make egg yolk-contg plates, add 20 mL 50% egg yolk emulsion, (c), to 250 mL sterile medium contg D-cycloserine. Dispense 15 mL portions into 100 × 15 mm sterile

petri dishes. Cover plates with towel and let dry overnight at room temp. before use.

(b) *D-Cycloserine soln*.—Dissolve 1 g D-cycloserine (Sigma Chemical Co. or Serva Feinbiochemica, Heidelberg, West Germany) without heating in 200 mL 0.05M phosphate buffer (pH 8.0±0.1) and sterilize by filtering thru 0.45  $\mu$ m membrane filter.

(c) *Egg yolk emulsion*.—Wash fresh eggs with stiff brush and drain. Soak 1 hr in 70% alcohol. Aseptically remove yolk and mix with equal vol. sterile 0.85% NaCl soln. Store at 4°.

(d) *Buffered motility-nitrate medium*.—3.0 g beef ext, 5.0 g peptone, 5.0 g KNO<sub>3</sub>, 2.5 g Na<sub>2</sub>HPO<sub>4</sub>, 3.0 g agar, 5.0 g galactose, and 5.0 g glycerol dild to 1 L with H<sub>2</sub>O. Adjust to pH 7.3±0.1, dispense 11 mL portions into 150 × 16 mm tubes, and sterilize 15 min at 121°.

(e) *Lactose-gelatin medium*.—15.0 g tryptose, 10.0 g yeast ext, 10.0 g lactose, 5.0 g Na<sub>2</sub>HPO<sub>4</sub>, 0.05 g phenol red, and 120.0 g gelatin dild to 1 L with H<sub>2</sub>O. Adjust to pH 7.5±0.1 before adding lactose and phenol red. Dispense 10 mL portions into 150 × 16 mm screw-cap tubes and sterilize 15 min at 121°.

(f) *Sporulation broth*.—15.0 g polypeptone, 3.0 g yeast ext, 3.0 g sol. starch, 0.1 g MgSO<sub>4</sub>, 1.0 g Na thioglycolate, and 11.0 g Na<sub>2</sub>HPO<sub>4</sub> dild to 1 L with H<sub>2</sub>O. Adjust to pH 7.8±0.1, dispense 15 mL portions into 150 × 20 mm screw-cap tubes, and sterilize 15 min at 121°.

(g) *Polypeptone-yeast extract (PY) medium*.—20.0 g polypeptone, 5.0 g yeast ext, and 5.0 g NaCl dild to 1 L with H<sub>2</sub>O. Adjust to pH 6.9±0.1, dispense 9 mL portions into 125 × 16 mm screw-cap tubes, and sterilize 15 min at 121°.

(h) *Fluid thioglycolate medium*.—(BBL-01-140, Difco 0256, Oxoid CM173). Dispense 10 mL portions into 150 × 16 mm screw-cap tubes. Sterilize 15 min at 121°, and cool quickly. Final pH is 7.1±0.1.

**46.034****Preparation of Sample**

(a) *For storage and shipping*.—Using aseptic technic, transfer 50 g sample to sterile container such as Whirl-Pak plastic bag and add 50 g sterile buffered glycerol-salt soln. Mix well by kneading bag or stirring with sterile pipet. Let soln penetrate solid foods 10 min before freezing. Treat liq. samples such as beef juice or gravy with double-strength (20% glycerol) soln to obtain final concn of 10% glycerol. Freeze samples as quickly as possible in ultra-low temp. freezer at -68° or, alternatively, by placing in sealable metal canister and storing with solid CO<sub>2</sub> in insulated shipping container. To ship samples, place in sealable metal canister and pack in well insulated styrofoam shipping carton with sufficient solid CO<sub>2</sub> to keep samples frozen during transit. Ship by most rapid means possible. Upon receipt, transfer samples to ultra-low temp. freezer at -68° or replenish solid CO<sub>2</sub> in shipping carton to maintain temp. at ca -56° until samples can be examined. Thaw samples and proceed as in (b) without delay.

(b) *For analysis*.—Using aseptic technic, weigh 50 g food sample into sterile blender jar. Add 450 mL peptone dild H<sub>2</sub>O and homogenize 2 min at low speed (13,000 rpm). Use this 1:10 dild to prep. serial dilns from 10<sup>-2</sup> to 10<sup>-6</sup> by transferring 10 mL of 1:10 dild to 90 mL dild blank, mixing well with gentle shaking, and continuing until 10<sup>-6</sup> dild is reached.

**46.035****Plate Count Technic**

Pour ca 5 mL TSC agar without egg yolk into each of ten 100 × 15 mm petri dishes and spread evenly by rapidly rotating dish. When agar has solidified, label plates and aseptically pipet 1 mL of each dild of homogenate in duplicate onto agar surface in center of dish. Pour addnl 15 mL TSC agar without egg yolk

into dish and mix well with inoculum by gently rotating dish.

Alternatively, with sterile glass rod spreader, spread 0.1 mL diln over previously poured plates of TSC agar contg egg yolk emulsion. Let plates absorb inoculum 5–10 min; then overlay with 10 mL TSC agar without egg yolk. (TSC agar contg egg yolk is preferred for foods which may also contain other sulfite-reducing *Clostridium* sp.)

When agar has solidified, place plates in upright position in anaerobic jar. Produce anaerobic conditions, and incubate jar 20 hr at 35° for TSC agar without egg yolk and 24 hr at 35° for TSC agar with egg yolk. After incubation, remove plates from jar and observe macroscopically for growth and black colony production. Select plates showing estd 20–200 black colonies. Using Quebec colony counter with piece of white tissue paper over counting area, count black colonies and calc. number of *Clostridium* sp./g food. *C. perfringens* colonies in medium contg egg yolk are black and usually surrounded by 2–4 mm zone of white ppt due to lecithinase activity. However, since a few strains are weak or neg. for lecithinase, count any black colonies suspected to be *C. perfringens* and confirm identity as in 46.036.

#### 46.036

#### Confirmation Technic

Select 10 characteristic colonies from countable plates (20–200 colonies), inoculate each into tube of fluid thioglycolate medium, and incubate 18–24 hr at 35°. Make Gram-stained smear of fluid thioglycolate cultures and check for purity and presence of short, thick, Gram-pos. bacillus characteristic of *C. perfringens*. Streak contaminated cultures on TSC agar contg egg yolk and incubate plates anaerobically 24 hr at 35° to obtain pure cultures. Stab-inoculate buffered motility-nitrate and lactose gelatin media with 2 mm loopfuls of pure fluid thioglycolate culture or portion of isolated colony from TSC agar plate. Inoculate sporulation broth with 1 mL fluid thioglycolate culture and incubate 24 hr at 35°. Examine tubes of buffered motility-nitrate medium by transmitted light for type of growth along stab. Nonmotile organisms produce growth only in and along line of stab. Motile organisms produce diffuse growth out into medium away from stab.

Test buffered motility-nitrate medium for presence of nitrite by adding 0.5 mL Reagent A and 0.2 mL Reagent B. Orange which develops within 15 min indicates presence of nitrites. If no color develops, add few grains of powd Zn metal, and let stand 10 min. No color change after addn of Zn indicates that nitrates are completely reduced; change to orange indicates that organism is incapable of reducing nitrates.

Examine lactose-gelatin medium for gas and color change from red to yellow, indicating that lactose is fermented with production of acid. Chill tubes 1 hr at 5° and check for gelatin liquefaction. If medium solidifies, reincubate addnl 24 hr at 35° and repeat test for gelatin liquefaction. Make Gram-stained smear from sporulation broth and examine microscopically for spores. Report whether or not spores are produced. Store sporulated cultures at 4° if further testing of isolates is desired.

Nonmotile, Gram-pos. bacilli which produce black colonies in TSC agar, reduce nitrates to nitrites, produce acid and gas from lactose, and liquefy gelatin within 48 hr are provisionally identified as *C. perfringens*.

Organisms suspected to be *C. perfringens* that do not meet criteria stated above must be confirmed by further testing. Subculture into fluid thioglycolate medium isolates that do not liquefy gelatin or which are atypical in other respects. Incubate 24 hr at 35°, make Gram-stained smear, and check for purity. Inoculate 1 tube of PY medium, (g), contg 1% salicin and 1 tube contg 1% raffinose with 0.1 mL fluid thioglycolate culture. Incubate media 24 hr at 35° and check PY-salicin for acid and

gas. Transfer 1.0 mL culture to test tube and add 1–2 drops 0.04% phenol red. Yellow indicates acid is produced from salicin. (Salicin usually is not fermented by *C. perfringens* but is rapidly fermented with production of acid and gas by closely related species.) Reincubate media addnl 48 hr and test both media for production of acid. Acid is usually produced from raffinose by *C. perfringens* but not by closely related species. Acid is produced from salicin in PY medium by a few strains of *C. perfringens*.

Calc. number of *C. perfringens* in sample on basis of % colonies tested that are confirmed as *C. perfringens*. (Example: If av. plate count of 10<sup>-4</sup> diln was 85, and 8 of 10 colonies tested were confirmed as *C. perfringens*, number of *C. perfringens*/g food is  $85 \times (8/10) \times 10,000 = 680,000$ .) (Note: Diln factor with plates contg egg yolk is 10-fold higher than diln plated.)

### *Clostridium botulinum* and its Toxins (7)

#### Official Final Action

(Caution: See 51.018)

#### 46.037

#### Principle

Mice injected intraperitoneally (IP) with food ext contg  $\geq 1$  min. lethal dose (MLD) of botulinum toxin die within 72 hr after exhibiting sequence of symptoms characteristic of botulinum intoxication. Homologous antitoxin will protect mice from symptoms while other antitoxins will not, thus detg serological type. Viable spores in food will grow in suitable culture medium and produce toxin, which is detected and typed.

#### 46.038

#### Apparatus

- (a) *Can opener*.—See 46.020(a).
- (b) *Anaerobic jars*.—Gas-Pak (BBL) or Case-nitrogen replacement.
- (c) *Petri dishes*.—100 mm diam. Dry prepd plates ca 24 hr at 35° before streaking.
- (d) *Centrifuge*.—High-speed, refrigerated.
- (e) *Syringes*.—1.0 or 3.0 mL with 25 gage  $\frac{5}{16}$ " needles for inoculating mice.

#### 46.039

#### Media and Reagents

- (a) *Cooked meat broth*.—Use either liver or heart medium.
  - (1) *Chopped liver broth*.—Grind 500 g fresh beef liver into 800 mL H<sub>2</sub>O. Heat to bp and simmer 1 hr. Cool, adjust to pH 7.0, and boil 10 min. Filter thru cheesecloth, pressing out excess liq. To broth add 10 g peptone, 1 g K<sub>2</sub>HPO<sub>4</sub>, and 1 g sol. starch. Adjust to pH 7.0 and dil. to 1 L with H<sub>2</sub>O. Filter thru coarse paper. (If desired, broth and liver may be stored sep. in freezer for future use.) To 18 or 20 × 150 mm test tubes, add liver to ht of 1–2 cm and 10–12 mL liq. Autoclave 20 min at 121°.
  - (2) *Cooked meat medium*.—Use com. medium of following formula: beef heart 454 g, proteose peptone 20 g, dextrose 2 g, and NaCl 5 g. Suspend 12.5 g medium in 100 mL cold H<sub>2</sub>O. Mix thoroly and let stand until particles are thoroly wetted (ca 15 min). (Alternatively, add 1.25 g solid medium into test tubes, add 10 mL cold H<sub>2</sub>O, and mix thoroly to wet all particles.) Autoclave 15 min at 121°. Final pH, 7.2 ± 0.1.

- (b) *Trypsin-peptone-glucose-yeast extract broth with trypsin (TPGYT)*.—Dissolve 50 g trypticase, 5 g Bacto-peptone, 20 g yeast ext, 4 g dextrose, and 1 g Na thioglycolate in 1 L H<sub>2</sub>O, and dispense 15 mL portions into 20 × 150 mm culture tubes or 100 mL portions into 6 fl oz prescription bottles. Autoclave 10 min (tubes) or 15 min (bottles) at 121°. Final pH, 7.0 ± 0.1. Refrigerate, and discard if not used within 2 weeks. Immediately before use, steam or boil 10–15 min to remove O, cool quickly, and aseptically add 1.0 mL trypsin soln/15 mL broth.

Prep. trypsin soln by dissolving 1.5 g trypsin (Difco 1:250) in 100 mL H<sub>2</sub>O. Sterilize by filtering thru 0.45 µm Millipore or equiv. filter, and refrigerate.

(c) *Liver-veal-egg yolk agar or anaerobic egg yolk agar.*—(1) *Liver-veal-egg yolk agar (LVEY).*—Wash 2 or 3 eggs with stiff brush, and drain. Soak eggs in 0.1% HgCl<sub>2</sub> soln 1 hr. Drain HgCl<sub>2</sub> soln and replace with 70% alcohol, soaking 30 min. Remove eggs, crack aseptically, and discard whites. Remove yolk with syringe, place in sterile container, and add equal vol. sterile 0.85% NaCl soln. Mix thoroly. To each 500 mL prepd sterile com. dehydrated liver veal agar at 50°, add 40 mL egg yolk-NaCl suspension. Mix thoroly and pour plates. Dry plates 2 days at room temp. or 24 hr at 35°. Discard contaminated plates, and store sterile plates in refrigerator. (2) *Anaerobic egg agar.*—Dissolve 5 g yeast ext, 5 g tryptone, 20 g proteose peptone, 5 g NaCl, and 20 g agar in 1 L H<sub>2</sub>O. Adjust to pH 7.0, dispense 500 mL into 1 L flask, and autoclave 20 min at 121°. To 500 mL melted agar at 45–50°, add 40 mL egg yolk-NaCl suspension, prepd as in (1). Mix, and pour plates immediately. Dry and store sterile plates as in (1).

(d) *Gel-phosphate buffer.*—pH 6.2. Dissolve 2 g gelatin and 4 g Na<sub>2</sub>HPO<sub>4</sub> in 1 L H<sub>2</sub>O with gentle heat. Dispense into 100 mL milk diln bottle. Autoclave 20 min at 121°.

(e) *Clostridium botulinum antitoxin preparations.*—Types A thru F or polyvalent A–F. Available from Scientific Resources Branch, Laboratory Division, Center for Disease Control, Atlanta, GA 30333.

#### 46.040

#### Preparation of Sample

(a) *Preliminary examination.*—Keep samples refrigerated. Unopened canned foods, unless badly swollen and in danger of bursting, need not be refrigerated. Record code and condition of container. Clean and identify container.

(b) *Solid foods.*—Aseptically transfer portion, with little or no free liq., to sterile mortar. Add equal amt sterile gel-phosphate buffer, (d), and grind with sterile pestle. Alternatively, inoculate small pieces of sample with sterile forceps directly into enrichment broth.

(c) *Liquid foods.*—Inoculate with sterile pipets directly into enrichment broth.

(d) *Canned foods.*—Prep., disinfect with alc. I soln, and open cans as in 46.021. If can has swelled, position can so vertical side seam is away from operator. If can has buckled ends, chill before opening, and flame cautiously to avoid bursting can.

(e) *Visual examination.*—Note appearance, odor, and any evidence of decomposition. DO NOT TASTE PRODUCT under any circumstances.

(f) *Reserve sample.*—After culturing, aseptically remove portion to sterile sample jars for further tests which may be needed later.

#### 46.041

#### Detection of Viable *C. botulinum*

(a) *Enrichment.*—Remove dissolved O from media before inoculation by steaming 10–15 min and cooling quickly without agitation. Inoculate 2 tubes of cooked meat broth, (a), with 1–2 g solid or 1–2 mL liq. food or ext/15 mL broth, introducing inoculum slowly beneath surface of broth. Incubate at 35°. Similarly inoculate 2 tubes of TPGYT broth, 46.039(b), and incubate at 26°.

(b) *Examination.*—After 5 days, examine cultures for turbidity, gas production, digestion of meat particles, and odor. Also examine microscopically by wet mount under high power phase contrast or by bright field illumination of smear stained by Gram stain, crystal violet, or methylene blue. Observe morphology of organisms and note existence of typical clostridial cells, occur-

rence and relative extent of sporulation, and location of spores within cells.

(c) *Further treatment.*—Usually 5 day incubation produces active growth and highest concn of toxin, as well as peak sporulation. Retain culture in refrigerator for pure culture isolation. If there is no growth after 5 days, incubate addnl 10 days to detect possible delayed germination of *C. botulinum* spores before discarding culture as sterile.

#### 46.042

#### Isolation of Pure Cultures

If good sporulation has occurred, *C. botulinum* is more readily isolated from mixed flora in enrichment culture or from original sample.

(a) *Pretreatment.*—Add equal vol. filter-sterilized absolute alcohol to 1–2 mL culture or sample in sterile screw-cap tube. Mix well and incubate at room temp. 1 hr. Alternatively, heat 1–2 mL enrichment culture 10–15 min at 80° to destroy vegetative cells. (Do not use heat treatment for nonproteolytic type *C. botulinum*.)

(b) *Plating.*—With inoculating loop, streak 1 or 2 loopfuls of alcohol or heat-treated cultures, dild if necessary, to either or both liver veal egg yolk agar or anaerobic egg yolk agar dried plates in manner to obtain isolated colonies. Incubate plates ca 48 hr at 35° under anaerobic conditions of Case anaerobic jar or Gas-Pak systems, or equivs.

(c) *Selection of colonies.*—Typical colonies are raised or flat, smooth or rough, and commonly show some spreading and have irregular edge. On egg yolk media, colonies usually exhibit surface iridescence when examined by oblique light. This luster zone is referred to as "pearly layer." Zone usually extends beyond and follows irregular contour of colony. Besides pearly zone, colonies of types C, D, and E are ordinarily surrounded by wide (2–4 mm) zone of yellow ppt. Colonies of types A and B generally show smaller zone of pptn. Not all typical colonies will produce toxin. Some members of genus *Clostridium* have typical morphological characteristics but do not produce toxins.

(d) *Cultures.*—With sterile transfer loop, inoculate each of 10 selected colonies into tube of sterile medium: (1) TPGYT broth for *C. botulinum* Type E, incubating 5 days at 26°; and (2) cooked meat broth for other toxin types, incubating 5 days at 35°. Use cultures for confirmation as in (e) and for detection and identification of toxin as in 46.043.

(e) *Confirmation.*—Streak culture from (d) in duplicate on egg yolk agar plates, incubating 1 plate anaerobically and other plate aerobically at 35°. If colonies typical of *C. botulinum* are found on anaerobic plate and no growth is found on aerobic plate, culture may be pure. Failure to isolate *C. botulinum* from ≥1 of selected colonies may indicate that its population relative to mixed flora is low. Repeated serial transfers thru addnl enrichment steps, 46.041(a), may increase numbers sufficiently to permit isolation. Store pure culture, (d), either under refrigeration, on glass beads, or lyophilized.

#### 46.043

#### Detection of Toxin

(a) *Preparation of sample.*—Ext solid foods with equal vol. gel-phosphate buffer, 46.039(d), macerating with sterile, pre-chilled mortar and pestle. Centrf. ext and liq. foods contg suspended solids under refrigeration. Rinse empty containers suspected of having held toxic foods with few mL gel-phosphate buffer. Use min. vol. to avoid diln of toxin.

(b) *Trypsin treatment.*—Toxins of nonproteolytic types, if present, may need trypsin activation to be detected. Do not use trypsin treatment with TPGYT culture which already contains trypsin. Further treatment may degrade any fully activated toxin present in culture.

Adjust portion of food supernate, (a), liq. food, or cooked meat culture, if necessary, to pH 6.2 with 1*N* NaOH or HCl. Prep. satd trypsin treated and untreated materials. Dil. portions of un-in clean culture tube. Mix 0.2 mL trypsin soln with 1.8 mL liq. to be tested. Incubate 1 hr at 37° with occasional gentle agitation.

(c) *Toxicity testing*.—Conduct each test in duplicate, i.e. on trypsin treated and untreated materials. Dil. portions of untreated and treated food supernate, liq. food, or culture 1:2, 1:10, and 1:100, resp., with gel-phosphate buffer. Inject sep. pairs of mice, ca 15–20 g, IP with original and dild fluids, treated and untreated, using syringe, (e). Heat 1.5 mL original untreated fluid 10 min at 100° for control. Cool, and inject pair of mice each with 0.5 mL heated fluid. These mice should not die because botulinum toxin, if present, is inactivated by this heat treatment.

Observe mice periodically for 72 hr, recording symptoms and time of deaths. Typical symptoms of botulism usually begin within 24 hr with ruffling of fur, followed in sequence by labored breathing, weakness of limbs, and finally total paralysis with gasping for breath, followed by death due to respiratory failure. Death without symptoms of botulism is not sufficient evidence that injected material contained botulinum toxin. Deaths may occur from chemo present in fluid or from trauma.

If after 72 hr, all but mice receiving heated prepn have died, repeat toxicity test, using higher dilns of fluids. It is necessary to have dilns that kill as well as dilns that do not kill to establish an end point or MLD (min. lethal dose) as est. of amt of toxin present. MLD is contained in highest diln killing both (or all) mice inoculated. Calc. MLD/mL.

#### 46.044

#### Typing of Toxin

Dil. monovalent antitoxins to types A, B, E, and F in 0.85% NaCl soln to concn of 1 International Unit/0.5 mL. Prep. enough dild antitoxin to inject 0.5 mL into each of 2 mice for each diln of prepn to be tested.

Use toxic prepn which gave greatest number of MLD, either treated or untreated. If untreated, same prepn can be used as was used for toxicity testing; if trypsinized prepn was most lethal, prep. freshly trypsinized fluid since continued action of trypsin may destroy toxin. Prep. dilns to cover range of at least 10, 100, and 1000 MLD below previously detd end point of toxicity.

Inject several groups of mice IP, each mouse receiving 0.5 mL of 1 of dild antitoxins, 30–60 min before challenging them with IP injection of toxic prepn.

Inject pairs of mice protected by specific monovalent antitoxin injection IP with each diln of toxic prepn. Also inject pair of unprotected mice (no injection of antitoxin) with each toxic diln as control. (This protocol requires 30 mice: 3 pairs for each of the 4 monovalent antitoxins (A, B, E, and F), each pair to receive challenge of 1 of the 3 dilns of toxic prepn ( $2 \times 3 \times 4 = 24$ ) plus 1 pair of unprotected mice for each diln of toxic material as control ( $2 \times 3 = 6$ ).

Observe mice 72 hr for symptoms of botulism and record time of deaths. If results indicate that toxin was not neutzd, repeat test, using monovalent antitoxins to types C and D, plus polyvalent antitoxin pool of types A thru F.

#### 46.045

#### Interpretation

Toxin in food means that product, if consumed without thoro heating, could cause botulism. Presence of toxin in food is required for botulism to occur. Viable *C. botulinum* but no toxin in food is not proof that food in question caused botulism. Ingested organisms may be found in alimentary tract, but are considered to be unable to multiply and produce toxin *in vivo*.

Presence of botulinum toxin and/or organisms in low-acid (pH >4.6) canned foods means that items were underprocessed or were contaminated thru post-processing leakage. Swollen cans are more likely than flat cans to contain botulinum toxin since organism produces gas during growth. Presence of toxin in flat can may imply that seams were loose enough to let gas escape. Toxin in canned foods is usually of type A or of proteolytic type B strain, since spores of proteolytics can be among more heat resistant bacterial spores. Spores of nonproteolytics, types B, E, and F, generally are of low heat resistance and would not normally survive even mild heat treatment.

Protection of mice from botulism and death with 1 of monovalent botulinum antitoxins confirms presence of botulinum toxin and detcs serological type of toxin in sample.

If mice are not protected by 1 of monovalent antitoxins, there may be too much toxin in sample, there may be more than 1 kind of toxin present, or deaths may be due to some other cause. In such cases, retesting at higher dilns of test fluids is required and mixts of antitoxins must be used in place of monovalent antiserum. If mice are still not protected, some other toxic material, which is not heat labile, could be responsible if both heated and unheated fluids cause death. It is also possible that heat stable toxic substance could mask botulinum toxin.

### Estimation of *Clostridium perfringens*, alpha-Toxin

#### Method (8)—Official Final Action

(Applicable to examination of outbreak foods in which relatively large numbers of vegetative cells are expected to be present)

#### 46.046

#### Apparatus

(a) *Centrifuge*.—High-speed, preferably refrigerated, with 250 mL bottles.

(b) *Seitz filter*.—100–250 mL with sterilizing filter pads.

(c) *High-speed blender*.—Waring Blendor or Omni-Mixer homogenizer (DuPont Co., Sorvall Operations, Newtown, CT 06470), with blending vessels.

(d) *Vacuum flask*.—Sidearm 1 L erlenmeyer fitted with 1-hole rubber stopper to receive 200 mm glass tubing with 125 cm of 6 mm od (3 mm id) rubber tubing attached.

(e) *Tubing*.—Stainless steel thin wall (No. 9 surgical), 3 (od)  $\times$  180 mm (Tubesaes, 175 Tubeway St, Forrest Park, GA 30050).

(f) *Dialysis tubing*.—1.21" flat width (Fisher Scientific Co., No. 8667C).

#### 46.047

#### Reagents

(a) *N-2-Hydroxyethyl piperazine-N'-2-ethane sulfonic acid (HEPES) buffer soln*.—Dissolve 6.0 g HEPES (Calbiochem) and 11.7 g NaCl in 500 mL H<sub>2</sub>O. Adjust to pH 8.0 with 3*N* NaOH and store at 4°.

(b) *Lecithovitellin soln*.—Mix 1 egg yolk with 250 mL saline soln, (e), and clarify by centrfg 20 min at 14,000 $\times g$  at 4°. Filter-sterilize supernate with Seitz filter and store at 4°.

(c) *Saline agar base*.—Add 15.0 g purified agar (Difco Laboratories) and 8.5 g NaCl to 1 L H<sub>2</sub>O. Adjust to pH 7.0, heat to dissolve agar, dispense in 100 mL portions, and autoclave 15 min at 121°.

(d) *Washed red blood cells*.—Wash packed human red blood cells 3 times by mixing with 4 vols saline soln, (e). Centrfg. 10 min at low speed (2500 rpm) to sediment cells. Remove supernate with vac. flask. Resuspend cells in addnl saline soln and repeat these steps twice. After final wash, mix cells with equal vol. saline soln. Use sterile precautions.

(e) *Sterile saline soln*.—Dissolve 8.5 g NaCl in 1 L H<sub>2</sub>O. Adjust to pH 7.0, dispense 250 mL portions into Pyrex containers, and autoclave 15 min at 121°.

(f) *Polyethylene glycol soln.*—30%. Dissolve 120 g polyethylene glycol (Carbowax Compound 20M, Union Carbide Corp., PO Box 8361, S Charleston, WV 25303) in 400 mL H<sub>2</sub>O.

(g) *Antiserum.*—*Clostridium perfringens* Type A diagnostic serum (Wellcome Reagents, Burroughs-Wellcome Co., 3030 Cornwallis Rd, Research Triangle Park, NC 27709).

**46.048****Preparation of Hemolysin Plates**

Melt 100 mL saline agar base, (c), cool to 50°, and add 11 mL washed red cells, (d). Mix thoroly and dispense 7 mL into 15 × 100 mm sterile plastic petri dishes. Dry plates overnight at room temp. and store at 4°. Just before use, cut test wells by applying vac. to sterile stainless steel tube, (e), and plunging tube into agar. Using template, space 9 test wells 3 cm apart and 2 cm from edge, and place 2 addnl wells 3 cm apart near center of plate.

**46.049****Toxin Extraction**

Homogenize 25 g food (do not include fat) in 100 mL HEPES buffer soln, (a), 1 min in high-speed blender. Centrf. homogenate 20 min at 14,000–20,000 × g at 5°. Filter supernate thru Whatman No. 31 paper, or equiv., to remove fat (chill ext centrfd without refrigeration 1 hr at 4° before filtering). Discard solids. Rinse Seitz filter pad with 15 mL saline soln. Discard saline soln and filter-sterilize ext, rinsing filter pad with 10 mL saline soln.

**46.050****Concentration**

Soak 90 cm dialysis tubing 1 hr in H<sub>2</sub>O. Tie one end and fill with saline soln. Check for leaks and rinse out twice with saline soln. Transfer sterile ext to dialysis sack and concd. to <10 mL by dialyzing 4–5 hr against 400 mL 30% polyethylene glycol, (f), at 4°. Rinse outside of sack with tap H<sub>2</sub>O and collect concd ext in sterile tube.

**46.051****Toxin Testing**

Adjust vol. of concd ext to 10 ± 0.5 mL with saline soln. Set up 10 sterile 13 × 100 mm test tubes and add 0.5 mL saline soln to all tubes except first and last. Add 0.5 mL ext to first and second tubes. Mix ext and saline soln in second tube and transfer 0.5 mL to third tube, etc., to serially dil. ext from 0 to 1+255. Change pipet after 3 dilns to prevent excessive carry-over. Mix 0.25 mL ext, 0.25 mL saline soln, and 0.1 mL antiserum, (g), in last tube. Fill 1 peripheral well of duplicate hemolysin plates with each diln of ext, using fine-tipped Pasteur pipet. Fill 1 center well of each plate with ext-antiserum mixt. and the other with saline soln. Add 0.5 mL lecithovitellin soln, (b), to remainder of dild ext in each tube, including ext-antiserum mixt. Mix well, and incubate tubes and plates (in plastic bag) 24 hr at 35°.

**46.052****alpha-Toxin Titer**

After incubation, refrigerate plates 2 hr at 4°. Measure hemolytic zone (width from edge of well in mm). Last 3 dilns before end point should exhibit ca 1 mm reduction in width for each 2-fold diln. If not, repeat α-toxin test. Hemolytic zone 1 mm in width is end point of titrn.

Examine ext-lecithovitellin mixt. in tubes for lecithinase activity and record results. Max. reaction (+++++) is white pellicle 4–5 mm thick over clear liq. Activity decreases with diln to (+) reaction (opaque soln with no pellicle). This diln is end point of lecithovitellin test. Hemolytic and lecithinase activities neutzd by antiserum are due to α-toxin.

**46.053****Population Estimate**

Compare titer of α-toxin present in ext with data in Table 46:02 to est. population of *C. perfringens*. Hemolysin (HI) plate titer is preferred for this because lecithovitellin (LV) test is less sensitive with some food exts.

**SALMONELLA (9)—OFFICIAL FINAL ACTION**

(Applicable to the detection and identification of *Salmonella* from dried active yeast, dried whole egg, dried egg yolk, and dried egg white, nonfat dry milk and dry whole milk, and onion and garlic powders. Method described is minimal. Depending upon history of sample, addnl types of examinations may be applied. Use *Identification of Enterobacteriaceae*, P. R. Edwards and W. H. Ewing, Burgess Publishing Co., Minneapolis, MN 55415, 3rd ed., 1972, as guide for further study of isolated microorganisms. For food sampling plans and initial sample handling, refer to Chapter 1, *FDA Bacteriological Analytical Manual*, 5th ed., 1978.)

**46.054****Culture Media**

(Sizes of culture media containers (test tubes, flasks, and petri dishes) are specified in prepn of each medium. Different size containers may be used if they give identical results. All media containers must have covers, caps, or plugs which prevent contamination but maintain aerobic conditions unless otherwise directed.)

(a) *Lactose broth.*—See 46.005(f). Dispense 225 mL portions into 500 mL screw-cap bottles or flasks.

(b)(1) *Selenite cystine broth.*—Suspend 5.0 g tryptone or polypeptone, 4.0 g lactose, 10.0 g Na<sub>2</sub>HPO<sub>4</sub>, 4.0 g NaHSeO<sub>3</sub>, and 0.01 g L-cystine in 1 L H<sub>2</sub>O and mix thoroly. Heat with frequent agitation. Dispense 10 mL portions into sterile 16 × 150 mm test tubes. Heat 10 min in flowing steam. Do not autoclave. Final pH, 7.0 ± 0.2. Medium is not sterile. Use same day as prep.

(2) *Selenite cystine broth (North and Bartram).*—Prep. as in (1), using 5.0 g polypeptone or 4.0 g tryptone, 4.0 g lactose, 4.0 g NaHSeO<sub>3</sub>, 5.5 g Na<sub>2</sub>HPO<sub>4</sub>, 4.5 g KH<sub>2</sub>PO<sub>4</sub>, and 1 mL 1% L-cystine (10 mg) soln prepd by dissolving 1.0 g L-cystine in 15 mL 1N NaOH and dilg to 100 mL with sterile H<sub>2</sub>O.

(c) *Tetrathionate broth (with iodine and brilliant green).*—Suspend 5.0 g polypeptone, 1.0 g bile salts, 10 g CaCO<sub>3</sub>, and 30 g Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>·5H<sub>2</sub>O in 1 L H<sub>2</sub>O, mix thoroly, and heat to bp. (Ppt will not dissolve completely.) Cool to <45° and store at 5–8°. Prep. I-KI soln by dissolving 5 g KI in 5 mL sterile H<sub>2</sub>O, adding 6 g resublimed I, dissolving, and dilg to 20 mL with sterile H<sub>2</sub>O. Prep. brilliant green soln by dissolving 0.1 g dye in sterile H<sub>2</sub>O and dilg to 100 mL. On day medium is used, add 20 mL I-KI soln and 10 mL brilliant green soln per 1 L basal broth. Resuspend ppt by gentle agitation and aseptically dispense 10 mL portions

**Table 46:02 Correlation between Population Levels of *C. perfringens* and Amount alpha-Toxin Produced in Food<sup>a</sup>**

α-Toxin titer <sup>b</sup>		Estd <i>C. perfringens</i> population/g × 10 <sup>6</sup>
HI plate	LV test	
Undild		1.2
1+1	Undild	2.5
1+3	1+1	6.5
1+7	1+3	9.5
1+15	1+7	25
1+31	1+15	55
1+63	1+31	80
1+127	1+127	150
1+255	1+255	210

<sup>a</sup> Based on viable counts obtained with 6 strains in chicken broth.

<sup>b</sup> Diln which produces 1 mm zone of hemolysis in HI plate or one + reaction in LV test.

into 20 or 16 × 150 mm sterile test tubes. *Do not heat medium after addn of I-KI and dye solns.*

(d) *Brilliant green agar*.—Use com. dehydrated medium contg 3.0 g yeast ext, 10 g proteose peptone No. 3 or polypeptone, 5.0 g NaCl, 10 g lactose, 10 g sucrose, 0.08 g phenol red, 5 mL 0.25% brilliant green (12.5 mg) soln, and 20 g agar. Suspend medium in 1 L H<sub>2</sub>O, mix thoroly, and heat with occasional agitation. Boil 1 min to dissolve. Autoclave 1 L portions 12 min at 121°. (Addnl heating decreases selectivity of medium; less heating increases selectivity.) Cool to 45–50° and pour 20 mL portions into 15 × 100 mm petri dishes. Let dry ca 2 hr with covers partially removed; then close plates. Final pH, 6.9±0.2.

(e) *Salmonella-Shigella agar*.—Suspend 5.0 g beef ext, 5.0 g polypeptone or proteose peptone, 10 g lactose, 8.5 g bile salts mixt., 8.5 g Na citrate.2H<sub>2</sub>O, 8.5 g Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>.5H<sub>2</sub>O, 1.0 g ferric citrate, 13.5 g agar, 0.33 mL 0.1% brilliant green (0.33 mg) soln, and 2.5 mL 1% neutral red (25 mg) soln in 1 L H<sub>2</sub>O, and mix thoroly until homogeneous. Heat with occasional agitation and boil 1–2 min until ingredients dissolve. Cool to 45–50° and pour 20 mL portions into 15 × 100 mm petri dishes. Let dry ca 2 hr with covers partially removed; then close plates. Final pH, 7.0±0.2. *Do not autoclave.*

(f) *Bismuth sulfite agar (Wilson and Blair)*.—Suspend 10 g polypeptone or peptone, 5.0 g beef ext, 5.0 g glucose, 4.0 g Na<sub>2</sub>HPO<sub>4</sub>, 0.3 g FeSO<sub>4</sub>, 8.0 g Bi<sub>2</sub>(SO<sub>3</sub>)<sub>3</sub> indicator, 0.025 g brilliant green, and 20 g agar in 1 L H<sub>2</sub>O, mix thoroly, and heat with occasional agitation. Boil ca 1 min to obtain uniform suspension. (Ppt will not dissolve.) Cool to 45–50°. Suspend ppt by gentle agitation and pour 20 mL portions into 15 × 100 mm petri dishes. Let dry ca 2 hr with covers partially removed; then close plates. Final pH, 7.6±0.2. *Do not autoclave.* Prepare plates day before streaking and store in dark at room temp. Selectivity of plates decreases 48 hr after prepn.

(g) *Triple sugar iron agar (TSI agar)*.—Suspend ingredients (1) or (2) in 1 L H<sub>2</sub>O, mix thoroly, and heat with occasional agitation. Boil ca 1 min until ingredients dissolve. Fill 16 × 150 mm tubes ⅓ full and cap or plug so that aerobic conditions are maintained during use. Autoclave 12 min at 121°. Before medium solidifies, place tubes in slanted position so that deep butts (ca 3 cm) and adequate slants (ca 5 cm) are formed on solidification.

(1) 20 g polypeptone, 5.0 g NaCl, 10 g lactose, 10 g sucrose, 1 g glucose, 0.2 g Fe(NH<sub>4</sub>)<sub>2</sub>(SO<sub>4</sub>)<sub>2</sub>.6H<sub>2</sub>O, 0.2 g Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>, 0.025 g phenol red, and 13 g agar. Final pH, 7.3±0.2.

(2) 3.0 g beef ext, 3.0 g yeast ext, 15 g peptone, 5.0 g proteose-peptone, 1.0 g glucose, 10 g lactose, 10 g sucrose, 0.2 g FeSO<sub>4</sub>, 5.0 g NaCl, 0.3 g Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>, 0.024 g phenol red, and 12 g agar. Final pH, 7.4±0.2.

(h) *Tryptophane broth*.—See 46.005(h). Use 16 or 20 × 150 mm test tubes.

(i) *Buffered glucose broth (MR-VP medium)*.—See 46.005(b). Use 16 or 20 × 150 mm test tubes.

(j) *Simmon's citrate agar*.—Dissolve 2.0 g Na citrate, 5.0 g NaCl, 1.0 g K<sub>2</sub>HPO<sub>4</sub>, 1.0 g NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub>, 0.2 g MgSO<sub>4</sub>, 0.08 g bromothymol blue, and 15 g agar in 1 L H<sub>2</sub>O, and heat gently with occasional agitation. Boil 1–2 min until ingredients dissolve. Final pH, 6.9±0.2. Fill 13 or 16 × 150 mm test tubes ⅓ full and cap or plug so that aerobic conditions are maintained during use. Autoclave 15 min at 121°. Before medium solidifies, place tubes in slanted position so that deep butts (ca 2 or 3 cm, resp.) and adequate slants (ca 4 or 5 cm, resp.) are formed on solidification.

(k)(1) *Urea broth*.—Dissolve 20 g urea, 0.1 g yeast ext, 9.1 g KH<sub>2</sub>PO<sub>4</sub>, 9.5 g Na<sub>2</sub>HPO<sub>4</sub>, and 4.0 mL 0.25% phenol red (10 mg) soln in 1 L H<sub>2</sub>O. *Do not heat.* Sterilize by filtration and aseptically dispense 1.5–3 mL portions into 13 × 100 mm sterile test tubes. Final pH, 6.8±0.2.

(2) *Rapid urea broth*.—Prep. as in (1), using 0.091 and 0.095 g phosphate salts, resp.

(l) *Malonate broth*.—Dissolve 1.0 g yeast ext, 2.0 g (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, 0.6 g K<sub>2</sub>HPO<sub>4</sub>, 0.4 g KH<sub>2</sub>PO<sub>4</sub>, 2.0 g NaCl, 3.0 g Na malonate, 0.25 g glucose, and 0.025 g bromothymol blue in 1 L H<sub>2</sub>O, heating if necessary until dissolved. Dispense 3 mL portions into 13 × 100 mm test tubes and autoclave 15 min at 121°. Final pH, 6.7±0.2.

(m)(1) *Lysine iron agar (Edwards and Fife)*.—Dissolve 5.0 g gelysate or peptone, 3.0 g yeast ext, 1.0 g glucose, 10 g L-lysine, 0.5 g ferric ammonium citrate, 0.04 g anhyd. Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>, 0.02 g bromocresol purple, and 15 g agar in 1 L H<sub>2</sub>O, heating until dissolved. Dispense 4 mL portions into 13 × 100 mL test tubes and cap or plug so that aerobic conditions are maintained during use. Autoclave 12 min at 121°. Before medium solidifies, place tubes in slanted position so that 4 cm butts and 2.5 cm slants are formed on solidification. Final pH, 6.7±0.2.

(2) *Lysine decarboxylase broth (Falkow)*.—Dissolve 5.0 g gelysate or peptone, 3.0 g yeast ext, 1.0 g glucose, 5.0 g L-lysine, and 0.02 g bromocresol purple in 1 L H<sub>2</sub>O, heating until dissolved. Dispense 5 mL portions into 16 × 125 mm screw-cap test tubes. Autoclave, loosely capped, 15 min at 121°. Screw caps on tightly for storage and after inoculation. Final pH, 6.5–6.8.

(n) *Motility test medium (semisolid medium)*.—Dissolve 3.0 g beef ext, 10 g peptone or gelysate, 5.0 g NaCl, and 4.0 g agar in 1 L H<sub>2</sub>O and heat gently with occasional agitation. Boil 1–2 min to dissolve. If medium is to be stored, dispense 20 mL portions into screw-cap containers, replacing caps loosely. Autoclave 15 min at 121°. Cool to 45°. To store, screw caps on tightly and refrigerate at 5–8°. To use, remelt in boiling H<sub>2</sub>O or flowing steam and cool to 45°. Aseptically dispense 20 mL portions into 15 × 100 mm petri dishes and let solidify with dish completely covered. Use plates same day as prepd. Final pH, 7.4±0.2.

(o) *Potassium cyanide (KCN) broth*.—Dissolve 3.0 g proteose peptone No. 3 or polypeptone, 5.0 g NaCl, 0.225 g KH<sub>2</sub>PO<sub>4</sub>, and 5.64 g Na<sub>2</sub>HPO<sub>4</sub> in 1 L H<sub>2</sub>O. Autoclave 15 min at 121°. Cool and refrigerate at 5–8°. Final pH, 7.6±0.2. Dissolve 0.5 g KCN in 100 mL cold (5–8°) sterile H<sub>2</sub>O. Using sterile bulb pipet or sterile syringe (*do not pipet by mouth*), aseptically add 15 mL cold KCN soln per L cold, sterile basal broth. Mix thoroly with gentle agitation and aseptically dispense 1.0–1.5 mL portions into sterile 13 × 100 mm test tubes. Using aseptic technic, immediately stopper tubes with No. 2 corks impregnated with paraffin. Prep. corks by boiling in paraffin ca 5 min. Place corks in tubes so that paraffin does not flow into broth but forms good seal between rim of tube and cork. Medium stored at 5–8° is usually stable ca 2 weeks.

(p)(1) *Phenol red carbohydrate broth*.—Dissolve 10 g trypticase or proteose peptone No. 3, 5.0 g NaCl, 1.0 g beef ext (optional), and 7.2 mL 0.25% phenol red (18 mg) soln in 1 L H<sub>2</sub>O and heat with gentle agitation until dissolved. Dissolve 5 g dulcitol, 10 g lactose, or 10 g sucrose (as specified in title of test) in this basal broth. Dispense 2.5 mL portions into 13 × 100 mm test tubes contg inverted 6 × 50 mm fermentation tubes. Autoclave 10 min at 118° (12 psi). Final pH, 7.3±0.2. Alternatively, dissolve ingredients, omitting carbohydrate, in 800 mL H<sub>2</sub>O with heat and occasional agitation. Dispense 2.0 mL portions into 13 × 100 mm test tubes contg inverted fermentation tubes. Autoclave 15 min at 118° and let cool. Dissolve carbohydrate in 200 mL H<sub>2</sub>O and sterilize by passing soln thru bacteria-retaining filter. Aseptically add 0.5 mL sterile filtrate to each tube of sterilized broth after cooling to <45°. Shake gently to mix. Final pH, 7.4±0.2.

(2) *Purple carbohydrate broth*.—Prep. as in (1), using as basal

broth 10 g proteose peptone No. 3 or gelysate, 5.0 g NaCl, and 0.015 or 0.020 g bromocresol purple. Final pH,  $6.8 \pm 0.2$ .

(q) *MacConkey agar*.—Suspend 3.0 g proteose peptone or polypeptone, 17 g peptone or gelysate, 10 g lactose, 1.5 g bile salts No. 3 or bile salts mixt., 5.0 g NaCl, 3.0 mL 1% neutral red (30 mg) soln, 1 mL 0.1% crystal violet (1.0 mg) soln, and 13.5 g agar in 1 L H<sub>2</sub>O and mix thoroly until homogeneous. Heat, with occasional agitation, and boil 1–2 min until ingredients dissolve. Autoclave 15 min at 121°. Cool to 45–50° and pour 20 mL portions into 15 × 100 mm petri dishes. Let dry  $\geq 2$  hr with plates covered. Do not use wet plates. Final pH,  $7.1 \pm 0.2$ .

(r) *Brain-heart infusion broth*.—Dissolve infusion from 200 g calf brain and from 250 g beef heart, 10.0 g proteose peptone or gelysate, 5.0 g NaCl, 2.5 g Na<sub>2</sub>HPO<sub>4</sub>·12H<sub>2</sub>O, and 2.0 g glucose in 1 L H<sub>2</sub>O, heating gently if necessary. Dispense 5 mL portions into 16 × 150 mm test tubes and autoclave 15 min at 121°. Final pH,  $7.4 \pm 0.2$ .

(s) *Trypticase soy-tryptose broth*.—Combine 15 g com. dehydrated trypticase soy broth medium (contg 17.0 g trypticase, 3.0 g phytone, 5.0 g NaCl, 2.5 g K<sub>2</sub>HPO<sub>4</sub>, and 2.5 g glucose), 13.5 g com. dehydrated tryptose broth medium (contg 20 g tryptose, 5 g NaCl, and 1.0 g glucose), 3 g yeast ext, and 1 L H<sub>2</sub>O. Heat, if necessary, until dissolved. Dispense 5 mL portions into 16 × 150 mm test tubes and autoclave 15 min at 121°. Final pH,  $7.2 \pm 0.2$ .

(t) *Trypticase (tryptic) soy broth*.—Prep. as in 46.013(f), but omit NaCl.

(u) *Lauryl sulfate tryptose broth*.—Prep. as in 46.013(b).

#### 46.055

#### Diagnostic Reagents

(a) *Kovacs reagent for indole test*.—Dissolve 5 g *p*-dimethylaminobenzaldehyde in 75 mL amyl alcohol and slowly add 25 mL HCl.

(b) *Voges-Proskauer (VP) test reagents*.—(1) *Alpha-naphthol soln*.—5%. Dissolve 5.0 g  $\alpha$ -naphthol in 100 mL absolute alcohol.

(2) *Potassium hydroxide soln*.—40%. Dissolve 40 g KOH in H<sub>2</sub>O and dil. to 100 mL.

(c) *Sodium hydroxide soln*.—1*N*. Dissolve 42.11 g 95% reagent NaOH in sterile H<sub>2</sub>O and dil. to 1 L.

(d) *Hydrochloric acid soln*.—1*N*. Dil. 89 mL to 1 L with sterile H<sub>2</sub>O.

(e) *Methyl red indicator*.—Dissolve 0.10 g Me red in 300 mL alcohol and dil. to 500 mL with H<sub>2</sub>O.

(f) *Sterile physiological saline soln*.—See 46.006(c).

(g) *Formalinized physiological saline soln*.—Add 6 mL HCHO soln (36–38%) to 1 L sterile saline soln, (f), mix, and store in tightly stoppered containers.

(h) *Salmonella polyvalent somatic (O) antiserum\**.—("Sero-logical Identification of the *Salmonella* Serotypes," No. 0168, Difco Laboratories, October 1977, p. 13, or equiv.) Contains agglutinins for at least somatic (O) antigens 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 19, 22, 23, 24, 25, 34, and Vi. They are agglutinins for somatic (O) groups: A, B, C<sub>1</sub>, C<sub>2</sub>, D, E<sub>1</sub>, E<sub>2</sub>, E<sub>3</sub>, E<sub>4</sub>, F, G<sub>1</sub>, G<sub>2</sub>, H, I, and Vi.

(i) *Salmonella individual somatic (O) antisera\**.—(See ref. in (h).) For at least each of the somatic (O) groups listed in (h).

(j) *Salmonella polyvalent flagellar (H) antiserum Poly a-z\**.—(See p. 12 of ref. in (h).) Contains agglutinins for at least the following flagellar (H) antigens: a, b, c, d, e, f, g, h, i, k, l, m, n, p, q, r, s, t, u, v, w, x, y, z, Z<sub>4</sub>, Z<sub>6</sub>, Z<sub>10</sub>, Z<sub>13</sub>, Z<sub>15</sub>, Z<sub>23</sub>, Z<sub>24</sub>, Z<sub>28</sub>, Z<sub>29</sub>, Z<sub>32</sub>, 1, 2, 5, 6, 7.

(k) *Salmonella "Spicer-Edwards" flagellar (H) antisera\**.—(From pp. 11 and 12 of ref. in (h).) Consists of 7 pooled or polyvalent antisera which react as in Table 46.03.

(l) *pH Test paper*.—Min. range 6.0–7.6 with max. gradations of 0.4 pH unit per color change.

(m) *Sterile distilled water*.—Dispense 1 L H<sub>2</sub>O into 2 L wide-mouth flask or wide-mouth jar; plug or cap loosely. Autoclave 20 min at 121°.

(n) *Brilliant green dye soln*.—1%. Dissolve 1 g in sterile H<sub>2</sub>O and dil. to 100 mL. (Since some batches of dye are unusually toxic, test all batches of dye before use and use only those producing satisfactory results when tested with known pos. and neg. test organisms.)

(o) *Bromocresol purple soln*.—0.2%. Dissolve 0.2 g in 100 mL sterile H<sub>2</sub>O.

#### Detection

#### 46.056

#### Preparation of Sample

(a) *Dried whole egg, dried egg yolk, and dried egg white*.—Aseptically open sample container and aseptically weigh 25 g sample into sterile, empty, wide-mouth, screw-cap pt (500 mL) jar. Add ca 15 mL sterile lactose broth, 46.054(a). Stir with sterile glass rod, sterile spoon, or sterile tongue depressor to smooth suspension. Add 3 addnl portions lactose broth, 10, 10, and 190 mL for total of 225 mL. Stir after each addn until sample is suspended without lumps. Cap jar securely and let stand at room temp. 60 min. Mix well by shaking, and det. pH with test paper, 46.055(l). Adjust pH, if necessary, to  $6.8 \pm 0.2$  with sterile 1*N* NaOH or HCl, 46.055(c) or (d), capping jar securely and mixing well before detg final pH. Loosen jar cap ca  $\frac{1}{4}$  turn and incubate  $24 \pm 2$  hr at 35°.

(b) *Nonfat dry milk and dry whole milk*.—Aseptically weigh 25 g sample into sterile, wide-mouth screw-cap 500 mL (1 pt) jar. Add 225 mL sterile H<sub>2</sub>O and mix well. Cap jar securely and let stand 1 hr at room temp. Mix well by swirling and det. pH with test paper, 46.055(l). Adjust pH, if necessary, to  $6.8 \pm 0.2$  with sterile 1*N* NaOH or HCl, 46.055(c) or (d). Add 0.45 mL of 1% aq. brilliant green dye soln, 46.055(n), and mix well. Loosen jar cap ca  $\frac{1}{4}$  turn and incubate  $24 \pm 2$  hr at 35°.

H Antigens enx, enz <sub>15</sub> lv, lw, lz <sub>13</sub> , lz <sub>28</sub> 1, 2; 1, 5; 1, 6; 1, 7	Salmonella H Antisera EN complex L complex 1 complex			

<sup>a</sup> The G complex component of *Salmonella* H antisera Spicer-Edwards 1 and 4 reacts with antigens f, g, m, p, q, s, t, and u.

<sup>b</sup> The Z<sub>4</sub> complex component reacts with Z<sub>4</sub>, Z<sub>23</sub>, Z<sub>24</sub>, and Z<sub>32</sub>. (From Difco Laboratories)

\* Conform to specifications issued by Diagnostic Products Evaluation Branch, Biological Products Div., Bureau of Laboratories, Center for Disease Control, Atlanta, GA 30333.

(c) *Dried active yeast*.—Aseptically weigh 25 g sample into sterile, empty, wide-mouth, screw-cap pt (500 mL) jar. Add 225 mL sterile trypticase (tryptic) soy broth, **46.013(f)** (omit 10% NaCl), and let yeast form smooth suspension. Det. pH with test paper, **46.055(l)**. Adjust pH, if necessary to  $6.8 \pm 0.2$  with sterile 1N NaOH or HCl, **46.055(c)** or **(d)**, capping jar securely and mixing well before detg final pH. (If pH is adjusted before yeast is evenly suspended, final pH will be less than desired.) Incubate  $24 \pm 2$  hr at  $35^\circ$ .

(d) *Onion powder and garlic powder*.—Aseptically weigh 25 g sample into sterile, wide-mouth, screw-cap 500 mL (1 pt) jar. Add 225 mL sterile trypticase (tryptic) soy broth, **46.013(f)** (omit 10% NaCl from media but add 0.5%  $K_2SO_3$  prior to autoclaving), and mix thoroly using sterile glass rod or spoon. Let stand 60 min and det. pH with test paper, **46.055(l)**. Adjust pH, if necessary, to  $6.8 \pm 0.2$  with sterile 1N NaOH or 1N HCl, **46.055(c)** or **(d)**. Incubate  $24 \pm 2$  hr at  $35^\circ$ .

#### 46.057

#### Isolation

(a) *Growth in selective broth*.—Gently shake incubated sample mixt., **46.056**, and transfer 1 mL to 10 mL selenite cystine broth, **46.054(b)(1)** or **(2)**, and addnl 1 mL to 10 mL tetrathionate broth, **46.054(c)**. Incubate  $24 \pm 2$  hr at  $35^\circ$ . (For dried active yeast, substitute lauryl sulfate tryptose broth, **46.013(b)**, for selenite cystine broth, **46.054(b)(1)** or **(2)**.)

Streak 3 mm loopful of incubated selenite cystine broth on selective media plates of brilliant green agar, **46.054(d)**, Salmonella-Shigella agar, **46.054(e)**, and  $Bi_2(SO_3)_3$  agar, **46.054(f)**. Repeat with 3 mm loopful of incubated tetrathionate broth. Incubate plates  $24 \pm 2$  hr at  $35^\circ$ .

(b) *Appearance of typical Salmonella colonies*.—(1) *On brilliant green agar*.—Colorless, pink to fuchsia, translucent to opaque, with surrounding medium pink to red. Some *Salmonella* appear as transparent green colonies if surrounded by lactose- or sucrose-fermenting organisms which produce colonies that are yellow-green or green.

(2) *On Salmonella-Shigella agar*.—Uncolored to pale pink, opaque, transparent or translucent, but some strains produce black-centered colonies.

(3) *On bismuth sulfite agar*.—Brown, gray to black, sometimes with metallic sheen. Surrounding medium is usually brown at first, turning black with increasing incubation time. Some strains produce green colonies with little or no darkening of surrounding medium.

If plates do not have typical or suspicious colonies or do not contain growth, incubate addnl 24 hr.

#### 46.058

#### Treatment of Typical or Suspicious Colonies

(a) *Inoculation of triple sugar iron (TSI) agar and lysine iron agar (LIA)*.—Pick with needle 2 or more typical or suspicious colonies, if present, from each brilliant green, Salmonella-Shigella, and  $Bi_2(SO_3)_3$  agar plates having growth. Inoculate TSI agar slant, **46.054(g)**, with portion of each colony by streaking slant and stabbing butt. After inoculating TSI agar with needle, do not obtain more inoculum from colony and do not heat needle, but inoculate LIA, **46.054(m)(1)**, as in **46.061(a)**. Store picked selective plates at  $5-8^\circ$  or at room temp. (ca  $26^\circ$ ).

(b) *Presumptive positive reactions*.—Incubate TSI slants  $24 \pm 2$  hr at  $35^\circ$ . Presumptive pos. *Salmonella* cultures have alk. (red) slants and acid (yellow) butts, with or without  $H_2S$  (blackening of agar). ( $H_2S$ -neg. TSI cultures which otherwise appear to be salmonellae cannot be excluded from further examination.) TSI cultures which otherwise appear not to be salmonellae (including yellow slants) cannot be excluded from further examination and should be treated as presumptive pos. TSI agar cultures if

corresponding LIA gives typical *Salmonella* reaction. Discard TSI cultures that appear to be non-*Salmonella* when corresponding LIA agar (acid in butt of tube) is not typical for *Salmonella*. LIA is useful in detection of lactose- or sucrose-fermenting *Salmonella* or lactose-fermenting *Salmonella arizonae* organisms which give neg. TSI reactions. Further test lysine decarboxylase-pos. cultures to det. if they are *Salmonella* sp., **46.062(e)(1)**, or *Salmonella arizonae* organisms, **46.062(e)(2)**.

If TSI fails to give typical *Salmonella* reaction, pick addnl suspicious colonies from selective medium plate not giving presumptive pos. culture and inoculate TSI and LIA slants as in (a).

(c) *Selection for identification*.—Apply biochem. and serological identification tests to 3 presumptive pos. TSI agar cultures picked from selective agar plates streaked from selenite cystine broth and to 3 presumptive pos. TSI agar cultures picked from selective agar plates streaked from tetrathionate broth.

If 3 presumptive pos. TSI agar cultures are not isolated from 1 set of selective agar plates, test other presumptive pos. TSI agar cultures, if isolated, by biochem. and serological tests. A min. of 6 TSI cultures are examined for each 25 g sample tested.

#### Identification

#### 46.059

#### Cultures

Pure cultures on TSI agar are required for inoculation of biochem. test media.

(a) *Pure cultures*.—Proceed to **46.060**.

(b) *Mixed cultures*.—Streak any culture that appears to be mixed on MacConkey agar, **46.054(q)**, or brilliant green agar, **46.054(d)**. Incubate  $24 \pm 2$  hr at  $35^\circ$ .

(c) *Appearance of Salmonella colonies*.—(1) *On MacConkey agar*.—Typical colonies appear transparent and colorless, sometimes with dark centers. *Salmonella* will clear areas of pptd bile caused by other organisms sometimes present in medium.

(2) *On brilliant green agar*.—See **46.057(b)(1)**.

Pick with needle  $\geq 2$  typical or suspicious colonies and inoculate TSI slants by streaking the slant and stabbing the butt as in **46.058(a)**. Retest purified cultures as in **46.058(b)**, and proceed with identification.

As alternative to conventional tube system for *Salmonella*, any one of the 3 commercial biochem. systems (API, Enterotube, or Minitek) may be used for presumptive generic identification of foodborne *Salmonella*. See **46.072-46.074**.

#### 46.060

#### Subcultures

(a) *Urease test*.—Subculture small amt of growth from presumptive pos. TSI agar culture to urea broth, **46.054(k)(1)**, and incubate  $24 \pm 2$  hr at  $35^\circ$  or inoculate rapid urea broth, **46.054(k)(2)** with two 3 mm loopfuls of growth from each presumptive-pos. TSI agar slant culture, and incubate 2 hr in  $H_2O$  bath at  $37 \pm 0.5^\circ$ . Discard all cultures that give pos. test (purple-red color). Salmonellae are urease neg. (no change in orange color of medium).

(b) *Serological flagellar (H) screening test*.—To reduce number of presumptive pos. TSI agar cultures carried thru identification tests, perform serological flagellar (H) screening test by transferring one 3 mm loopful of each urease-neg. TSI agar culture to either:

(1) Brain-heart infusion broth, **46.054(r)**, (for test on same day) and incubate at  $35^\circ$  until visible growth occurs (ca 4-6 hr); or

(2) Trypticase soy-tryptose broth, **46.054(s)**, (for test on following day) and incubate  $24 \pm 2$  hr at  $35^\circ$ .

To 5 mL of each of the 6 broth cultures add ca 2.5 mL formalinized physiological saline soln, **46.055(g)**. Select 2 formalinized broth cultures and test with *Salmonella* flagellar (H) antisera, **46.055(j)** or **(k)**, as in **46.066** or **46.067**.

If selected formalized broth cultures are pos., perform addnl tests on these cultures, beginning with **46.061**, except step **46.061(d)** may be omitted.

If both formalized broth cultures are neg., perform serological test on the 4 additional broth cultures (**46.060(b)**(1) or (2)) to obtain, if possible, 2 pos. cultures for addnl testing, **46.061**.

If all urease-neg. TSI cultures from sample are *Salmonella* serological flagellar (H) test neg., then perform addnl tests, beginning with **46.061**, on these cultures.

#### 46.061

#### Testing Urease-Negative Cultures

Using needle, transfer portion of presumptive pos. TSI agar culture to lysine iron agar medium and small amt of growth from the TSI agar culture to each of other media:

(a) *Lysine iron agar*, **46.054(m)**(1).—Streak slant and stab butt. Replace tube cap *loosely* and incubate  $48 \pm 2$  hr at  $35^\circ$ . Examine at least every 24 hr. Most salmonellae give purple color of alk. reaction thruout medium (final color is slightly darker than original purple color of medium). If  $H_2S$  is produced, butt of medium is blackened. Neg. test is purple or red slant and yellow butt. If LIA test, **46.058(a)**, was satisfactory, it need not be repeated. Use lysine decarboxylase broth for final detn of lysine decarboxylase if culture gives doubtful LIA reaction.

If liq. medium is preferred, inoculate tube of lysine decarboxylase broth, **46.054(m)**(2). Close tube cap *tightly* after inoculation and incubate  $96 \pm 2$  hr at  $35^\circ$ . Examine at least every 24 hr. Salmonellae give purple color of alk. reaction thruout broth (final color is slightly darker than original purple color of medium). Sometimes tubes which have yellow color after 8–12 hr of incubation change to purple later. Neg. test is permanent yellow color thruout broth. If medium appears to be discolored (neither purple nor yellow) add few drops of 0.2% bromocresol purple dye **46.055(o)**, and re-read tube reactions.

(LIA is incubated loosely capped so that aerobic conditions are maintained, while lysine decarboxylase broth is incubated tightly closed to exclude air.)

(b) *Phenol red dulcitol broth*, **46.054(p)**(1).—Incubate  $48 \pm 2$  hr at  $35^\circ$ . Examine at least every 24 hr. Most salmonellae give pos. test indicated by gas formation (displacement of liq. in inverted tube) and/or acid reaction (yellow). Neg. test is alk. reaction (red) and no gas formation.

(Purple broth base with dulcitol, **46.054(p)**(2), may be substituted. Pos. test is acid reaction (yellow) and gas. Neg. test is alk. reaction (purple).)

(c) *Tryptophane broth*, **46.054(h)**.—Incubate  $24 \pm 2$  hr at  $35^\circ$  and test as follows:

(1) Transfer 3 mm loopful, excluding all solid particles, to KCN broth, **46.054(o)**. Heat rim of tube to form good seal when restoppered. Incubate  $48 \pm 2$  hr at  $35^\circ$ . Salmonellae do not grow in this broth as shown by lack of turbidity (neg. test).

(2) Transfer 3 mm loopful to malonate broth, **46.054(l)**, and incubate  $48 \pm 2$  hr at  $35^\circ$ . Salmonellae give neg. test as shown by green color (unchanged). Pos. test (alk. reaction) is shown by blue color.

(3) Transfer 5 mL to empty test tube and add 0.2–0.3 mL Kovac's reagent, **46.055(a)**. Pos. test for indole is shown by deep red color in reagent on surface of broth. Most salmonellae are indole-neg.

(d) *Trypticase soy-tryptose broth*, **46.054(s)**.—Incubate  $24 \pm 2$  hr at  $35^\circ$ . To 5 mL broth culture add ca 2.5 mL formalized physiological saline soln, **46.055(g)**. Refrigerate formalized broth at  $5-8^\circ$  if test is to be performed on another day. Perform *Salmonella* serological flagellar (H) test, **46.066**, or "Spicer-Edwards" flagellar (H) test tube test, **46.067**, using formalized broth culture as flagellar (H) antigen to be tested.

(e) *Tests indicating absence of Salmonella*.—Discard, as not *Salmonella*, cultures that show either:

(1) Pos. indole test (red) and neg. *Salmonella* serological flagellar (H) test.

(2) Pos. KCN broth test (growth) and neg. lysine decarboxylase test (yellow).

(f) *Testing of TSI agar cultures*.—Use *Salmonella* serological somatic (O) test, **46.064**.

(g) *Classification*.—Classify as *Salmonella* sp. cultures that have all characteristics shown in Table **46.04**. If 1 TSI culture from 25 g sample is classified as *Salmonella* sp., further testing of other TSI cultures from same 25 g sample is unnecessary.

(h) *Special cases*.—Cultures that contain demonstrable *Salmonella* antigens as shown by pos. *Salmonella* serological somatic (O) test and pos. flagellar (H) test but do not have biochem. characteristics of salmonellae should be purified as in **46.059(b)** and retested, beginning with **46.060**.

#### 46.062

#### Additional Biochemical Tests

Perform addnl tests on cultures that do not give identical test results as in Table **46.04** and do not classify as *Salmonella* sp. Transfer 1 loopful of culture from each unclassified TSI agar slant to each of following media:

(a) *Phenol red lactose broth*, **46.054(p)**(1).—Incubate  $48 \pm 2$  hr at  $35^\circ$ . Examine inoculated broth at least every 24 hr. Pos. test is shown by gas formation (displacement of liq. in inverted tube) and acid reaction (yellow). Most salmonellae give neg. test shown by alk. reaction (red) and no gas formation.

Discard, as not *Salmonella*, cultures that give pos. phenol red lactose broth test, except: (1) Cultures described in **46.058(b)**, and (2) cultures that also give pos. malonate broth test. Cultures that are phenol red lactose broth pos. or neg. and malonate broth pos. are tested further to det. if they are *Salmonella arizonae*, **46.062 (e)**(2).

(Purple lactose broth, **46.054(p)**(2), may be substituted. Pos. test is acid reaction (yellow) and gas. Neg. test is alk. reaction (purple) and no gas formation.)

(b) *Phenol red sucrose broth*, **46.054(p)**(1).—Incubate and read as in (a) above. Discard, as not *Salmonella*, cultures that give pos. test, except cultures described in **46.058(b)**. (Purple sucrose broth may be substituted and read as in (a) above.)

(c) *Buffered glucose broth (MR-VP medium)*, **46.054(i)**.—Incubate  $48 \pm 2$  hr at  $35^\circ$ .

(1) Perform Voges-Proskauer (VP) test at room temp. by transferring 1 mL 48-hr culture to test tube and adding 0.6 mL  $\alpha$ -naphthol soln, **46.055(b)**(1), and 0.2 mL 40% KOH soln, **46.055(b)**(2). Shake after each addn. To intensify and speed reaction, add few creatine crystals to test medium. Read results 4 hr after adding reagents. Pos. VP test is development of eosin pink color. Salmonellae give neg. test.

Table 46.04 Characteristics of *Salmonella*

Test or Substrate	Results <sup>a</sup>
Urease, <b>46.060(a)</b>	Negative (orange-red)
Lysine decarboxylase, <b>46.061(a)</b>	Positive (alk.; purple thruout medium)
Phenol red dulcitol broth, <b>46.061(b)</b>	Positive (yellow and gas) <sup>b</sup>
KCN broth, <b>46.061(c)</b> (1)	Negative (no growth)
Malonate broth, <b>46.061(c)</b> (2)	Negative (unchanged green) <sup>c</sup>
Indole test, <b>46.061(c)</b> (3)	Negative (no red color)
Polyvalent flagellar test, <b>46.060(b)</b> , <b>46.061(d)</b>	Positive (visible agglutination)
Polyvalent somatic test, <b>46.061(f)</b>	Positive (visible agglutination)

<sup>a</sup> +,  $\geq 90\%$  pos. in 1–2 days; –,  $\geq 90\%$  neg. in 1–2 days.

<sup>b</sup> Majority of *S. arizonae* cultures are neg.

<sup>c</sup> Majority of *S. arizonae* cultures are pos.

(2) Incubate remainder of MR-VP medium addnl 48±2 hr at 35°. Perform Me red test by transferring 5 mL culture to test tube and adding 5–6 drops Me red soln, **46.055(e)**, and read results immediately. *Salmonellae* give pos. test (red). Neg. test is indicated by yellow color.

(d) *Simmon's citrate agar*, **46.054(j)**.—Inoculate by streaking slant and stabbing butt. Incubate 96±2 hr at 35°. *Salmonellae* usually give pos. test shown by growth and color change from green to blue (alk.). Color change usually appears first on slant and then spreads thru medium. Neg. test is indicated by no or very little growth and no change in color of medium.

(e) *Classification*.—Classify cultures according to results listed in Table **46:05**. If 1 TSI culture from 25 g sample is classified as *Salmonella* sp., further testing of other TSI cultures from same 25 g sample is unnecessary.

(1) *Salmonella* sp.—Cultures that have reaction patterns of Table **46:05**.

(2) *Salmonella arizonae* sp.—Cultures that have reaction pattern of Table **46:05**, except footnote reactions <sup>b</sup> and <sup>c</sup>.

(3) *Non-Salmonella* sp.—Discard, as not *Salmonella*, cultures that give results listed in any 1 subdivision of Table **46:06**.

(f) *Tests indicating absence of Salmonella*.—Discard, as not *Salmonella*, cultures that give following 3 results:

- (1) Pos. KCN broth test (growth),
- (2) Pos. Voges-Proskauer test (red), and
- (3) Neg. Me red test (yellow).

#### 46.063

#### Summary of Classification of Non-Salmonella Cultures

Classify, by performing addnl tests described in *Identification of Enterobacteriaceae*, any culture that is not clearly identified as *Salmonella* sp. or *Salmonella arizonae* by classification schemes in Tables **46:04** and **46:05** or not eliminated from these groups by test reactions listed in Table **46:06**.

If neither of 2 TSI cultures carried thru biochem. tests, **46.061–46.062** and Tables **46:04–46:06**, confirms as *Salmonella*, perform biochem. tests, beginning with **46.061**, on remaining urease-neg. TSI cultures from same 25 g sample.

#### Salmonella Serological Tests

(Follow manufacturer's instructions for reconstitution, mixing, diln, and operation of *Salmonella* antisera. Dil. and pretest all *Salmonella* serological antisera with known test cultures to ensure reliability of results with unknown cultures. *Caution*: Handle viable cultures carefully to prevent contaminating environment.)

#### 46.064

#### Polyvalent Somatic (O) Slide or Plate Test

Using wax pencil, mark off 2 sections ca 1 × 2 cm on inside of glass or plastic petri dish. Place ½ of 3 mm loopful of culture from 24- or 48-hr TSI agar slant on dish in upper part of each marked section. Add 1 drop saline soln, **46.055(f)**, to lower part of one section only. Add 1 drop *Salmonella* polyvalent somatic (O) antiserum, **46.055(h)**, to other section only. With clean, sterile transfer loop or needle, emulsify culture in saline soln for one section and repeat for other section contg antiserum. Tilt mixt. in both sections back and forth 1 min and observe against dark background. Any degree of agglutination is pos. reaction.

Classify polyvalent somatic (O) test as:

(a) *Positive*.—Agglutination in culture-saline-serum mixt. and no agglutination in culture-saline mixt.

(b) *Negative*.—No agglutination in culture-saline-serum mixt. (Polyvalent somatic antisera do not contain agglutinins for antigens of some salmonellae isolated from foods. Neg. somatic reactions occur with salmonellae serotypes whose corresponding agglutinins are not contained in the antisera, i.e., *S. cerro*, group K(18); *S. minnesota*, group L(21); *S. alachua*, group O(35).)

(c) *Non-specific*.—Both mixts agglutinate. Requires addnl testing as in *Identification of Enterobacteriaceae*.

#### 46.065

#### Determination of Somatic Grouping (Optional)

Perform serological somatic (O) test on culture as in **46.064**, using individual group somatic (O) antiserum (including Vi), **46.055(i)**, instead of *Salmonella* polyvalent somatic (O) antiserum. Repeat test, using each group somatic antiserum or until culture reacts with specific group antiserum.

Suspend cultures pos. with Vi antiserum by emulsifying growth from slant surface in 1 mL physiological saline soln, **46.055(f)**, to make heavy suspension. Heat in boiling H<sub>2</sub>O 20–30 min and let cool. Retest heated suspension, using somatic group D, C<sub>1</sub>, and Vi antisera. Vi-pos. cultures which react with somatic group D antiserum are probably *Salmonella typhi*, and Vi-pos. cultures which react with somatic group C<sub>1</sub> antiserum are probably *Salmonella paratyphi* C. For these cultures to be classified as *Salmonella* sp., they must have characteristics of salmonellae as in Table **46:04** or **46:05**. Heated Vi-pos. cultures which do not react with any individual somatic serum but continue to react with Vi antiserum probably belong to *Citrobacter* and are not *Salmonella*. Confirm conclusion by biochem. tests listed in Table **46:05**.

Table 46:05 Biochemical and Serological Reactions of *Salmonella*

Test or substrate	Positive	Negative	<i>Salmonella</i> reaction <sup>a</sup>
Glucose (TSI), <b>46.058(b)</b>	yellow butt	red butt	+
H <sub>2</sub> S (TSI), <b>46.058(b)</b>	blackening	no blackening	+

<sup>a</sup> +, ≥90% pos. in 1–2 days; —, ≥90% neg. in 1–2 days; v, variable.

<sup>b</sup> Majority of *S. arizonae* cultures are neg.

<sup>c</sup> Majority of *S. arizonae* cultures are pos.

**Table 46.06 Criteria for Discarding Non-Salmonella Cultures**

Test(s) or Substrate(s)	Results
(a) Urease test, <b>46.060(a)</b>	Positive (purple-red)
(b) Indole test, <b>46.061(c)(3)</b>	Positive (red)
Polyvalent flagellar test, <b>46.060(b)</b> , <b>46.061(d)</b> , or Spicer-Edwards flagellar (H) test, <b>46.067</b>	Negative (no agglutination)
(c) Lysine decarboxylase test, <b>46.061(a)</b>	Negative (yellow)
KCN broth, <b>46.061(c)(7)</b>	Positive (growth)
(d) Phenol red lactose broth <sup>a</sup> , <b>46.062(a)</b>	Positive (gas and/or acid) <sup>b</sup>
(e) Phenol red sucrose broth, <b>46.062(b)</b>	Positive (gas and/or acid) <sup>b</sup>
(f) KCN broth, <b>46.061(c)(7)</b>	Positive (growth)
Voges-Proskauer test, <b>46.062(c)(7)</b>	Positive (red)
Methyl red test, <b>46.062(c)(2)</b>	Negative (yellow)

<sup>a</sup> Malonate broth positive cultures are tested further to det. if they are *Salmonella arizonae*, **46.062(e)(2)**

<sup>b</sup> Do not discard pos. broth cultures if corresponding LIA cultures give typical *Salmonella* reactions; test further to det. if they are *Salmonella* sp. See **46.058(a)**

Cultures that give pos. somatic (O) test with any individual somatic (O) antiserum are recorded as pos. for that somatic (O) group; cultures that do not react with any individual somatic (O) antiserum are recorded as neg. for individual group somatic (O) test.

#### **46.066 Polyvalent Flagellar (H) Test Tube Test**

Place 0.5 mL appropriately dild *Salmonella* polyvalent flagellar (H) antiserum, **46.055(j)**, in 10 × 75 or 13 × 100 mm serological test tube and add 0.5 mL antigen to be tested: formalinized brain-heart infusion broth, **46.060(b)(1)**, or formalinized trypticase soy-tryptose broth, **46.060(b)(2)** or **46.061(d)**. If formalinized culture contains granular particles, pellicles, or sediment, also prep. saline control by mixing 0.5 mL formalinized saline soln, **46.055(g)**, with 0.5 mL formalinized trypticase soy-tryptose broth culture in same size serological test tube. Incubate mixts 1 hr in H<sub>2</sub>O bath at 48–50°. Observe preliminary results at 15 min intervals and read final results at 1 hr.

Classify polyvalent flagellar (H) test as:

(a) *Positive*.—Agglutination in culture-formalinized saline-serum mixt. and no agglutination in culture-formalinized saline mixt.

(b) *Negative*.—No agglutination in culture-formalinized saline-serum mixt. (Polyvalent flagellar antiserum does not contain agglutinins for antigens of some salmonellae isolated from foods. Neg. flagellar reactions occur with *Salmonella* serotypes whose corresponding agglutinins are not contained in the antisera (i.e., *S. simsbury*, *Z*<sub>27</sub>; *S. chittagong*, *Z*<sub>35</sub>)).

(c) *Non-specific*.—Both mixts agglutinate. Requires addnl testing as in *Identification of Enterobacteriaceae*.

Cultures that give typical biochem. results as salmonellae but do not agglutinate in *Salmonella* flagellar (H) antisera must be tested to det. if enough flagellar (H) antigens are present. Test motility of culture as follows:

Inoculate petri dish contg motility test medium, **46.054(n)**, with 3 mm loopful TSI culture by stabbing medium once, 10 mm from edge of plate to depth of 2–3 mm. (Do not stab to bottom of plate with inoculum.) Do not inoculate any other portion of plate. Incubate 24 hr at 35°. When organism has migrated 40 mm or more toward other side of plate, it is sufficiently motile to retest.

Transfer 3 mm loopful of growth which migrated farthest from inoculation point into tube of trypticase soy-tryptose broth, **46.061(d)**. Retest this culture by adding ½ vol. formalized

physiological saline soln, **46.055(g)**, and repeat *Salmonella* serological flagellar (H) test, **46.066** or **46.067**.

Incubate cultures that are not motile after first 24 hr incubation for addnl 24 hr at 35°. If still neg., incubate 5 days at 25° before classifying as nonmotile (flagellar (H) antigen not detected).

Cultures that are non-motile or cultures that are *Salmonella* serological flagellar (H) test-neg., when retested, are classified according to results of other tests in *Identification of Enterobacteriaceae*.

#### **46.067 "Spicer-Edwards" Flagellar (H) Test Tube Test**

(Alternative to polyvalent flagellar (H) test tube test, **46.066**, to det. presence or absence of flagellar (H) antigens)

Test each culture, using each of the 7 "Spicer-Edwards" flagellar (H) antisera, **46.055(k)**. Perform test as in **46.066**, using 1 of the 7 "Spicer-Edwards" (H) antisera for each test instead of *Salmonella* polyvalent flagellar (H) antiserum. Since there are 7 "Spicer-Edwards" antisera, each culture must be tested 7 times.

Pos. agglutination indicates presence of flagellar (H) antigen. Identify by comparing pattern of agglutination reactions obtained with agglutinins known to be present in each of the 7 "Spicer-Edwards" (H) antisera. Results of these reactions are shown in Table **46.03**.

If culture produces pos. agglutination when tested with each of the 4 "Spicer-Edwards" antisera 1, 2, 3, and 4 (4 plus pattern), then results indicate presence of non-specific antigen other than *Salmonella* antigen or presence of more than single *Salmonella* H antigen which cannot be identified with this antisera until antigens are sepd.

#### **Fluorescent Antibody (FA) Method (10) Official Final Action**

##### **46.068**

##### **Precautions**

Method is screening test for presence of *Salmonella*; it is not confirmatory test, since conjugate will react with some other members of enterobacteriaceae.

Enrichment broths from samples pos. by FA method must be streaked on selective media as in **46.057** and typical or suspicious colonies identified as in **46.058–46.067**.

Method must be followed rigorously since errors in prepn of sample, smears, conjugate, and other reagents can lead to invalid results. Microscopic observation of stained smears must be performed with critically aligned and properly functioning equipment.

Visual estimation of degree of fluorescence of stained cells is somewhat subjective and should be conducted by analyst with prior training or experience in both FA methodology and in cultural technic for detection of *Salmonella*.

If sample prepn does not normally include pre-enrichment step (as with meat, poultry, and certain environmental samples), 4 hr post-enrichment incubation period may not be sufficient for development of number of *Salmonella* cells required for detection by FA method. Therefore, include pre-enrichment step or extend post-enrichment incubation time. In some cases when pre-enrichment step is not used, sample is not adequately dild and carryover of debris into post-enrichment broth may interfere with observation of FA stained cells.

##### **46.069**

##### **Apparatus**

(a) *Multiwell coated slides*.—Clean thin (1.0–1.2 mm) slides thoroly with detergent and rinse with distd H<sub>2</sub>O and alcohol. Apply double row of 4 sep. drops of glycerol (8 drops total) to each of series of slides and spray with fluorocarbon coating

material (Fluorolube, Fisher Scientific Co.). After few min, rinse off each slide individually under tap and then with distd  $H_2O$ , and stand on end in rack to dry. (Prepd slides are available from Cell-Line Associates, Minotola, NJ 08341 and Clinical Sciences, Inc., 30 Troy Rd, Whippany, NJ 07981.)

(b) *Fluorescent microscope*.—With exciter filter with wavelength transmission of 330–500 nm and barrier filter with wavelength reception  $>400$  nm.

#### 46.070

#### Reagents

(a) *Phosphate-buffered saline (PBS) soln*.—pH 7.5; 0.01M; 0.85% NaCl. Dissolve 12.0 g anhyd.  $Na_2HPO_4$ , 2.2 g  $NaH_2PO_4 \cdot H_2O$ , and 85.0 g NaCl in  $H_2O$  and dil. to 1 L. Dil. 100 mL this soln to 1 L with  $H_2O$ . Adjust pH to 7.5 with 0.1N HCl or 0.1N NaOH, if necessary.

(b) *Carbonate buffer*.—pH 9.0. Mix 4.4 mL 0.5M  $Na_2CO_3$  (5.3 g in 100 mL  $H_2O$ ) with 100 mL 0.5M  $NaHCO_3$  (4.2 g in 100 mL  $H_2O$ ). pH should be 9.0; if not, adjust by addn of 0.5M  $Na_2CO_3$ .

(c) *Glycerol saline soln*.—pH 9.0. Mix 9 mL glycerol with 1 mL carbonate buffer, (b). pH decreases on storage; prep. weekly.

(d) *Salmonella polyvalent fluorescent antibody conjugate*.—Fluorescein isothiocyanate-labelled *Salmonella* OH globulin, polyvalent, contg antibodies for all antigens within *Salmonella* O groups A–S, and meeting specifications of Center for Disease Control, Atlanta, GA 30333 (1975). (Available from Difco Laboratories; Clinical Sciences, Inc., 30 Troy Rd, Whippany, NJ 07981) Before use, titer each lot to det. appropriate routine test diln (RTD). Use pure cultures of *Salmonella* representative of several somatic groups. Prep. 5 dilns (1:2, 1:4, 1:8, 1:16, and 1:32) of conjugate in PBS soln, (a). Stain duplicate smears from cultures with each diln and det. intensity of fluorescence. RTD is that diln one less than highest diln giving 4+ fluorescence with representative *Salmonella* cultures. Store stock (undild) conjugate of known titer frozen, and dil. when needed. Dild conjugate can be stored at 4° for few weeks as long as control cultures remain pos.

#### 46.071

#### Determination

(a) *Pre-enrichment*.—Pre-enrich product in noninhibitory broth to initiate growth of salmonellae. Methods used vary with product as in (1)–(8). In all cases loosen jar caps  $\frac{1}{4}$  turn and incubate  $24 \pm 2$  hr at 35°. Except where selenite cystine and tetrathionate broths, 46.054(b)(1) or (2) and (c), resp., have already been used ((2)(b) and (5)), transfer 1 mL incubated mixts to selenite cystine broth and tetrathionate broth for selective enrichment as in 46.057(a). Where these broths have already been used ((2)(b) and (5)), proceed directly to post-enrichment, (b).

(1) *Dried yeast (inactive)*.—Weigh 25 g into sterile, wide-mouth, screw-cap, 500 mL (pt) jar, add 225 mL sterile trypticase (tryptic) soy broth, 46.054(t), and mix well. If pH is  $<6.6$ , adjust to  $6.8 \pm 0.2$  with 1N NaOH.

(2) *Meats, animal substances, glandular products, and fish meal*.—(a) *Heated, processed, and dried products*.—Weigh 25 g into sterile blending jar, add 225 mL sterile lactose broth, 46.005(f), and blend 2 min at 8000 rpm. If product is powd., ground, or comminuted, blending may be omitted. Transfer aseptically to sterile, wide-mouth, screw-cap, 500 mL (pt) jar and adjust pH to  $6.8 \pm 0.2$  with 1N NaOH. If product contains large amt of fat, add 2.2 mL of steamed (15 min) Tergitol Anionic 7, 44.003(jj)(1).

(b) *Raw and highly contaminated products*.—Weigh duplicate 25 g samples into sep. sterile blending jars. Add 225 mL of selenite cystine broth to one jar and 225 mL of tetrathionate

broth to other, and blend 2 min. Transfer aseptically to sterile, wide-mouth, screw cap, 500 mL (pt) jars.

(c) *Raw frog legs*.—Aseptically place 2 legs into single sterile, wide-mouth, screw cap, 500 mL (pt) jar contg 225 mL sterile lactose broth, 46.005(f).

(3) *Dry nonfat and dry whole milk*.—Weigh 25 g into sterile, wide-mouth, screw cap, 500 mL (pt) jar, add 225 mL sterile distd  $H_2O$ , and mix well. Adjust pH to  $6.8 \pm 0.2$  with 1N NaOH, if necessary. Add 0.45 mL 1% aq. brilliant green soln and mix well.

(4) *Dried whole eggs, yolks, and whites; pasteurized liquid and frozen eggs; prepared powdered mixes (cake, cookie, donut, biscuit, and bread); and infant formula*.—If product is frozen, thaw rapidly at  $\leq 45^\circ$  for  $\leq 15$  min or overnight at 5–10°. Weigh 25 g into sterile, wide-mouth, screw cap jar. Add 225 mL lactose broth, little at time with mixing, cap jar, and let stand at room temp. 60 min. Mix well and adjust to pH  $6.8 \pm 0.2$  with 1N NaOH or HCl.

(5) *Nonpasteurized frozen egg products*.—Thaw as in (4). Weigh duplicate 25 g samples into sep. sterile, wide-mouth, screw cap, 500 mL (pt) jars. Add 225 mL selenite cystine broth to one jar and 225 mL tetrathionate broth to other, and mix well. Adjust pH to  $6.8 \pm 0.2$  with 1N NaOH.

(6) *Egg-containing foods (noodles, egg rolls, etc.)*.—Proceed as in (2)(a).

(7) *Coconut*.—Proceed as in (2)(a), using Tergitol Anionic 7, but omitting blending.

(8) *Candy and candy coatings*.—Weigh 25 g into sterile blending jar. Add ca 225 mL from 1 L sterile reconstituted skim milk (100 g nonfat dry milk dispersed in 1 L  $H_2O$ ), and blend 2 min. Adjust pH to  $6.8 \pm 0.2$  with 1N NaOH, if necessary. Add 0.45 mL 1% aq. brilliant green soln and mix well.

(b) *Postenrichment*.—Transfer 1 mL of incubated selenite cystine enrichment broth to 10 mL of sterile selenite cystine broth as post-enrichment. (Other vols may be used if 1:10 diln ratio is maintained.) Take aliquot from upper third of selective enrichment cultures to minimize product carryover. Similarly transfer 1 mL of incubated tetrathionate enrichment broth to 10 mL of sterile selenite cystine broth. Incubate 4 hr in 35°  $H_2O$  bath.

(c) *Staining*.—Transfer ca 0.0075 mL of each post-enrichment medium with sterile 2 mm loop into sep. wells of multiwell coated slide, and dry thoroly in air at room temp. Fix by immersion in bath of alcohol- $CHCl_3$ -formalin (60+30+10) 3 min. Rinse 2 or 3 times in alcohol, and air dry at room temp. Change alcohol periodically to prevent cell carryover (250 mL alcohol will rinse 5–10 slides). Slides may also be fixed and rinsed by flooding. Apply solns to one end of slide and allow to flow into wells.

Cover dried smears with titered *Salmonella* polyvalent FA conjugate and let stain in moist chamber 15–30 min. FA conjugate must not dry on smear. (Covered plastic petri dish contg piece of filter paper moistened with  $H_2O$  is excellent staining chamber.) Drain excess conjugate by standing slide on edge few sec. (Avoid mixing conjugate from one well on slide to another.) Immediately rinse slides in PBS soln, 46.070(a). Then soak slides 10 min in fresh PBS soln and rinse briefly with  $H_2O$ . Air-dry smears again at room temp. and then mount by placing drop of glycerol saline soln, (b), directly onto each smear and covering with No. 1 glass cover slip. Add enough glycerol saline soln to smear to ensure adequate, but not excessive, coverage of all wells after cover slips have been placed. Do not trap air bubbles under cover slip.

(d) *Examination*.—Examine smears with fluorescent microscope. Scan entire smear using 40–50 $\times$  oil immersion objective to locate fluorescent cells. When found, change objective to

100× oil immersion lens for definitive detn of cell morphology and fluorescence. Objectives with iris diaphragm for adjusting numerical aperture are helpful for control of contrast between cells and background. Estimate degree of fluorescence of cells on scale of neg. to 4+ as follows:

- 4+ = Max. fluorescence; brilliant yellow-green; clearcut cell outline; sharply defined cell center.
- 3+ = Less brilliant yellow-green fluorescence; clearcut cell outline; sharply defined cell center.
- 2+ = Definite but dim fluorescence; cell outline less well defined.
- 1+ = Very subdued fluorescence; cell outline indistinguishable from cell center in most instances.
- = Negligible or complete lack of fluorescence.

Typical pos. smears for salmonellae exhibit ≥2 short to medium rod-shaped cells per field, using 100× objective. Cells should be distributed thruout entire smear. Intensity of fluorescence should be in range of 3+ to 4+. Occasionally cells are observed with proper morphology and cell distribution, but fluorescence is rated 2+. Sometimes 3+ to 4+ fluorescence is observed, but distribution is poor and not all fields contain cells, due to improper processing of slides. Score both cases pos. and subject to confirmatory tests.

Each time samples are tested, carry culture of known *Salmonella* strain thru all cultural, staining, and observation steps as control.

Report: (1) morphological characteristics of fluorescent cells; (2) number of typical cells per field under 100× oil immersion objective; and (3) degree of fluorescence of cells (1+ to 4+).

#### **Presumptive Generic Identification Using Commercial Biochemical Kits (11)—Official First Action**

(Use of com. biochem. kit as alternative to **46.060–46.063** is based upon demonstration in analyst's laboratory of adequate correlation between com. biochem. kit intended for use and **46.060–46.063**.)

#### **46.072**

#### **Kits**

(a) *API*.—Available from Analytab Products Inc., 200 Express St, Plainview, NY 11803. Consists of series of 20 plastic microtubes contg biochem. test substrate affixed to plastic strip for conducting following 22 tests: urease; oxidase; tryptophan deaminase; *o*-nitrophenyl- $\beta$ -D-galactosidase (ONPG); lysine and ornithine decarboxylase; arginine dihydrolase; gelatinase; citrate utilization; H<sub>2</sub>S production; indole production; acetoin production (Voges-Proskauer or VP test); nitrate reduction; and fermentation of amygdalin, arabinose, glucose, inositol, mannitol, melibiose, rhamnose, sorbitol, and sucrose. Required reagents include Kovacs reagent, **46.055(a)**; 10% FeCl<sub>3</sub> soln (for phenylalanine deaminase test); VP test reagents (5%  $\alpha$ -naphthol soln and 40% KOH soln), **46.055(b)**; nitrate reduction reagents (solns of sulfanilic acid and *N,N*-dimethyl- $\alpha$ -naphthylamine); sterile mineral oil; oxidase test reagents (1% *N,N,N',N'*-tetramethyl-*p*-phenylenediamine.2HCl soln and 0.2% ascorbic acid soln); sterile H<sub>2</sub>O; and 1.5% H<sub>2</sub>O<sub>2</sub>.

(b) *Enterotube*.—Available from Roche Diagnostics, Div. of Hoffman-La Roche, Inc. Consists of self-contained sterile compartmental plastic tube contg 12 different conventional media and enclosed inoculating needle for conducting following 15 tests: lysine and ornithine decarboxylase; phenylalanine deaminase; urease; Voges-Proskauer (VP); citrate utilization; H<sub>2</sub>S production; indole production; and utilization of dulcitol, lactose, adonitol, arabinose, sorbitol, and glucose (acid and gas). Kovacs reagent, **46.055(a)** (for indole test) and VP reagents, **46.055(b)**, are also required.

(c) *Minitek*.—Available from BBL, Div. of BioQuest. Consists of system for differentiation of microorganisms by observation

of their effect upon chem. substrates impregnated into paper disks for conducting following 25 tests: urease; *o*-nitrophenyl- $\beta$ -D-galactosidase (ONPG); phenylalanine deaminase; lysine and ornithine decarboxylase; arginine dihydrolase; nitrate reduction; citrate utilization; H<sub>2</sub>S production; indole production; malonate utilization; Voges-Proskauer (VP) test; and fermentation of adonitol, arabinose, dulcitol, esculin, glucose, inositol, lactose, mannitol, raffinose, rhamnose, salicin, sorbitol, and sucrose. In addition to inoculum broth, required reagents include Kovacs reagent, **46.055(a)**, 10% FeCl<sub>3</sub> soln (for phenylalanine deaminase test); VP test reagents (5%  $\alpha$ -naphthol soln and 40% KOH soln), **46.055(b)**; nitrate reduction reagents (solns of sulfanilic acid and *N,N*-dimethyl- $\alpha$ -naphthylamine); and sterile mineral oil. Required apparatus includes Minitek pipetter, disposable pipet tips, color comparator cards, disk dispenser, plastic multiwell plates, humidior with sponges for incubation of disks in plates after adding inoculum broth contg test culture, and paper disks impregnated with individual substrates for performing biochem. tests.

Systems (a)–(c) are also available from Scientific Products, Inc., and Fisher Scientific Co. Systems (b) and (c) are also available from VWR Scientific, Inc.

#### **46.073**

#### **Isolation**

Prep. samples and isolate presumptive cultures by **46.056–46.058**.

#### **46.074**

#### **Identification**

Assemble supplies and prep. reagents required for utilizing kit. Inoculate each unit according to directions supplied by manufacturer, incubating for time and temp. specified. Add reagents, observe, and record results. For presumptive identification, classify cultures according to flow charts and tables supplied by manufacturer as *Salmonella* or non-*Salmonella* sp.

For confirmation of cultures presumptively identified as *Salmonella* sp., perform *Salmonella* serological somatic (O) test, **46.064**, and *Salmonella* serological flagellar (H) test, **46.066**, or "Spicer-Edwards" flagellar (H) test, **46.067**, and classify cultures according to following guidelines:

(a) Cultures classified as presumptive *Salmonella* sp. with com. biochem. kits are confirmed as *Salmonella* sp. when culture demonstrates pos. *Salmonella* somatic (O) test and pos. *Salmonella* (H) test.

(b) Cultures classified as presumptive non-*Salmonella* sp. with com. biochem. kits are confirmed as non-*Salmonella* sp. when culture demonstrates neg. *Salmonella* somatic (O) test and neg. *Salmonella* (H) test.

(c) Cultures which do not conform to (a) or (b) should be classified according to addnl tests specified in *Identification of Enterobacteriaceae*, P. R. Edwards and W. H. Ewing, Burgess Publishing Co., Minneapolis, MN 55415, 3rd ed., 1972, or sent to ref. typing laboratory for definitive serotyping and identification.

#### **Surface Plating Method for Isolation and Enumeration of *Staphylococcus aureus* in Food (12) Official First Action**

(Applicable for general purpose use in testing foods expected to contain ≥10 cells of *S. aureus*/g. For small numbers, see **46.017**.)

#### **46.075**

#### **Apparatus**

*Sterile, bent glass streaking rods*.—Hockey stick or hoe-shape, with fire-polished ends, 3–4 mm diam., 15–20 cm long, with angled spreading surface 45–55 mm long.

## 46.076

**Determination**

At each diln plated, aseptically transfer 1 mL of sample suspension, 46.014(a), to triplicate plates of Baird-Parker medium, 46.013(e)(3), and equitably distribute the 1 mL inoculum over the triplicate plates (e.g., 0.4 mL–0.3 mL–0.3 mL). Spread inoculum over surface of agar using sterile, bent glass streaking rods. Avoid extreme edges of plate. Retain plates in upright position until inoculum is absorbed by medium (ca 10 min on properly dried plates). If inoculum is not readily absorbed, plates may be placed in incubator in upright position ca 1 hr before inverting. Invert plates and incubate 45–48 hr at 35–37°. Select plates contg 20–200 colonies, unless only plates at lower dilns (>200 colonies) have colonies with typical appearance of *S. aureus*, 46.013(e)(4). If several types of colonies are observed which appear to be *S. aureus*, count number of colonies of each type and record counts sep. When plates at lowest diln plated contain <20 colonies, these may be used. If plates contg >200 colonies have colonies with typical appearance of *S. aureus* and typical colonies do not appear at higher dilns, use these plates for enumeration of *S. aureus*, but do not count non-typical colonies. Select  $\geq 1$  colony of each type counted and test for coagulase production, 46.017. Add number of colonies on triplicate plates represented by colonies giving pos. coagulase test and multiply by sample diln factor. Report this number as number of *S. aureus*/g of food tested.

**Staphylococcal Enterotoxin****Microslide Gel Double Diffusion Test (13)  
Official Final Action**

(Detects 0.1–0.01  $\mu\text{g}$  enterotoxin/mL and is applicable to detection of enterotoxin in culture fluids and concd food exts)

## 46.077

**Principle**

Pptn line occurs when serological type of enterotoxin diffuses thru gel and reacts with its specific antibody. Coalescence with ref. pptn line which results from serological reactivity of enterotoxin serotype and specific antibody confirms identity.

## 46.078

**Apparatus**

(a) *Debubblers*.—Fine glass rods. Prep. by pulling glass tubing very fine, as in making capillary pipets. Break into ca 6 cm lengths and seal ends in flame.

(b) *Electrical tape*.—Insulating tape, 0.25  $\times$  19.1 mm (Scotch Brand, 3M Co., Electro-Products Division, St Paul, MN 55110, or equiv.).

(c) *Microscope slides*.—Plain glass, pre-cleaned, 7.62  $\times$  2.54 cm (3  $\times$  1"), 0.96–1.06 mm thick.

(d) *Pasteur pipets*.—Prep. by drawing out ca 7 mm od glass tubing or use disposable 30 or 40  $\mu\text{L}$  pipets (Kensington Scientific Corp., 1399 64th St, Emeryville, CA 94608, or equiv.).

(e) *Petri dishes*.—20  $\times$  150 mm and 15  $\times$  100 mm.

(f) *Plastic templates*.—See Fig. 46:01. (Available from Division of Microbiology, Food and Drug Administration, 200 C St, SW, Washington, DC 20204.)

(g) *Silicone lubricant*.—High vac. grease (Dow Corning Corp., or equiv.).

(h) *Staining jars*.—Coplin or Wheaton jars.

(i) *Sterile bent glass spreaders*.—Bend glass rods like hockey sticks and fire polish.

(j) *Water-saturated synthetic sponge strips*.—Approx. 1.5  $\times$  1.5  $\times$  6.5 cm  $\text{H}_2\text{O}$ -satd absorbent cotton is also satisfactory.

## 46.079

**Media and Reagents**

(a) *Agar soln for coating slides*.—0.2%. Add 2 g bacteriological grade agar to 1 L boiling  $\text{H}_2\text{O}$  and heat until agar dissolves. Pour 20–30 mL portions agar into 180 mL (6 oz) prescription bottles or equiv. containers and store at room temp. Remelt when needed for coating slides.

(b) *Brain-heart infusion (BHI) agar*.—0.7% (w/v). Adjust BHI broth to pH 5.3; add bacteriological grade agar to prep. 0.7% concn and dissolve by boiling gently. Distribute in 25 mL portions into 25  $\times$  200 mm test tubes, and autoclave 10 min at 121°. Immediately before use, aseptically empty tubes of sterile medium into 15  $\times$  100 mm petri dishes.

(c) *Enterotoxin antisera*.—Dil. lyophilized sera (Makor Chemical Ltd., P.O. Box 6570, Jerusalem, Israel, or Division of Microbiology, Food and Drug Administration, 200 C St, SW, Washington, DC 20204) with normal physiological saline according to specific instructions of supplier. Store liq. stocks (highly concd) and working dilns of antisera at 4°; for long term storage, freeze-drying or freezing is recommended.

(d) *Enterotoxin references*.—Rehydrate lyophilized enterotoxin preps, (c), according to specific instructions of supplier.

(e) *Gel diffusion agar*.—Add 1.2% purified agar (Noble special agar, Difco Laboratories) to boiling fluid base (0.85% NaCl–0.80% Na barbital with final concn of 1:10,000 merthiolate (Eli Lilly and Co., or equiv.) adjusted to pH 7.4). Filter hot agar thru 2 layers of anal. grade paper and store in 15–25 mL portions in screw-cap bottles.

(f) *Staining soln*.—0.1% Thiazine Red R stain (MC/B Manufacturing Chemists, or equiv.) in 1% HOAc.

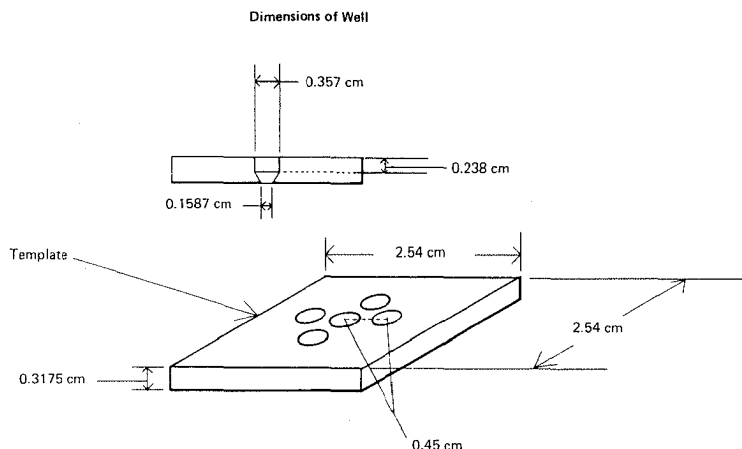

FIG. 46:01—Plastic template schematic for microslide assembly

(g) *Sterile distilled water*.—Dispense 5 mL distd H<sub>2</sub>O into tubes and autoclave 15 min at 121°. Normal physiological saline may be substituted for H<sub>2</sub>O.

(h) *Turbidity std.*—1% BaCl<sub>2</sub>–1% H<sub>2</sub>SO<sub>4</sub> (1+99) (No. 1 of McFarland nephelometer scale).

**46.080****Preparation of Sample**

Select  $\geq 4$  isolated staphylococcal colonies from enumeration and recovery media, and streak nutrient media agar slants, or equiv. Incubate slants 18–24 hr at 35–37°. Add loopful of growth from agar slants to 5.0 mL sterile distd H<sub>2</sub>O or saline and prep. aq. suspension of organisms from each slant which is equiv. to turbidity of No. 1 tube of McFarland nephelometer scale (ca  $3 \times 10^8$  organisms/mL). Inoculate surface of semisolid BHI agar with 4 drops aq. suspension of organisms delivered from sterile 1.0 mL pipet. Spread drops of aq. culture suspension over entire surface of semisolid agar with sterile glass rod and incubate plates upright 48 hr at 35–37°. Transfer contents of petri dish to 50 mL centr. tube with aid of wood applicator stick and centr. 10 min at 32,800 *g* to remove agar and organisms. Examine culture fluid for presence of serologically identifiable enterotoxins.

**46.081****Preparation of Slides**

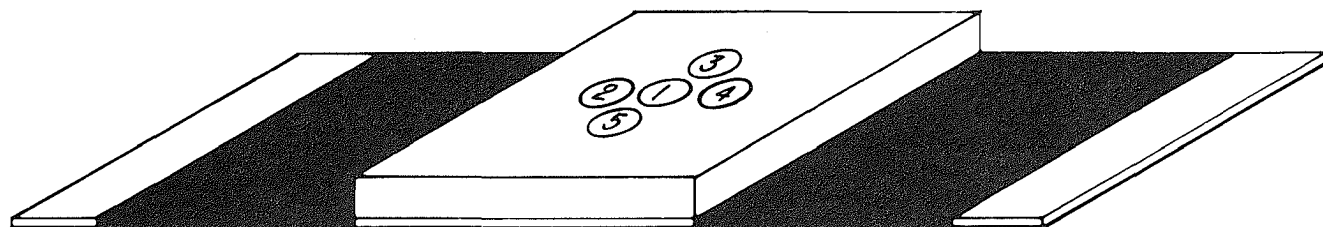

Wrap double layer of elec. tape around pre-cleaned microscope slide, leaving 2.0 cm space in center, as follows: Start piece of tape ca 9.5–10 cm long ca 0.5 cm from edge of bottom surface of slide and wrap tightly around slide twice. Wipe area between tapes with cheesecloth soaked with alcohol, and dry with dry cheesecloth. Coat upper surface area between tapes with 0.2% bacteriological grade agar as follows: Melt 0.2% agar, and maintain at  $\geq 55^\circ$  in screw-cap bottle. Hold slide over beaker on hot plate adjusted to 65–85° and pour or brush 0.2% agar over slide between 2 pieces of tape. Let excess agar drain off, wipe bottom surface of slide, and collect agar in beaker for reuse. Place slide on tray and dry in dust-free atm. (e.g., incubator). If slides are not clean, agar will not coat slides uniformly.

**46.082****Preparation of Slide Assemblies**

Prep. plastic templates according to specifications in Fig. 46:01. Spread *thin* film of silicone grease on side of template that will be placed next to agar (i.e., side with smaller holes). Place ca 0.4 mL melted and cooled (55–60°) 1.2% gel diffusion agar between tapes. Immediately lay silicone-coated template on melted agar and edges of bordering tapes. Place 1 edge of template on 1 piece of tape, and bring opposite edge to rest gently on other piece. Sat. strips of synthetic sponge (ca  $1.5 \times 1.5 \times 6.5$  cm) with H<sub>2</sub>O, and place 2 strips on periphery of each 20 × 150 mm petri dish. Place slide in prepd petri dish (2–4 slide assemblies/dish) soon after agar hardens, and label slide.

**46.083****Slide Gel Diffusion Test**

To prep. record of assay, draw hole pattern of template on record sheet and indicate number (same as that used for slide) and contents of each well. Place suitable diln of antiserum or sera in central well, homologous ref. enterotoxin in peripheral well(s), and material under examination in well adjacent to that contg ref. enterotoxin. See Fig. 46:02(1) for reagent arrangement for simultaneous detection of 2 enterotoxin types (bivalent detection system). Prep. control slide with only ref. toxin and antienterotoxin serum to det. proper reactivity of reagents. Fill wells to convexity with reagents, using Pasteur or disposable 30 or 40  $\mu$ L pipet. Partially fill capillary pipet with soln and remove excess liq. by touching pipet to edge of sample tube. Slowly lower pipet into well until it touches agar surface, and fill to convexity. Remove trapped air bubbles from *all* wells by probing with debubbler, (a), against dark background. Let slides incubate 48–72 hr at room temp. in covered petri dishes contg moist sponge strips (24 hr slide incubation at 35° is generally sufficient for testing of culture fluids). Carefully remove template by sliding it to 1 side. If necessary, clean slide by dipping in H<sub>2</sub>O and wiping bottom of slide. Enhance lines of pptn by immersing slide in staining soln, (f), 5–10 min. To preserve slide as permanent record, rinse any reactant liq. remaining on slide by dipping in H<sub>2</sub>O and then immerse slide in each of following baths 10 min: staining soln, 1% HOAc, 1% HOAc, and 1% HOAc

**(1) Bivalent**

1. Combination Antisera (e.g., Anti A and B)
2. Prepn under test
3. Ref. enterotoxin (e.g., Type A)
4. Prepn under test
5. Ref. enterotoxin (e.g., Type B)

**(2) Monovalent**

1. Antiserum (e.g., Anti A)
2. Dilns of prepn under test
3. Ref. enterotoxin (e.g., Type A)
4. Dilns of prepn under test
5. Dilns of prepn under test

FIG. 46:02—Arrangement of antisera and homologous reference enterotoxins (1) when assaying preparation(s) under test for presence of 2 staphylococcal enterotoxins simultaneously (bivalent detection system) or (2) when assaying dilutions of preparation under test with apparent enterotoxin excess (monovalent detection system)

contg 1% glycerol. Drain excess fluid from slide and dry in 35° incubator. After prolonged storage, lines of pptn may not be visible until slide is immersed in H<sub>2</sub>O.

**46.084****Interpretation**

Examine slide for lines of pptn by holding at oblique angle to light source against dark background. Coalescence of test sample lines of pptn with ref. line(s) of pptn indicates pos. reaction. Fig. 46:03 shows microslide gel diffusion test as bivalent detection system: Antisera to enterotoxins A and B are in well 1; known ref. enterotoxins A and B are in wells 3 and 5, resp., to produce ref. lines of A and B; preps under test are in wells 2 and 4. Interpret 4 reactions as follows: (1) No line development between test preps—absence of enterotoxins A and B; (2) coalescence of test prep line from well 4 with enterotoxin A ref. line (intersection of test prep line with enterotoxin B ref. line)—absence of enterotoxins A and B in well 2, presence of enterotoxin A and absence of enterotoxin B in well 4; (3) presence of enterotoxin A and absence of enterotoxin B in both test preps; and (4) absence of enterotoxins A and B in test prep in well 2, presence of enterotoxins A and B in well 4. Operator can simplify assay by testing only 1 prep for presence of 2 different enterotoxins on same set of slides.

If concn of enterotoxin in test material is excessive, formation of ref. line will be inhibited because of fast migration of toxin thru gel, thus localizing antibody in its well. Fig. 46:04(A) shows this inhibition of ref. line formation when 10 and 5 µg enterotoxin/mL, resp., are used. Figs. 46:04(B)—46:04(F) show ppt patterns when successively less enterotoxin is used. If test prep inhibits formation of ref. line as in Fig. 46:04(A), dil. test material, utilizing monovalent system shown in Fig. 46:05. Reactant arrangement for assaying dilns of prep under test is

shown in Fig. 46:02(2). Figure 46:05 shows microslide gel diffusion test as monovalent system in which antiserum is placed in well 1; ref. enterotoxin in well 3; and dilns of test prep in wells 2, 4, and 5. Do not make starting diln of culture fluid (test material) so high as to dil. beyond reactive concn of enterotoxin.

Occasionally, atypical ppt patterns form which may be difficult for inexperienced analysts to interpret. One of most common atypical reactions is formation of lines not related to toxin, but caused by other antigens in test material. Examples of such patterns are given in Fig. 46:06, which shows microslide gel diffusion test as bivalent detection system. (See reactant arrangement in Fig. 46:02(1).) In ppt pattern 46:06(1), test prep in well 4 produced atypical reaction indicated by nonspecific line of pptn (lines of nonidentity with enterotoxin refs A and B), which intersects enterotoxin ref. lines. In ppt pattern 46:06(2), both test preps (wells 2 and 4) are neg. for enterotoxins A and B but produce nonspecific lines of pptn which intersect enterotoxin A and B ref. lines of pptn.

**46.085****Slide and Template Recovery**

To recover slides for reuse, clean without removing tape. Rinse slides with tap H<sub>2</sub>O to remove agar gel, boil 3–5 min in tap H<sub>2</sub>O contg mild detergent, rinse in tap H<sub>2</sub>O and then in distd H<sub>2</sub>O, immerse momentarily in alcohol, and wipe dry with cheesecloth. Wash templates with hot (not boiling) H<sub>2</sub>O contg moderately strong detergent, using cheesecloth to remove silicone film. Rinse templates with tap H<sub>2</sub>O, distd H<sub>2</sub>O, and alcohol; dry with cheesecloth, and tap alcohol out of wells. In cleaning plastic templates, avoid exposure to excessive heat or plastic-dissolving solvs. Templates and especially wells must be dry before reuse.

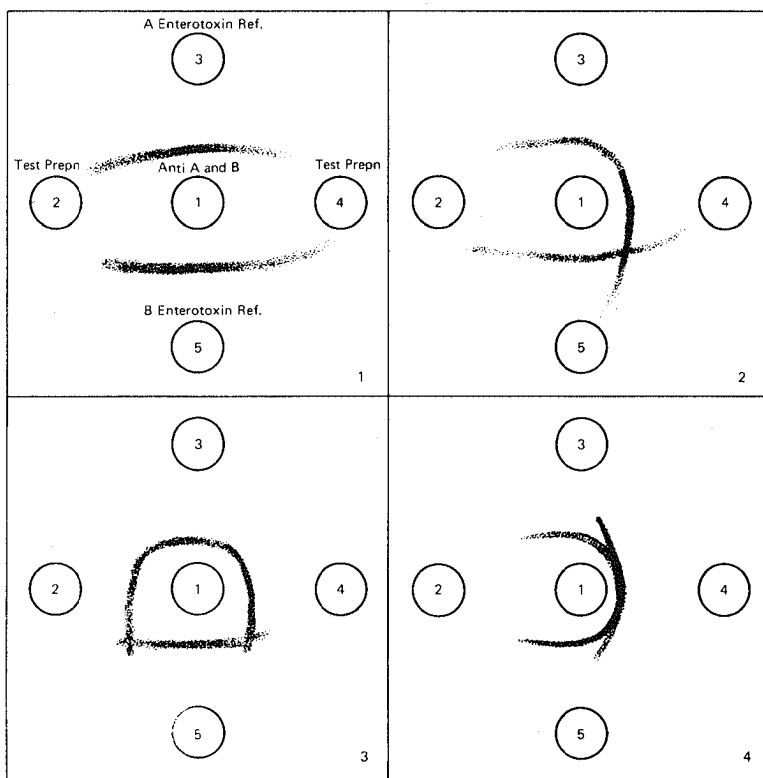

FIG. 46:03—Examples of 4 possible reactions in bivalent detection system. See 46.084 for explanation of reactions

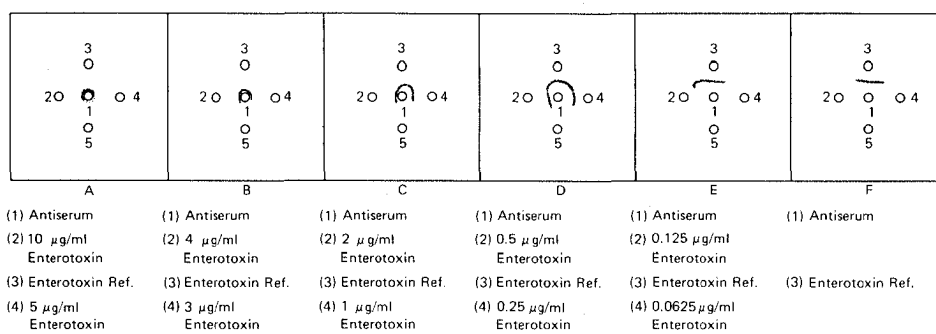

FIG. 46:04—Effect of amount of enterotoxin in test preparation on development of reference line of precipitation. See 46.084 for explanation of reactions

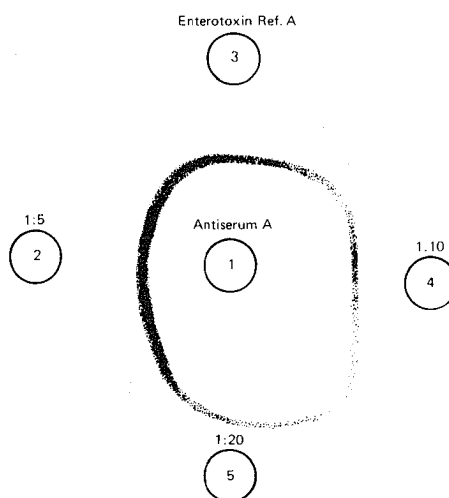

FIG. 46:05—Appearance of microslide gel diffusion test as monovalent system

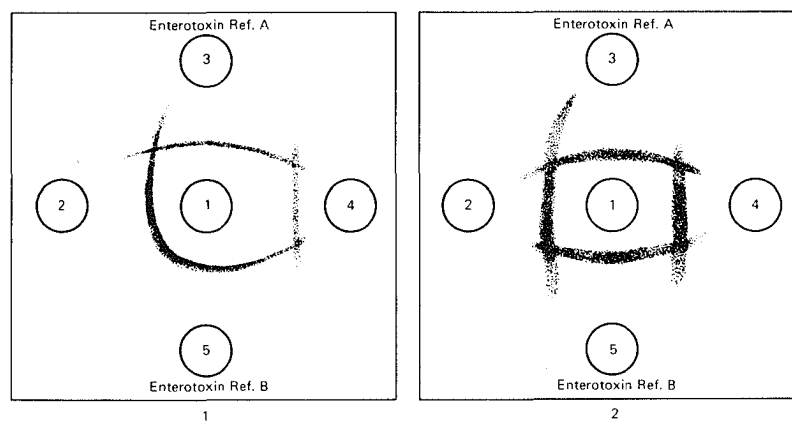

FIG. 46:06—Precipitate patterns in microslide gel diffusion test demonstrating nonspecific (atypical) lines of precipitation

**46.090****Start-Up Procedure**

Place all reagent lines in appropriate solns and sampling line in wash H<sub>2</sub>O. Check bath temp. (60°). Turn on power switch for each module. Latch platen into position and pump reagents thru system until oscilloscope on cell counter indicates particle-free flow stream (ca 15 min). Set threshold control to 21. Turn on recorder chart drive. Set reagent baseline to 0 and record baseline 5 min.

**46.091****Shut-Down Procedure**

Turn off sampler manually, or with stop pin, after last sample has been aspirated. Turn off recorder chart drive when pen returns to baseline after last sample peak. Place clarification reagent line in 75% MeOH wash soln. Place diluent and sampling lines into wash H<sub>2</sub>O. Pump cleaning solns thru system 20 min. Remove all lines from wash solns. Release platen, relax pump tubes, and turn module switches off. Heating bath may be left on to avoid warm-up time following day.

**46.092****Checks and Calibration**

Proceed as in 46.090 and obtain reagent baseline. Thoroughly mix one tube of ref. cells by inverting 30 times, letting siliconized glass beads fall completely thru liq. until cells are evenly distributed. Place sampling probe into ref. tube, keeping end of probe  $\geq 5$  mm from bottom of tube, and continually aspirate ref. into system. When cell pulses appear on oscilloscope, adjust recorder pen to 50% full scale, using cell counter sensitivity control. Record 2 min, turn off chart drive, set threshold control to 8, wait 2 min, turn on chart drive, record 30 sec, and turn off chart drive. Manually advance paper 0.5". Set threshold control to 24, wait 2 min, turn on chart drive, record 30 sec, and turn off chart drive. Manually advance paper 0.5". Set threshold to 21, wait 2 min, turn on chart drive, and record 2–5 min. Return probe to sampler arm, and turn off chart drive. Difference between readings at threshold settings of 8 and 24 should be  $\leq 5\%$  full scale deflection. Excessive threshold difference may be due to blockage in flowcell or tube system, optics out of focus, or inadequate mixing of ref. cells.

**46.093****Preparation of Sample**

(Protect samples from freezing before analysis to avoid irreversible coagulation of protein, resulting in high counts. Take extreme care not to contaminate samples with extraneous particulate matter.)

Pipet 4 mL fresh milk  $< 36$  hr from time of collection into sampling tubes. Add 0.1 mL fixative reagent, stopper, and invert 10 times for mixing. Let tube stand 18 hr at  $20 \pm 3^\circ$ , or incubate 55 min in 55° H<sub>2</sub>O bath, remove, and let cool to room temp.

**46.094****Determination**

Place H<sub>2</sub>O in first cup and ref. cells in next 3 cups. Place untreated milk sample, for reagent control (response should be similar to H<sub>2</sub>O response), in fifth cup.

Continue with samples, inserting H<sub>2</sub>O cup every 10–15 samples and ref. cell cup every 30 samples. Set sampling rate to either 30 or 60/hr, with 1:1 sample-to-wash ratio. Activate sampler. As first ref. peak appears on chart, adjust peak to correspond to assigned value of ref. tube, using sensitivity control. Each scale division on strip chart should be equiv. to 20,000 somatic cells, e.g., ref. assigned value of  $1.4 \times 10^6 = 70\%$  full scale.

Calc. results for each sample by multiplying peak ht in scale divisions  $\times 20,000$ . Report as optical somatic cell count (OSCC)/mL. If peak ht exceeds full scale, report as OSCC =

$> 2,000,000/\text{mL}$ . If peak ht is not clear, e.g., from instrument lag time when sample with high cell count is followed by sample with low cell count at 60/hr sampling rate, reanalyze doubtful sample to obtain well defined peak ht.

**Method II (15)—Official First Action****46.095****Principle**

See 46.086.

**46.096****Apparatus**

(a) *Automatic analyzer*.—AutoAnalyzer with following modules (Technicon Instruments Corp.): Sampler IV, proportioning pump III, const temp. bath cartridge with 3.5 min hold time at 65°, optical somatic cell counter, recorder with strip chart, and 1 manifold (Fig. 46.08).

(b) *Pipets*.—See 46.087(b).

(c) *Sample tubes*.—Disposable plastic or glass to fit sampler tray.

**46.097****Reagents**

(Caution: See 51.037, 51.040, and 51.066.)

(a) *Fixative*.—See 46.088(a).

(b) *Methanolic Triton X-100*.—50%. Mix 500 mL Triton X-100® (Rohm & Haas Co.) in 500 mL absolute MeOH.

(c) *Diluent/wash soln*.—Add 2 mL methanolic Triton X-100, (b), to 1 L H<sub>2</sub>O, and mix.

(d) *Clarification reagent*.—Dissolve 36.2 g KOH in 1 L H<sub>2</sub>O. Add 192 mL NH<sub>4</sub>OH and mix well. Dissolve 120 g Na<sub>4</sub>EDTA in the soln. Mix 1.5 L MeOH with 300 mL Triton X-100. Combine the 2 solns and mix well. Dil. to 4 L with H<sub>2</sub>O and mix well. Filter as in 46.088(h), if necessary. Reagent must be free of particulate matter  $\geq 2-3 \mu\text{m}$ .

(e) *Reference cells*.—See 46.088(j). Use each vial for  $\leq 8$  samplings and within 2 days; do not freeze or refrigerate, as refrigeration causes cells to clump and freezing causes lysis.

**46.098****Analytical System**

Use std Solvaflex pump tubing thruout system, unless otherwise specified (Fig. 46.08). Pump sample at 0.32 mL/min; pump diluent at 1.20 mL/min, and segment with air pumped at 0.32 mL/min; add to sample in HO fitting. Pass dild sample thru double Kel-F mixing coil to resample fitting where clarification reagent is introduced thru Solvaflex tubing at 2.50 mL/min. Pump stream thru double Kel-F mixing coil into 65° heating bath. Pass clarified dild sample thru single Kel-F mixing coil, and then thru flowcell in optical somatic cell counter.

**46.099****Start-Up Procedure**

Place all reagent lines in appropriate solns and sampling line in wash H<sub>2</sub>O. Turn on power switch for each module. Latch platen into position and pump reagents thru system until oscilloscope in counter indicates particle-free flow stream (ca 10 min). Fill PC1 valve  $\frac{1}{2}$  full by inversion. Check that flowcell pull-thru line is free of bubbles. Adjust resample fitting so that small portion of every air bubble is pulled thru. Examine for leaks. Check bath temp. ( $65 \pm 1^\circ$ ). Set threshold control to 21. Turn on recorder chart drive. Set reagent baseline to 0 and record baseline 5 min. Clamp off sample waste.

**46.100****Shut-Down Procedure**

Proceed as in 46.091, except place clarification reagent line in 30% MeOH wash soln.

**Working soln.**—0.002%. Dil. 20 mL dye stock soln to 1 L with KH phthalate buffer soln, (c), and mix thoroly.

(b) **Rinsing liquid.**—(1) **Stock soln.**—1% Triton X-100 (Rohm & Haas Co., or equiv.). Dissolve 10 mL Triton X-100 in 1 L H<sub>2</sub>O. Stock soln is stable 25 days in air-tight container. (2) **Working soln.**—Add 10 mL stock soln to 25 mL NH<sub>4</sub>OH (1+3), dil. to 10 L with H<sub>2</sub>O, and mix thoroly.

(c) **Potassium hydrogen phthalate buffer soln.**—0.025M. Dissolve 51.0 g KH phthalate and 13.75 g KOH in 10 L H<sub>2</sub>O by heating to 50° and mixing thoroly. Add 10 mL 1% Triton X-100, (b)(1), and again mix thoroly. Store ≤7 days in air-tight container.

#### 46.108

#### Analytical System

Two fl oz (60 mL) milk sample is heated to 40°, placed on self-feeding rack, and stirred to ensure even cell distribution just before 200  $\mu$ L milk is withdrawn. Sample is combined with 1.800 mL 60° buffer soln and 2.000 mL 60° dye soln. Final mixt. is stirred continuously until 20  $\mu$ L is spread 10  $\mu$ m deep on edge of rotating disk, 0.5 mm wide along effective length of 3500 mm. Field is viewed with 15 $\times$  microscope objective. Cell-dye complex is excited by filtered blue light (400–570 nm) from Xe lamp to emit red fluorescence, and filtered fluorescence (590–700 nm) over background (removed by discriminator) is sensed by photomultiplier. Each pulse is transformed and reading of total cells/20  $\mu$ L is digitized on display as well as on printer. Rinsing liq. is used to flush system between milk samples to ensure no carryover effect of sample.

Somatic cells/mL milk = No. pulses  $\times$  1000

#### 46.109

#### Standardization

Perform direct somatic cell counts (DMSCC) on 3 std milk samples within range 300,000–2,000,000 cells/mL as in 46.086–46.094 or 46.095–46.104. (Before analysis, obtain 3 subsamples of each std to avoid excessive reheating.) To arrive at optimum discriminator setting, compare stds over  $\geq 5$  discriminator settings having increments of 0.25–0.5 between

settings. Choose initial setting near previous operating point and additional settings to provide  $\geq 1$  set of readings above and  $\geq 1$  below apparent optimum. Optimum is setting at which deviations of Fossomatic readings from those of stds are minimal, with 1 of opposite sign from rest. Check instrument every 700–800 samples or after each 4 hr of operation against std milk samples preserved with 0.05% K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>.

#### Spiral Plate Method for Bacterial Count (17)

##### Official First Action

(Applicable to foods and cosmetics)

#### 46.110

#### Principle

Bacterial suspension from prepd sample of food or cosmetic is deposited continuously on surface of rotating agar plate. Resultant track on surface is in form of Archimedes spiral. Vol. is decreased while dispensing stylus moves from center to edge so that exponential relationship exists between vol. deposited and radius of agar. On incubation, colonies develop along lines where liq. was deposited. Counting grid is calibrated for sample vol. associated with different areas of agar. No. colonies per known area is counted and calcd to bacterial concn.

#### 46.111

#### Apparatus

**Spiral plating machine.**—For use with 150  $\times$  15 mm petri dishes and adjusted to deliver total vol. of 0.035 mL/plate. Platform carrying plate is rotated at ca 50 rpm and is connected mech. to lead screw driving hollow syringe dispenser. Backflow syringe, 2-way valve, and vac. trap control loading and dispensing of sample, disposal of residual sample, and rinsing of system. Liq. is dispensed from backflow syringe thru thin wall Teflon tubing thru stylus to surface of agar plate. (Available com. from Spiral Systems Marketing, 4853 Cordell Ave, Suite A10, Bethesda, MD 20014.)

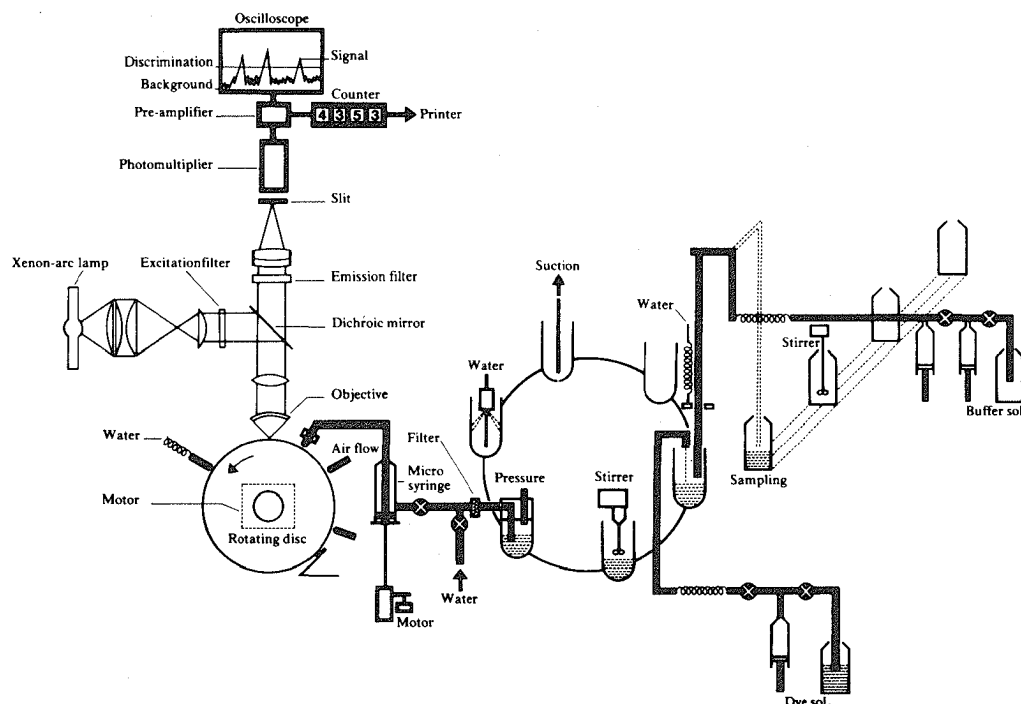

FIG. 46:09—Optical somatic cell counter flow diagram (Fossomatic)

**46.112****Plates**

Pour 40–45 mL portions plate count agar, **46.005(g)**, into 150 × 15 mm petri dishes; let harden and dry to smooth, even surface.

**46.113****Calibration of Spiral Counters**

To det. vol. associated with different parts of counting grid, prep. 11 bacterial suspensions by dilg 1:1 from  $10^6$  to  $10^3$  cells/mL (use nonspreaders). Plate all dilns in duplicate by both **46.015** and spiral plater, using same medium and incubator. Count spiral plates as in **46.116** and divide by av. count/mL by **46.015** to calc. vol. of counted grid area.

$$\text{mL in counted area} = \frac{\text{No. spiral colonies on area}}{\text{count/mL by 46.015}}$$

**46.114****Preparation of Samples**

Weigh 50 g sample into sterile blender jar, add 450 mL diln  $\text{H}_2\text{O}$ , **46.005(a)**, and blend 2 min. If necessary, let settle few min before removing portion of supernate for spiral plating. (Presence of particles may clog tubing.)

Liqs may be used directly or after dilg 1+9 with diln  $\text{H}_2\text{O}$ .

**46.115****Operation**

Check stylus tip angle by letting vac. hold microscope cover slip against face of stylus tip at 1 mm above platform. Cover slip should be parallel to rotating platform in all directions. Adjust angle if necessary. Check stylus at start position.

Clean stylus tip before use and between plating each sample by rinsing 1 sec with com. 5.25% NaOCl soln and then 1 sec with sterile  $\text{H}_2\text{O}$ . Identify 3 disposable polyethylene sample cups and fill with com. 5.25% NaOCl soln, sterile  $\text{H}_2\text{O}$ , and sample. Turn vac. filling valve to "on" and move sample holder into position under stylus tip. Lower stylus into NaOCl soln and lift out twice. Repeat with  $\text{H}_2\text{O}$ . Lower stylus into sample soln. Draw soln thru stylus until continuous column of liq. is present in tube above vac. filling valve. With tip of stylus still below surface of sample, close vac. valve. Raise stylus and move sample holder out of way.

Identify lid of agar plate and remove lid. Place dish on turntable, and lower stylus until tip rests freely on agar surface. Start app. and let rotate until stylus is lifted and app. stops automatically. Remove dish and replace cover. Incubate  $48 \pm 1^\circ$  hr at  $35 \pm 1^\circ$ .

After all samples have been plated, flush app. with NaOCl soln and  $\text{H}_2\text{O}$ . When not in use, leave filled with  $\text{H}_2\text{O}$ .

**46.116****Counting Spiral Plates**

Transparent viewing grid consists of 13.2 cm circle divided into 5 areas by 4 concentric circles equidistant along diam. (marked 1 (furthest) and 4 (nearest) to center) and into eight 45° wedges or octants, marked A thru H. Thus, each octant is subdivided by 4 arcs linearly equidistant from each other. Outer ring of 2 opposite octants (e.g., A and E) is further subdivided in half by arc in middle (marked  $\frac{1}{2}$ ), and outer ring thus formed is divided in half by line toward center. Addnl lines are provided for use with 10 cm plates.

After incubation, center plate over grid. Choose any octant sector and count colonies from outer edge toward center until 20 colonies have been counted. Continue counting remaining colonies contained in segment in which 20th colony was observed. Record this count together with No. segment that included 20th colony (i.e.,  $\frac{1}{2}$ , 1, 2, 3, or 4). Count opposite similar segment and add together. If 20 colonies are not con-

tained in an octant, count all colonies on plate and designate as T (total). If total No. colonies counted exceeds 75 in completing count in segment contg 20th colony, count will generally be low because of coincidence error associated with crowding of colony. In this case, count circumferentially adjacent annular segments starting with sector 1 until  $\geq 50$  colonies are counted, and complete count of remaining colonies in segment in which 50th colony was observed.

Divide No. colonies counted (or sum of 2 sector counts) by corresponding vol. sectors counted in mL to obtain bacterial count/mL. Use as vol. that calcd for that sector(s) from calibration, **46.113**, based on std plate count.

**Fecal Coliforms (78)—Official Final Action**

(Applicable to enumeration of fecal coliforms and also as presumptive test for *Escherichia coli* in shellfish growing waters)

**46.117****Apparatus**

(a) *Pipets*.—1.0 mL serological with 0.1 mL graduations and 10.0 mL with 0.1 mL graduations. Pipets conforming to APHA stds as given in "Standard Methods for the Examination of Dairy Products," 14th ed., 1978, American Public Health Association, 1015 18th St, NW, Washington, DC 20036, may also be used.

(b) *Incubator*.—Air,  $35 \pm 0.5^\circ$ .

(c) *Water bath*.—Covered, circulating,  $44.5 \pm 0.2^\circ$ .

(d) *Dilution bottles or tubes*.—Borosilicate glass, with glass or rubber stoppers or polyethylene screw caps equipped with Teflon liners.

**46.118****Media**

(a) *Butterfield's buffered phosphate diluent*.—See **46.013(m)**.

(b) *Medium A-1 broth*.—Dissolve 5 g lactose, 20 g tryptone, 5 g NaCl, and 0.5 g salicin in 1 L  $\text{H}_2\text{O}$ . Heat to dissolve ingredients, pipet in 1 mL Triton X-100 (Rohm & Haas Co.), and adjust pH to  $6.9 \pm 0.1$ . For 10 mL sample aliquots, prep. and use double strength medium. To achieve approx. same level of medium and inoculum in all tubes, dispense 10 mL portions of single strength broth into 150 × 18 mm tubes contg inverted fermentation vials; use 175 × 22 mm tubes contg inverted fermentation vials for double strength broth. Autoclave 10 min at  $121^\circ$ . Formation of flocculent ppt, particularly in double strength medium, is common and does not impair performance. Store in dark at room temp. and use within 7 days. Store dehydrated ingredients and/or medium under conditions that will prevent absorption of moisture.

**46.119****Determination**

Shake sample and each successive diln bottle vigorously using 25 complete up and down movements of ca 30 cm in 7 sec. Inoculate  $\text{H}_2\text{O}$  sample directly into tubes contg A-1 medium in suitable decimal dilns using 3 or 5 tubes/diln with Butterfield's buffered phosphate diluent. Place inoculated tubes into air incubator and incubate 3 hr at  $35 \pm 0.5^\circ$ . Transfer tubes to  $\text{H}_2\text{O}$  bath and incubate  $21 \pm 2$  hr at  $44.5 \pm 0.2^\circ$ . Maintain  $\text{H}_2\text{O}$  level in bath above level of liq. in inoculated tubes. Presence of gas in inverted vial or of dissolved gas which can be removed by slight agitation of tube constitutes pos. test. Use std Most Probable Number (MPN) tables, Table **46:01** or Table **46:07**, to det. MPN values. Report results as fecal coliform MPN/100 mL sample.

**Virus in Ground Beef (79)—Official Final Action****46.120****Media and Reagents**

(a) *Diethylaminoethyl (DEAE) dextran sulfate soln*.—Add 1 g

**Table 46:07 Most Probable Numbers per 100 mL of Sample, Planting 5 Portions in Each of 3 Dilutions in Geometric Series**

DEAE dextran sulfate,  $2 \times 10^6$  MW (Pharmacia Fine Chemicals, Inc., 800 Centennial Ave, Piscataway, NJ 08854), to H<sub>2</sub>O, dil. to 100 mL, mix on mag. stirrer, and filter thru 0.22  $\mu$ m filter.

(b) *Magnesium chloride soln.*—Add 50.75 g MgCl<sub>2</sub>·6H<sub>2</sub>O to H<sub>2</sub>O, dil. to 100 mL, mix on mag. stirrer, and filter thru 0.22  $\mu$ m filter.

(c) *Neutral red soln.*—Add 1 g neutral red to 1 L H<sub>2</sub>O, mix overnight on mag. stirrer, autoclave 15 min at 121°, and dispense into 100 mL bottles for storage at 10°.

(d) *Sodium bicarbonate soln.*—pH 8.0. Add 75 g NaHCO<sub>3</sub> to H<sub>2</sub>O, dil. to 1 L, and filter thru 0.22  $\mu$ m filter.

(e) *Tissue culture.*—Propagate Vero monkey kidney cell cultures (ATCC CCL 81) in 6 oz (45 sq cm) prescription bottles contg growth medium, (f). After cell sheets are confluent, ca 7 days, decant medium, add 10 mL 0.02% Na<sub>2</sub>EDTA in phosphate buffered saline soln, 46.070(a), and shake. When cells resuspend, ca 20 min, pour suspension into centr. tube, centr. 15 min at 700 rpm in International PR-2, rotor 259, and decant supernate. Add 146 mL growth medium to cell pellet, mix, and distribute into 8 prescription bottles. Repeat propagation until enough cultures are prep'd to perform analysis.

(f) *Growth medium.*—To Leibovitz medium (L-15) (Grand Island Biological Co., 3175 Staley Rd, Grand Island, NY 14072) add equal vol. Eagle's minimum essential medium (MEM) with Hank's salt (Grand Island Biological Co.). Add 10% fetal bovine

serum (Flow Laboratories, 1710 Chapman Ave, Rockville, MD 20852). To final mixt. add 10 mL of 7.5% NaHCO<sub>3</sub> soln, (d). Medium will maintain cells 15 days without having to be changed.

(g) *Virus.*—Poliovirus 1, Chat, attenuated (ATCC VR-192). Passage in Vero cell cultures. Prep. virus pool and titer. Dil. pool to provide 10–50 plaque forming units (pfu)/g.

(h) *High antibiotic minimum essential medium (HAMEM).*—Prep. MEM with nonessential amino acids in Hank's salt soln contg in each L: 20 mL fetal bovine serum, 5.0 mL MgCl<sub>2</sub> soln, (b), 10 mL DEAE dextran sulfate soln, (a), 4.643 g K penicillin G, 5.0 g streptomycin sulfate, 0.25 g tetracycline.HCl, and 5.0 mg amphotericin B. Adjust to pH 8.5 with 1N NaOH for elution of virus and to prevent coagulation of sample slurry.

(i) *Agar medium.*—Mix 400 mL "2×" MEM (filtered thru 0.22  $\mu$ m filter), 20 mL fetal bovine serum, 30 mL NaHCO<sub>3</sub> soln, (d), 15 mL neutral red soln, (c), 10 mL DEAE dextran sulfate soln, (a), 10 mL MgCl<sub>2</sub> soln, (b), 2 mL amphotericin B soln (10  $\mu$ g/mL), 2 mL tetracycline.HCl soln (50  $\mu$ g/mL), 5 mL K penicillin G soln (1435 units/mL), and 6 mL streptomycin sulfate soln (1 mg/mL).

(j) *Agar overlay medium.*—Add 9.5 g Oxoid Ion agar No. 2 (Flow Laboratories) or 12 g Difco purified agar to H<sub>2</sub>O, dil. to 490 mL, mix on mag. stirrer, autoclave 15 min at 121°, and temper in 47° H<sub>2</sub>O bath. Add tempered agar to 500 mL agar medium, (i), and temper in 43° H<sub>2</sub>O bath. Add 10 mL canned sterile milk

(Real-fresh, Inc., PO Box 1551, Visalia, CA 93277) just before use.

**46.121*****Preparation of Sample***

Place 100 g sample in plastic Whirl-Pac bag (Fisher Scientific Co.) and add 200 mL HAMEM, (h). Shake vigorously by hand, adjust pH of slurry to 8.5, and let stand 1 hr at room temp, shaking vigorously 1 min every 20 min. Readjust pH to 8.5 and pour thru funnel contg 5 g Pyrex glass wool pretreated with HAMEM. Let filter 1 hr (ca 180 mL filtrate is obtained) and compress glass wool and slurry with wooden tongue depressor to express remaining liq.

**46.122*****Assay***

Inoculate 1 mL filtrate into each of 10 bottles of Vero cell monolayers, (e), rotating bottles to obtain even distribution of inoculum. Incubate 1 hr at 36°. Return bottles to room temp. Dispense 18 mL agar overlay medium, (j), into each bottle against inside surface away from cell sheet. Cap bottles and turn so overlay gently floods cell surface. Let solidify at room temp. 30 min with bottles covered to exclude light. Turn bottles so that overlay side is up, and incubate in dark at 36°. Remove bottles daily from incubator, and count and mark plaques until no new plaques appear in 48 hr. Discard after 14 days.

Plaque forming units (pfu)/100 g sample = (Av. plaque count/bottle) × (total vol. filtrate/mL filtrate inoculated per bottle).

## 47. Microchemical Methods

### Molecular Weight (MW) (1)—Official Final Action

#### Thermoelectric-Vapor Pressure Method

(Applicable to materials with MW <500)

#### 47.001

#### Apparatus and Reagents

(a) *Molecular weight apparatus*.—Vapor pressure osmometer, Hewlett-Packard; MW app., Hitachi Perkin-Elmer, available as Corona/Wescan Model 232 A from (Wescan Instruments, Inc., 3018 Scott Blvd, Santa Clara, CA 95050; isothermal distn app., Arthur H. Thomas Co.; or equiv. equipment using vapor pressure equilibrium technic. Instrument must use sensitive bridge system to measure temp. difference between solv. and test soln drops suspended on thermistors in const temp. cell whose atm. is satd with solv. vapor.

(b) *Standards*.—Benzil, MW 210.23, mp 94.5–95.5°, and C and H analyses within 0.2% of theoretical values (C, 79.99; H, 4.79). Recrystallize from EtOAc, acetone, or CHCl<sub>3</sub>, if necessary.

If sample is ionizable salt sol. in H<sub>2</sub>O, use reagent grade KCl as std. If sample is not a salt and sol. only in H<sub>2</sub>O, use sucrose as std.

(c) *Solvents*.—Use reagent grade solv. from same lot and preferably from same bottle to sat. cell and to prep. sample and std solns. Solv. must completely dissolve sample, preferably without heating. (Proper choice of solv. and std is critical.) Preferred solvs are (number indicates order of choice):

Solvent	Nature of Sample				
	Unknown	Neutral	Acidic	Basic	Salt
Acetone	2	1	1	—	—
Ethyl acetate	1	2	2	1	—
Chloroform	3	3	—	2	—
Water	—	—	—	—	1

For samples not sol. in solvs listed, test solubility in H<sub>2</sub>O (if thermistor wiring is completely encased in glass or plastic), *n*-heptane, and benzene. Other solvs that may be used are: alcohol, CCl<sub>4</sub>, methylethyl ketone, dioxane, cyclohexane, CH<sub>2</sub>Cl<sub>2</sub>, dimethyl formamide, toluene, and CH<sub>3</sub>CN. Use solvs such as esters, ketones, or alcohols for samples which tend to form dimers thru H bonding, e.g., org. acids.

#### 47.002

#### Determination

Follow manufacturer's instructions, including recommended concn range for solns, instrument operation, and reading of  $\Delta R$  response.

Adjust cell temp. so vapor pressure of solv. is 150–350 mm, preferably 200–300 mm. If instrument is not equipped to cool cell, cell temp. must be enough above ambient (ca 5°) so thermostatic control maintains const cell temp.

Construct calibration curve with std and solv. to be used in analysis. Det.  $\Delta R$  response at 4 std concns in recommended range and plot  $\Delta R$  against mole fraction (MF). Prep. sample soln in recommended range and obtain 3  $\Delta R$  readings. Use median  $\Delta R$  value to calc. MW. If calibration curve is straight line, calc. MW of sample by:

$$MW = (g \text{ solute})(MW \text{ solv.})(K - \Delta R)/(\Delta R)(g \text{ solv.}),$$

where  $K = (\Delta R \text{ std})/(\text{MF std})$  and

$$\text{MF std} = [(g \text{ std})/(MW \text{ std})]/[(g \text{ std}/MW \text{ std}) + (g \text{ solv.}/MW \text{ solv.})]$$

If  $\Delta R$ -MF plot yields curved line, interpolate MF of sample from calibration curve and calc. MW by:

$$MW = (g \text{ solute})(MW \text{ solv.})(1 - \text{MF})/(\text{MF})(g \text{ solv.})$$

### Bromine, Chlorine, and Iodine

#### Carius Combustion Method (2)—Official Final Action

(Do not alter combustion conditions such as temp., size of sample, vol. of acid, etc. Variations from specified conditions present dangerous explosion hazard.)

#### 47.003

#### Reagents

(a) *Fuming nitric acid*.—Reagent grade, halogen-free, sp gr 1.50.

(b) *Silver nitrate*.—Reagent grade, powd.

#### 47.004

#### Apparatus (3)

(a) *Combustion tubes*.—Fig. 47:01. Use clean, heavy- or std-wall Pyrex tubes, free from flaws, with round seal at bottom, and with following specifications. (Vol. HNO<sub>3</sub> and temp. depend on combustion tube used.)

Dimensions	Heavy-Wall	Std-Wall
Wall thickness, mm	2.3±0.3	1.2±0.2
Outside diam., mm	13±0.8	13±0.7
Length, mm	210±10	240±10
Length of sealed tube between bottom and start of taper at shoulder, mm	150–175	180–210
Vol. HNO <sub>3</sub> (sp gr 60°F, ca 1.5), mL	0.5	0.3
Temp., °C	250	300

(b) *Furnace*.—Elec., to hold ≥4 tubes at ca 45° angle. Must maintain temp. of 250±10° or 300±10° for ≥5 hr, with ≤5° difference between any 2 points on a tube or ≤5° difference between similar points on any 2 tubes. Must have variable resistor or other device to adjust furnace to desired temp. Open end of furnace wells must have safety device to retain glass in furnace in case tube explodes, and device must be provided for removing individual tubes from wells (2).

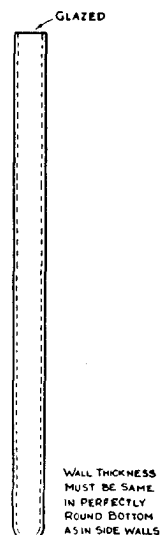

FIG. 47:01—Combustion tube

(c) *Filter tubes*.—Micro 3 mL filter tube with medium-coarse porosity fritted disk (av. pore diam. 15–25  $\mu$ m) (3).

(d) *Siphon*.—Make from 3 mm od glass tubing, with parallel arms, one 50 and other 250 mm long, and with 110 mm connecting section rising with 13° slope to longer arm (3).

#### 47.005

#### Sample

Using microchem. balance, weigh 5–20 mg sample contg min. of 1.5 mg Cl, 2.5 mg Br, or 3.2 mg I; or using semimicrochem. balance, weigh 10–20 mg sample contg min. of 2.5 mg Cl, 4.5 mg Br, or 5.7 mg I.

(a) *Solid samples*.—Weigh by difference in weighing tube (3).

(b) *Viscous liquids or gummy solids*.—Weigh in porcelain boat.

(c) *Volatile liquids*.—Weigh in 5 cm sealed glass tube, 1–2 mm id with capillary tip. Break off tip of capillary before placing in combustion tube, sealed end down.

#### 47.006

#### Determination

Place weighed sample in combustion tube, add powd AgNO<sub>3</sub> 100% in excess of amt estd to be necessary, and add 0.5±0.05 or 0.3±0.03 mL fuming HNO<sub>3</sub>, depending on type of combustion tube, 47.004 (a). Using blast lamp and holding at 30–40° angle, slowly rotate tube in flame until wall thickens, pull out, and seal off narrow neck of tube. Wall of seal should be  $\geq \frac{3}{4}$  of thickness of tube wall and sealed tube should have length shown in table. (If sample and HNO<sub>3</sub> react at room temp., immediately cool bottom of tube in ice-H<sub>2</sub>O or solid CO<sub>2</sub>-acetone bath, remove, and seal at once.) Immediately place tube in furnace and heat 5 hr at 250 or 300±10°, according to tube size.

Observe following precautions before and during opening of combustion tubes: (a) Place asbestos glove on hand used to hold small burner or hand torch; (b) protect face by transparent face mask or work behind safety shield; (c) be certain tube has cooled to room temp.; (d) force tip of tube 2–5 cm out of furnace well; (e) gently flame end to drive all acid from tip and upper walls; and (f) soften tip with small hot flame until pressure in tube is released by blowing out softened glass.

Remove vented tube from furnace and cut off constricted end by scratching tube with file ca 1 cm from shoulder of open end, moistening scratch, and touching with tip of very hot glass rod. Remove end of tube with care and fire polish to avoid contaminating ppt with glass splinters.

Rinse walls of tube with H<sub>2</sub>O until tube is ca  $\frac{3}{4}$  full, place in steam or boiling H<sub>2</sub>O bath, protected from light, and digest until ppt coagulates (ca 30 min). Longer digestion is required for I than for Br or Cl since eutectic mixt. of AgNO<sub>3</sub> and AgI is formed, which melts below temp. of steam bath and persists as heavy yellow oil on bottom of tube. Stirring with glass rod speeds up soln of AgNO<sub>3</sub> and greatly reduces digestion time, which *must* be continued until ppt is in form of *fine powder*. If excessive amts of AgNO<sub>3</sub> have been used, greater dilns than specified are required for complete pptn. Therefore, after digestion appears complete, pipet few drops of clear supernate aq. soln into test tube contg several mL H<sub>2</sub>O. If turbidity occurs, entire supernate must be dild with H<sub>2</sub>O until pptn stops, and digestion to coagulate ppt must be repeated. If no turbidity occurs on diln, pipetted portion may be discarded.

Place previously washed, dried, and weighed filter tube in 1-hole stopper in suction flask, connect short arm of siphon tube to filter tube thru small rubber stopper, and adjust tube so that long arm of siphon almost touches ppt. Transfer ppt to filter tube by suction. Rinse tube and ppt alternately with 1% HNO<sub>3</sub> and alcohol, using 2 or 3 mL portions for each rinse.

Remove siphon, rinse tip and stopper with alcohol, and rinse

filter tube and ppt first with the acid, then with alcohol. Wipe outside of filter tube with moist chamois (or cheesecloth) and dry 30 min at 125° in air oven or 30 min at 80° in vac. oven; cool to room temp. (ca 30 min) and weigh. Handle dry tube with chamois finger cots or tweezers. Make blank detn and subtract any correction from wt sample ppt.

$$\% \text{ Cl} = (\text{wt ppt} - \text{blank}) \times \frac{\text{Cl}}{\text{AgCl}} \times \frac{100}{\text{wt sample}}$$

$$\% \text{ Br} = (\text{wt ppt} - \text{blank}) \times \frac{\text{Br}}{\text{AgBr}} \times \frac{100}{\text{wt sample}}$$

$$\% \text{ I} = (\text{wt ppt} - \text{blank}) \times \frac{\text{I}}{\text{AgI}} \times \frac{100}{\text{wt sample}}$$

#### Oxygen Flask Combustion Method (4) Official Final Action

#### 47.007

#### Apparatus and Reagents

(a) *s-Diphenylcarbazone indicator*.—1.5% alc. soln. Heat to dissolve, if necessary. Prep. fresh daily.

(b) *Bromophenol blue indicator*.—0.05%. Dil. 5 mL 1% alc. soln to 100 mL with alcohol.

(c) *Mercuric nitrate std soln*.—Dissolve 1.7 g Hg(NO<sub>3</sub>)<sub>2</sub>·H<sub>2</sub>O in 500 mL H<sub>2</sub>O contg 2 mL HNO<sub>3</sub> and dil. to 1 L. Adjust to pH 1.7, using pH meter, by adding HNO<sub>3</sub> dropwise. Stdze as follows: Accurately weigh 4–6 mg KCl and transfer to 250 mL erlenmeyer. Add 20 mL H<sub>2</sub>O and 80 mL alcohol, and stir mag. at moderate speed. Add 5 drops bromophenol blue indicator and 0.5N HNO<sub>3</sub> to yellow end point; then add 3 drops excess. Add 5 drops s-diphenylcarbazone indicator and titr. at  $\leq 5$  mL/min with Hg(NO<sub>3</sub>)<sub>2</sub> std soln to orchid-pink. Subtract reagent blank. Repeat stdzn  $\geq 3$  times.

$$\text{Normality} = \text{mg KCl} / (74.551 \times \text{mL Hg(NO}_3)_2)$$

(d) *Hydrogen peroxide soln*.—30%.

(e) *Hydrazine sulfate soln*.—Satd aq. soln.

(f) *Buret*.—Graduated to 0.01 mL. Tip should be fine enough that 1 drop is ca 0.015 mL.

#### 47.008

#### Determination

Accurately weigh sample contg 1.5–3 mg Cl, 3–6 mg Br, or 6–9 mg I and fold in paper carrier. Insert carrier in Pt holder in stopper of 500 mL Schöniger flask, 47.041(b). Add 2.0 mL 0.5N KOH, 4 drops satd aq. hydrazine sulfate soln, and 10 mL H<sub>2</sub>O to flask. Flush flask  $\geq 3$  min with rapid stream of O. Add 1 drop long-chain alcohol (e.g., dodecanol) to carrier in basket (not on tail) just before combustion. Ignite carrier and immediately insert into flask. (*Caution*: Use safety barrier and reinforced gloves. Remote control igniting device is available.) After combustion is complete, shake stoppered flask 10 min or until all visible cloudiness disappears. Let stoppered flask stand 5 min at room temp. Add ca 3 mL H<sub>2</sub>O at funnel portion of stoppered flask as H<sub>2</sub>O seal and stopper wash. Remove stopper, and rinse stopper, Pt holder, and flask walls with ca 15 mL H<sub>2</sub>O. Add 8 drops 30% H<sub>2</sub>O<sub>2</sub> to flask and boil until small bubbles no longer evolve (ca 10 min). (Do not let contents go to dryness. Add H<sub>2</sub>O if necessary.) Cool to *room temp.* and proceed within 5 min.

Rinse walls of flask with enough H<sub>2</sub>O to bring to ca 75 mL; then add 150 mL alcohol. Stir mag. at moderate speed. Add 15 drops bromophenol blue indicator, and proceed as in stdzn, (c), beginning "... and 0.5N HNO<sub>3</sub> ...", taking as end point change in color from faint yellow to orchid-pink. Subtract paper blank from vol. used. Typical blank is 0.15 mL Hg(NO<sub>3</sub>)<sub>2</sub>.

$$\% \text{ Halogen} = [\text{mL Hg(NO}_3)_2 \times \text{atomic wt of halogen} \times \text{normality} \times 100] / \text{mg sample.}$$

## Carbon and Hydrogen (5)—Official Final Action

47.009

## Reagents

(a) *Copper oxide*.—Wire form, ca 1 mm diam. and 3–4 mm long; discard material finer than "20-mesh." Ignite 1 hr at 800–900° before placing in combustion tube.

(b) *Platinum gauze, 52 mesh*.—From three 3 × 5 cm sections, make 3 rolls, each 30 mm long × 7 mm od. Boil 15 min in  $\text{HNO}_3$  (1+1) and ignite in nonluminous Bunsen flame.

(c) *Asbestos*.—Gooch asbestos; ignite 30 min at 800–900° and store in wide-mouth bottle. (Caution: See 51.086.)

(d) *Silver*.—Fine wire or ribbon; if tarnished, reduce in stream of H at 350–450°. (Note: H ignites explosively in O. Flush reduction app. with  $\text{CO}_2$  or N before and after H use. Vent exhaust gas into effective fume removal device. Perform reduction behind safety barrier.)

(e) *Lead dioxide*.—Pellets, 1–2 mm diam., special grade for microanalysis; or prep. by digesting com. grade powder 2 hr in  $\text{HNO}_3$ , let stand 1 hr, decant, wash with  $\text{H}_2\text{O}$  until acid-free, evap. to dryness, and cut into 2 mm cubes. Roll cubes in jar to round corners and sieve out powder.

(f) *Glass wool*.—Pyrex, pliable.

(g) *Dehydrite or Anhydrite*.—( $\text{Mg}(\text{ClO}_4)_2$ , anhyd.) Break pieces to <3 mm long; discard portion passing thru No. 40 sieve.

(h) *Ascarite*.—( $\text{NaOH}$  on asbestos.) Use com. prepn of "8–20 mesh."

47.010

## Apparatus (See Fig. 47.02)

(a) *Oxygen*.—Cylinder with pressure regulator adjustable from 0 to 10 lb pressure (69 kPa) on low-pressure side and with needle-valve control.

(b) *Preheater*.—Specifications as recommended by Committee on Microchemical Apparatus, Div. Anal. Chem. (ACS) (3), except with 12/2 ball joint. Rubber connectors may be used.

(c) *Bubble counter and U-tube*.—According to recommended specifications (3), except with ball joints. Rubber connectors may be used.

(d) *Combustion tube*.—Fused quartz (or Vycor), dimensions according to recommended specifications (3) but with 12/2 ball joint on side arm and 5/12 or 7/15 inner joint on exit end. Rubber connectors may be used. Pyrex glass tubes may be used, but furnace temps should be  $\leq 725^\circ$ .

(e) *Absorption tubes*.—Pregl-type, according to recommended specifications (3) but with 5/12 joints; alternatively, Prater-type, semimicro size with 7/15 joints. Rubber connectors may be used.

(f) *Bubble counter or flowmeter*.—Any convenient arrangement to measure 10–30 mL/min gas flow from exit end of second absorption tube.

(g) *Preheater furnace*.—Elec., 12–14 mm id × 13 cm (5") long, maintained at  $600 \pm 25^\circ$ . Gas heaters may be used for all furnaces but specified temps should be maintained. Temps of furnaces are measured at center of furnace inside empty combustion tube with one end stoppered.

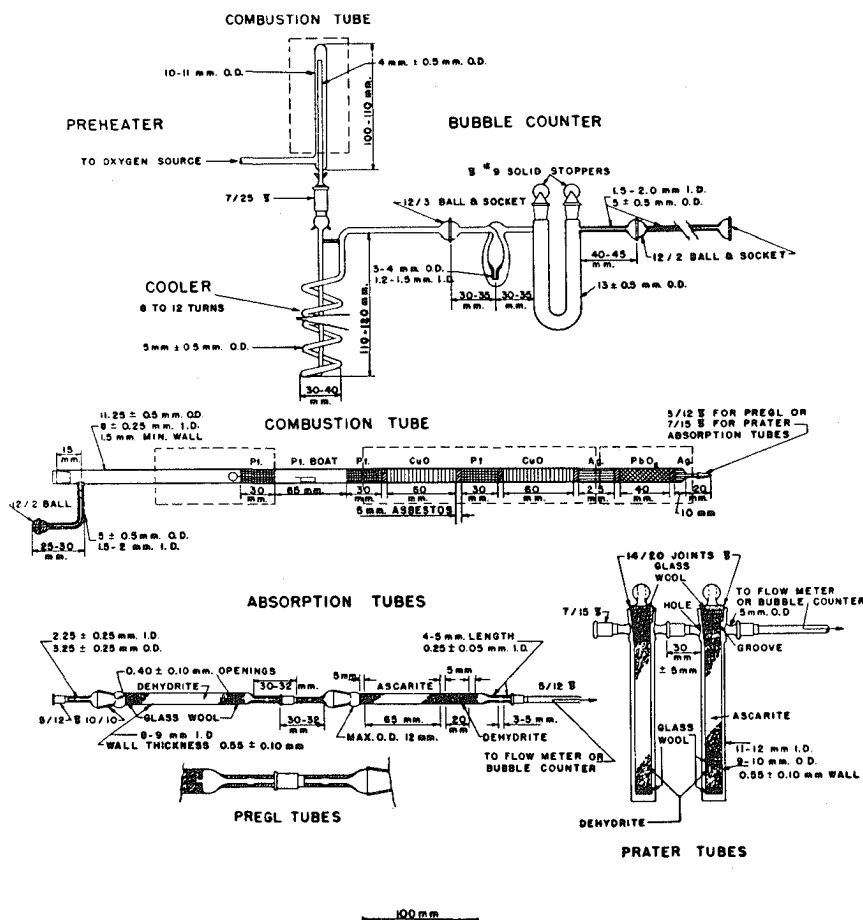

FIG. 47.02—Carbon and hydrogen apparatus

(h) *Burning furnace*.—Elec., 13–14 mm id  $\times$  10 cm (4") long. Furnace should reach 600–700° in 5 min, ca 800° in 15 min, with max. of 850° in 30 min. See (g).

(i) *Long furnace*.—Elec., 13–14 mm id  $\times$  20 cm (8") long; maintained at 775–800°. See (g).

(j) *Constant temperature mortar*.—Elec., 13–14 mm id  $\times$  8 cm (3") long, thermostatically controlled at  $177 \pm 2^\circ$ . See (g).

#### 47.011

##### Preparation of Apparatus

(a) *Preheater*.—Place CuO in preheater tube, connect spiral cooling coil, immerse coil in beaker of H<sub>2</sub>O, and support assembly by suitable clamps and stand. Place furnace over preheater tube and maintain at ca 600°. Connect side arm of combustion unit to needle valve of O pressure regulator by suitable tubing, rubber or Tygon.

(b) *Bubble counter-U-tube*.—Fill bubble counter and U-tube by placing glass wool plug at bottom of U, fill side next to bubble counter with Dehydrite to within 12 mm of side arm, and cap with another glass wool plug. Place Ascarite layer in other side to within 38 mm of side arm; then insert glass wool plug, ca 25 mm of Dehydrite, and finally second plug. Cement in stoppers with glass cement or paraffin; then with medicine dropper add H<sub>2</sub>SO<sub>4</sub> to bubbler until level is 3–4 mm above bubbler tip. Connect to preheater with pressure clamp.

(c) *Combustion tube*.—Clean and dry combustion tube. Place 10 mm roll of Ag in exit end with 1 or 2 strands reaching to open end of ground joint. Insert loose asbestos plug (not choking plug), 40 mm PbO<sub>2</sub>, asbestos plug, and second Ag roll 25 mm long, which should extend into long furnace ca 12 mm. Insert asbestos plug, 60 mm CuO, asbestos plug, 30 mm Pt gauze roll, asbestos plug, 60 mm CuO, asbestos plug, and finally 30 mm Pt gauze, which should extend about 10 mm beyond end of long furnace. Place prep tube in furnaces with exit end protruding far enough beyond const temp. mortar to permit connecting absorption tubes. Connect side arm to bubble counter-U-tube.

(d) *Absorption tubes*.—Place glass wool plug in end of H<sub>2</sub>O absorption tube, fill tube to within 12 mm of other end with Dehydrite or Anhydrone, and cap with second glass wool plug. If Pregl tubes are used, seal ground-glass joint with enough glass cement to give clear seal, and remove any excess on outer surface of tube with cotton dipped in benzene or other solv. If Prater tubes are used, lubricate lower  $\frac{2}{3}$  of inner joint with min. of light stopcock grease and insert in outer tube.

Prep. CO<sub>2</sub> absorption tube by placing glass wool plug in end and fill tube to within ca 38 mm of other end with Ascarite. Insert 6 mm glass wool plug, add 20 mm layer of Dehydrite, and cap filling with another glass wool plug. Complete assembly of absorption tube as for H<sub>2</sub>O absorption tube. Connect absorption tubes to combustion tube with ground joints (use no lubricant) or with special impregnated rubber tubing.

Attach calibrated bubble counter or flowmeter to exit end of CO<sub>2</sub> absorption tube.

#### 47.012

##### Determination

(a) *Conditioning apparatus*.—Condition prep and assembled app. by heating combustion tube 3–4 hr with long furnace at 775–800° and with O flowing thru app. at rate of 15–20 mL/min. Use 3–4 lb (21–28 kPa) O pressure on low pressure side of regulator. At the same time, make 2 simulated sample burnings, without sample, with burning furnace at 825–850°. (Temp. must be ca 100° lower if Pyrex combustion tubes are used.)

Burn unweighed 10–15 mg sample to condition combustion and absorption tubes. With absorption tubes connected, adjust needle valve on regulator so that O flow is 15–20 mL/min and

place burning furnace ca 75 mm from long furnace. Place micro Pt boat contg sample in combustion tube ca 50 mm from long furnace. Insert third Pt roll 25 mm from boat, and stopper tube. Turn on burning furnace and let it reach ca 600° before starting sample combustion by moving furnace over sample at rate of 25 mm in 6–8 min. Move burning furnace across sample only once, taking 18–24 min for full travel of furnace. Turn off burning furnace 5 min after it reaches long furnace but continue to sweep O thru tube for addnl 15 min before disconnecting absorption tubes.

Remove absorption tubes and place by balance to equilibrate. Handle tubes only with clean chamois finger cots. If Prater tubes are used, turn joints  $\frac{1}{4}$  turn to seal. If rubber connections are used, wipe only tips of tubes with moist, then dry, chamois before placing them by balance. Wait 10 min if ground joints were used or 15 min if rubber connections were made; then weigh CO<sub>2</sub> absorption tube first and H<sub>2</sub>O absorption tube next, using glass tare with vol. and surface approx. equal to that of absorption tubes. Record wts of tubes and reconnect to combustion tube for subsequent analysis.

(b) *Proving the apparatus*.—Replace boat with one contg 10–15 mg sample of std compd such as NBS microchem. std, weighed to nearest 0.01 mg. Repeat combustion and weighing as in (a). Calc. % C and H in std sample from increase in wt of CO<sub>2</sub> and H<sub>2</sub>O absorption tubes. Repeat analysis until results from 2 consecutive runs are within 0.30% of theoretical values and means of C and H results are within 0.20% of theoretical value for the std compd. (Humidity conditions of room may make it necessary to correct apparent wt of H<sub>2</sub>O by subtracting a blank value.)

When app. meets this test, analyze samples as above.

$$\%C = \text{wt CO}_2 \times 0.2729 \times 100/\text{wt sample}$$

$$\%H = \text{wt H}_2\text{O} \times 0.1119 \times 100/\text{wt sample}$$

#### Carbon, Hydrogen, and Nitrogen Automated Method (6)—Official Final Action

#### 47.013

##### Apparatus

(a) *Automatic carbon-hydrogen-nitrogen (C-H-N) analyzer*.—Model 185 (FM) (current model 185B; Hewlett-Packard, Rte 41, Avondale, PA 19311), Perkin-Elmer 240 (PE) (current model 204B; Perkin-Elmer Corp.), or equiv.

(b) *Helium*.—Cylinder with pressure regulator and needle valve control. Preheater and purifier optional.

(c) *Oxygen*.—For PE only. Cylinder with pressure regulator and needle valve control.

(d) *Line voltage regulator*.—Optional; 50 amp, output  $115 \text{ v} \pm 0.25\%$ .

(e) *On-line computer or integrator*.—Mandatory for FM app. but optional for PE app.

#### 47.014

##### Reagents

(See instrument instruction manuals.)

(a) *Catalyst*.—Solid oxidn catalyst (oxides of Co, W, or Ag) required for FM; optional for PE if time and temp. meet conditions specified.

(b) *Std compounds*.—NBS acetanilide, or equiv.

#### 47.015

##### Preparation of Apparatus

Prep. and assemble app. as in manual. Adjust preliminary settings and regulate He flow (He and O for PE). Set and let temp. systems equilibrate until const. Use combustion temp.  $>1080^\circ$  for FM and  $980\text{--}1000^\circ$  for PE. Use specified 500° and 650° reduction temps, resp., for FM and PE. Maintain detector column suboven within  $5\text{--}15^\circ$  of main oven. Adjust bridge

current to value specified. After sweeping air "slug" from combustion chamber, use 20–50 sec range combustion period (gas flow diverted) for FM (40–50 sec for samples difficult to burn). Use extended "Hold 30 sec" combustion period for PE. Add  $\text{Co}_3\text{O}_4 + \text{Ag}_2\text{WO}_4$ ,  $\text{Ag}_2\text{O} + \text{Ag}_2\text{WO}_4$ , or  $\text{CoO} + \text{WO}_3$  to combustion tube filling of PE. However, if PE is in optimum condition, only 2 of 3 required conditions (temp., time, and catalyst) need be adhered to.

## 47.016

## Determination

Burn 2 unweighed samples ca 2 mg (PE) or 0.6 mg (FM) to condition app. Make  $\geq 2$  blank runs (simulated sample runs without sample) to check and adjust timing of each phase where necessary, to check pattern of final measurements, and to obtain blank factors if required in calcs. Then run std and sample compds, weighed to nearest 0.001 mg or better for PE and 0.0001 mg for FM. Calc. factors as suggested in manual. Rerun std to check factors. Different type std may be used for this rerun. Initially check factors until 2 of 3 detns are within 0.3% of theoretical value. Calc. % C, H, and N, using factors obtained from std compds.

## 47.017

## Special Precautions for Volatile Samples

Weigh volatile samples in capillaries, Al capsules, or Al weighing pans. During sweeping period, volatile samples must be in cooler portion of combustion tube, as near orifice as possible.

## Fluorine (7)—Official Final Action

## 47.018

## Reagents

(a) *Sodium alizarin sulfonate indicator*.—(Alizarin red S) 0.035% aq. soln.

(b) *Sodium fluoride std soln*.—0.01N. Dissolve 0.4200 g NaF in  $\text{H}_2\text{O}$  and dil. to 1 L.

(c) *Thorium nitrate std soln*.—0.01N. Dissolve 1.38 g  $\text{Th}(\text{NO}_3)_4 \cdot 4\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$  and dil. to 1 L. Stdze by titrg against 0.01N NaF, using 1, 2, 3, 4, 5, 6, 7, 8, 9, and 10 mL portions and plotting curve.

## 47.019

## Apparatus

(a) *Schöniger combustion flask*.—500 mL with filter paper carriers.

(b) *Distillation apparatus*.—See Fig. 47:03. Attach to steam generator. Steam enters thru joint,  $J_1$ , passes thru 2 concentric tubes,  $IT_1$  and  $ET_1$ , and enters distn flask,  $D$ , thru 2 openings. Vapors enter condenser,  $C$ , which consists of 3 concentric tubes. In  $IT_2$  and  $ET_2$ , vapors are condensed; in  $ET_3$ , cooling  $\text{H}_2\text{O}$  is circulated. Distillate drains off on right thru descending tube. Ground joint,  $J_2$ , serves as opening for addn of soln and as seat for thermometer which records temp. of liq.,  $L$ . Elec. heating jacket,  $H$ , surrounds section of distn flask contg liq. and is prepd from 600 cm Nichrome wire,  $W$ , of 2.120 ohms/foot, 420 cm of which is wound on 48 mm diam. glass cylinder covered with Al foil and asbestos, then covered with insulating cement, asbestos, and another layer of cement. Jacket is held in place with ring,  $R$ , and temp. is controlled with 7.5 amp variable transformer.

## 47.020

## Determination

(a) *In absence of arsenic, mercury, and phosphorus*.—Place sample contg 0.5–0.7 mg F on filter paper carrier. (Weigh liq. samples in gelatin or Me cellulose capsules and place closed capsule on paper carrier.) Add ca 15–20 mg  $\text{Na}_2\text{O}_2$ , wrap mixt. in filter paper, and place in Pt basket carrier in stopper of

Schöniger flask. Place 20 mL  $\text{H}_2\text{O}$  in flask, introduce O several min, ignite sample, and immediately insert into flask. (Note: Use safety barrier and reinforced gloves. Remote control igniting device is available.) After combustion is complete, shake vigorously until cloudiness disappears, and let flask stand undisturbed ca 15 min to ensure complete absorption of oxidn products. (If enough I is present to give yellow soln, warm on steam bath to dispel color.) Wash soln into titrg vessel, adjust to pH  $3.0 \pm 0.05$  with 1N and 0.1N HCl and 0.1N NaOH, using pH meter, and add 2 mL Na alizarin sulfonate indicator. (pH adjustment is critical, since alizarin sulfonate is also acid-base indicator.) Titrg. with std  $\text{Th}(\text{NO}_3)_4$  soln to pink end point, preferably using photoelec. photometer with 520 nm filter. Use entire soln rather than aliquot. If visual titrn is used, compare color with controls in fluorescent light. Det. mg F from std curve.

$$\% \text{ F} = \text{mg F} \times 100 / \text{mg sample.}$$

(b) *In presence of arsenic, mercury, and phosphorus*.—Burn sample as in (a) and transfer soln to distn app. thru joint  $J_2$  with as little  $\text{H}_2\text{O}$  as possible. Add 20 mL 70–72%  $\text{HClO}_4$ , 1 mL 25%  $\text{AgClO}_4$  soln, and ca 12 glass beads. Heat mixt. by means of jacket, and as temp. rises, start steam generation. Maintain temp. of mixt. at  $135 \pm 2^\circ$  after raising temp. to this point as quickly as possible by adjusting transformer. Collect distillate in 250 mL vol. flask. (Practice is required for successful manipulation of distn. To avoid sucking back of soln, keep vol. in flask at min. and keep steam generation const. Addn of phthln and small amt of 0.1N NaOH to generator provides means of detg if suck-back has occurred.) (Clean distn app. between detns by replacing steam generator with bottle or flask connected to suction and immersing distillate delivery tube in F-free  $\text{H}_2\text{O}$ , which is sucked thru entire system.)

Transfer distillate to titrg vessel, adjust to pH  $3.0 \pm 0.05$ , add 2 mL Na alizarin sulfonate indicator, and titrg. as in (a).

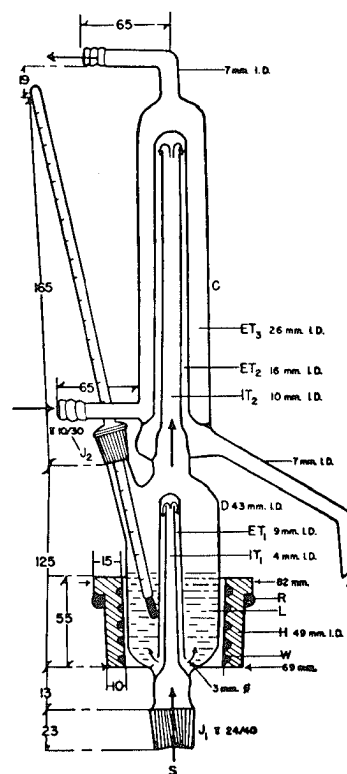

FIG. 47:03—Upper section of distilling apparatus. From Anal. Chem. 29, 141(1957)

**Nitrogen (8)****Micro-Kjeldahl Method—Official Final Action**

(Not applicable to material contg N—N or N—O linkages)

**47.021****Reagents**

- (a) *Sulfuric acid*.—Sp gr 1.84, N-free.
- (b) *Mercuric oxide*.—N-free.
- (c) *Potassium sulfate*.—N-free.
- (d) *Sodium hydroxide-sodium thiosulfate soln*.—Dissolve 60 g NaOH and 5 g  $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$  and dil. to 100 mL or add 25 mL 25%  $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$  to 100 mL 50% NaOH soln.
- (e) *Boric acid soln*.—Satd soln.
- (f) *Indicator soln*.—(1) *Methyl red-methylene blue*.—Mix 2 parts 0.2% alc. Me red soln with 1 part 0.2% alc. methylene blue soln; or (2) *Methyl red-bromocresol green soln*.—Mix 1 part 0.2% alc. Me red soln with 5 parts 0.2% alc. bromocresol green soln.
- (g) *Hydrochloric acid*.—0.02*N*. Prep. as in 50.011 and stdze as in 50.015 or 50.017.

**47.022****Apparatus (9)**

- (a) *Digestion rack*.—With either gas or elec. heaters which will supply enough heat to 30 mL flask to cause 15 mL  $\text{H}_2\text{O}$  at 25° to come to rolling boil in  $\geq 2$  but  $< 3$  min.
- (b) *Distillation apparatus*.—One-piece or Parnas-Wagner distn app. recommended by Committee on Microchemical Apparatus, ACS (9).
- (c) *Digestion flasks*.—Use 30 mL regular Kjeldahl or Soltys-type flasks (9). For small samples, 10 mL Kjeldahl flasks may be used.

**47.023****Determination**

Weigh sample requiring 3–10 mL 0.01 or 0.02*N* HCl and transfer to 30 mL digestion flask. If sample wt is  $< 10$  mg, use microchem. balance (max. wt 100 mg dry org. matter). Use charging tube for dry solids, porcelain boat for sticky solids or nonvolatile liqs, and capillary or capsule for volatile liqs. Add  $1.9 \pm 0.1$  g  $\text{K}_2\text{SO}_4$ ,  $40 \pm 10$  mg  $\text{HgO}$ , and  $2.0 \pm 0.1$  mL  $\text{H}_2\text{SO}_4$ . If sample wt is  $> 15$  mg, add addnl 0.1 mL  $\text{H}_2\text{SO}_4$  for each 10 mg dry org. matter  $> 15$  mg. Make certain that acid has sp gr  $\geq 1.84$  if sample contains nitriles. (10 mL flasks and  $\frac{1}{2}$  quantities of reagents may be used for samples  $< 7$  mg.) Add boiling chips which pass No. 10 sieve. If boiling time for digestion rack heaters is 2–2.5 min, digest 1 hr after all  $\text{H}_2\text{O}$  is distilled and acid comes to true boil; if boiling time is 2.5–3 min, digest 1.5 hr. (Digest 0.5 hr if sample is known to contain no refractory ring N.)

Cool, add min. vol. of  $\text{H}_2\text{O}$  to dissolve solids, cool, and place thin film of Vaseline on rim of flask. Transfer digest and boiling chips to distn app. and rinse flask 5 or 6 times with 1–2 mL portions  $\text{H}_2\text{O}$ . Place 125 mL Phillips beaker or erlenmeyer contg 5 mL satd  $\text{H}_3\text{BO}_3$  soln and 2–4 drops indicator under condenser with tip extending below surface of soln. Add 8–10 mL NaOH- $\text{Na}_2\text{S}_2\text{O}_3$  soln to still, collect ca 15 mL distillate, and dil. to ca 50 mL. (Use 2.5 mL  $\text{H}_3\text{BO}_3$  and 1–2 drops indicator, and dil. to ca 25 mL if 0.01*N* HCl is to be used.) Tit to end point. Make blank detn and calc.

$$\% \text{N} = [(\text{mL HCl} - \text{mL blank}) \times \text{normality} \times 14.007 \times 100] / \text{mg sample.}$$

**Oxygen (10)—Official Final Action****47.024****Principle**

Org. O compds are thermally decomposed in inert atm. to  $\text{H}_2\text{O}$ , CO, and  $\text{CO}_2$ . At 1120°, following reactions are complete:

$\text{C} + \text{CO}_2 \rightarrow 2\text{CO}$ ;  $\text{H}_2\text{O} + \text{C} \rightarrow \text{H}_2 + \text{CO}$ . The CO is converted to  $\text{CO}_2$  by reaction with CuO and  $\text{CO}_2$  is detd gravimetrically.

**47.025****Reagents**

- (a) *Copper oxide*.—See 47.009(a).
- (b) *Ascarite*.—See 47.009(h).
- (c) *Dehydrite or Anhydrone*.—See 47.009(g).
- (d) *Nitrogen*.—Purify high purity N by passing thru series of scrubbing bottles contg different solid desiccants ( $\text{CaCl}_2$ , anhyd.  $\text{Mg}(\text{ClO}_4)_2$ , and  $\text{P}_2\text{O}_5$ ), then thru tube contg closely packed reduced Cu turnings at 600°, thru Anhydrone, and finally thru bubble counter and U-tube.
- (e) *Carbon*.—Fisher, C-198, lampblack, or equiv. Pelletize by swirling constantly while adding  $\text{CCl}_4$  dropwise; dry in oven at 100–120°. Purify by digesting with HCl. Add large vol.  $\text{H}_2\text{O}$ , stir mech., let C settle, and decant  $\text{H}_2\text{O}$ . Repeat until  $\text{H}_2\text{O}$  wash is Cl-free. Dry C, place in quartz tube, and heat in slow stream of N, (d), several hr, increasing temp. gradually to 550°.
- (f) *Quartz chips*.—Clean chips with HF, rinse with  $\text{H}_2\text{O}$ , and dry in oven.

**47.026****Apparatus (See Figs. 47:04 and 47:05)**

- (a) *Long stationary furnace, 675°*.—47.010(i), except maintained at  $675 \pm 5^\circ$ ; (A).
  - (b) *Long stationary furnace, 1120°*.—See (c); (B).
  - (c) *Short movable furnace, 1120°*.—This furnace (C) and that in (b) may be available as unit.
  - (d) *Nitrogen purification train*.—Preheater furnace (D), 47.010(g), with section of combustion tubing, quartz, Vycor, or Pyrex glass No. 1720, or equiv., packed with ca 10 cm reduced Cu turnings.
  - (e) *Bubble counter and U-tube*.—See 47.010(c) and 47.011(b).
  - (f) *Cap*.— $\frac{1}{4}$  14/35 cap with 2 mm stopcock; (F).
  - (g) *Thermal decomposition tube*.—Clear fused quartz, solar radiation grade, 7.5–8 mm id, 10–11 mm od, and 60 cm long, exclusive of capillary tube; (G). At one end is  $\frac{1}{4}$  14/35 male joint. About 1 cm from joint is bent side arm, 6–7 mm od and 2–4 mm id. At other end is 15 cm capillary tube 6–7 mm od and 1–2 mm id. Wash tube with HF and  $\text{H}_2\text{O}$ , and dry.
- Fill tube as shown in Fig. 47:05, with repeated tapping to avoid channeling. The C must at all times be in section of furnace that is at 1120°.

- (h) *By-pass stopcocks*.—3 way T-type with  $\frac{1}{4}$  ball joint on side arm; (H) and (H').
- (i) *Spiral by-pass tube*.—Glass tube (I), contg spiral, for flexibility, and  $\frac{1}{4}$  socket joints on each end. Length should be sufficient to connect to  $\frac{1}{4}$  ball joints on  $\frac{1}{4}$  stopcocks, (H) and (H').
- (j) *Quartz tube*.—Filled with reduced Cu; (J).
- (k) *Short stationary furnace, 900°*.—47.010(h), except capable of maintaining 900°; (K).
- (l) *Scrubber tube*.—Any type of drying tube fitted with crushed KOH pellets or Ascarite, (L), for removing halogens and S.
- (m) *Drying tube*.—See 47.010(e), or use U-tube. Fill with Anhydrone only, as in 47.011(d); (M).
- (n) *Carbon dioxide absorption tube*.—Fill with Ascarite and Anhydrone as in 47.011(d); (N).
- (o) *Oxidation tube*.—Tube, 30–40 cm, exclusive of tip, similar to that in (d) except packed with ca 25 cm CuO wire. Let 5 cm extend beyond furnace. Maintain at  $675 \pm 5^\circ$  to oxidize CO to  $\text{CO}_2$ ; (O).
- (p) *Guard tube*.—Glass tube 110–120 mm  $\times$  10–12 mm od, 1 mm wall, contg Anhydrone; (P).
- (q) *Mariotte bottle*.—Glass 2 L bottle. Place 1-hole rubber stopper in top of bottle. Insert glass tube to 7–10 cm of bottom of bottle. Attach 3-way stopcock to top of tube. In bottom

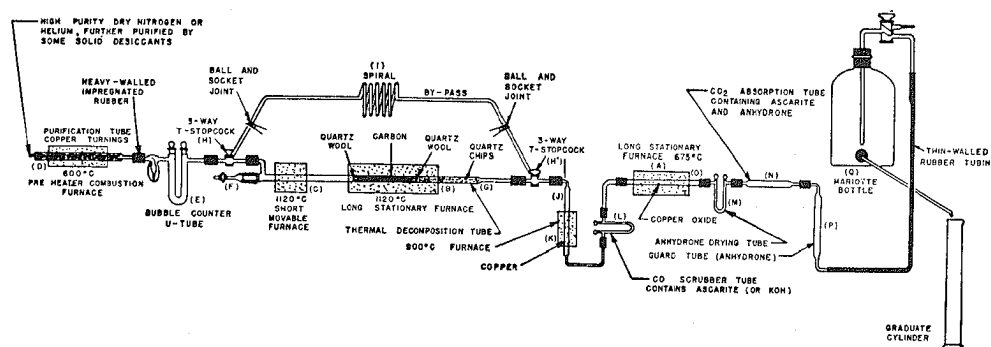

FIG. 47:04—Gravimetric setup for oxygen determination. (Note: (1) All rubber connections made of heavy-walled impregnated rubber except Mariotte bottle. (2) Tubes marked (M) and (L) may be replaced with regulation absorption tubes)

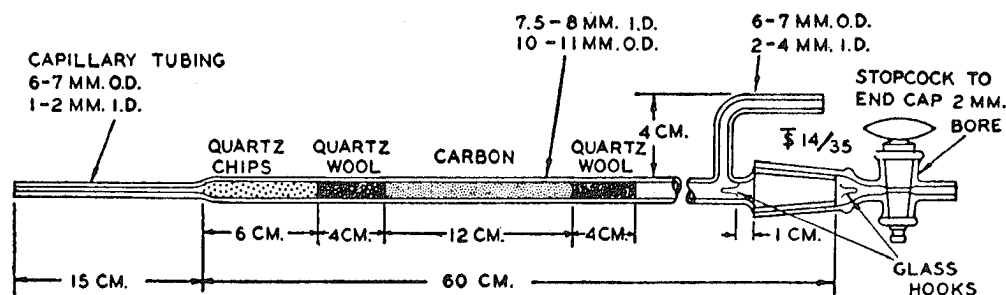

FIG. 47:05—Quartz reaction tube and filling for oxygen determination

opening insert 1-hole rubber stopper contg drain tube to 1 L graduate. Fill bottle with  $H_2O$ ; (Q).

(r) *Safety trap*.—Gas washing bottle, 125 mL, Drechsel tall-form, Kimble Products No. 15060 or equiv. Connect T-tube to top of center tube. Fill bottle ca  $\frac{1}{3}$  with Hg and connect by T-tube between preheater and N supply. (Gas pressure valve, Friedrich, or other regulator may also be used.)

(s) *Nitrogen tank*.—Use tank of high purity N equipped with pressure reducing valve, and safety valve to blow off at set pressure.

#### 47.027

#### Assembling Apparatus

Assemble as in Fig. 47:04, starting with N tank (s), not shown, and connecting as follows, using ground glass joints and paraffin-impregnated heavy-wall tubing: Safety trap (r), not shown; purification train (D); bubble counter and U-tube (E); thermal decomposition tube (G); spiral by-pass tube (I); quartz tube (J); U-tube (L); oxidn tube (O); drying tube (M);  $CO_2$  absorption tube (N); guard tube (P); and Mariotte bottle (Q).

#### 47.028

#### Conditioning Apparatus

Assemble app. up to  $CO_2$  absorption tube; set various furnaces in place. Pass slow stream of N (10 mL/min) thru system 1–2 hr at room temp. Heat all units to specified temps and continue N stream 2 days. Attach remainder of app. with arm of Mariotte bottle slightly below horizontal, and adjust ht of Hg in safety trap (r) to obtain 10 mL N/min thru system with all parts at operating temp. Record rates of bubble flow thru bubble counter and Mariotte bottle.

C in thermal decomposition tube (g) must be at  $1120^\circ$ . Best

results are obtained by keeping furnaces at specified temp. at all times, even when not in use.

#### 47.029

#### Determination

Adjust N flow to 10 mL/min with all furnaces heated to specified temp. Cool short movable furnace (C) to room temp. Weigh enough sample to produce 1.0–1.3 mg O; if solid, weigh directly in Pt boat; if liq., weigh in capillary tube, preferably quartz, and insert in Coombs-Alber Pt sleeve or long Pt boat. Turn stopcocks (H) and (H') and open stopcock on cap (F) to let N flow in reverse direction thru tube (G). Remove cap (F), and insert Pt boat contg sample to within ca 7 cm of long furnace (B) with aid of Pt hook on end of glass rod. Immediately replace cap (F) with its stopcock open and let reverse flow of N continue ca 20 min to expel all air.

Weigh  $CO_2$  absorption tube (N) as in 47.012(a) and attach in position. Close stopcock on cap (F) and turn stopcocks (H) and (H') so N flows forward thru decomposition tube (G). Open stopcock on Mariotte bottle (Q) and let N flow thru entire system at 10 mL/min. Heat movable furnace (C) to ca  $1120^\circ$ , move to within ca 3 cm of sample, and turn on automatic drive to pyrolyze sample slowly. About 25–30 min is required for furnace (C) to reach furnace (B). Move furnace forward and heat parts of tube insulated by walls of furnaces 5–10 min to pyrolyze any material condensed in cooler portions of tube. Return furnaces to original positions. Let furnace (C) cool. Continue flow of N until ca 700 mL has passed thru from beginning of pyrolysis, using exactly same amt in detn and blank. Remove  $CO_2$  absorption tube N, and reweigh as in 47.012(a).

Perform blank detn with empty Pt boat and subtract wt  $CO_2$  of blank from that of detn. (Well-functioning app. gives zero blank.)

$$\% O = Wt CO_2 \times 0.3635 \times 100/wt sample.$$

## 47.030

**Cleaning Reaction Tube**

When visibility becomes poor on thermal decomposition tube from deposited C, remove as follows: With entire app. assembled (with absorption tube and Mariotte bottle attached), close stopcock (H) to both (G) and (I). Turn stopcock (H') to connect (G) to (J). Open cap stopcock (F), lower arm of Mariotte bottle, and suck air thru reaction tube. Heat movable furnace to 1120° and move it over against long furnace; C will be burned off in few min. Close stopcock of cap (F), and turn stopcock (H) to connect reaction tube (G) with N supply. Pass N thru system overnight to remove air.

**Phosphorus (11)—Official Final Action**

## 47.031

**Reagents**

(a) *Nitric-sulfuric acid mixture*.—Slowly pour 420 mL HNO<sub>3</sub> into 580 mL H<sub>2</sub>O; then slowly add 30 mL H<sub>2</sub>SO<sub>4</sub>.

(b) *Ammonium nitrate soln*.—2%. Prep. 2% soln of NH<sub>4</sub>NO<sub>3</sub> in H<sub>2</sub>O, add 2 drops HNO<sub>3</sub>, and store in g-s bottle. Filter immediately before use.

(c) *Molybdate reagent*.—Dissolve 150 g powd NH<sub>4</sub> molybdate in 400 mL H<sub>2</sub>O and cool under tap. Place 50 g (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> in 1 L vol. flask, dissolve in mixt. of 105 mL H<sub>2</sub>O and 395 mL HNO<sub>3</sub>, and cool under tap. Pour cooled molybdate soln slowly into (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> soln with const stirring and cooling under tap. Dil. soln to 1 L, store in refrigerator 3 days, filter, and store in paraffin-lined, g-s, brown bottle in refrigerator. Filter reagent immediately before use and check by periodically analyzing std sample.

## 47.032

**Apparatus**

(a) *Kjeldahl digestion flasks (30 mL), rack, and manifold*.—See 47.022(a) and (c).

(b) *Filter tubes and filtration assembly*.—See 47.004(c) and (d).

(c) *Rubber stoppers*.—Two or three small, solid rubber stoppers to loosen ppt from walls of flask.

## 47.033

**Determination**

Weigh 3–20 mg sample, depending on P content and whether microchem. or semimicrochem. balance is used (max. wt ppt = 50 mg). Weigh in charging tube, if possible, and transfer to Kjeldahl flask. Use porcelain boat for sticky solids and viscous liqs, and glass capillary for volatile liqs.

Add 0.5 mL H<sub>2</sub>SO<sub>4</sub> followed by 4–5 drops HNO<sub>3</sub>. Heat on digestion rack to white SO<sub>3</sub> fumes and cool under tap. Add 4–5 drops HNO<sub>3</sub>, repeat digestion, and cool under tap. Add 4–5 drops HNO<sub>3</sub> and again digest to SO<sub>3</sub> fumes. Cool to room temp.; add 2 mL acid mixt., (a), and 12.5 mL H<sub>2</sub>O, rinsing down neck of flask. (If porcelain boat was used to add sample, remove boat with Pt wire; if glass capillary was used, filter digestion mixt. to remove capillary. Rinse filter and boat or capillary with 12.5 mL H<sub>2</sub>O used to dil. sample.)

Place flask on steam bath 15 min to convert P to H<sub>3</sub>PO<sub>4</sub>. Remove from steam bath and pipet 15 mL molybdate reagent, (c), into center of digest, not down walls of flask. Let stand 2–3 min; then gently swirl to mix contents, being careful to prevent reagents from splashing on neck of flask. Cover flask and set in dark place overnight.

Condition filter tube as described below and weigh empty tube. Connect tared filter tube to filtration assembly and transfer ppt to filter thru siphon tube. Wash flask alternately with 1–2 mL portions of the NH<sub>4</sub>NO<sub>3</sub> soln and alcohol. Add 2–3 small rubber stoppers to digestion flask, shake to loosen any ppt, and

transfer with the NH<sub>4</sub>NO<sub>3</sub> soln and alcohol. Disconnect siphon tube; rinse ppt from tip and stopper into filter tube with the NH<sub>4</sub>NO<sub>3</sub> soln and alcohol. Wash ppt with more NH<sub>4</sub>NO<sub>3</sub> soln, alcohol, and finally with acetone, and suck dry. Wipe filter tube with chamois skin, place in vertical position in vac. desiccator contg no desiccant, and evacuate to 1 mm for 30 min with mech. vac. pump in continuous operation. Release vac. and weigh *immediately* to nearest 0.1 mg. (Rapid weighing is essential because of hygroscopic nature of ppt.)

$$\% P = \text{mg ppt} \times 0.014524 \times 100/\text{mg sample}$$

**Sulfur****Titrimetric Carius Combustion Method (12)  
Official Final Action**

(Not applicable in presence of P)

## 47.034

**Reagents**

(a) *Fuming nitric acid*.—Reagent grade, sp gr 1.50.

(b) *Sodium chloride*.—Reagent grade, fine crystals.

(c) *Barium chloride soln*.—Approx. 0.02N. Stdze by titrg 5–7 mg freshly dried K<sub>2</sub>SO<sub>4</sub>, ACS (weighed to nearest 0.01 mg), by method used for sample titrn, 47.037. Correct titrn for indicator error by blank detn.

$$\text{Normality} = \text{mg K}_2\text{SO}_4 / 174.258 (\text{mL BaCl}_2 \text{ soln} - \text{mL blank})$$

(d) *Potassium sulfate*.—ACS, powd and dried.

(e) *Phenolphthalein soln*.—0.5% soln in 50% alcohol.

(f) *Sulfate indicator*.—"THQ" sulfate indicator (Betz Laboratories, Inc., 4636 Somerton Rd, Trevose, PA 19047) or mix 0.1 g K rhodizonate with 15 g sucrose by grinding in mortar.

## 47.035

**Apparatus**

(a) *Combustion tubes and furnace*.—See 47.004(a) and (b).

(b) *Titration assembly*.—5 mL buret graduated in 0.01 mL; rectangular titrn cell ca 2 × 4 × 5 cm with min. capacity of 50 mL; and std orange-red glass color filter (Corning Glass Works No. 3482, CS 3-67) selected to have 37% T at 550 nm. (Alternatively, use ref. titrn cell contg 30 mL of soln of 20 g Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>/L H<sub>2</sub>O.) Place cell and filter side by side on milk glass window illuminated from below, preferably by fluorescent light. Mask light source so that only cells and filter are illuminated. For best results use no overhead illumination. Place microscope slides (1–3) with ground glass surface (prepd by grinding with H<sub>2</sub>O suspension of fine SiC) over glass filter to compensate for increased turbidity.

## 47.036

**Sample**

Using microchem. balance, weigh 5–20 mg sample contg ≥0.75 mg S, or using semimicrochem. balance, weigh 10–20 mg sample contg ≥0.75 mg S (1.5 mg for gravimetric detn). Weigh samples as in 47.005.

## 47.037

**Determination**

Place weighed sample in combustion tube, add NaCl 100% in excess of amt equiv. to S in sample, and proceed as in 47.006, beginning "... and add ... fuming HNO<sub>3</sub>, ..." thru end of third par. "... with glass splinters."

Transfer contents of tube to 50 mL beaker, rinsing tube 4–6 times with 3–5 mL portions H<sub>2</sub>O. Evap. to dryness on steam bath.

Dissolve residue in 10 mL H<sub>2</sub>O, pour soln into titrn cell, add 1 drop phthln, and make just alk. with ca 0.1N NaOH, then acid with ca 0.02N HCl, adding 1 drop excess. Add ca 0.15 g of the sulfate indicator, stir to dissolve, and rinse beaker 2 or 3 times,

using enough alcohol so that final soln contains ca 50%. Titr. with std  $\text{BaCl}_2$  soln from 5 mL buret until stable color of soln immediately after stirring matches std glass color filter. Make certain end point taken is real and not pseudo end point which fades on standing 1–2 min. (Addn of 1–2 drops  $\text{BaCl}_2$  soln develops definite red.) Det. blank on reagents and correct titrn.

$$\% S = (\text{mL BaCl}_2 - \text{mL blank}) \times \text{normality} \times 16.032 \times 100/\text{mg sample.}$$

**Gravimetric Carius Combustion Method (13)**  
**Official Final Action**

(Applicable in presence of P)

47.038

**Apparatus (3)**

**Crucible and filter stick.**—Porcelain crucible, ca 15 mL capacity, with black inside glaze, wt ca 10 g; with porcelain filter stick, with unglazed bottom, wt ca 2 g. (Altho filter stick is weighed with crucible, it is removed before addn of soln of residue.)

47.039

**Determination**

Dissolve residue, **47.037**, in 3 mL  $\text{H}_2\text{O}$ , pour into previously ignited and weighed (with filter stick) porcelain crucible, and rinse beaker with four 2 mL portions  $\text{H}_2\text{O}$ . Place crucible on steam bath until soln is near bp. If vol. exceeds 10–11 mL, evap. to this vol. Add dropwise 0.5 mL 10%  $\text{BaCl}_2$  soln (1 mL for samples contg >5 mg S), digest  $\geq 15$  min, and cool 15 min.

Connect porcelain filter, previously ignited and weighed with crucible, to arm of siphon with rubber tubing. Connect other arm of siphon to suction flask thru rubber stopper. Lower filter into crucible, slowly draw off soln, and rinse ppt, walls of crucible, and filter with five or six 3 mL portions HCl (1+300), drawing off as much liq. as possible. Carefully detach filter, place in crucible, wipe outside of crucible and end of filter with moist chamois or cheesecloth, and handle thereafter with crucible tongs. Place crucible and filter in larger crucible and dry in oven 10 min at ca 110°. Ignite in furnace 10 min at 700–750° (ppt may also be ignited by heating larger crucible contg crucible and filter to dull red heat with Meker burner), cool on metal block 30 min or in desiccator 1 hr, and weigh. Det. blank on reagents.

$$\% S = (\text{wt BaSO}_4 - \text{blank}) \times 0.1374 \times 100/\text{wt sample}$$

**Oxygen Flask Combustion Method (14)**  
**Official First Action**

(Not applicable in presence of P)

47.040

**Reagents**

(a) **Barium chloride soln.**—Approx. 0.02N. Stdze as follows: Accurately weigh 3.5–5.5 mg  $\text{K}_2\text{SO}_4$  into titrn cell, dissolve in 15 mL  $\text{H}_2\text{O}$ , add 0.15 g sulfate indicator, (f), and dissolve; dil. soln to 30 mL with alcohol. Titr. to end point (same color as ref. glass) with  $\text{BaCl}_2$  soln, making certain end point taken is real; see **47.042**. Titr. blank. Calc. normality as in **47.034(c)**.

(b) **Hydrogen peroxide soln.**—30% (Fisher Scientific Co. No. H-325, or equiv. purity). (Caution: See **51.070**.)

(c) **Oxygen cylinder.**—With regulator and connections for filling combustion flask.

(d) **Potassium sulfate.**—ACS, powd and dried.

(e) **Phenolphthalein soln.**—0.5% soln in 50% alcohol.

(f) **Sulfate indicator.**—Tetrahydroxyquinone (THQ) sulfate indicator (Betz Laboratories, Inc., 4636 Somerton Rd, Trevose, PA 19047) or mix 0.1 g K rhodizonate with 15 g sucrose by grinding in mortar. Vac.-dry overnight at room temp.

47.041

**Apparatus**

(a) **Mechanical shaker.**—Optional.

(b) **Oxygen flask combustion apparatus.**—Thomas-Ogg infrared igniter (Arthur H. Thomas Co. No. 6516-G10) and 500 mL thick wall combustion flask (No. 6514-F10), black sample wrappers (No. 6514-F65), Pt sample carrier, stopper, and clamp to avoid loss of sample during pressure changes which occur during combustion. App. is completely shielded within hinged cabinet. Precautions used when employing other manually operated elec. units should include proper safety shielding and reinforced gloves. Flasks must be free of org. solvs to avoid explosion.

(c) **Titration assembly.**—See **47.035(b)**.

47.042

**Determination**

Weigh sample contg ca 0.75 mg S and fold into paper carrier. Add 5 mL 0.1N NaOH and 3 drops  $\text{H}_2\text{O}_2$  to 500 mL combustion flask. Flush flask with  $\text{O}_2 \geq 2$  min. Place paper carrier contg sample in Pt basket, hang on hook of stopper, and insert stopper in flask. Ignite. Shake 30 min. (If gas phase has not cleared, let stand 10 min.) Open flask, and rinse stopper and Pt sample basket with  $\text{H}_2\text{O}$ . Transfer soln to 100 mL beaker, rinsing flask with min. vol.  $\text{H}_2\text{O}$ . Acidify with 2 mL 0.5N  $\text{HNO}_3$  ( $\geq 1$  mL in excess of base) and evap. to dryness on steam bath. Dissolve acid-free residue in ca 5 mL  $\text{H}_2\text{O}$  and transfer to titrn cell. Rinse beaker with ca 5 mL  $\text{H}_2\text{O}$ . Add 1 drop phthln and make just alk. with ca 0.1N NaOH; then acidify with ca 0.02N  $\text{HNO}_3$ . Add ca 0.15 g THQ indicator, stir to dissolve, and rinse beaker 2–3 times with enough alcohol so that final soln in cell contains ca 50% alcohol. Titr. with std  $\text{BaCl}_2$  soln from 5 mL buret until stable color of soln immediately after stirring matches std glass color filter as in **47.037**.

$$\% S = [(\text{mL BaCl}_2 - \text{mL blank}) \times \text{normality} \times 16.032 \times 100]/\text{mg sample}$$

**Alternative Oxygen Flask Combustion Method (15)**  
**Official First Action**

(Not applicable in presence of P. All reagents must be as pure as possible, since high concns of Cl, F,  $\text{NO}_3$ ,  $\text{PO}_4$ , K, and Na interfere. Useful in absence of titrn assembly necessary for THQ titrn.)

47.043

**Reagents**

(a) **Barium perchlorate std soln.**—Approx. 0.01N. Accurately weigh ca 6 g  $\text{Ba}(\text{ClO}_4)_2 \cdot 3\text{H}_2\text{O}$  and dissolve in 200 mL  $\text{H}_2\text{O}$ . Add 2 drops HCl and dil. to 1 L. Stdze as follows: Accurately weigh ca 3.8 mg S-benzylisothioureia.HCl, (e), and proceed as in **47.045**, beginning "... and fold into paper carrier." and continuing to "... and correct titrn values." Calc. factor  $F$ , mg S/mL  $\text{Ba}(\text{ClO}_4)_2$ .

$$F = (\text{mg S-benzylisothioureia.HCl} \times 0.1582)/[\text{mL Ba}(\text{ClO}_4)_2 - \text{mL blank}],$$

where 0.1582 is fraction S in S-benzylisothioureia.HCl.

(b) **Hydrogen peroxide soln.**—6%. Dil. 20 mL 30%  $\text{H}_2\text{O}_2$  (Fisher Scientific Co., No. H-325, or equiv. purity) to 100 mL with  $\text{H}_2\text{O}$ . (Caution: See **51.070**.)

(c) **Methylene blue indicator soln.**—Approx. 0.0125%. Dissolve 12.5 mg methylene blue (J. T. Baker Chemical Co., or equiv.) in 100 mL  $\text{H}_2\text{O}$ .

(d) **Oxygen cylinder.**—See **47.040(c)**.

(e) **S-Benzylisothioureia.HCl.**—Purity equiv. to NBS specifications.

(f) **Thorin indicator soln.**—Approx. 0.2%. Dissolve 200 mg thorin (J. T. Baker Chemical Co., or equiv.) in 100 mL  $\text{H}_2\text{O}$ .

## 47.044

## Apparatus

- (a) *Mechanical shaker*.—Optional.  
 (b) *Oxygen flask combustion apparatus*.—See 47.041(b).

## 47.045

## Determination

Weigh sample contg ca 0.60 mg S and fold into paper carrier. Add 10 mL 6%  $\text{H}_2\text{O}_2$  soln to 500 mL combustion flask. Flush flask with  $\text{O}_2 \geq 2$  min. Place paper carrier contg sample in Pt basket, hang on hook of stopper, and insert stopper in flask. Ignite. Shake 30 min. (If gas phase has not cleared, let stand addnl 10 min.) Open flask, and rinse stopper and Pt sample basket with alcohol. Transfer soln to 200 mL beaker, rinsing flask with alcohol. Place mag. stirring bar in beaker. Add alcohol to 100 mL mark. Add 2 drops thorin indicator soln and 2 drops methylene blue indicator soln, and titr. with  $\text{Ba}(\text{ClO}_4)_2$  soln to faint pink end point, stirring mag. Det. blank on reagents and correct titrn values. Calc. % S, using factor  $F$  from 47.043(a).

$$\% \text{ S} = [(\text{mL } \text{Ba}(\text{ClO}_4)_2 - \text{mL blank}) \times F \times 100] / \text{mg sample}$$

Alkoxy Groups (16)—Official Final Action

## 47.048

## Reagents

(a) *Acetic acid-potassium acetate-bromine soln*.—Dissolve 10 g KOAc in enough HOAc to make 100 mL, and add 3 mL Br. Prep. fresh.

(b) *Sodium acetate soln*.—Dissolve 25 g  $\text{NaOAc} \cdot 3\text{H}_2\text{O}$  in enough  $\text{H}_2\text{O}$  to make 100 mL.

(c) *Starch indicator*.—Mix ca 2 g finely powd potato starch with cold  $\text{H}_2\text{O}$  to thin paste; add ca 200 mL boiling  $\text{H}_2\text{O}$ , stirring constantly. Add ca 1 mL Hg, shake, and let soln stand over the Hg.

(d) *Sodium thiosulfate std soln*.—0.02N. Prep. daily by dilg 0.1N soln, 50.037–50.038.

(e) *Hydriodic acid*.—Place 250 mL constant boiling HI (57%, sp gr 1.7) in 500 mL r-b flask connected by  $\frac{3}{8}$  joint to air condenser, and reflux 2 hr while stream of  $\text{CO}_2$  or N bubbles thru from glass tube extending to bottom. Do not let acid vapors come in contact with org. material. As soon as refluxing stops, discontinue gas flow. Cool, and store in g-s bottle.

## 47.049

## Apparatus

Use modified Clark app., Figs. 47.06 and 47.07.

## 47.050

## Determination

Fill scrubber halfway with NaOAc soln, and fill receiver  $\frac{2}{3}$  full with freshly prepd KOAc-Br soln. Weigh enough sample in Pt boat to require ca 8 mL  $\text{Na}_2\text{S}_2\text{O}_3$  soln in detn, and place in bottom of boiling flask. Add 2.5 mL melted *phenol* from wide-tip pipet and 5 mL of the HI, and connect boiling flask. Pass  $\text{CO}_2$  thru app. from side arm of flask at uniform rate of 15 mL/min. Let reaction mixt. remain at room temp. 30 min. With mantled microburner, boil liq. at such rate that vapors of boiling liq. rise into condenser, but not more than halfway; continue boiling 60 min (first 30 min with  $\text{H}_2\text{O}$  circulating thru condenser and last 30 min with  $\text{H}_2\text{O}$  drained from condenser). Disconnect flask, remove receiver, and rinse delivery tube and contents of receiver into 125 mL erlenmeyer contg 5 mL NaOAc soln. Adjust vol. to

★ Surplus method—see inside front cover.

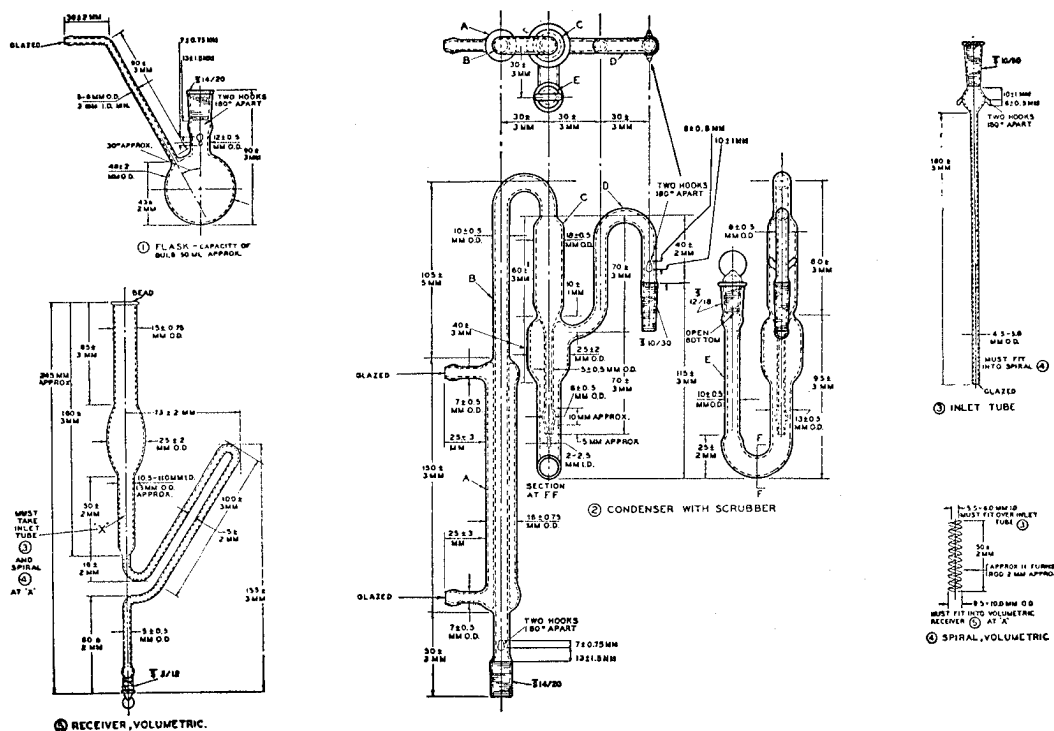

FIG. 47.06—Details of modified Clark apparatus

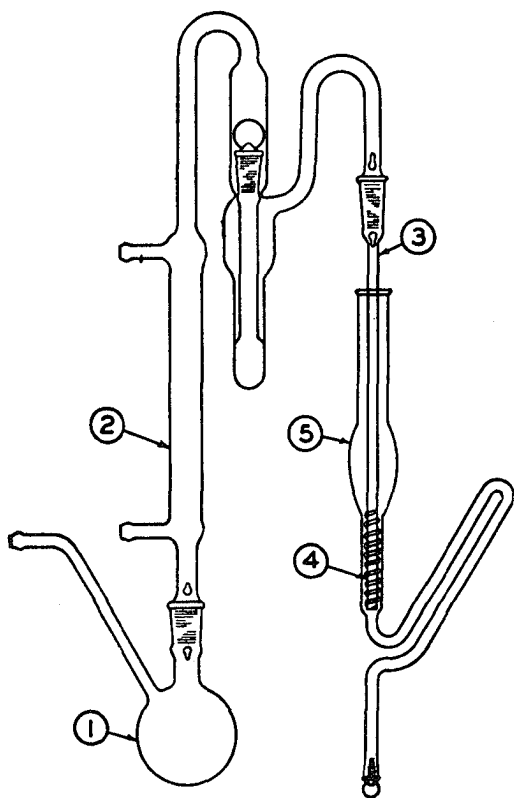

FIG. 47:07—Modified Clark apparatus

ca 50 mL and add *formic acid* dropwise until excess Br is destroyed.

Remove any Br vapors by blowing air over liq.; then add 0.5 g KI and 5 mL 10% H<sub>2</sub>SO<sub>4</sub>. Swirl soln to dissolve KI and mix contents; then titr. liberated I with the Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> soln, using starch indicator as in stdzn.

Det. blank on all reagents by making detn without sample.

% Alkoxy group = (mL in detn - mL in blank) × normality  
× equiv. wt × 100/mg sample.

Equiv. wt: methoxyl = 5.173; ethoxyl = 7.510.

#### Tritium in Water (4)—Official Final Action

### 48.005

#### Principle

Sample is distd to remove quenching materials and nonvolatile radioactive materials. Distn is to dryness to ensure complete transfer of  $^3\text{H}$  to distillate. Aliquot of distillate is mixed with scintillation soln and counted in liq. scintillation spectrometer (coincidence-type). Std  $^3\text{H}$  and background samples are prepd and counted alternately to nullify errors produced by aging of scintillation medium or instrument drift.

### 48.006

#### Apparatus

(a) *Liquid scintillation spectrometer*.—Coincidence-type. Available from Searle Analytic, Inc., 2000 Nuclear Dr, Des Plaines, IL 60018; Packard Instrument Co., 2200 Warrenville Rd, Downers Grove, IL 60515; and others.

(b) *Liquid scintillation vial*.—20 mL; low-K glass, polyethylene, nylon, or equiv. bottles, available from manufacturers under (a).

### 48.007

#### Reagents

(a) *Scintillation soln*.—Thoroly mix 4 g PPO (2,5-diphenyl-oxazole), 0.05 g POPOP (1,4-di-2-(5-phenyloxazolyl) benzene), and 120 g solid naphthalene in 1 L spectral grade 1,4-dioxane. (Available from manufacturers under 48.006(a).) Store in dark bottles. Soln is stable 2 months.

(b) *Tritium std soln*.—Pipet 4 mL  $\text{H}_2\text{O}$  of known  $^3\text{H}$  activity and 16 mL scintillation soln into scintillation vial, tightly cover vial with screw cap, and mix thoroly by shaking.

(c) *Background soln*.—Mix 4 mL distd  $\text{H}_2\text{O}$  (free of  $^3\text{H}$  activity to be measured in samples) with 16 mL scintillation soln as in (b).

★ Surplus method—see inside front cover.

### 48.008

#### Preparation of Sample

Distil 20–30 mL sample to dryness. Mix 4 mL sample distillate with 16 mL scintillation soln as in 48.007(b).

### 48.009

#### Determination

Prior to counting, dark-adapt and cool sample, background, and std solns ca 3 hr in instrument freezer at  $>2^\circ$  (to prevent solidification of soln with time), or at ambient temp. if ambient temp. liq. scintillation spectrometer is used. Count solns for total of 200,000 counts or 100 min, whichever is sooner.

### 48.010

#### Calculation

Counting efficiency,  $E = (S - B)/D$ ;

$^3\text{H}$ , pCi (picocuries)/mL =  $(C - B)/(E \times 4 \times 2.22)$ ,

where  $S$  = gross cpm (counts/min) of std,  $B$  = cpm background,  $D$  = dpm (disintegrations/min) of  $^3\text{H}$  activity in std, and  $C$  = gross cpm for sample.

#### Strontium-90 in Water (5)—Official Final Action

### 48.011

#### Principle

Applicable to  $\text{H}_2\text{O}$ , and to sewage and industrial waste if org. matter is destroyed and interfering ions are eliminated.

Added carrier Sr along with radionuclides are sep'd from other radioactive elements and inactive sample solids by pptn as  $\text{Sr}(\text{NO}_3)_2$  from fuming  $\text{HNO}_3$ . Sr is finally pptd as  $\text{SrCO}_3$ , which is dried, weighed, and set aside ca 2 weeks for ingrowth of  $^{90}\text{Y}$ . Ppt is then dissolved and  $^{90}\text{Y}$  is prep'd for counting by (a) extn by tributyl phosphate and evapg on planchet, or (b) addn of Y carrier and pptg as oxalate.

Radioactive Ba and Ra which interfere are removed by addn of Ba carrier. Ca interferes with Sr pptn, but is removed by  $\text{HNO}_3$  pptn and acetone treatment.

### 48.012

#### Apparatus

(a) *Counting pans*.—Stainless steel, ca 50 mm diam. and 7 mm deep.

(b) *Filtration assembly*.—For mounting ppts for counting. Consists of (1) 2-piece filtering app. for 2.4 cm filter such as stainless steel filter holder (Interex Corp., 3 Strathmore Rd, Natick, MA 01760, No. 12-103; ICN Pharmaceuticals, Inc., Life Sciences Group, No. 83012), Teflon filter holder, or equiv. (2) Nylon (Zytel 101) disk with ring for mounting ppt (Control Molding Corp., PO Box F, Mariners Harbor Station, Staten Island, NY 10303, No. J-356).

(c) *Film, Mylar*.—To cover ppts during counting and storage, ca 1 mil (0.025") thick. Available in rolls 1.5" (3.8 cm) wide as manufacturer's No. 92A, E. I. du Pont de Nemours, Film Dept, Wilmington, DE 19898.

(d) *Glass fiber filter paper*.—No. 934-AH, 2.4 cm diam., available from H. Reeve Angel and Co.

(e) *Centrifuge tubes*.—40 mL, heavy duty with short cone bottom and pour-out lip.

(f) *Beta particle counter*.—Low background, shielded, anti-coincidence counter. Det. counter efficiency for  $^{90}\text{Y}$  as oxalate and  $^{89}\text{Sr}$  as carbonate for specific counter and geometry.

## 48.013

## Reagents

(a) *Dilute acetic acid*.—6*N*. Add 345 mL HOAc to H<sub>2</sub>O and dil. to 1 L.

(b) *Ammonium acetate buffer*.—pH 5.5. Dissolve 154 g NH<sub>4</sub>OAc in 700 mL H<sub>2</sub>O, add 57 mL HOAc, adjust pH to 5.5 with dropwise addn of either HOAc or 6*N* NH<sub>4</sub>OH, as necessary, and dil. to 1 L.

(c) *Dilute ammonium hydroxide*.—6*N*. Dil. 400 mL NH<sub>4</sub>OH to 1 L with H<sub>2</sub>O.

(d) *Barium carrier soln*.—10 mg Ba/mL. Dissolve 19.0 g Ba(NO<sub>3</sub>)<sub>2</sub> in H<sub>2</sub>O and dil. to 1 L.

(e) *Dilute hydrochloric acid*.—6*N*. Add 500 mL HCl to H<sub>2</sub>O and dil. to 1 L.

(f) *Fuming nitric acid*.—21*N*. Sp gr 1.48, 90% HNO<sub>3</sub>.

(g) *Dilute nitric acid*.—(1) 14*N*.—Add 875 mL HNO<sub>3</sub> to H<sub>2</sub>O and dil. to 1 L. (2) 6*N*.—Add 384 mL HNO<sub>3</sub> to H<sub>2</sub>O and dil. to 1 L. (3) 0.1*N*.—Add 6.25 mL HNO<sub>3</sub> to H<sub>2</sub>O and dil. to 1 L.

(h) *Oxalic acid soln*.—Satd. Approx. 11 g H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>·2H<sub>2</sub>O in 100 mL H<sub>2</sub>O.

(i) *Mixed rare earth carrier soln*.—Dissolve 12.8 g Ce(NO<sub>3</sub>)<sub>3</sub>·6H<sub>2</sub>O, 14 g ZrOCl<sub>2</sub>·8H<sub>2</sub>O, and 25 g FeCl<sub>3</sub>·6H<sub>2</sub>O in 600 mL H<sub>2</sub>O contg 10 mL HCl, and dil. to 1 L. (Caution: Ce(NO<sub>3</sub>)<sub>3</sub> is toxic. Wear resistant rubber or plastic gloves.)

(j) *Sodium carbonate soln*.—2*N*. Dissolve 142 g Na<sub>2</sub>CO<sub>3</sub>·H<sub>2</sub>O in H<sub>2</sub>O and dil. to 1 L.

(k) *Sodium chromate soln*.—0.5*M*. Dissolve 117 g Na<sub>2</sub>CrO<sub>4</sub>·4H<sub>2</sub>O in H<sub>2</sub>O and dil. to 1 L.

(l) *Sodium hydroxide soln*.—6*N*. Dissolve 240 g NaOH in H<sub>2</sub>O and dil. to 1 L.

(m) *Strontium carrier soln*.—10 mg Sr/mL. Dissolve 24.16 g Sr(NO<sub>3</sub>)<sub>2</sub> in H<sub>2</sub>O and dil. to 1 L. Stdze by pipetting (in triplicate) 10 mL soln into 40 mL centr. tubes and adding 15 mL 2*N* Na<sub>2</sub>CO<sub>3</sub>. Stir and heat in boiling H<sub>2</sub>O bath 15 min. Filter thru weighed, fine porosity, fritted glass, 15 mL crucible. Wash with three 5 mL portions H<sub>2</sub>O and three 5 mL portions absolute alcohol or acetone, wipe crucible with absorbent tissue, and dry to const wt at 110° (ca 20 min). Cool in desiccator and weigh.

$$\text{mg Sr/mL} = \text{mg SrCO}_3 \times 0.5935/10.$$

(n) *Tributyl phosphate (TBP), equilibrated*.—Shake TBP with equal vol. 14*N* HNO<sub>3</sub>. Sep. and discard lower acid phase.

(o) *Yttrium carrier soln*.—10 mg Y/mL. Dissolve 12.7 g Y<sub>2</sub>O<sub>3</sub> in 30 mL HNO<sub>3</sub> by stirring and heating. Add addnl 20 mL HNO<sub>3</sub> and dil. to 1 L with H<sub>2</sub>O. 1 mL = 34 mg Y<sub>2</sub>(C<sub>2</sub>O<sub>4</sub>)<sub>3</sub>·9H<sub>2</sub>O. Det. exact equivalence as in 48.014(f) or (g).

## 48.014

## Determination

(Caution: See 51.026 and 51.031.)

(a) *Precipitation as carbonate*.—To 1 L drinking H<sub>2</sub>O (or less, but contg  $\geq 25$  pCi <sup>90</sup>Sr) or filtered raw H<sub>2</sub>O sample in beaker, add 2.0 mL HNO<sub>3</sub> and mix. Add 2.0 mL each of Ba and Sr carrier solns and mix well. (Ppt of BaSO<sub>4</sub> will not cause difficulty.) Heat to bp, and add 20 mL 6*N* NaOH and 20 mL 2*N* Na<sub>2</sub>CO<sub>3</sub>. Stir, and let simmer ca 1 hr at 90–95°. Let cool until ppt has settled (1–3 hr). Decant and discard supernate. Transfer ppt to 40 mL centr. tube, centr., and discard supernate.

(b) *Purification as nitrate*.—Cautiously add 4 mL HNO<sub>3</sub> dropwise to ppt. Heat to bp, stir, and cool under running H<sub>2</sub>O. Add 20 mL fuming HNO<sub>3</sub>, cool 5–10 min in ice bath, stir, and centr. Discard supernate. Add 4 mL H<sub>2</sub>O to residue, stir, and heat to bp to dissolve Sr(NO<sub>3</sub>)<sub>2</sub>. Centr. while hot and decant supernate into clean centr. tube. Add 2 mL 6*N* HNO<sub>3</sub> to residue, heat to bp, centr. while hot, and combine supernate with aq. supernate. Discard insol. residue of BaSO<sub>4</sub>, SiO<sub>2</sub>, etc.

Cool combined supernates, add 20 mL fuming HNO<sub>3</sub>, cool

5–10 min in ice bath, stir, centr., and discard supernate. Add 4 mL H<sub>2</sub>O to ppt and dissolve by heating, cool, add 20 mL fuming HNO<sub>3</sub>, cool 5–10 min in ice bath, stir, centr., and discard supernate. If  $>200$  mg Ca is present in sample, repeat H<sub>2</sub>O soln and fuming HNO<sub>3</sub> pptn.

(c) *Removal of rare earths*.—After last HNO<sub>3</sub> pptn, invert tube in beaker ca 10 min to drain off most of excess HNO<sub>3</sub>. Add 20 mL acetone to ppt. Stir thoroly, cool, centr., and discard supernate. Dissolve ppt of Sr and Ba nitrates in 10 mL H<sub>2</sub>O and boil 30 sec to remove any remaining acetone.

Add 0.25 mL mixed rare earth carrier soln and ppt rare earth hydroxides by making soln basic with 6*N* NH<sub>4</sub>OH. Digest in boiling H<sub>2</sub>O bath 10 min. Cool in ice bath, centr., decant supernate to clean tube, and discard ppt. Repeat addn of rare earth carrier soln, pptn, and decantation. Note time as beginning of <sup>90</sup>Y ingrowth period.

(d) *Removal of barium*.—Add 2 drops Me red indicator and then 6*N* HOAc, dropwise with stirring, until soln is red. Add 5 mL acetate buffer soln, heat to bp, and add 2 mL Na<sub>2</sub>CrO<sub>4</sub> soln dropwise with stirring. Digest in boiling H<sub>2</sub>O bath 5 min. Cool in ice bath, centr., decant supernate into clean tube, and discard residue.

(e) *Precipitation as strontium carbonate*.—Add 2 mL 6*N* NaOH to supernate; then add 5 mL 2*N* Na<sub>2</sub>CO<sub>3</sub> and heat to bp. If pH is  $<9$ , add addnl NaOH soln. Cool in ice bath ca 5 min, centr., and discard supernate. Add 15 mL H<sub>2</sub>O to ppt, stir, centr., and discard wash H<sub>2</sub>O. Repeat washing and weigh SrCO<sub>3</sub> as in (1) or (2):

(1) Slurry ppt with small vol. H<sub>2</sub>O, and transfer to weighed stainless steel pan. Dry under IR lamp, cool, and weigh. (2) Transfer ppt to weighed paper or glass filter mounted in 2 piece funnel. Let settle by gravity for uniform deposition; then apply suction. Wash ppt with three 5 mL portions H<sub>2</sub>O, three 5 mL portions alcohol, and three 5 mL portions ether or acetone. Dry 15–30 min in 110–125° oven, cool, and weigh.

Store ppt  $\geq 2$  weeks to permit ingrowth of <sup>90</sup>Y. Sep. and count <sup>90</sup>Y by (f) or (g).

(f) *Separation by TBP extraction*.—If SrCO<sub>3</sub> is weighed in pan, place pan in small funnel in mouth of 60 mL separator and carefully add 1 mL 6*N* HNO<sub>3</sub> dropwise. Tilt pan to empty, and rinse with two 2 mL portions 6*N* HNO<sub>3</sub>.

If SrCO<sub>3</sub> is weighed on filter, dislodge bulk of ppt into small funnel in mouth of 60 mL separator. Cautiously add 1 mL 6*N* HNO<sub>3</sub> dropwise to dissolve remaining ppt. Rinse filter and funnel with two 2 mL portions of 6*N* HNO<sub>3</sub>.

Remove pan or filter and add 10 mL fuming HNO<sub>3</sub> to separator thru funnel. Remove funnel and add 1 mL Y carrier soln to separator. Add 5.0 mL TBP, shake thoroly 3–5 min, let sep., and transfer aq. layer to second 60 mL separator. Add 5.0 mL TBP to second separator, shake 5 min, let sep., and transfer aq. layer to third 60 mL separator. Combine TBP exts and wash with two 5 mL portions 14*N* HNO<sub>3</sub>. Record time as beginning of <sup>90</sup>Y decay. (Combine acid washings with aq. phase in third separator if second ingrowth of <sup>90</sup>Y is desired.)

Back-ext <sup>90</sup>Y from combined org. phase with 10 mL 0.1*N* HNO<sub>3</sub>, 5 min. Either (1) repeat TBP extrn as above, beginning "Add 5.0 mL TBP, . . ." and finally back-extg <sup>90</sup>Y into 10 mL 0.1*N* HNO<sub>3</sub> and continue as in (g), line 10 beginning "Gradually . . ."; or (2) transfer aq. phase to 50 mL beaker and evap. on hot plate to 5–10 mL. Transfer residual soln to weighed stainless steel counting pan and evap. Rinse with two 2 mL portions 0.1*N* HNO<sub>3</sub>, add rinsings to counting pan, evap. to dryness, and weigh. Count in internal proportional or end window counter and calc. <sup>90</sup>Sr as in 48.015.

(g) *Separation by yttrium oxalate precipitation*.—Dissolve SrCO<sub>3</sub> by cautiously adding 2 mL 6*N* HNO<sub>3</sub> dropwise, and

transfer to 40 mL centr. tube, rinsing with 0.1N HNO<sub>3</sub>. Add 1 mL Y carrier soln, 2 drops Me red, and NH<sub>4</sub>OH dropwise to Me red end point. Add addnl 5 mL NH<sub>4</sub>OH and record time as end of <sup>90</sup>Y ingrowth and beginning of decay. Centrf. and decant supernate into beaker. (Save supernate and washings for second ingrowth, if desired.) Wash ppt with two 20 mL portions hot H<sub>2</sub>O. Add 5–10 drops 6N HNO<sub>3</sub>, stir to dissolve ppt, add 25 mL H<sub>2</sub>O, and heat in H<sub>2</sub>O bath at 90°. Gradually add 15–20 drops satd oxalic acid soln with stirring, and adjust pH to 1.5–2.0 (pH meter or indicator paper) with dropwise addn of NH<sub>4</sub>OH. Digest ppt 5 min; then cool in ice bath with occasional stirring.

Transfer ppt to weighed glass fiber filter in 2-piece funnel. Let ppt settle by gravity for uniform deposition and then apply suction. Wash ppt with 10–15 mL H<sub>2</sub>O, three 5 mL portions alcohol, and then three 5 mL portions ether. Air dry ppt 2 min with suction, weigh, mount on nylon disk and ring with Mylar cover, count, and calc. <sup>90</sup>Sr as in 48.015.

#### 48.015

#### Calculations

##### (a) Strontium-90 calculation.—

$$^{90}\text{Sr}, \text{ pCi/L} = \text{net cpm}/(\text{abcdfg} \times 2.22),$$

where a = counting efficiency for <sup>90</sup>Y; b = chem. yield (fraction) of extd or pptd <sup>90</sup>Y; c = mg final Y oxalate ppt/mg Y oxalate in 1 mL carrier; d = chem. yield (fraction) of Sr detd as in 48.014(e) (20 mg Sr equiv. to 33.6 mg SrCO<sub>3</sub>) or by flame photometry; f = vol., L, original sample; g = <sup>90</sup>Y decay factor =  $e^{-\lambda t}$ ; e = base of natural logarithms;  $\lambda = 0.693/T_{1/2}$ ;  $T_{1/2} = 64.2$  hr for <sup>90</sup>Y; and t = time, hr, between sepn and counting.

(b) Counting efficiency.—Prep. curve from various wts Y oxalate ppt spiked with <sup>90</sup>Sr/<sup>90</sup>Y, pptd as in 48.014(g).

(c) Correction for carrier recovery.—If sample contains more than trace stable Sr, it will act as carrier and will result in >100% yield. In such case det. Sr by flame photometry.

#### Strontium-89 and Strontium-90 in Milk

#### Ion Exchange Method (6)—Official Final Action

#### 48.016

#### Principle

Fresh milk samples are preserved with HCHO and stored to obtain <sup>90</sup>Y ingrowth. After storage, Y, Sr, and Ba carriers and citrate soln are added. Citrate forms Y complex which is adsorbed on anion exchange resin. Y is desorbed and sepd from radionuclides by tributyl phosphate extn. Y is re-extd into dil. HNO<sub>3</sub> and pptd as oxalate, which is weighed and counted for <sup>90</sup>Y activity to calc. <sup>90</sup>Sr.

Radio-Sr is desorbed along with Ca and radio-Ba; Ca, radio-Ba, and rare earth radionuclides are sepd by repetitive pptns; Sr is pptd as SrCO<sub>3</sub> and counted. Total radio-Sr minus <sup>90</sup>Sr by <sup>90</sup>Y measurement yields value for <sup>89</sup>Sr.

Milk contg known increments of <sup>89</sup>Sr and <sup>90</sup>Sr detd in triplicate by 11 laboratories showed following results (av. of triplicates):

	Amt Present, pCi/L	Std Dev.		Bias	
		%	pCi/L	%	pCi/L
<sup>89</sup> Sr	29.0	10.0	2.9	+7.0	+2.0
	197.0	3.4	7.2	+1.5	+3.0
<sup>90</sup> Sr	32.4	0.9	0.3	+0.3	+0.1
	151.2	2.8	4.2	-0.9	-1.3

#### 48.017

#### Operating Notes

Radio-Ba and La radionuclides will interfere without purification. Purification from Ca is important for recovery tests but

need not be as thoro if Sr recovery is detd by <sup>85</sup>Sr tracer or flame photometry. Thoro desorb columns before re-use and test periodically to assure complete desorption.

#### 48.018

#### Apparatus

See 48.012(b)–(f), plus following:

**Ion exchange system.**—Consists of 1 L graduated separator, 250 mL separator with fritted glass disk as cation exchange column, and 30 mL separator with fritted glass disk as anion exchange column (Kontes Glass Co., No. K-427530).

#### 48.019

#### Reagents

See 48.013(c), (e)–(g), plus following:

(a) **Ammonium acetate buffer.**—pH 5.0. Dissolve 153 g NH<sub>4</sub>OAc in 900 mL H<sub>2</sub>O. Adjust pH to 5.0 with HOAc, using pH meter, and dil. to 1 L.

(b) **Anion exchange resin.**—Dowex 1-X8 (Cl form), anal. grade, 50–100 mesh size, available from Bio-Rad Laboratories, 32nd and Griffin Aves, Richmond, CA 94804.

(c) **Barium carrier soln.**—20 mg Ba/mL. Dissolve 38.1 g Ba(NO<sub>3</sub>)<sub>2</sub> in H<sub>2</sub>O, add 1 mL HNO<sub>3</sub>, and dil. to 1 L.

(d) **Cation exchange resin.**—Dowex 50W-X8 (Na form), anal. grade, 50–100 mesh size, available from Bio-Rad Laboratories. Convert com. available H form into Na form by passing 1.5 L 4N NaCl thru 170 mL resin placed in column and rinsing with ca 500 mL H<sub>2</sub>O until wash H<sub>2</sub>O is Cl-free when tested with 1% AgNO<sub>3</sub>.

(e) **Citrate soln.**—2M. Dissolve 384 g anhyd. citric acid (420 g monohydrate) in H<sub>2</sub>O, adjust to pH 6.5 with dil. NaOH soln, and dil. to 1 L.

(f) **Oxalic acid soln.**—2N. Dissolve 126 g H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>·H<sub>2</sub>O in warm H<sub>2</sub>O, cool, and dil. to 1 L.

(g) **Silver nitrate soln.**—1%. Dissolve 1 g AgNO<sub>3</sub> in H<sub>2</sub>O and dil. to 100 mL. Store in brown bottle.

(h) **Sodium chloride soln.**—4N. Dissolve 236 g NaCl in H<sub>2</sub>O and dil. to 1 L.

(i) **Sodium carbonate soln.**—3N. Dissolve 159 g Na<sub>2</sub>CO<sub>3</sub> in H<sub>2</sub>O and dil. to 1 L.

(j) **Sodium chromate soln.**—1N. Dissolve 81 g Na<sub>2</sub>CrO<sub>4</sub> in H<sub>2</sub>O and dil. to 1 L.

(k) **Strontium carrier soln.**—20 mg Sr/mL. Dissolve 48.3 g Sr(NO<sub>3</sub>)<sub>2</sub> in H<sub>2</sub>O, add 1 mL HNO<sub>3</sub>, and dil. to 1 L. Stdze by pipetting 1 mL portions into six sep. 40 mL centr. tubes contg 15 mL H<sub>2</sub>O. Adjust pH (indicator paper or meter) to 8.5–9.0 with 6N NH<sub>4</sub>OH. Add, with stirring, 3–5 mL 3N Na<sub>2</sub>CO<sub>3</sub> and digest 5 min in near boiling H<sub>2</sub>O bath. Cool to room temp. and process ppt as in 48.022(d) or (e).

(l) **Tributyl phosphate (TBP), pre-equilibrated.**—Add 150 mL H<sub>2</sub>O and 30 mL 3N Na<sub>2</sub>CO<sub>3</sub> to 300 mL TBP in 1 L separator. Shake 2–3 min and let sep. Discard lower aq. phase. Add 150 mL H<sub>2</sub>O to separator, shake 2–3 min, and let sep. Discard lower aq. phase. Add 150 mL 14N HNO<sub>3</sub> and shake 5 min. Let sep. and discard lower aq. phase. Repeat 14N HNO<sub>3</sub> treatment twice.

(m) **Yttrium carrier soln.**—10 mg Y/mL. Dissolve 12.7 g Y<sub>2</sub>O<sub>3</sub> in 50 mL HNO<sub>3</sub> by heating (avoid boiling). Dil. to 900 mL with H<sub>2</sub>O, adjust pH to 2.0 with NH<sub>4</sub>OH, and dil. to 1 L with H<sub>2</sub>O. Stdze by pipetting 1 mL portions into each of six 40 mL centr. tubes contg 15 mL H<sub>2</sub>O. Add 5 mL 2N oxalic acid and adjust pH to 1.5 with 6N NH<sub>4</sub>OH, using pH meter. Digest in hot H<sub>2</sub>O bath 10 min, and cool to below room temp. Centrf. and discard supernate. Process ppt as in 48.022(d) or (e).

Use Y<sub>2</sub>O<sub>3</sub> of 99.999% purity (Ventron Corp., Alfa Products, 8 Congress St, Beverly, MA 01915). Material of lower purity may require purification because of radioactive contaminants.

## 48.020

**Preparation of Sample**

Preserve freshly drawn sample with ca 3 mL HCHO soln for each L milk and refrigerate for known period of time up to 2 weeks to allow  $^{90}\text{Y}$  ingrowth. Thoroughly mix preserved, stored sample. If homogeneous, transfer 1 L to separator, **48.018**. If nonhomogeneous, before transfer, filter thru loose bed of Pyrex glass wool to prevent clogging of resin columns.

## 48.021

**Removal of Radioelements by Ion Exchange**

Combine 1.00 mL each of Y, Sr, and Ba carriers with 10 mL citrate soln, (e) in small beaker or vial. Transfer quant. to 1 L sample in separator, and mix well.

Add 170 mL Dowex 50W-X8, (d), to 250 mL separator filled with  $\text{H}_2\text{O}$ . Add 15 mL Dowex 1-X8, (b), to 30 mL separator filled with  $\text{H}_2\text{O}$ . Connect all separators together in order sample (top), anion column, cation column (bottom), and place beaker to collect effluent. Open stopcocks of sample, anion, and cation separators, in that order, and note time. Control effluent rate at 10 mL/min with anion column stopcock. Check and adjust effluent flow periodically.

Stop flow when milk level reaches top of each resin bed and note time. Record as mean time the av. period of effluent flow. This time is taken as beginning of  $^{90}\text{Y}$  decay. Do not permit unnecessary delay during elution. Discard eluate.

Connect separator contg 300 mL warm  $\text{H}_2\text{O}$ , continue elution at 10 mL/min as above, and discard.

## 48.022

**Yttrium-90 Separation, Purification, and Determination**

Connect separator contg 100 mL 2N HCl to top of anion separator. Open upper stopcock and then lower stopcock, and control effluent flow at 2 mL/min. Collect 15 mL eluate. Close both stopcocks and remove top separator. Stir resin thoroughly with glass stirring rod, and rinse into resin column with small vol. 2N HCl. Reconnect separator, and continue 2N HCl elution, collecting total of 70 mL Y eluate. Retain eluate.

Adjust flow rate to 10 mL/min for remaining 30 mL acid to recharge separator. Discard this eluate. Wash resin with  $\geq 100$  mL  $\text{H}_2\text{O}$  until Cl-free by  $\text{AgNO}_3$  test. Separator is ready for next detn.

Add 5 mL 2N oxalic acid to retained eluate and adjust pH to 1.5 with 6N  $\text{NH}_4\text{OH}$ , using pH meter. Stir, heat to near bp in  $\text{H}_2\text{O}$  bath, cool in ice bath, centr., decant, and discard supernate. Proceed as in (a) or (b), depending on whether  $^{140}\text{Ba}$ - $^{140}\text{La}$  is absent or present from gamma analysis of sample.

(a) *If fresh fission products are absent.*—Dissolve ppt in 1 mL 6N HCl, add 15 mL  $\text{H}_2\text{O}$ , and filter thru Whatman No. 541 paper into 40 mL centr. tube. Wash paper, collecting washings in tube, discard paper, and continue as in (c).

(b) *If fresh fission products are present.*—Dissolve ppt in 10 mL  $\text{HNO}_3$ ; transfer soln to 60 mL separator, washing centr. tube with addnl 10 mL  $\text{HNO}_3$ . Add 10 mL equilibrated TBP, (I), shake 2–3 min, let sep., and drain and discard lower acid phase. Add 15 mL 14N  $\text{HNO}_3$  to separator, shake 2–3 min, let sep., and drain and discard lower acid phase. Repeat 14N  $\text{HNO}_3$  treatment to remove light lanthanide elements, particularly  $^{140}\text{La}$ . Add 15 mL  $\text{H}_2\text{O}$  to separator and shake 2–3 min. Let sep., and drain aq. phase contg most of Y into 40 mL centr. tube. Repeat wash, using 15 mL 0.1N  $\text{HNO}_3$ , adding it to centr. tube.

(c) *Preparation of yttrium oxalate.*—Add 5 mL 2N oxalic acid to purified Y soln from (a) or (b), and adjust to pH 1.5 with  $\text{NH}_4\text{OH}$ , using pH meter. Digest soln in hot  $\text{H}_2\text{O}$  bath 10 min with occasional mixing. Cool in ice bath, centr., and discard supernate. Sep. and count  $^{90}\text{Y}$  oxalate as in (d) or (e), stdze carrier by

the same technic used for sample, and calc.  $^{90}\text{Sr}$  activity from  $^{90}\text{Y}$  count as in **48.024(a)**.

(d) *Filtration method.*—Place 2.8 cm glass fiber filter on stainless steel planchet and weigh together. Transfer tared filter to filter holder, **48.012(b)(7)**, and assemble.

With  $\text{H}_2\text{O}$  spray, quant. transfer Y oxalate ppt to filter funnel, using min. of suction so that ppt is distributed uniformly over filter area. Increase suction as necessary after most of ppt is on filter. Wash ppt with three 10 mL portions warm  $\text{H}_2\text{O}$ , three 5 mL portions alcohol, and three 5 mL portions ether. Continue suction ca 2–3 min. Carefully remove filter, place on original planchet, and let stand at room temp. 10–15 min. Weigh and calc. yield Y oxalate (likely  $\text{Y}_2(\text{C}_2\text{O}_4)_3 \cdot 9\text{H}_2\text{O}$ ) by dividing this wt by wt obtained on stdzn of carrier, **48.019(m)**.

Remove filter from planchet, place on top of nylon disk, cover with piece of Mylar film, place nylon ring over Mylar film, and press ring onto nylon disk. Cut off excess film. Count  $^{90}\text{Y}$  activity, without undue delay, in low background anticoincidence beta counter. Repeat counting after 3 days to confirm purity of  $^{90}\text{Y}$  by its rate of decay. Record dates and time of counting.

(e) *Direct dispersion method.*—Wash ppt twice with 20 mL portions warm  $\text{H}_2\text{O}$ , cool to below room temp., centr., and discard supernate. Quant. transfer ppt to tared stainless steel dish. Uniformly disperse ppt over dish bottom and dry under IR lamp to const wt. Count in  $\beta$  particle counter.

## 48.023

**Strontium-89 Separation, Purification, and Determination**

(Caution: See **51.026** and **51.031**.)

Connect 1 L separator contg 1 L 4N NaCl to cation separator. Open upper stopcock and then lower stopcock, and control effluent flow at 10 mL/min. Collect ca 1 L eluate in 2 L beaker, but leave resin covered with 2–3 mL soln. Retain eluate.

Wash cation separator with 500 mL  $\text{H}_2\text{O}$  from top separator at rate of 10 mL/min. Discard wash  $\text{H}_2\text{O}$ . If resin becomes clogged with milk solids, back-wash separator or transfer resin to beaker, agitate with  $\text{H}_2\text{O}$ , and decant.

Dil. retained eluate to 1.5 L with  $\text{H}_2\text{O}$ , heat to 85–90° on hot plate, and add 100 mL 3N  $\text{Na}_2\text{CO}_3$  with gentle stirring. Remove from heat and cool to room temp. Decant bulk of clear supernate. Quant. transfer ppt to 250 mL centr. bottle with  $\text{H}_2\text{O}$  and centr.; discard supernate. Add 50 mL  $\text{H}_2\text{O}$  and disperse ppt. Centr., discard supernate, and repeat. Dry ppt 4 hr in oven at 110°.

Dissolve ppt with vigorous stirring by adding ca 4 mL 6N  $\text{HNO}_3$  in small amts (mag. stirrer is helpful). Filter thru Whatman No. 541 paper into 40 mL graduated centr. tube. Rinse bottle with 4 mL 6N  $\text{HNO}_3$  and pour washing thru paper. Discard paper. Add 20 mL 21N  $\text{HNO}_3$  to filtrate. Stir and cool in ice bath; centr. and discard supernate. ( $\text{Sr}(\text{NO}_3)_2$  pptn is critical in obtaining good recovery of Sr adequately sepd from Ca.) Recoveries from single pptn are as follows:

[ $\text{HNO}_3$ ]	Sr Rec., %	Ca Rec., %
14N	81 ± 4	2.6 ± 0.9
16N	98 ± 1.4	11 ± 2
18N	100 ± 1.7	51 ± 3

Dissolve ppt in 5 mL  $\text{H}_2\text{O}$  and adjust to pH 5.0 with  $\text{NH}_4\text{OH}$ , using pH meter. Add 5 mL  $\text{NH}_4\text{OAc}$  buffer. Heat in  $\text{H}_2\text{O}$  bath, add 1 mL 1N  $\text{Na}_2\text{CrO}_4$ , and mix well. Digest in bath 5 min. Centr. and decant supernate into small beaker. Evap. to ca 2 mL, add 2 mL 6N  $\text{HNO}_3$ , and transfer to 40 mL centr. tube, using one 3 mL  $\text{H}_2\text{O}$  rinse. Add 20 mL 21N  $\text{HNO}_3$ , stir, cool in ice bath, centr., and discard supernate. Add 3 mL  $\text{H}_2\text{O}$  and 5 mL 6N  $\text{HNO}_3$  to

dissolve ppt. Add 20 mL 21*N* HNO<sub>3</sub>, stir, cool in ice bath, centr., and discard supernate. Record time as beginning of <sup>90</sup>Y ingrowth.

Dissolve ppt in few mL H<sub>2</sub>O and adjust pH to 8.5–9.0 with 6*N* NH<sub>4</sub>OH. Add 3–5 mL 3*N* Na<sub>2</sub>CO<sub>3</sub> to ppt SrCO<sub>3</sub>. Centr., and discard supernate. Disperse ppt in 10 mL H<sub>2</sub>O, centr., and discard supernate. Sep. and count SrCO<sub>3</sub> as in (a) or (b):

(a) *Filtration method*.—Proceed as in 48.022(d), but wash ppt with three 5–10 mL portions H<sub>2</sub>O, transfer to original planchet, and dry 30 min in oven at 110°. Cool in desiccator and weigh. Count as in 48.022(d), record time of counting, and calc. <sup>89</sup>Sr as in 48.024(b).

(b) *Direct dispersion method*.—Wash ppt twice with ca 10 mL portions H<sub>2</sub>O, dispersing ppt, centr., and decant and discard supernate. Quant. transfer ppt to tared stainless steel dish. Uniformly disperse ppt over dish bottom, dry 30 min in 110° oven. Cool in desiccator and weigh. Count in β particle counter. Record time of counting and calc. <sup>89</sup>Sr as in 48.024(b).

#### 48.024

#### Calculations

(a) *For strontium-90 activity*.—

$$^{90}\text{Sr activity, pCi/L} = (\text{cpm} \pm \sigma) / R_S R_Y E_Y D_Y I_Y V,$$

where cpm = net beta count rate of <sup>90</sup>Y

$$\sigma = \sqrt{\frac{N_s}{t_s} + \frac{N_b}{t_b}}$$

N<sub>s</sub> = sample count rate

N<sub>b</sub> = background count rate

t<sub>s</sub> = sample counting time

t<sub>b</sub> = background counting time

R<sub>S</sub> = fraction Sr carrier recovered

R<sub>Y</sub> = fraction Y carrier recovered

E<sub>Y</sub> = counter efficiency for <sup>90</sup>Y as Y oxalate, cpm/pCi

D<sub>Y</sub> = decay correction factor (= e<sup>-λt</sup>, defined in 48.015(a)) for <sup>90</sup>Y, where t is time of sepg <sup>90</sup>Y from Sr to time of counting, 48.022(d) or (e)

I<sub>Y</sub> = ingrowth correction factor (= 1 - e<sup>-λt</sup>) for degree of equilibrium attained during <sup>90</sup>Y ingrowth period, where t is time from start of ingrowth period to time of sepg <sup>90</sup>Y from Sr

V = sample vol., L.

(b) *For strontium-89 activity*.—

$$^{89}\text{Sr activity, pCi/L} = \frac{1}{E_S D_S} \left[ \frac{N_s + \sigma}{R_S V} - C_s (a_s E'_s + E_Y I_Y) \right]$$

where E<sub>S</sub> = counter efficiency for <sup>89</sup>Sr as SrCO<sub>3</sub>, cpm/pCi

D<sub>S</sub> = decay correction factor (= e<sup>-λt</sup>) for <sup>89</sup>Sr, where t is time from sample collection to time of counting

$$\sigma = \sqrt{\frac{N_s}{t_s} + \frac{N_b}{t_b}}$$

R<sub>S</sub> = fraction Sr carrier recovered

N<sub>s</sub> = net counts/min of observed radio-Sr

V = sample vol., L

C<sub>s</sub> = <sup>90</sup>Sr activity, pCi/L

a<sub>s</sub> = absorption factor for <sup>90</sup>Sr as SrCO<sub>3</sub> obtained from self-absorption calibration curve. (Self-absorption curves for <sup>89</sup>Sr and <sup>90</sup>Sr derived by pptg series of carrier SrCO<sub>3</sub> concns over expected recovery range in presence of const amt of <sup>89</sup>Sr and Y-free <sup>90</sup>Sr, resp. Ordinate is ratio of count rate for each thickness to count rate at 0 sample thickness and abscissa is sample wt for given type of sample mount.)

E'<sub>s</sub> = counter efficiency for <sup>90</sup>Sr as SrCO<sub>3</sub>, cpm/pCi

E<sub>Y</sub> = counter efficiency for <sup>90</sup>Y as Y oxalate, cpm/pCi

I<sub>Y</sub> = correction factor (= 1 - e<sup>-λt</sup>) for degree of equilibrium attained during <sup>90</sup>Y ingrowth period, where t

is time <sup>90</sup>Y was sepd from SrCO<sub>3</sub> to time of counting, 48.023(a) or (b).

### Cesium-137 in Milk by Gamma-Ray Spectroscopy, Using Simultaneous Equations (7)—Official Final Action

#### 48.025

#### Principle

Applicable to <sup>137</sup>Cs in fluid milk preserved with HCHO. Known vol. is placed in counting vessel positioned over and around right cylinder scintillation crystal detector, NaI(Tl), of multichannel gamma spectrometer. Gamma radiation is counted for given time. Accumulated pulses of <sup>137</sup>Cs from its selected photon energy range are sepd from other gamma-emitting radionuclides and background radiation by simultaneous equations. <sup>131</sup>I and <sup>140</sup>Ba may be present and <sup>40</sup>K is always present as natural contaminant. They may contribute counts in 1 or more of photopeak ranges.

In special cases, newly formed fission products may be present, e.g., <sup>133</sup>I and <sup>135</sup>I, which may interfere either thru direct overlapping of photopeaks or by contributing Compton-continuum counts. Such interference may be minimized by waiting for decay of short-lived radionuclides, by addnl counting following decay, or by chem. sepn.

Milk contg known increments of <sup>137</sup>Cs detd in triplicate by 25 laboratories showed following results (av. of triplicates):

Amt <sup>137</sup> Cs Present, pCi/L	Std Deviation		Bias	
	%	pCi/L	%	pCi/L
52	10.2	5.3	+1.9	+1
305	5.9	18.1	-3.3	-10

#### 48.026

#### Apparatus

(a) *Alignment sources*.—Gamma ray energies, at least 1 near <sup>137</sup>Cs spectrum, with well known energies and abundance of gamma rays in photopeaks, for alignment. Solid sources, ca 0.1 μCi, are preferred over liq. sources. <sup>207</sup>Bi is satisfactory single source with several photopeaks; <sup>137</sup>Cs and <sup>60</sup>Co are good pair.

(b) *Counter*.—Low level gamma spectrometer consisting of shielded Tl-activated NaI scintillation detector, 4 × 4", coupled to multichannel pulse-ht analyzer and readout system.

(c) *Counting vessel (Marinelli beaker)*.—Use 3.5 L beaker, Fig. 48.01, for 4 × 4" detector. Beaker and lid available from plastic laboratory-ware suppliers such as Bel-Art Products, Pequannock, NJ 07440, No. F26862 for beaker and No. 26872 for lid.

#### 48.027

#### Reagents

(Caution: See 51.075.)

(a) *Carrier solns*.—10 mg/mL. Prep. solns of CsCl (1.267 g/100 mL), NaI (1.181 g/100 mL), and BaCl<sub>2</sub>·2H<sub>2</sub>O (1.779 g/100 mL). Store in polyethylene or glass bottles.

(b) *Stock std solns*.—10,000 pCi/mL. Dil. calibrated solns of <sup>137</sup>Cs, <sup>131</sup>I, and <sup>140</sup>Ba to approx. indicated strength.

(c) *Potassium-40 stock std soln*.—1.89 dpm (disintegrations/min) <sup>40</sup>K/mg K. Dissolve 240 g KCl (equiv. to 126 g K) in 3 L H<sub>2</sub>O in Marinelli beaker and dil. to 3.5 L.

(d) *Calibrating solns*.—For Cs and Ba, add 3–5 mL carrier soln, (a), to 3 L H<sub>2</sub>O in Marinelli beaker, mix, add convenient amt of stock std soln, (b), sufficient to reduce counting error to ca 1% when counted within 10–100 min, mix, adjust pH to 3.5–4.5, and dil. to 3.5 L. Prep. I soln similarly, but adjust pH to 8.5.

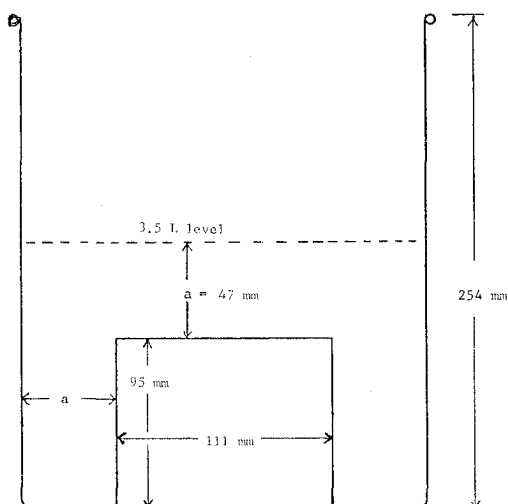

FIG. 48.01—Cross-section of Marinelli beaker.

## 48.028

**Determination**

Using alignment sources centered on detector, adjust spectrometer to cover range at least between 0 and 2 MeV, in intervals (channels) of 10 or 20 keV. Adjust voltage or gain control so that the 2 gamma photopeaks of std fall in their appropriate channels. Check and adjust alignment daily.

Place Marinelli beaker contg 3.5 L calibrating soln, (d), over detector, and count std for time (10–100 min) sufficient to reduce counting error to ca 1%. Repeat with each calibrating soln and with H<sub>2</sub>O. Recalibrate spectrometer yearly or more frequently if gamma ray resolution changes.

Transfer 3.5 L well mixed milk sample at room temp. into Marinelli beaker, place over detector, and count 100 min or time sufficient to give desired counting statistics.

## 48.029

**Calculations**

(a) *Counter efficiency*.—Total individual counts observed in channels of photopeak range for each calibrating soln. Subtract total background count for same photopeak range. Divide net count by counting time in min and amt of radionuclide in pCi, and record cpm/pCi for each.

(b) *Interference coefficients*.—When counting std soln of each interfering radionuclide, <sup>131</sup>I, <sup>140</sup>Ba, <sup>40</sup>K, ratio of net counting rate in <sup>137</sup>Cs energy range to net counting rate in its own photon energy range gives its fractional interfering coefficients for <sup>137</sup>Cs energy range.

Designate counting rate for <sup>131</sup>I, <sup>140</sup>Ba, <sup>137</sup>Cs, and <sup>40</sup>K with symbols I, B, C, and K, resp. Designate net counting rates (observed – background) in their resp. photon energy ranges as N<sub>i</sub>, N<sub>b</sub>, N<sub>c</sub>, and N<sub>k</sub>, resp. Then, f, fractional coefficients or contributions of nuclide in particular range, is designated by 2 lower case subscripts; first one indicates nuclide photon energy range (column) and second, nuclide (row). Then following 4 equations:

$$N_i = I + f_{bi} B + f_{ci} C + f_{ki} K \quad (1)$$

$$N_b = f_{ib} I + B + f_{cb} C + f_{kb} K \quad (2)$$

$$N_c = f_{ic} I + f_{bc} B + C + f_{kc} K \quad (3)$$

$$N_k = f_{ik} I + f_{bk} B + f_{ck} C + K \quad (4)$$

can be solved simultaneously by matrix algebra, using inversions to provide numerical consts W, X, Y, and Z in equations 5, 6, 7, and 8. These consts are used to solve for <sup>137</sup>Cs concn and

≤3 of other nuclides in sample. Net counting rate for each nuclide is:

$$^{131}\text{I} = I = W_i N_i + W_b N_b + W_c N_c + W_k N_k \quad (5)$$

$$^{140}\text{Ba} = B = X_i N_i + X_b N_b + X_c N_c + X_k N_k \quad (6)$$

$$^{137}\text{Cs} = C = Y_i N_i + Y_b N_b + Y_c N_c + Y_k N_k \quad (7)$$

$$^{40}\text{K} = K = Z_i N_i + Z_b N_b + Z_c N_c + Z_k N_k \quad (8)$$

Calibration to derive values for consts in equations 5, 6, 7, and 8 is applicable as long as instrument alignment and mode of operation remain const and gamma-emitting nuclides are limited to the 4 elements in matrix. Long-hand inversion of 4 × 4 matrix is tedious and subject to mistakes. Use of computer is recommended to provide numerical consts for equations 5–8. Thereafter, desk calcs can det. concns of <sup>131</sup>I, <sup>140</sup>Ba, <sup>137</sup>Cs, and <sup>40</sup>K in samples in absence of computer by summing counts in each photopeak, subtracting background, and applying equations 5–8.

(c) *Cesium-137 activity*.—From spectral gamma counts of sample, substitute net value in equation 7 and convert net counts/min for <sup>137</sup>Cs to pCi/L milk at time of counting:

$$^{137}\text{Cs} \text{ (pCi/L)} = \text{net cpm} / (E \times V),$$

where E = counting efficiency/pCi from std solns, and V = sample vol., L.

**Radioactive Contamination—Procedure****Emergency Level Procedure (8)**

## 48.030

**Apparatus**

(a) *Portable count-rate meter*.—Consists of: (1) *Self-quenching glass Geiger-Müller tube*, side wall ≤32 mg/cm<sup>2</sup>, mounted in slide opening metal shield; threshold ca 800 v, operated at ca midpoint of voltage plateau, slope of which is ≤10%, connected with coaxial cable to (2) *Suitable power supply and electronic amplifier unit* with meter calibrated in milliroentgens (mr)/hr, connected thru sensitivity switch providing 3 ranges of scale reading, e.g., 0–20, 0–2, and 0–0.2 mr/hr; linear response within each range.

(b) *Comparison std*.—Induces meter response identical to that from surface of H<sub>2</sub>O contaminated with fission products decaying at rate of 2 × 10<sup>5</sup> dmp/mL (emergency tolerance level for H<sub>2</sub>O to be consumed for ≤10 day period). Construct such std as follows: Uniformly suspend suitable amt of "60-mesh" UO<sub>2</sub>(OAc)<sub>2</sub>·2H<sub>2</sub>O (ca 3 g, adjusted by trial; *Caution: See 51.083 and 51.084*) in 5 g liq. casting plastic, level, and solidify in shallow container, such as lid of ointment tin, ca 80 mm diam. and side wall 15 mm deeper than layer of plastic. Base of ointment tin, fitted with indented ring 15 mm below its edge, serves as container for liqs and finely divided solids to be tested, and to protect comparison std when not in use. Supplementary std of ½ this activity may be prep'd similarly for monitoring supplies to be consumed over 30 day period.

## 48.031

**Determination**

With selectivity switch set for highest range (e.g., 0–20 mr/hr), and with shield open, place G-M tube diametrically across std in contact with edge of container at 2 points. Adjust meter pointer to convenient value ca midway of scale with calibration screw and record reading as av. of fluctuations over 1–2 min. Duplicate reading should check within ±5%. Avoid extraneous radiation, such as that from luminous dial watch.

Fill sample container with liq. or finely divided solid to level of indented ring and obtain duplicate readings. Sample readings

within  $\pm 100\%$  of std reading are of practical quant. significance for monitoring under emergency conditions.

# 49. Spectroscopic Methods

## EMISSION SPECTROGRAPHIC METHODS OFFICIAL FIRST ACTION

Aluminum, Barium, Boron, Calcium, Copper, Iron,  
Magnesium, Manganese, Molybdenum, Phosphorus,  
Potassium, Sodium, Strontium, and Zinc in Plants (1)

49.001

### General Recommendations

(a) *Instrumental technic.*—If, because of equipment limitations, described methods cannot be followed in detail, or if detn of other elements is desired, following protocol is recommended: Det. experimentally, with available facilities, potentials of various sample preps and excitation conditions with relation to element detectability and general concn requirements. Select analysis lines on basis of desirable intensity and freedom from spectral interference by other elements, as detd by prep spectrum of each component element at av. concn at which it occurs in samples to be analyzed. Line and phototube characteristics are usually detd by instrument manufacturer.

(b) *Precision.*—Stdze all conditions of technic and det. reproducibility of results by making ca 20 successive exposures on sample of representative composition. For each element, calc. std deviation of single exposure and divide by square root of number of individual exposures that will be averaged in practice to constitute 1 detn. From this est. of std deviation of single detn, calc. coefficient of variation for each element. Following upper limits for precision error of spectrographic detns in analysis of plant material are satisfactory in relation to other routine methods or to practical requirements: Coefficients of variation (%)—Ca, Mg, Mn, and Mo, 3–7; B, Ba, Cu, K, P, and Zn, 7–15; and Al, Fe, and Na, >15. Coefficients of variation vary from instrument to instrument for each element; above values were obtained from std plant tissue by 11 different instruments.

(c) *Accuracy.*—Precise technic is essential but not only factor involved in accuracy. Reliability and appropriateness of stds and judgment used in ref. method are of utmost importance. Failure in any of these respects can result in serious calibration error for otherwise satisfactory method.

Carefully prep. synthetic stds from highest grade H<sub>2</sub>O-free analyzed chems, collectively blanked for minor and trace elements. Preferably confirm values assigned to natural stds by results of >1 laboratory.

Matrix similarity between stds and samples, or closely controlled correction system for matrix differences, is essential. Check correction scales frequently against stds which closely match particular types of plant materials being analyzed.

Precision error of technic applies to ref. exposures as well as to samples. For this reason, base fiducial adjustments on as many ref. exposures as may be feasibly included in each series of samples.

### Direct Reading Method—Official First Action

49.002

### Apparatus

(a) *Spark excitation source.*

(b) *Spectrograph.*—1.5 m grating spectrograph with spark stand and disk attachment rotating at 30 rpm.

(c) *Electrode sharpener.*

(d) *Disk electrode.*—High purity graphite disk 0.492" diam. and 0.200" thick.

(e) *Upper (pin) electrode.*—Point appropriate lengths of std grade spectrographic C rods, 0.180" diam., in pencil sharpener equipped with pin stop to produce 1/16" diam. flat tip.

(f) *Porcelain boat.*—60 mm long, 10 mm wide, and 8 mm high (Coors No. 2, or equiv.).

49.003

### Reagents

(a) *Buffer.*—Dissolve 50 g Li<sub>2</sub>CO<sub>3</sub> in 200 mL HNO<sub>3</sub>, and dil. to 1 L with H<sub>2</sub>O. (*Caution:* See 51.026.)

(b) *Element stock std solns.*—On basis of expected sample concn range, prep. stock solns from individual pure nitrates, chlorides, or carbonate salts, or metal of resp. elements, as indicated in Table 49:01.

(c) *Mixed element std solns.*—Prep. 5 std solns contg % or ppm element indicated in Table 49:02 as follows: Dissolve 50 g Li<sub>2</sub>CO<sub>3</sub> in 200 mL HNO<sub>3</sub>, pipet in indicated aliquots, and dil. to 1 L with H<sub>2</sub>O. Prep. fresh every 6 months.

49.004

### Preparation of Sample

Dry plant material 24 hr at 80° and grind in Wiley mill with No. 20 stainless steel sieve. Store in air-tight containers or in coin envelopes in dry atm.

Weigh 1.0 g prepd sample into 30 mL high form crucible (porcelain is satisfactory). Ash ≥4 hr at 500° with crucible resting on asbestos plate rather than on floor of furnace. Cool, add 5.0 mL buffer soln, (a), stir, and let stand 30 min.

49.005

### Determination

(a) *Excitation.*—Align and space electrodes 4 mm apart in holders; position pin electrode over disk electrode. Set source parameters to give uniform breakdown voltage at tandem air gap with operating parameters at 4 breaks/cycle and 4 amp (parameters may vary with source for best operating efficiency).

Table 49:01 Preparation of Stock Standard Solutions

Element	Salt	Element, g/L	Salt, g/L	Solvent
K	KCl	125	238.36	H <sub>2</sub> O

★ Surplus method—see inside front cover.

## 50. Standard Solutions and Materials

### 50.001 General Directions (1)

Use accurately calibrated equipment, which meets NBS specifications. Because alk. and other corrosive solns dissolve glass, to avoid vol. errors do not store such solns in calibrated app. burets used continuously with such solns should be recalibrated periodically.

Working temp. of std soln should approximate that of its temp. during stdzn. If temp. corrections are necessary, sufficient accuracy may be obtained by use of Table 50:01.

### Ammonium and Potassium Thiocyanates (2) Official Final Action

#### 50.002

#### Reagents

(a) *Purified silver nitrate*.—Dissolve 50 g  $\text{AgNO}_3$  in 20 mL boiling  $\text{H}_2\text{O}$  contg ca 5 drops  $\text{HNO}_3$ . Heat to dissolve, filter while still hot thru fritted glass filter, using suction, and collect filtrate in clean Pyrex beaker. Wash beaker and filter with ca 5 mL hot  $\text{H}_2\text{O}$ , adding washings to filtrate. Cool in ice bath, stirring to induce crystn, and place in refrigerator at ca  $10^\circ$  until equilibrium is reached. Decant liq. thru fritted glass filter and transfer crystals to filter. Cover filter with watch glass and draw air thru filter to remove adhering liq. Transfer crystals to small, clean Pyrex beaker. Cover beaker with watch glass and place inside larger covered Pyrex beaker. Dry at  $105^\circ$  and fuse at  $220\text{--}250^\circ$  (mp  $208^\circ$ ), holding at this temp. ca 15 min after crystals are melted. Protect from dust during prepn. Cool in desiccator, remove product from beaker, powder in mortar, dry 0.5 hr at  $105^\circ$ , and store in brown g-s bottle in dark over good desiccant.

(b) *Reference soln*.—To mixt. of 5 mL  $\text{HNO}_3$  (1+1), 2 mL Fe alum soln, 50.030(a), and 115 mL  $\text{H}_2\text{O}$ , add ca 0.02 mL 0.1N thiocyanate, 50.003, noting exact vol. used.

#### 50.003

#### Preparation of Standard Solution

Prep. ca 0.1N soln from reagent that shows no Cl, using 7.612 g  $\text{NH}_4\text{SCN}$  or 9.718 g  $\text{KSCN/L}$ .

#### 50.004

#### Standardization

Accurately weigh, on tared watch glass, enough purified  $\text{AgNO}_3$  to give titrn of ca 40 mL (ca 0.7 g for 0.1N soln) and transfer with  $\text{H}_2\text{O}$  thru glass funnel to 250 mL g-s erlenmeyer. Dissolve in ca 75 mL  $\text{H}_2\text{O}$  (halogen-free), and add 5 mL  $\text{HNO}_3$  (1+1) and 2 mL Fe alum soln, 50.030(a). Tit. with thiocyanate soln until titrd soln is reddish brown, which remains after shaking vigorously 1 min. Record buret reading and set flask aside 5 min, shaking occasionally and maintaining end point color by addn of thiocyanate soln as required. Then add addnl

thiocyanate soln, if necessary, to produce permanent end point color, matching with color of ref. soln, 50.002(b). From total vol. thiocyanate soln used in titrn, subtract vol. contained in ref. soln.

$$\text{Normality} = \text{g AgNO}_3 \times 1000/\text{mL titer} \times 169.87.$$

### Arsenious Oxide (3)—Official Final Action

#### 50.005

#### Reagent

*Arsenious oxide*.—Use NBS SRM 83. Dry 1 hr at  $105^\circ$  immediately before using.

#### 50.006

#### Preparation of Standard Solution

Accurately weigh  $\text{As}_2\text{O}_3$  by difference from small g-s weighing bottle (use ca 4.95 g/L for 0.1N). Dissolve in 1N  $\text{NaOH}$  (50 mL/5 g  $\text{As}_2\text{O}_3$ ) in flask or beaker by heating on steam bath. Add ca same vol. 1N  $\text{H}_2\text{SO}_4$ . Cool, quant. transfer mixt. to vol. flask, and dil. to vol. (Soln must be neut. to litmus, not alk.)

$$\text{Normality} = \text{g As}_2\text{O}_3 \times 4000/\text{mL final vol.} \times 197.84.$$

### Buffer Solutions for Calibration of pH Equipment (4) Official Final Action

#### 50.007

#### Preparation of Standard Buffer Solutions

Use  $\text{H}_2\text{O}$  with pH of  $\geq 6.5$  but  $\leq 7.5$ , obtained by boiling  $\text{H}_2\text{O}$  15 min and cooling under  $\text{CO}_2$ -free conditions. Store std buffer solns except  $\text{Ca}(\text{OH})_2$  in bottles of chem. resistant glass. Protect phosphate, borax, and  $\text{Ca}(\text{OH})_2$  buffers from  $\text{CO}_2$ . pH values as function of temp. are given in Table 59:02.

(a) *Potassium tetroxalate buffer soln*.—0.0496M; 0.05m. Transfer 12.61 g  $\text{KHC}_2\text{O}_4 \cdot \text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$  (air wt) (NBS SRM 189) to 1 L vol. flask, dil. to vol. with  $\text{H}_2\text{O}$ , and mix thoroly. (It is not necessary to remove dissolved  $\text{CO}_2$  from the  $\text{H}_2\text{O}$  or to dry salt before weighing.) Prep. fresh every 2 months.

(b) *Potassium hydrogen tartrate buffer soln*.—Satd soln at  $25^\circ$ , 0.034M. Add excess (ca 100%) of  $\text{KHC}_4\text{H}_4\text{O}_6$  (NBS SRM 188) to  $\text{H}_2\text{O}$  in g-s bottle or flask, and shake vigorously; few min shaking is enough for satn (100 mL  $\text{H}_2\text{O}$  at  $25^\circ$  dissolves ca 0.7 g  $\text{KHC}_4\text{H}_4\text{O}_6$ ). Adjust to  $25^\circ$ , let solid settle, and decant clear soln, or filter if necessary. Discard when mold appears. Few crystals of thymol added during prepn will retard mold growth, and will alter pH by  $<0.01$  unit. For accuracy of  $\pm 0.01$  pH unit, temp. of soln at satn must be between  $20$  and  $30^\circ$ .

(c) *Acid potassium phthalate buffer soln*.—0.0496M; 0.05m. Dissolve 10.12 g dried (2 hr at  $110^\circ$ )  $\text{KHC}_8\text{H}_4\text{O}_4$  (NBS SRM 185) in  $\text{H}_2\text{O}$  and dil. to 1 L. (Elaborate precautions for exclusion of atm.  $\text{CO}_2$  are unnecessary, altho soln should be protected

Table 50:01 Temperature Corrections for Volume of Aqueous Solutions

Vol. Std Soln	Correction in Milliliters at—												
	6°	8°	10°	12°	14°	16°	18°	20°	22°	24°	26°	28°	30°
mL													
10	0.01	0.01	0.01	0.01	0.01	0.01	0.00	0.00	0.00	0.00	−0.01	−0.02	−0.02
20	0.03	0.03	0.03	0.02	0.02	0.01	0.01	0.00	−0.01	−0.02	−0.03	−0.03	−0.03

50	0.07	0.07	0.06	0.06	0.05	0.03	0.02	0.00	−0.02	−0.04	−0.06	−0.09	−0.12

against evapn and contamination with molds. Replace soln if mold appears.)

(d) *Phosphate buffer soln.*—0.0249*M*; 0.025*m*. Dissolve 3.387 g  $\text{KH}_2\text{PO}_4$  and 3.533 g  $\text{Na}_2\text{HPO}_4$  (NBS SRM 186-I and II) in  $\text{H}_2\text{O}$  and dil. to 1 L. (Dry salts 2 hr at 110–130° before use.)

(e) *Phosphate buffer soln.*—0.008663*M*, 0.008695*m*  $\text{KH}_2\text{PO}_4$  and 0.03030*M*, 0.03043*m*  $\text{Na}_2\text{HPO}_4$ . Dissolve 1.179 g  $\text{KH}_2\text{PO}_4$  and 4.303 g  $\text{Na}_2\text{HPO}_4$  (NBS SRM 186-I and II) in  $\text{H}_2\text{O}$  and dil. to 1 L. (Dry salts 2 hr at 110–130° before use.)

(f) *Borax buffer soln.*—0.00996*M*; 0.01*m*. Dissolve 3.80 g  $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$  (NBS SRM 187) in  $\text{H}_2\text{O}$  and dil. to 1 L. (Salt must not be dried in oven before use.) To avoid contamination with  $\text{CO}_2$ , stopper bottle except when in use or protect with soda-lime tube. Use buffer soln within 10 min after removal from bottle.

(g) *Sodium bicarbonate-carbonate buffer soln.*—0.0249*M*; 0.025*m* (each). Transfer 2.092 g  $\text{NaHCO}_3$  (NBS SRM 191; do not heat) and 2.640 g  $\text{Na}_2\text{CO}_3$  (NBS SRM 192; dry 2 hr at 275°) to 1 L vol. flask. Dissolve and dil. to vol. with  $\text{CO}_2$ -free  $\text{H}_2\text{O}$ .

(h) *Calcium hydroxide buffer soln.*—Satd soln at 25°, 0.02025*M*. Slowly heat finely granular  $\text{CaCO}_3$ , Low in Alkalies, to 1000° in Pt dish and maintain at this temp. 45–60 min. Cool in desiccator, and add to  $\text{H}_2\text{O}$  with stirring. Heat to bp with continuous stirring. Cool, and filter on medium fritted glass filter. Dry at 110°, cool, and crush to fine, granular powder.

Place crushed  $\text{CaO}$  in polyethylene bottle, add  $\text{H}_2\text{O}$ , shake vigorously, let settle, and record temp. (Keep large excess of  $\text{Ca}(\text{OH})_2$  in bottle.) For use, filter soln thru medium fritted glass filter. Use at same temp. at which satn took place, and discard filtered soln if it becomes turbid. When more buffer soln is needed, add addnl  $\text{H}_2\text{O}$  to suspension, re-sat., and filter as above.

#### Standard Buffers and Indicators for Colorimetric pH Comparisons (5)—Official Final Action

##### 50.008 Preparation of Sulfonphthalein Indicators

	X	pH
Bromocresol green	14.3	3.8–5.4
Chlorophenol red	23.6	4.8–6.4
Bromothymol blue	16.0	6.0–7.6
Phenol red	28.2	6.8–8.4

X = mL 0.01*N* NaOH/0.1 g indicator required to form mono-Na salt. Dil. to 250 mL for 0.04% reagent.

##### 50.009 Preparation of Stock Solutions

Use recently boiled and cooled  $\text{H}_2\text{O}$ .

(a) *Acid potassium phthalate soln.*—0.2*M*. Dry to const wt at 110–115°. Dissolve 40.836 g in  $\text{H}_2\text{O}$  and dil. to 1 L.

(b) *Monopotassium phosphate soln.*—0.2*M*. Dry  $\text{KH}_2\text{PO}_4$  to const wt at 110–115°. Dissolve 27.232 g in  $\text{H}_2\text{O}$  and dil. to 1 L. Soln should be distinctly red with Me red, and distinctly blue with bromophenol blue.

(c) *Boric acid-potassium chloride soln.*—0.2*M*. Dry  $\text{H}_3\text{BO}_3$  to const wt in desiccator over  $\text{CaCl}_2$ . Dry KCl 2 days in oven at 115–120°. Dissolve 12.405 g  $\text{H}_3\text{BO}_3$  and 14.912 g KCl in  $\text{H}_2\text{O}$ , and dil. to 1 L.

(d) *Sodium hydroxide std soln.*—0.2*M*. Prep. and stdze as in 50.032–50.035; 0.04084 g  $\text{KHC}_8\text{H}_4\text{O}_4 = 1$  mL 0.2*M* NaOH. It is preferable to use factor with soln rather than try to adjust to exactly 0.2*M*.

##### 50.010 Preparation of Buffer Solutions

Prep. std buffer solns from designated amts stock solns, 50.009, and dil. to 200 mL. For use as colorimetric std, mix 20 mL buffer soln with 0.5 mL indicator soln, 50.008.

#### Phthalate-NaOH Mixtures

pH	0.2 <i>M</i> KH Phthalate (mL)	0.2 <i>M</i> NaOH (mL)
5.0	50	23.65
5.2	50	29.75
5.4	50	35.25
5.6	50	39.70
5.8	50	43.10
6.0	50	45.40
6.2	50	47.00

#### $\text{KH}_2\text{PO}_4$ -NaOH Mixtures

pH	0.2 <i>M</i> $\text{KH}_2\text{PO}_4$ (mL)	0.2 <i>M</i> NaOH (mL)
5.8	50	3.66
6.0	50	5.64
6.2	50	8.55
6.4	50	12.60
6.6	50	17.74
6.8	50	23.60
7.0	50	29.54
7.2	50	34.90
7.4	50	39.34
7.6	50	42.74
7.8	50	45.17
8.0	50	46.85

#### $\text{H}_3\text{BO}_3$ -KCl-NaOH Mixtures

pH	0.2 <i>M</i> $\text{H}_3\text{BO}_3$ , KCl (mL)	0.2 <i>M</i> NaOH (mL)
7.8	50	2.65
8.0	50	4.00
8.2	50	5.90
8.4	50	8.55
8.6	50	12.00

#### Hydrochloric Acid—Official Final Action

##### 50.011

##### Preparation of Standard Solutions

Following table gives approx. vols of 36.5–38% HCl required to make 10 L std solns:

Approx. normality	mL HCl to be dild to 10 L
0.01	8.6
0.02	17.2
0.10	86.0
0.50	430.1
1.0	860.1

##### 50.012 Standard Sodium Hydroxide Method (6)

Tit. 40 mL against std alkali soln, 50.034–50.036, of ca same concn as acid being stdzd in 300 mL flask that has been swept free from  $\text{CO}_2$ , using  $\text{CO}_2$ -free  $\text{H}_2\text{O}$  and 3 drops phthln.

Normality = (mL std alkali  $\times$  normality of alkali)/mL HCl.

If more concd than desired, dil. soln to required normality value by following formula:

$$V_1 = V_2 \times N_2/N_1$$

where  $N_2$  and  $V_2$  represent normality and vol. of stock soln, resp., and  $V_1$  = vol. to which stock soln should be dild to obtain desired normality,  $N_1$ .

Check exact concn of final soln by titrn as above. Normality will be exact only if same indicator is used in detn as in stdzn. Restdze if indicators other than phthln are used.

##### 50.013 Constant Boiling Method (7)

Dil. 822 mL HCl (36.5–38% HCl) with 750 mL  $\text{H}_2\text{O}$ . Check sp gr with spindle and adjust to 1.10. Place 1.5 L in 2 L flat-bottom distg flask, add ca 10 SiC grains (ca “20 mesh”), and connect to long, straight inner-tube condenser. Heat on elec. hot plate and distil at 5–10 mL/min, keeping end of condenser open to air. When 1125 mL has distd, change receivers and catch next 225

**Table 50:02 pH Values for Standard Buffer Solutions as Function of Temperature**

Temperature	0.05M Potassium Tetroxalate	Satd Potassium Hydrogen Tartrate	0.05M Acid Potassium Phthalate	0.025M Phosphate	0.008695M and 0.03043M Phosphate	0.01M Borax	0.025M NaHCO <sub>3</sub> and 0.025M Na <sub>2</sub> CO <sub>3</sub>	Satd Calcium Hydroxide

60	1.723	3.560	4.085	—	—	—	—	11.449

mL, which is const boiling HCl, in erlenmeyer with end of condenser inserted into flask, but above surface of liq. Read barometer to nearest mm at beginning and end of collection of 225 mL portion and note barometer temp. Average readings.

Calc. air wt in g (G) of this const boiling HCl required to give one equiv. wt of HCl from one of following equations:

$$\text{For } P_0 = 540\text{--}669 \text{ mm Hg:}$$

$$G = 162.255 + 0.02415 P_0$$

$$\text{For } P_0 = 670\text{--}780 \text{ mm Hg:}$$

$$G = 164.673 + 0.02039 P_0$$

where  $P_0$  = barometric pressure in mm Hg corrected to 0°C for expansion of Hg and of barometer scale. For brass scale barometer, following correction is accurate enough:

$$P_0 = P_t(1 - 0.000162t), \text{ where } t = \text{barometer temp. in } ^\circ\text{C}.$$

Weigh required amt of const boiling HCl in tared, stoppered flask to at least 1 part in 10,000. Dil. immediately, and finally dil. to vol. with CO<sub>2</sub>-free H<sub>2</sub>O at desired temp.

#### Standard Borax Method (8)

##### 50.014

##### Reagents

(a) *Methyl red indicator*.—Dissolve 100 mg Me red in 60 mL alcohol and dil. with H<sub>2</sub>O to 100 mL.

(b) *Reference soln*.—Prep. ref. soln of H<sub>3</sub>BO<sub>3</sub>, NaCl, and indicator corresponding to composition and vol. of soln at equivalence point. For use in detn of end point of titrn with 0.1N HCl, ref. soln should be 0.1M in H<sub>3</sub>BO<sub>3</sub> and 0.05M in NaCl.

(c) *Std borax*.—Sat. 300 mL H<sub>2</sub>O at 55° (not higher) with Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·10H<sub>2</sub>O (ACS) (ca 45 g). Filter at this temp. thru folded paper into 500 mL erlenmeyer. Cool filtrate to ca 10°, with continuous agitation during crystn. Decant supernate, rinse ppt once with 25 mL cold H<sub>2</sub>O, and dissolve crystals in just enough H<sub>2</sub>O at 55° to ensure complete soln (ca 200 mL). Recrystallize by cooling to ca 10°, agitating flask during crystn.

Filter crystals onto small buchner with suction, wash ppt once with 25 mL ice-cold H<sub>2</sub>O, and dry crystals by washing with two 20 mL portions alcohol, drying after each washing with suction. Follow with two 20 mL portions ether. (Just before use, free alcohol and ether from any possible reacting acids by vigorously shaking each with 2–3 g of the pure, dry Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·10H<sub>2</sub>O and then filtering.) Spread crystals on watch glass, immediately place dried Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·10H<sub>2</sub>O in closed container over soln satd with respect to both sucrose and NaCl, and let it remain ≥24 hr before using. Then transfer the pure Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·10H<sub>2</sub>O to g-s container and store in closed container over soln satd with

respect to both sucrose and NaCl (stable under these conditions 1 year).

##### 50.015

##### Standardization

Accurately weigh enough std Na<sub>2</sub>B<sub>4</sub>O<sub>7</sub>·10H<sub>2</sub>O to titr. ca 40 mL and transfer to 300 mL flask. Add 40 mL CO<sub>2</sub>-free H<sub>2</sub>O, **50.033(a)**, and stopper flask. Swirl gently until sample dissolves. Add 4 drops Me red and titr. with soln that is being stdzd to equivalence point as indicated by ref. soln.

$$\text{Normality} = \text{g Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O} \times 1000/\text{mL acid} \times 190.69.$$

#### Standard Sodium Carbonate Method (8)

##### 50.016

##### Reagents

(a) *Methyl orange indicator*.—0.1% in H<sub>2</sub>O.

(b) *Reference soln*.—80 mL CO<sub>2</sub>-free H<sub>2</sub>O contg 3 or 4 drops Me orange.

(c) *Anhydrous sodium carbonate (9)*.—Heat 250 mL H<sub>2</sub>O to 80° and add NaHCO<sub>3</sub> (ACS), stirring until no more dissolves. Filter soln thru folded paper (use of hot H<sub>2</sub>O funnel is desirable) into erlenmeyer. Cool filtrate to ca 10°, swirling constantly during crystn. Fine crystals of trona that sep. out have approx. composition: Na<sub>2</sub>CO<sub>3</sub>·NaHCO<sub>3</sub>·2H<sub>2</sub>O. Decant supernate, drain crystals by suction, and wash once with cold H<sub>2</sub>O.

Transfer ppt, being careful not to include any paper fibers, to large flat-bottom Pt dish. Heat 1 hr at 290° in elec. oven or furnace with pyrometer control. Stir contents occasionally with Pt wire. Cool in desiccator. Place the anhyd. Na<sub>2</sub>CO<sub>3</sub> in g-s container and store in desiccator contg efficient desiccant. Dry at 120° and cool just before weighing.

##### 50.017

##### Standardization

Accurately weigh enough anhyd. Na<sub>2</sub>CO<sub>3</sub>, (c), to titr. ca 40 mL, transfer to 300 mL erlenmeyer, and dissolve in 40 mL H<sub>2</sub>O. Add 3 drops Me orange and titr. until color begins to deviate from H<sub>2</sub>O tint (ref. soln). (Equivalence point has not been reached.) Boil soln gently 2 min, and cool. Titr. until color is barely different from H<sub>2</sub>O tint of indicator.

$$\text{Normality} = \text{g Na}_2\text{CO}_3 \times 1000/\text{mL acid} \times 52.994.$$

#### Iodine (3)—Official Final Action

##### 50.018

##### Preparation of Standard Solution

Dissolve weighed amts of I (12.7 g/L for 0.1N soln) and KI, in

proportion of 20 g KI to 13 g I, in 50 mL H<sub>2</sub>O. When I dissolves, transfer soln to g-s vol. flask. Dil. to vol. with H<sub>2</sub>O and mix thoroly. Store in dark brown, g-s bottle away from light and restdze as frequently as necessary.

**50.019****Standardization**

Transfer accurately measured portion of std As<sub>2</sub>O<sub>3</sub> soln, **50.006** (40–50 mL ca 0.1*N* soln for 0.1*N* I soln), to erlenmeyer. Acidify slightly with H<sub>2</sub>SO<sub>4</sub> (1+10), neutze with solid NaHCO<sub>3</sub>, and add ca 2 g excess. Titr. with I soln, using ca 0.2% starch soln (5 mL/100 mL) as indicator. Sat. soln with CO<sub>2</sub> at end of titrn by adding 1 mL H<sub>2</sub>SO<sub>4</sub> (1+10) just before end point is reached.

$$\text{Normality} = \text{mL As}_2\text{O}_3 \times \text{normality As}_2\text{O}_3/\text{mL I.}$$

**Potassium Bromide-Bromate (10)—Official Final Action****50.020****Preparation of Standard Solution**

Dissolve ca 2.8 g KBrO<sub>3</sub> and 12 g KBr in boiled H<sub>2</sub>O and dil. to 1 L with boiled H<sub>2</sub>O for ca 0.1*N* soln.

**50.021****Standardization**

Measure 40 mL std As<sub>2</sub>O<sub>3</sub> soln, **50.006**, from buret into 300 mL erlenmeyer. Add 10 mL HCl and 3 drops Me orange, **50.016(a)**. Titr. with KBr-KBrO<sub>3</sub> soln until ≤1 drop causes color of Me orange to fade completely. Swirl soln constantly and add last mL dropwise, swirling between drops.

$$\text{Normality} = \text{mL As}_2\text{O}_3 \times \text{normality As}_2\text{O}_3/\text{mL KBr-KBrO}_3.$$

**Potassium Dichromate (11)—Official Final Action****50.022****Reagent**

*Starch soln.*—Mix ca 1 g arrowroot starch with 10 mL H<sub>2</sub>O and pour slowly, with const stirring, into 200 mL boiling H<sub>2</sub>O. Boil until thin, translucent fluid is obtained. Let settle and use clear supernate. Preserve with Hg.

**50.023****Assay of Stock Potassium Dichromate**

If K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> is in small crystals, mix by shaking thoroly in large, clean jar; if it is in lumps, grind representative sample to pass No. 60 sieve, and then mix by shaking. Dry portion for weighings 2 hr at 100°.

Weigh, into each of 3 g-s erlenmeyers, enough K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> (NBS SRM 136) to give titer of 100.5–102.0 mL 0.1*N* Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>, **50.037** (0.4928–0.5001 g for 0.1*N* soln). Completely dissolve in 100 mL H<sub>2</sub>O, add 4.0 g KI, and swirl mixt. until dissolved. With buret, add 4.0 mL HCl, stopper flask, mix by swirling, and let stand in dark 10 min. Cool flask ca 1 min in ice-H<sub>2</sub>O.

While swirling flask, pipet in 100 mL Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> soln. Add 5 mL starch soln and complete titrn with Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> soln added from 10 mL microburet (graduated in 0.05 mL). End point is from bluish green to clear green; change takes place within 0.01 mL. Record vol. to nearest 0.01 mL. Calc. apparent normality of Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> soln for each of the 3 titrns, and average. Designate this av. as  $N_{\text{NBS}}$ .

Similarly titr. 3 portions of stock K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> and calc. the 3 apparent normalities. Designate each of these results as  $N_{\text{stock}}$ . Calc. % purity of stock K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> =  $(N_{\text{NBS}} \times 100)/N_{\text{stock}}$ .

Take av. of the 3 results as % purity of stock K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>.

**50.024****Preparation of Standard Solution**

Dissolve theoretical wt K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> (NBS SRM 136) (4.9032 g for 0.1*N* soln), or wt stock K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, **50.023**, found to have oxidimetric value 99.95–100.05% of NBS SRM, in enough H<sub>2</sub>O to make 1 L. (Dry K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> 2 hr at 100° before using.)

**Potassium Permanganate (12)—Official Final Action****50.025****Preparation of Standard Solution**

Dissolve slightly more than desired equiv. wt (3.2 g for 0.1*N*) of KMnO<sub>4</sub> in 1 L H<sub>2</sub>O. Boil soln 1 hr. Protect from dust and let stand overnight. Thoroly clean 15 cm glass funnel, perforated porcelain plate from Caldwell crucible, and g-s bottle (preferably of brown glass) with warm chromic acid cleaning soln. Digest asbestos for use in gooches on steam bath 1 hr with ca 0.1*N* KMnO<sub>4</sub> that has been acidified with few drops H<sub>2</sub>SO<sub>4</sub> (1+3). Let settle, decant, and replace with H<sub>2</sub>O. To prep. glass funnel, place porcelain plate in apex, make pad of asbestos ca 3 mm thick on plate, and wash acid-free. (Pad should not be too tightly packed and only moderate suction should be applied.) Insert stem of funnel into neck of bottle and filter KMnO<sub>4</sub> soln directly into bottle without aid of suction.

**50.026****Standardization**

For 0.1*N* soln, transfer 0.3 g dried (1 hr at 105°) Na oxalate (NBS SRM 40) to 600 mL beaker. Add 250 mL H<sub>2</sub>SO<sub>4</sub> (5+95), previously boiled 10–15 min and then cooled to 27±3°.

Stir until Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub> dissolves. Add 39–40 mL KMnO<sub>4</sub> soln at rate of 25–35 mL/min, stirring slowly. Let stand until pink disappears (ca 45 sec). If pink persists because KMnO<sub>4</sub> soln is too concd, discard and begin again, adding few mL less of KMnO<sub>4</sub> soln. Heat to 55–60°, and complete titrn by adding KMnO<sub>4</sub> soln until faint pink persists 30 sec. Add last 0.5–1 mL dropwise, letting each drop decolorize before adding next.

Det. excess of KMnO<sub>4</sub> soln required to turn soln pink by matching with color obtained by adding KMnO<sub>4</sub> soln to same vol. of boiled and cooled dil. H<sub>2</sub>SO<sub>4</sub> at 55–60°. This correction is usually 0.03–0.05 mL. From net vol. KMnO<sub>4</sub>, calc. normality:

$$\text{Normality} = \text{g Na}_2\text{C}_2\text{O}_4 \times 1000/\text{mL KMnO}_4 \times 66.999.$$

**Silver Nitrate (13)—Official Final Action****50.027****Preparation of Standard Solution**

Dissolve slightly more than theoretical wt of AgNO<sub>3</sub> (equiv. wt, 169.87) in halogen-free H<sub>2</sub>O and dil. to vol. Thoroly clean glassware, avoid contact with dust, and keep prepd soln in amber g-s bottles away from light.

**Mohr Method****50.028****Reagents**

(a) *Potassium chloride.*—Recrystallize KCl 3 times from H<sub>2</sub>O, dry at 110°, and then heat at ca 500° to const wt. Equiv. wt KCl = 74.555. Or, preferably, use NBS SRM 999.

(b) *Potassium chromate soln.*—5% soln of K<sub>2</sub>CrO<sub>4</sub> in H<sub>2</sub>O.

**50.029****Standardization**

Accurately weigh enough KCl to yield titrn of ca 40 mL (ca 0.3 g for 0.1*N* soln), and transfer to 250 mL g-s erlenmeyer with 40 mL H<sub>2</sub>O. Add 1 mL K<sub>2</sub>CrO<sub>4</sub> soln and titr. with AgNO<sub>3</sub> soln until first perceptible pale red-brown appears. From titrn vol., subtract mL of the AgNO<sub>3</sub> soln required to produce end point color in 75 mL H<sub>2</sub>O contg 1 mL K<sub>2</sub>CrO<sub>4</sub> soln. From net vol. AgNO<sub>3</sub>, calc. normality:

$$\text{Normality} = \text{g KCl} \times 1000/\text{mL AgNO}_3 \times 74.555.$$

**Volhard Method****50.030****Reagents**

(a) *Ferric alum indicator soln.*—Satd soln of FeNH<sub>4</sub>(SO<sub>4</sub>)<sub>2</sub>·12H<sub>2</sub>O in H<sub>2</sub>O.

(b) *Potassium or ammonium thiocyanate std soln.*—Prep. ca 0.1*N* soln, **50.003**. Det. working titer by accurately measuring 40–50 mL std AgNO<sub>3</sub> soln, adding 2 mL Fe alum soln and 5 mL HNO<sub>3</sub> (1+1), and titrg with the thiocyanate soln until soln appears pale rose after vigorous shaking.

**50.031****Standardization**

Accurately weigh enough KCl, **50.028(a)**, to yield titrn of ca 40 mL (ca 0.3 g for 0.1*N* soln) and transfer to 250 mL g-s erlenmeyer with 40 mL H<sub>2</sub>O. Add 5 mL HNO<sub>3</sub> (1+1) and excess AgNO<sub>3</sub> soln. Mix, and let stand few min protected from light. Filter thru gooch prepd with medium pad of asbestos previously rinsed with 2% HNO<sub>3</sub>. Wash flask and ppt with several small portions of 2% HNO<sub>3</sub>, passing washings thru crucible until filtrate and washings measure ca 150 mL. Add 2 mL Fe alum soln and titr. residual AgNO<sub>3</sub> with thiocyanate soln. From titrn, together with ratio of the 2 solns, calc. net vol. AgNO<sub>3</sub> soln. (Errors of blank are compensating and may be disregarded.) From net vol. AgNO<sub>3</sub>, calc. normality as in **50.029**.

**Sodium Hydroxide—Official Final Action****Standard Potassium Hydrogen Phthalate Method (14)****50.032****Apparatus**

Use buret and pipet calibrated by NBS or by analyst. Protect exits to air of automatic burets from CO<sub>2</sub> contamination by suitable guard tubes contg soda-lime. Use containers of alkali-resistant glass.

**50.033****Reagents**

(a) *Carbon dioxide-free water.*—Prep. by one of following methods: (1) Boil H<sub>2</sub>O 20 min and cool with soda-lime protection; (2) bubble air, freed from CO<sub>2</sub> by passing thru tower of soda-lime, thru H<sub>2</sub>O 12 hr.

(b) *Sodium hydroxide soln.*—(1+1). To 1 part NaOH (reagent quality contg <5% Na<sub>2</sub>CO<sub>3</sub>) in flask add 1 part H<sub>2</sub>O and swirl until soln is complete. Close with rubber stopper. Set aside until Na<sub>2</sub>CO<sub>3</sub> has settled, leaving perfectly clear liq. (ca 10 days).

(c) *Acid potassium phthalate.*—NBS SRM for Acidimetry 84. Crush to pass No. 100 sieve. Dry 2 hr at 120°. Cool in desiccator contg H<sub>2</sub>SO<sub>4</sub>.

**50.034****Preparation of Standard Solution**

Following table gives approx. vols of NaOH soln (1+1) necessary to make 10 L of std solns:

Approx. normality	mL NaOH to be dild to 10 L
0.01	5.4
0.02	10.8
0.10	54.0
0.50	270.0
1.0	540.0

Add required vol. of NaOH soln (1+1) to 10 L CO<sub>2</sub>-free H<sub>2</sub>O. Check normality, which should be slightly high, as in **50.035**, and adjust to desired concn by following formula:

$$V_1 = V_2 \times N_2 / N_1$$

where  $N_2$  and  $V_2$  represent normality and vol. stock soln, resp., and  $V_1$ , vol. to which stock soln should be dild to obtain desired normality,  $N_1$ . Stdze final soln as in **50.035** or **50.036**.

**50.035****Standardization**

Accurately weigh enough dried KHC<sub>8</sub>H<sub>4</sub>O<sub>4</sub> to titr. ca 40 mL and transfer to 300 mL flask that has been swept free from CO<sub>2</sub>. Add 50 mL cool CO<sub>2</sub>-free H<sub>2</sub>O. Stopper flask and swirl gently until

sample dissolves. Titr. to pH 8.6 with soln being stdzd, taking precautions to exclude CO<sub>2</sub> and using as indicator either glass-electrode pH meter or 3 drops phthln. In latter case, det. end point by comparison with pH 8.6 buffer soln, **50.010**, contg 3 drops phthln. Det. vol. NaOH required to produce end point of blank by matching color in another flask contg 3 drops phthln and same vol. CO<sub>2</sub>-free H<sub>2</sub>O. Subtract vol. required from that used in first titrn and calc. normality.

$$\text{Normality} = \text{g KHC}_8\text{H}_4\text{O}_4 \times 1000 / \text{mL NaOH} \times 204.229.$$

**50.036 Constant Boiling Hydrochloric Acid Method (7)**

Accurately weigh from weighing buret enough const boiling HCl, **50.013**, to titr. ca 40 mL, into erlenmeyer previously swept free from CO<sub>2</sub>. Add ca 40 mL CO<sub>2</sub>-free H<sub>2</sub>O, then 3–5 drops desired indicator, and titr. with soln being stdzd.

$$\text{Normality} = \text{g HCl} \times 1000 / \text{mL titer} \times G,$$

where  $G$  has value given in **50.013**.

**Sodium Thiosulfate (15)—Official Final Action****50.037****Preparation of Standard Solution**

Dissolve ca 25 g Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>·5H<sub>2</sub>O in 1 L H<sub>2</sub>O. Boil gently 5 min and transfer while hot to storage bottle previously cleaned with hot chromic acid cleaning soln and rinsed with warm boiled H<sub>2</sub>O. (Temper bottle, if not heat-resistant, before adding hot soln.) Store soln in dark, cool place; do not return unused portions to stock bottle. If solns less concd than 0.1*N* are desired, prep. by dildn with boiled H<sub>2</sub>O. (More dil. solns are less stable and should be prepd just before use.)

**50.038****Standardization**

Accurately weigh 0.20–0.23 g K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> (NBS SRM 136 dried 2 hr at 100°) and place in g-s I flask (or g-s flask). Dissolve in 80 mL Cl-free H<sub>2</sub>O contg 2 g KI. Add, with swirling, 20 mL ca 1*N* HCl and immediately place in dark 10 min. Titr. with Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> soln, **50.037**, adding starch soln after most of I has been consumed.

$$\text{Normality} = \text{g K}_2\text{Cr}_2\text{O}_7 \times 1000 / \text{mL Na}_2\text{S}_2\text{O}_3 \times 49.032.$$

**Sulfuric Acid—Official Final Action****50.039****Preparation of Standard Solution**

Following table gives approx. vols of 95–98% H<sub>2</sub>SO<sub>4</sub> necessary to make 10 L std solns:

Approx. normality	mL H <sub>2</sub> SO <sub>4</sub> to be dild to 10 L
0.01	2.8
0.02	5.6
0.10	27.7
0.50	138.1
1.0	276.1

**Standard Borax Method (8)****50.040****Standardization**

See **50.015**.

**50.041 Specific Gravity Method (16)**

Dil. H<sub>2</sub>SO<sub>4</sub> with enough H<sub>2</sub>O to make convenient vol. of ca 70% H<sub>2</sub>SO<sub>4</sub> by wt. Det. sp gr in air at convenient temp. (0–40°) as in **9.011** (or sp gr may be detd with Sprengel pycnometer), protecting soln from contact with air. Calc. exact % H<sub>2</sub>SO<sub>4</sub> by wt,

$$P = S(85.87 + 0.057 - 0.0004t^2) - 69.82,$$

where  $S$  = sp gr (in air) at  $T^\circ$ , compared with H<sub>2</sub>O at  $t^\circ$ .

Weigh exactly  $W$  g prepd acid contg  $P\%$   $H_2SO_4$  and dil. to  $n$  L to make required soln contg  $G$  g  $H_2SO_4$ /L. Calc.  $W$  from equation:

$$W = nG \times 100/P.$$

### Titanium Trichloride (17)—Official Final Action

#### 50.042

#### *Preparation of Standard Solution*

To 200 mL com. 15%  $TiCl_3$  soln add 150 mL HCl and dil. to 2 L. Make soln ca 0.1*N*, place in container with H atm. provision (e.g., JAOAC 5, 207(1921)), and let stand 2 days for absorption of residual O.

#### 50.043

#### *Standardization*

Weigh 3 g  $FeSO_4(NH_4)_2SO_4 \cdot 6H_2O$  and transfer to 500 mL flask. Introduce stream of  $CO_2$ , and add 50 mL recently boiled  $H_2O$  and 25 mL 40% (by wt)  $H_2SO_4$ . Then, without interrupting current of  $CO_2$ , rapidly add 40 mL 0.1*N*  $K_2Cr_2O_7$ , 50.024. Add  $TiCl_3$  soln until near calcd end point. Then quickly add 5 g  $NH_4SCN$ , and complete titrn. Det. blank on 3 g  $FeSO_4(NH_4)_2SO_4 \cdot 6H_2O$ , using same vols of  $H_2O$ ,  $H_2SO_4$ , and  $NH_4SCN$ , and current of  $CO_2$ . From net vol.  $TiCl_3$ , calc. normality:

$$\text{Normality} = \text{mL } K_2Cr_2O_7 \times \text{normality } K_2Cr_2O_7 / \text{mL } TiCl_3.$$

# 51. Laboratory Safety

## Introduction

This chapter is not intended to be an exhaustive treatise on laboratory safety. These precautionary notes serve only as a reminder of possible hazards involved in the use of particular operations or substances. Refer to std texts on laboratory safety for fuller treatment of subject. Follow safety requirements of laboratory and rules issued by voluntary organizations and government agencies expert in the field of occupational safety. These notes do not meet all requirements of U.S. Occupational Safety and Health Act of 1970.

Nature and amt of each chemical and its prescribed use were criteria used in detg if cautionary statement for method was indicated.

Safety hazard was considered to exist when nature, amt, and use of chemical or equipment specified in method appeared likely to produce any of following:

(a) Concn of vapors from flammable liq. exceeding 25% of lower flammability limit of that liq. described by National Fire Protection Association, Boston, MA.

(b) Contact between analyst and amts of material highly active physiologically or toxic to man in excess of Threshold Limit Values published by American Conference of Governmental Industrial Hygienists, P.O. Box 1937, Cincinnati, OH 45201.

(c) Contact between analyst and amts of highly corrosive material sufficient to produce serious injury.

(d) Contact between analyst and radiations which could be harmful.

(e) Explosion or violent reaction.

(f) Injury to analyst by hazards in equipment or processes which are not readily detectable by analyst.

When in doubt about possible hazards not covered in this chapter, consult refs at end of chapter or other sources of information such as hazard warnings on labels and manufacturers' data sheets.

## Equipment

Use equipment only for purposes for which it was designed. Some common hazards associated with equipment specified in this book are described below (7, 9).

### 51.001 Refrigerators

Should be explosion proof or explosion resistant when used for storage of ether and other highly volatile, flammable liqs. Ordinary refrigerator can be made explosion resistant by removal of light switch, receptacle, and associated wiring and placing thermoregulation controls on outside of refrigerator.

### 51.002 Glass

Dispose of chipped or broken glassware in special containers; minor chips may be fire-polished and glassware retained. If glassware is to be repaired, mark defective area plainly and store in special location until repairs are completed.

Use heat-resistant glassware for prepn of solns that generate heat (e.g., not bottles or graduates).

### 51.003 Fire Extinguishers

Class B and C dry chemical fire extinguishers (for flammable liq. and elec. fires) should be conveniently available to each

laboratory room. Carbon dioxide fire extinguishers should be used on fires in electronic equipment.

Become familiar with their location and methods for effective use.

### 51.004 Blenders

Motor on high-speed blenders used to mix flammable solv. with other materials should be explosion proof. Blend toxic or flammable liqs in effective fume removal device.

### 51.005 Centrifuges

Adjust all tubes to equal wt before loading them into centrfg. Make certain that stoppers of tubes placed in pivot-type head will clear center when tubes swing to horizontal. Do not open centrfg. cover until machine stops completely. Before removing tubes, turn elec. switch to "off." Do not rely on zero-set rheostat. Use only tubes specially designed for centrfg. Do not exceed safe speed for various tube materials (glass, cellulose nitrate, polyethylene, etc.) recommended by tube manufacturer. Cellulose nitrate tubes may explode if autoclaved. Heating cellulose nitrate tubes  $>60^{\circ}$  may cause them to produce harmful nitrogen oxide fumes.

### 51.006 Atomic Absorption Spectrophotometer

Use effective fume removal device to remove gaseous effluents from burner. Use especially designed exhausts when  $N_2O$  is used as fuel oxidant. If instrument has drain trap, check to ensure it is filled with  $H_2O$  before igniting burner. Explosions of fuel gas accumulated thru this drain line have been reported.

### 51.007 Flame Photometer

Use effective fume removal device to remove gaseous burner effluents.

### 51.008 Photofluorometer

Considerable amts of  $O_3$  are formed by UV light radiated by quartz lamp. Ozone is toxic even in low concns; remove thru effective fume removal device placed near quartz lamp.

### 51.009 Monitoring Equipment

Monitor unattended operations with equipment that will automatically shut down process if unsafe condition develops (9).

### 51.010 Compressed Gas Cylinders

Identify by name(s) of gas(es) contents of compressed gas cylinders on attached decal, stencil, or tag, instead of by color codes. Secure cylinders in upright position by means of strap, chain, or non-tip base. Use only correct pressure gages, pressure regulator, and flow regulator for each size of gas cylinder and type of gas as specified by supplier. Use toxic gases only in effective fume removal device. When burning gas, use back flow prevention device in gas line to prevent flame being sucked back into cylinder.

### 51.011 Distillation, Extraction, and Evaporations

(a) *Flammable liquids*.—Perform operations behind safety barrier with hot  $H_2O$ , steam, or elec. mantle heating. Use effective

fume removal device to remove flammable vapors as produced. Set up app. on firm supports and secure all connections. Leave ample headroom in flask and add boiling chips *before* heating is begun. All controls, unless vapor sealed, should be located outside vapor area. Dispose of waste flammable solvs by evapn as above unless other provisions for safe disposal are available.

(b) *Toxic liquids*.—Use effective fume removal device to remove toxic vapors as produced. Avoid contact with skin. Set up app. on firm supports and secure all connections. Dispose of waste toxic solvs by evapn, using effective fume removal device unless other provisions for safe disposal are available.

#### 51.012 *Electrical Equipment*

Accidents involving elec. equipment may result in *mech. injury*, e.g., fingers being caught in chopping mill knives; *elec. shock*, which may be due to lack of or improper grounding, defective equipment, exposed wiring, or inadequate maintenance; and *fire* thru ignition of flammable vapors by electrically produced spark. Ground all elec. equipment to avoid accidental shock. Installation, maintenance, and repair operations should be performed by qualified electricians.

#### 51.013 *Parr Bomb*

Follow manufacturer's directions closely to avoid explosion.

#### 51.014 *Pressure*

Do not conduct pressure operations with std glassware. In certain circumstances, glassware specifically designed to withstand pressure may be used. Observe manufacturer's recommended safeguards when using pressure app. such as calorimeter bomb, hydrogenator, etc.

#### 51.015 *Vacuum*

Tape or shield with safety barrier containers and app. to be used under vac. to minimize effects of possible implosion. Vac. pump drive belts must have effective guards.

#### 51.016 *Hazardous Radiations*

UV radiation is encountered in AA spectrophotometry, fluorometry, UV spectrophotometry, germicidal lamps, and both long- and shortwave UV lamps used to monitor chromatgc sepns. Never expose unprotected eyes to UV light from any source either direct or reflected (e.g., flames in flame photometer, lamps, elec. arcs, etc.). Always wear appropriate eye protection such as goggles having uranium oxide lenses, welder's goggles, etc., when such radiations are present and unshielded. Keep skin exposure to UV radiations to min.

### Technics and Practices

#### 51.017 *Spraying Chromatograms*

When strong corrosive and toxic reagents are sprayed on chromatograms, use gloves, face shield, respiratory protection, and appropriate fume removal device to protect skin, eyes, and respiratory tract against mists or fumes generated by spraying device.

#### 51.018 *Pipets*

Do not pipet hazardous liqs by using mouth suction to fill pipet. Use pipet fillers or rubber tubing connected thru trap to vac. line for this purpose.

#### 51.019 *Wet Oxidation*

This technic is among most hazardous uses of acids but can be performed safely. Observe precautions in this chapter for particular acids used and rigorously follow directions given in specific method being used.

#### 51.020 *Hazardous or After Hours Work*

Anyone working alone after hours or on hazardous procedures should arrange for someone to contact him periodically as safety measure.

#### 51.021 *Glass Tubing*

Protect hands with heavy towel or gloves when inserting glass tubing into cork or rubber stopper. Fire polish all raw glass cuts.

Open ampules in fume removal device over tray large enough to hold contents if ampule should break. If contents are volatile, cool before opening.

### Acids

Use effective *acid-resistant* fume removal device whenever heating acids or performing reactions which liberate acid fumes. In dilg, always add acid to H<sub>2</sub>O unless otherwise directed in method. Keep acids off skin and protect eyes from spattering. If acids are spilled on skin, wash immediately with large amts of H<sub>2</sub>O.

#### 51.022 *Acetic Acid and Acetic Anhydride*

React vigorously or explosively with CrO<sub>3</sub> and other strong oxidizers. Wear face shield and heavy rubber gloves when using.

#### 51.023 *Chromic and Perchromic Acids*

Can react explosively with Ac<sub>2</sub>O, HOAc, EtOAc, isoamyl alcohol, and benzaldehyde. Less hazardous with ethylene glycol, furfural, glycerol, and MeOH. Conduct reactions behind safety barrier. Wear face shield and heavy rubber gloves.

#### 51.024 *Formic and Performic Acids*

Strong reducing agents; react vigorously or explosively with oxidizing agents. Irritating to skin, forming blisters. Performic acid (formyl hydroperoxide) has detonated for no apparent reason while being poured. Wear face shield and heavy rubber gloves when using.

#### 51.025 *Hydrofluoric Acid*

Very hazardous with NH<sub>3</sub>. It can cause painful sores on skin and is extremely irritating to eyes. Use effective removal device. Wear goggles and acid-resistant gloves.

#### 51.026 *Nitric Acid*

Reacts vigorously or explosively with aniline, H<sub>2</sub>S, flammable solvs, hydrazine, and metal powders (especially Zn, Al, and Mg). Gaseous nitrogen oxides from HNO<sub>3</sub> can cause severe lung damage. Copious fumes are evolved when concd HNO<sub>3</sub> and concd HCl are mixed. Avoid premixing. Use effective fume removal device when fumes are generated. Handle with disposable polyvinyl chloride, not rubber, gloves.

#### 51.027 *Oxalic Acid*

Forms explosive compd with Ag and Hg. Oxalates are toxic. Avoid skin contact and ingestion.

**51.028****Perchloric Acid**

Contact with oxidizable or combustible materials or with dehydrating or reducing agents may result in fire or explosion. Persons using this acid should be thoroughly familiar with its hazards. Safety practices should include following:

(a) Remove spilled  $\text{HClO}_4$  by immediate and thorough washing with large amounts of  $\text{H}_2\text{O}$ .

(b) Hoods, ducts, and other devices for removing  $\text{HClO}_4$  vapor should be made of chem. inert materials and so designed that they can be thoroughly washed with  $\text{H}_2\text{O}$ . Exhaust systems should discharge in safe location and fan should be accessible for cleaning.

(c) Avoid use of org. chems in hoods or other fume removal devices used for  $\text{HClO}_4$  digestions.

(d) Use goggles, barrier shields, and other devices as necessary for personal protection; use polyvinyl chloride, not rubber, gloves.

(e) In wet combustions with  $\text{HClO}_4$ , treat sample first with  $\text{HNO}_3$  to destroy easily oxidizable org. matter unless otherwise specified. *Do not evap. to dryness.*

(f) Contact of  $\text{HClO}_4$  soln with strong dehydrating agents such as  $\text{P}_2\text{O}_5$  or concd  $\text{H}_2\text{SO}_4$  may result in formation of anhyd.  $\text{HClO}_4$  which reacts explosively with org. matter and with reducing agents. Exercise special care in performing analyses requiring use of  $\text{HClO}_4$  with such agents. Extremely sensitive to shock and heat when concn is  $>72\%$ .

(g) Also observe precautions outlined in (1) "Perchloric Acid Solution," Chemical Safety Data Sheet SD-11 (1965), Manufacturing Chemists Association of the US, 1825 Connecticut Ave, NW, Washington, DC 20009; (2) "Applied Inorganic Analysis," W. F. Hillebrand, G. E. F. Lundell, H. A. Bright, and J. I. Hoffman, 2nd ed. (1953), pp. 39–40, John Wiley and Sons, Inc., New York, NY; (3) "Notes on Perchloric Acid and Its Handling in Analytical Work," Analyst **84**, 214–216 (1959); (4) "Perchlorates," ACS Monograph No. 146, J. C. Schumacher, ed., Reinhold (1960). See also refs at end of this chapter.

**51.029****Picric Acid**

Highly sensitive to shock when in dry state. In contact with metals and  $\text{NH}_3$ , it produces picrates which are more sensitive to shock than picric acid. Readily absorbed thru skin and irritating to eyes. Wear heavy rubber gloves and eye protection.

**51.030****Sulfuric Acid**

Always add  $\text{H}_2\text{SO}_4$  to  $\text{H}_2\text{O}$ . Wear face shield and heavy rubber gloves to protect against splashes.

**51.031****Fuming Acids**

Prep. and use with effective fume removal device. Wear acid-resistant gloves and eye protection.

**Alkalies**

Alkalies can burn skin, eyes, and respiratory tract severely. Wear heavy rubber gloves and face shield to protect against concd alkali liqs. Use effective fume removal device or gas mask to protect respiratory tract against alkali dusts or vapors.

**51.032****Ammonia**

Extremely caustic liq. and gas. Wear skin, eye, and respiratory protection when handling in anhyd. liq. or gaseous state.  $\text{NH}_3$  vapors are flammable. Reacts violently with strong oxidizing agents, halogens, and strong acids.

**51.033****Ammonium Hydroxide**

Caustic liq. Forms explosive compds with many heavy metals such as Ag, Pb, Zn, and their salts, especially halide salts.

**51.034****Sodium, Potassium, Lithium, and Calcium Metals**

Violently reactive with  $\text{H}_2\text{O}$  or moisture,  $\text{CO}_2$ , halogens, strong acids, and chlorinated hydrocarbons. Emit corrosive fumes when burned. Can cause severe burns. Wear skin and eye protection when handling. Use only dry alcohol when preparing Na alcoholate and add metal directly to alcohol, one small piece at a time. Avoid adding metallic Na to reaction thru condenser.

**51.035****Sodium Peroxide**

Less caustic than Na and K hydroxides but reacts violently with  $\text{H}_2\text{O}$ , org. matter, charcoal, glycerol,  $\text{Et}_2\text{O}$ , or P. Wear skin, eye, and respiratory protection when handling multigram amounts.

**51.036****Calcium Oxide (Burnt Lime)**

Strongly caustic! Reacts violently with  $\text{H}_2\text{O}$ . Protect skin, eyes, and respiratory tract against contact with dust.

**51.037****Sodium and Potassium Hydroxides**

Extremely caustic. Can cause severe burns. Protect skin and eyes when working with these alkalies as solids or concd solns. Add pellets to  $\text{H}_2\text{O}$ , not vice versa.

**51.038****Sodium Biphenyl, Sodium Methyllate, and Sodium Ethyllate**

Less caustic than NaOH but can be injurious. React vigorously with  $\text{H}_2\text{O}$ . Protect skin and eyes when handling.

**Organic Solvents**

(Do not mix waste solvs.)

**51.039****Flammable Solvents**

Do not let vapors conc. to flammable level in work area, since it is nearly impossible to eliminate all chance of sparks from static electricity even tho elec. equipment is grounded. Use effective fume removal device to remove these vapors when released.

**51.040****Toxic Solvents**

Vapors from some volatile solvs are highly toxic (**1–3, 9, 10**). Several of these solvs are readily absorbed thru skin. Use effective fume removal device to remove vapors of these solvs as they are liberated.

**Special Chemical Hazards****51.041****Pesticides**

Many pesticide chemicals are extremely toxic. These chemicals include org. Cl, carbamate, and org. P insecticides, mercurials, arsenicals, cyanides, nicotine, and other chemicals (**1, 6**). Observe following min. precautions at all times. Consult safety data sheets or labels for addnl information.

(a) Do all laboratory sampling, mixing, weighing, etc., under effective fume removal device in area having good forced ventilation of nonrecirculated air, or wear gas mask of proper type. If mask is used, replace cartridges as recommended, since using contaminated mask may be worse than no mask.

(b) Keep off skin. Wear clean protective clothing and non-permeable gloves (such as polyethylene gloves) as necessary.

Wash thoroly with soap and water to avoid contaminating food and smoking materials.

(c) Label all sample containers with name and approx. content of all pesticides.

(d) Have readily available and study information on symptoms of poisoning and first aid treatment for each type of pesticide being handled (**1, 6**).

(e) Consult physician about preventive measures and antidotes for use in emergencies when pesticide poisoning is suspected.

(f) Follow your organization's procedures when disposing of waste pesticides. The manufacturer can be contacted for advice on disposal problems.

(g) Do not enter pesticide *residue* or other laboratories after handling pesticide formulations until protective clothing and gloves have been removed and face and hands thoroly washed with soap and water.

**51.042****Aniline**

Toxic. Avoid contact with skin and eyes. Use effective fume removal device. Highly toxic when heated to decomposition. Flammable. May react vigorously with oxidizing agents. Ignites in presence of fuming  $\text{HNO}_3$ . May react violently with  $\text{O}_3$ .

**51.043****Acetonitrile**

Toxic. Avoid contact with skin and eyes. Use effective fume removal device. HCN is liberated on contact with acid.

**51.044****Ammoniacal Silver Nitrate**

Use soon after prepn and do not allow to stand for long periods of time.

**51.045****Benzene**

Toxic. Highly flammable. Avoid contact with skin. Do not breath vapors. Use effective fume removal device. Decomposes violently in presence of strong oxidizing agents. Reacts violently with Cl. Considered to be tumor producing agent.

**51.046****Acetone**

Highly flammable. Forms explosive peroxides with oxidizing agents. Use effective fume removal device. Do not mix with  $\text{CHCl}_3$ .

**51.047****Bromine and Chlorine**

Hazardous with  $\text{NH}_3$ , H, petroleum gases, turpentine, benzene, and metal powders. Extremely corrosive. Use effective fume removal device. Protect skin against exposure.

**51.048****Carbon Disulfide**

Extremely flammable with low ignition temp. Toxic. Use effective fume removal device. Can react vigorously to violently with strong oxidizing agents, azides, and Zn. Avoid static electricity.

**51.049****Carbon Tetrachloride**

Reacts violently with alkali metals. Toxic. Fumes may decompose to phosgene when heated strongly. Use effective fume removal device.

**51.050****Cyanides**

React with acids to form highly toxic and rapid acting HCN gas. Use only in effective fume removal device. Destroy residues with alk. NaOCl soln.

**51.051****Cyclohexane**

Highly flammable. Use effective fume removal device. Can react vigorously with strong oxidizing agents.

**51.052****Di- and Triethylamine**

Flammable. Toxic. Corrosive to skin and eyes. Use effective fume removal device. Can react vigorously with oxidizing materials.

**51.053****Dimethylformamide**

Toxic. Flammable. Avoid contact with skin and eyes. Use effective fume removal device. Can react vigorously with oxidizing agents, halogenated hydrocarbons, and inorg. nitrates.

**51.054****Diethyl Ether**

Store protected from light. Extremely flammable. Unstable peroxides can form upon long standing or exposure to sunlight in bottles. Can react explosively when in contact with Cl,  $\text{O}_3$ ,  $\text{LiAlH}_4$ , or strong oxidizing agents. Use effective fume removal device. Avoid static electricity. See also **51.070(b)**.

**51.055****Ethanol**

Flammable. Use effective fume removal device when heating or evapg.

**51.056****Chloroform**

Can be harmful if inhaled. Forms phosgene when heated to decomposition. Use effective fume removal device. Can react explosively with Al, Li, Mg, Na, K, disilane,  $\text{N}_2\text{O}_4$ , and NaOH plus MeOH. Considered to be tumor producing agent.

**51.057****Ethyl Acetate**

Flammable, especially when being evapd. Irritating to eyes and respiratory tract. Use effective fume removal device.

**51.058****Formaldehyde**

Exposure to high concns may cause skin irritation and inflammation of mucous membranes, eyes, and respiratory tract. Use skin protection and effective fume removal device.

**51.059****Hydrogen Sulfide**

Hazardous with oxidizing gases, fuming  $\text{HNO}_3$ , and  $\text{Na}_2\text{O}_2$ . Forms explosive mixts with air. Toxic. Use effective fume removal device.

**51.060****Hypophosphorus Acid**

Reacts violently with oxidizing agents. On decomposition, emits highly toxic fumes (phosphine) and may explode. Use effective fume removal device.

**51.061****Hexane**

Highly flammable. Use effective fume removal device.

**51.062****Isooctane**

Highly flammable. Use effective fume removal device.

**51.063****Magnesium**

When finely divided, liberates H in contact with  $H_2O$ . Burns in air when exposed to flame. Can be explosive in contact with  $CHCl_3$  or  $CH_3Cl$ .

**51.064****Magnesium Perchlorate**

Explodes on contact with acids and reducing materials. Use as drying agent on inorg. gases and materials only.

**51.065****Mercury**

Hazardous in contact with  $NH_3$ , halogens, and alkali. Vapors are extremely toxic and cumulative. Regard spills on hot surfaces as extremely hazardous and clean up promptly. Powder sprinkled over spilled Hg can assist in cleaning up spills. High degree of personal cleanliness is necessary for persons who use Hg. Handle only in locations where any spill can be readily and thoroughly cleaned up. When Hg evapn is necessary, use effective fume removal device.

To avoid environmental contamination, dil. liq. remaining in Kjeldahl distn flask to ca 300 mL with  $H_2O$ , cool to room temp., and add 50 mL 30%  $H_2O_2$ . (If Raney powder method is used, 6 mL is enough.) Warm gently to initiate reaction, let reaction go to completion in warm flask, and sep. pptd HgS. Reserve ppt in closed labeled container for recovery of Hg or disposal appropriate for Hg.

See also 51.079.

**51.066****Methanol**

Flammable. Toxic. Avoid contact with eyes. Avoid breathing vapors. Use effective fume removal device. Can react vigorously with NaOH plus  $CHCl_3$ , and KOH plus  $CHCl_3$  or  $HClO_4$ .

**51.067****Methyl Cellosolve**

Vapors can be harmful. Use effective fume removal device.

**51.068****Nitrobenzene and Other Nitroaromatics**

Readily absorbed thru skin. Symptoms of intoxication are sense of well-being and bluish tint on tongue, lips, and fingernails. Wear resistant rubber gloves when handling. Heat or evap. in effective fume removal device.

**51.069****Oxidizers**

(Perchlorates, peroxides, permanganates, persulfates, perborates, nitrates, chlorates, chlorites, bromates, iodates, concd  $H_2SO_4$ , concd  $HNO_3$ ,  $CrO_3$ )

Can react violently with most metal powders,  $NH_3$ , and  $NH_4$  salts, P, many finely divided org. compds, flammable liqs, acids, and S. Use exactly as specified in method. Handle in effective fume removal device from behind explosion-resistant barrier. Use face shield.

**51.070****Peroxides**

(a) *Hydrogen peroxide*.—30% strength is hazardous; can cause severe burns. Drying  $H_2O_2$  on org. material such as paper or cloth can lead to spontaneous combustion. Cu, Fe, Cr, other metals, and their salts cause rapid catalytic decomposition of  $H_2O_2$ . Hazardous with flammable liqs, aniline, and nitrobenzene. Since it slowly decomposes with evolution of O, provide stored  $H_2O_2$  with vent caps. Wear gloves and eye protection when handling.

(b) *Ether peroxides*.—These peroxides form in  $Et_2O$ , dioxane, and other ethers during storage. They are explosive and must be destroyed chem. before distn or evapn. Exposure to light

influences peroxide formation in ethers. Filtration thru activated alumina is reported to be effective in removing peroxides. Store over Na ribbon to retard peroxide formation.

**51.071****Phosphotungstic Acid**

Emits highly toxic fumes when heated to decomposition or in strong alkali.

**51.072****Pyridine**

Toxic. Flammable. Use effective fume removal device. Releases toxic cyanides when heated to decomposition.

**51.073****Petroleum Ether**

Extremely flammable. Use effective fume removal device. Avoid static electricity.

**51.074****Pentane**

Extremely flammable. Use effective fume removal device. Avoid static electricity.

**51.075****Radioactive Chemicals**

Consult NBS Handbook No. 92, "Safe Handling of Radioactive Materials" (available as NCRP Report No. 30 from National Council on Radiation Protection, Publications Dept., 4201 Conn. Ave. NW, Washington, DC 20008) and NCRP Report No. 39 "Basic Radiation Protection Criteria," before handling these materials.

**51.076****Silver Nitrate**

Powerful oxidizing agent; strongly corrosive. Dust or solid form is hazardous to eyes. Handle as in 51.069.

**51.077****Silver Iodate**

Powerful oxidizing agent. Can initiate combustion in contact with org. material (e.g., paper or cloth). Can react vigorously with reducing agents. Handle as in 51.069.

**51.078****Arsenic Trioxide**

Toxic. Forms toxic volatile halides in contact with halide acids. Forms volatile, highly toxic arsine when reduced in acid soln. Protect skin and respiratory tract when handling. Use effective fume removal device when arsine or arsenic trihalide is formed.

**51.079****Mercury Salts**

Mercuric salts are quite toxic and mostly  $H_2O$ -sol. Use skin and respiratory protection when dry mercuric salts are to be used. Use skin protection when concd aq. solns of mercuric salts are used. Mercurous salts are generally less toxic than mercuric salts. Use of personal protection is advisable when handling these salts and their concd solns.

See also 51.065.

**51.080****Permanganates**

Moderately toxic. Readily sol. in  $H_2O$ . Strong oxidizing agent. May form explosive mixt. with  $H_2SO_4$  or  $HClO_4$ . When using with strong acids to destroy org. matter, perform reaction behind safety barrier.

**51.081****Sulfur Dioxide**

Toxic gas. Forms  $H_2SO_3$  in contact with moisture. Use effective fume removal device to remove  $SO_2$  vapors released by reaction

or from gas cylinder. Avoid contact with skin, eyes, and respiratory tract.

51.082

***Di- and Trichloroacetic  
and Trifluoroacetic Acids***

Protein precipitants. Can cause severe burns to skin and respiratory tract. Use rubber gloves, eye protection, and effective fume removal device to remove vapors generated.

51.083

***Uranyl Acetate***

Highly toxic. Avoid skin contact and breathing dusts.

51.084

***Toxic Dusts***

Use gloves and goggles to avoid contact with skin and eyes. Use effective fume removal device or other respiratory protection.

51.085

***Carcinogens***

Regulations of U.S. Department of Labor require special precautions to avoid exposure of persons to carcinogenic chems. Consult 29CFR1910.93c (U.S. Government Printing Office, Washington, DC 20402) for these precautions.

51.086

***Asbestos***

Dry asbestos fibers are hazardous when inhaled. Wet fibers form a mat which does not constitute a hazard. Transfer dry fibers in hood to container of distilled H<sub>2</sub>O and store under H<sub>2</sub>O until needed, e.g., for prepn of mats in Gooch crucibles. Do not dry asbestos in forced draft oven, only in convection oven. Open

oven doors slowly to avoid developing convection currents that will make fibers airborne. Reuse of filtering mats is often possible by washing, drying, and ignition, as appropriate.

Wein table for determining maltose .....	<b>43.016</b>

- w Element for which known variations in isotopic composition in normal terrestrial material prevent a more precise atomic weight being given;  $A_r(E)$  values should be applicable to any "normal" material.
- x Element for which geological specimens are known in which the element has an anomalous isotopic composition, such that the difference between the atomic weight of the element in such specimens and that given in the Table may exceed considerably the implied uncertainty.
- y Element for which substantial variations in  $A_r$  from the value given can occur in commercially available material because of inadvertent or undisclosed change of isotopic composition.
- z Element for which the value of  $A_r$  is that of the radioisotope of longest half-life.

**52.001 Table of atomic weights 1977; from Commission on Atomic Weights, International Union of Pure and Applied Chemistry**

 Scaled to the relative atomic mass,  $A_r(^{12}\text{C}) = 12$ 

The atomic weights of many elements are not invariant but depend on the origin and treatment of the material. The footnotes to this Table elaborate the types of variation to be expected for individual elements. The values of  $A_r(E)$  given here apply to elements as they exist naturally on earth and to certain artificial elements. When used with due regard to the footnotes, they are considered reliable to  $\pm 1$  in the last digit or  $\pm 3$  when followed by an asterisk\*. Values in parentheses are used for certain radioactive elements whose atomic weights cannot be quoted precisely without knowledge of the origin of the elements; the value given is the atomic mass number of the isotope of that element of longest known half life.

150	535.71	595.2
200	714.29	793.7

(b) *Sodium hydroxide solns*: Specification requires  $\geq 97\%$  NaOH in sticks or pellets of caustic soda. Dissolve and dil. to 1 L.

NaOH Strength Desired	NaOH Required	
g/L	g	
12.5	12.89	For crude fiber
30	30.93	
40	41.24	1N soln
50	51.55	
75	77.32	
100	103.09	
150	154.64	
200	206.19	
250	257.73	
300	309.28	

(c) *Hydrochloric acid solns*: Specification requires  $\geq 36.5$ – $\leq 38.0\%$  HCl by wt. Sp gr of 37.2% HCl soln = 1.19 at 15°. Mix with  $\text{H}_2\text{O}$  and dil. to 1 L.

HCl Strength Desired	HCl Required	
g/L	g	ml
5	13.44	11.29
10	26.88	22.59
15	40.32	33.88
20	53.77	45.18
36.46	98.01	82.36
50	134.41	112.95
100	268.82	225.90
150	403.23	338.85
200	537.63	451.79
222.6	598.39	502.85
278.4	748.39	628.90
300	806.45	677.69

1N soln

Constant boiling  
Sp gr 1.125

(d) *Nitric acid solns*: Specification requires  $\geq 69.0$ – $\leq 71.0\%$   $\text{HNO}_3$  by wt. Sp gr of 70.4%  $\text{HNO}_3$  soln = 1.42 at 15°. 1 ml concd  $\text{HNO}_3$  contains ca 1.00 g  $\text{HNO}_3$ . Mix with  $\text{H}_2\text{O}$  and dil. to 1 L.

HNO <sub>3</sub> Strength Desired	HNO <sub>3</sub> Required	
g/L	g	ml
5	7.10	5.0
10	14.20	10.0
20	28.41	20.0
30	42.61	30.0
40	56.82	40.0
50	71.02	50.0
63	89.49	63.0
70	99.43	70.0
100	142.05	100.0
150	213.07	150.0
200	284.09	200.1
300	426.14	300.1

1N soln

(e) *Sulfuric acid solns*: Specification requires  $\geq 95.0$ – $\leq 98.0\%$   $\text{H}_2\text{SO}_4$  by wt. Sp gr of 96.0% soln = 1.84 at 15°. Pour acid into excess of  $\text{H}_2\text{O}$  and dil. to 1 L.

H <sub>2</sub> SO <sub>4</sub> Strength Desired	H <sub>2</sub> SO <sub>4</sub> Required	
g/L	g	ml
5	5.21	2.8
12.5	13.02	7.1

150	156.25	84.9
250	260.42	141.5
300	312.50	169.8
400	416.67	226.5

For crude fiber

1N soln

(f) *Alcoholic solns*:<sup>b</sup> Specification requires 95%  $\text{C}_2\text{H}_5\text{OH}$  by vol. Sp gr = 0.810 at 25°. Mix and dil. to 1 L.

Alcohol Strength Desired	Alcohol Required	
ml/L	g	ml
50	42.63	52.6
100	85.26	105.3
150	127.89	157.9
200	170.52	210.5
250	213.16	263.2
300	255.78	315.9
400	341.04	421.1
500	426.32 (proof)	526.3
700	596.84	736.8

<sup>a</sup> Prep'd by G. C. Spencer and H. J. Fisher, 1935 and updated by W. D. Hubbard, 1970.

<sup>b</sup> Alcohol of any desired strength may be obtained by taking number of ml 95% alcohol equiv. to desired strength and dilg soln to 95 ml; e.g., to obtain soln of 70% alcohol, take 70 ml 95% alcohol and dil. to 95 ml.

(Continued)

<sup>a</sup> Rearranged from table of B. H. St. John, which is based upon data of Doroshevskii and Dvorzhanchik, *J. Russ. Phys. Chem. Soc.* 40, 101(1908). Scale readings were converted into refractive indices by using  $n_D = 1.327338 + 0.00039347X - 0.0000020446X^2$ .

<sup>b</sup> Scale readings refer only to scale of arbitrary units proposed by Pulfrich, *Z. Angew. Chem.* 1168(1899). According to this scale, 14.5 = 1.33300, 50.0 = 1.34650, and 100.0 = 1.36464. If immersion refractometer used is calibrated to another arbitrary scale, readings must be converted into refractive indices before table is used to determine per cent alcohol.

**52.007 Correction factors for gasometric determination of carbon dioxide<sup>a</sup>**

(Based on sample weighing 1.7000 g)

(Multiply number of ml gas evolved from 1.7000 g sample by factor that corresponds with existing atmospheric conditions and divide by 10 to obtain % CO<sub>2</sub> by wt in sample.)

(Continued)

<sup>a</sup> Calcd from 1.976 = wt 1 L CO<sub>2</sub> at 0°C, 760 mm pressure, and 41° latitude. Formula given by W. Parr, *J. Am. Chem. Soc.* 31, 237(1909).

**52.007 Correction factors for gasometric determination of carbon dioxide<sup>a</sup>—Concluded.**

(Based on sample weighing 1.7000 g)

(Multiply number of ml gas evolved from 1.7000 g sample by factor that corresponds with existing atmospheric conditions and divide by 10 to obtain % CO<sub>2</sub> by wt in sample.)

**51.010 Temperature corrections for readings of saccharometers (standard at 20°C)**

(Calcd from data on thermal expansion of sugar solns by Plato<sup>a</sup> and assumed that instrument is of Jena 16<sup>111</sup> glass. Table should be used with caution and only for approx. results when temp. differs much from standard temp. or from temp. of surrounding air.)

<sup>a</sup> Values in this table are calcd from equation developed by K. Rosenhauer for ICUMSA, programmed and computed by Frank G. Carpenter of USDA, and published in *Sugar J.* 33, 15-22 (June 1970). Refractive index was measured at 20° with D line of Na; Brix (% sucrose by wt) was obtained by weighing at 20° in air at 760 Torr (mm Hg) pressure and 50% relative humidity. It replaces previous table, 47.012, 11th ed., taken from *Intern. Sugar J.* 39, 22s (1937).

44	4426	7.66	75	5569	15.01			

<sup>a</sup> Values in this table were calcd by J. A. Mathews from five-place indices of Schönrock as given by Landt, Z. Ver. Deut. Zucker-Ind. 83, 692(1933).

<sup>b</sup> Scale readings refer only to scale of arbitrary units proposed by Pulfrich, Z. Angew. Chem. 1168(1899). According to this scale 14.5 = 1.33300, 50.0 = 1.34650, and 100.0 = 1.36464. If immersion refractometer used is calibrated according to another arbitrary scale, readings must be converted into refractive indices before this table is used to determine per cent sugar.

52.024 Optical crystallographic properties of some crystalline drugs<sup>a</sup>

Compound	$\alpha$	$\beta$	$\gamma$	Optic Sign	Extinction	Elongation	2V	Remarks
Alkaloids and Related Amines								
Aconitine	1.560	—	1.575	+		—	36°	
Alphaprodine.HCl	1.499	1.572	1.597	—	p, i		63°	
Apomorphine.HCl	1.638	1.658	1.701	+				
Arecoline.HBr	1.555	1.590	1.655	+	p	—		$n_\alpha$ very common
Atropine	1.550	1.583	1.595	—				
Atropine sulfate	1.555	—	1.60					
Benzethonium chloride	1.560	1.565	1.589	+			48°	Most fragments do not extinguish completely
Berberine	1.490	1.701	>1.734	—	p	—		Yellow needles and rods
Berberine.HCl.2H <sub>2</sub> O	1.500	1.535	>1.733	+	p			
Brucine	1.562	—	>1.65		p			
Brucine sulfate	1.512	1.595	1.688	+	p	+		6-sided plates and rods
Cetylpyridinium chloride	1.509	1.566	1.613	—	i		88°	Op. ax. fig. common
Cinchonidine	1.610	1.625	1.675	+	p	+	59°	r > v weak
Cinchonidine sulfate	1.562	1.604	1.660	+	p	+		
Cinchonine	1.570	1.685	1.690	—	p	+	21°	Plates and rods
Cinchonine.HCl.2H <sub>2</sub> O	1.545	1.617	1.661	—		+	large	
Cocaine.HCl	1.570	1.596	1.618	—				
Codeine	1.543	1.636	1.684	—			53°	
Codeine.HCl	1.559	1.580	1.676	+				
Codeine sulfate	1.561	1.642	1.661	—	p	—		Rods
Desipramine.HCl	1.586	1.622	1.698	+	p, s	—	large	Elongate prisms, many 6-sided in outline; op. ax. figs. rare, flash figs. common
Dextropropoxyphene napsylate	1.568	1.636	1.638	—			23°	Marked dispersion, r < v
Diacetylmorphine (Heroin)	1.556	1.607	1.627	—				Sl. sol. in R. I. oils
Diacetylmorphine.HCl.H <sub>2</sub> O	1.578 <sub>w</sub>		1.613 <sub>t</sub>	+				Uniaxial
Diphenylhydantoin	1.600	—	1.635		p	—		
/-Ephedrine.HCl	1.530	1.603	1.638	—	p	—	70°	Prisms and rods
Ethoheptazine citrate	1.537	—	1.556					
Ethylhydrocupreine.HCl	1.513	—	1.619					
Hydrastine	1.550	1.734	>1.734					$n_\alpha$ common
Hyoscyamine	1.562	—	1.581		p, i	+		
Isobucaine.HCl	1.522	1.574	1.612	—	p, i	±	82°	
Levallorphan tartrate	1.545	1.595	1.653	+			86°	
Meperidine.HCl	1.545	1.581	1.618	+	p	+		
Methaqualone.HCl	1.568	1.659	sl >1.800	+	p	—		Long rods and rectangular plates; $\alpha$ lengthwise, $\beta$ and $\gamma$ crosswise
Methscopolamine bromide	1.580	1.615	1.617	—			33°	

<sup>a</sup> Abbreviations: p = parallel; s = symmetrical; i = inclined; n = index;  $n_i$  = intermediate index; Bx.ac. = acute bisectrix; Bx.ob. = obtuse bisectrix; Op.ax. = optic axis; fig. = figure; sl = slightly; r = red; v = violet.

Compound	$\alpha$	$\beta$	$\gamma$	Optic Sign	Extinction	Elongation	2V	Remarks
Alkaloids and Related Amines—Continued								
Methylphenidate.HCl	1.558	1.581	1.585	—			43°	
O <sup>6</sup> .Monoacetylmorphine.HCl	1.526	1.597	1.639	—	p	—	fairly large	Elongate prisms; $\alpha$ lengthwise, $\beta$ and $\gamma$ crosswise
Morphine.HCl, anhyd.	1.612	1.637	1.644	—	p	—	med. to large	Irregular plates, some rectangular or lath-shaped showing $\alpha$ and $\gamma$
Morphine.H <sub>2</sub> O	1.580	1.625	1.645	—	p	±		
Morphine.HCl.3H <sub>2</sub> O	1.540	n <sub>D</sub> 1.590	1.635	—	p	—		
Morphine sulfate.5H <sub>2</sub> O	1.545	1.620	1.632	—	p	—		
Papaverine	1.625	1.690	>1.690		p	—	large	Orthorhombic
Papaverine.HCl	1.555	n <sub>D</sub> 1.733	>1.733					n <sub>a</sub> common
Pentazocine	1.575	1.590	1.627	+	p	—		$\alpha$ lengthwise, $\gamma$ crosswise
Pentazocine.HCl	1.577	—	1.594		p, i	+		Mostly inclined extinction; flash figs. common; $\alpha$ crosswise, $\gamma$ lengthwise
Phenmetrazine.HCl	1.508	1.516	1.628	+				
Phensuximide	1.536	1.617	>1.673		p, i		very large	
Phenylbutazone	1.600	—	1.620	+	p	—		
Quinidine	1.580	1.665	1.690	—	p	+	55°	
Quinidine sulfate	1.565	1.607	1.670	+	p	+		
Quinine	1.620	1.625	1.630		p	—	very large	
Quinine.HCl	1.590	1.610	1.669	+	p	+	61°	r > v
Racephedrine.HCl	1.570	1.608	1.630	—				Irregular fragments; op. ax. figs. occasional
Scopolamine.HBr	1.567	1.585	1.623	+	p		medium	Rods and prisms
Strychnine	1.617	1.660	>1.690	—	p	+	large	
Strychnine.HCl.2H <sub>2</sub> O	1.610	1.626	1.668	+		—	large	
Syrosingopine	1.529	1.538	1.646	+	p	—	34°	
Yohimbine	1.548	1.563	1.688	+			42°	
Yohimbine.HCl	1.57	1.61	1.69	+				
Antibiotics								
Carbomycin	1.474	1.484	1.513	+	p	±		
Chloramphenicol	1.523	1.608	1.659	—	p	—	70–80°	
Chloramphenicol palmitate	1.527	—	1.569		p	±		
Chlortetracycline.HCl	1.635	1.706	1.730	—	p, s		59°

Compound	$\alpha$	$\beta$	$\gamma$	Optic Sign	Extinction	Elongation	2V	Remarks
Antibiotics—Continued								
Cycloserine	1.583	—	1.630	—				Rod-shaped aggregates
Dihydrostreptomycin.3HCl	1.522	1.548	1.566	—	p	+	80°	
Dihydrostreptomycin sulfate	1.552	1.558	1.566	+	p, i	—	89°	Ext. angle = 18°
Erythromycin estolate	1.483	1.488	1.515	+	p	—	52°	
Erythromycin ethylcarbonate	1.496	1.506	1.510	—	p	+	medium	Op. ax. figs. common
Erythromycin ethylsuccinate	1.490	1.515	1.567	+	p	—		$n_\gamma$ rare
Erythromycin gluceptate	1.506	—	1.528	—	p	+		
Erythromycin. Hl. H <sub>2</sub> O	1.528	1.536	1.550	+	p	+	75°	
Erythromycin.2H <sub>2</sub> O	1.512	1.523	1.532	—	p	—	84°	
Erythromycin oxalate.2H <sub>2</sub> O	1.484	1.492	1.516	+	p	+	60°	
Erythromycin stearate	1.498	1.507	1.563	+	p	±	small	$n_\gamma$ rare
Fumagillin	1.518	ca 1.572	>1.780	+	p, i		small	
Gramicidin	1.541	ca 1.553	1.573	+				
Neomycin sulfate	n 1.541							Isotropic
Novobiocin acid, form 2	1.608	1.638	1.654	—			71°	$r > v$
Novobiocin sodium	1.565	—	1.629	—	p	—		Tiny needles
Nystatin	1.512	1.583	1.682	+	p	—		Small, pale yellow rods
Oxytetracycline.2H <sub>2</sub> O	1.634	1.646	>1.700	+	p		28°	
Oxytetracycline.HCl	1.546	1.635	1.730	+	p, i	+	very large	Op. ax. figs. common
Penicillin G benzathine	1.523	1.622	1.630	—	p	+	very small	$n_\alpha$ and $n_\gamma$ common
Penicillin G dibenzylamine	1.567	—	1.613	—	p	+		
Penicillin G /-ephedrine	1.575	—	1.610	—	p	—		
Penicillin G /-ephedamine	1.583	1.590	1.648	+	i		very small	Bx. ac. figs.
Penicillin G hydrabamine	1.556	ca 1.590	1.619	—	p, i	—		
Penicillin G.Hl diethylaminoethyl ester	1.601	1.608	1.632	+	p	—	medium	
Penicillin G potassium	1.550	—	1.603	—	p	+		Elongated rectangular plates
Penicillin G procaine	1.545	1.570	1.685	+	p, i	±		$n_\beta$ common
Penicillin G sodium	1.550	1.609	1.620	—	p	+	large	$n_\beta$ common
Penicillin O chloroprocaine	1.541	1.585	1.656	+	p	±	large	
Penicillin O potassium	1.545	—	1.593	—	p	+		
Tetracycline.HCl	1.603	1.685	1.714	—	p		large	Bx. ac. and op. ax. figs.
Tetracycline.3H <sub>2</sub> O	1.538	1.646	sl >1.787	+	p, i		large	Occasional op. ax. figs.
Tyrocidine.HCl	1.553	—	1.584	—	p	+

Compound	$\alpha$	$\beta$	$\gamma$	Optic Sign	Extinction	Elongation	2V	Remarks
Antihistamines								
Anthallan <sup>®</sup> .HCl	1.505	1.585	1.617	—	p	—	very small	Small rods & irregular fragments; no figs.
Bromothén.HCl	1.617	1.654	1.734	+	i	+		Very small rods
Chlorcyclizine.HCl	1.590	1.610	1.665	+				Thin platy fragments; op. ax. figs. common
Chlorcyclizine.2HCl	1.610	1.660	1.665	—	p			Short rods & thin 6-sided plates; op. ax. figs. common
Chlorothén citrate	1.583	1.603	1.645				60° 70°	Minute plates & shreds; op. ax. figs. rare
Chlorothén.HCl	1.553	1.625	>1.734					Massive fragments, some rectangular; op. ax. figs. occasional
Chlorpheniramine maleate	1.533	n <sub>D</sub> 1.668	l <1.734					Box-like prisms & irregular fragments; figs. infrequent
Cyproheptadine.HCl	1.620	1.647	1.738	+	p			
Dexchlorpheniramine maleate	1.509	1.564	1.683	+	p		86° large	Platy material & rods
Dimenhydrinate (unsatisfactory for optical crystallographic study)								6-sided plates
Diphenhydramine.HCl	1.602	1.625	1.630	—	p	—		
Doxylamine succinate	ca 1.525	1.563	1.598	—				
p-Fluorotripenennamine.HCl	1.585	1.600	1.668	+	p	—	small small	Rods & square plates; op. ax. figs. occasional
Methaphenilene.HCl	1.604	1.675	1.733	—				Elongated 6-sided rods with obtuse ends; op. ax. figs. frequent
Methapyrilene.HCl	1.588	1.654	>1.695— <1.734	—				Thick hexagonal plates
2-(4-Morpholinyl) ethyl benzhydryl ether.HCl (Linadryl.HCl)	1.577	1.631	1.672	—	p, i	±		Elongated 6-sided & irregular fragments; figs. rare
Phenbenzamine.HCl	1.587	1.635	1.734	+			small small	Short prisms
Pheniramine maleate	1.548	1.574	1.665	+	p	+		Rods & plates
Promethazine.HBr	1.667	1.675	>1.733	+				Massive prisms; elongated or short & stubby
Promethazine.HCl	1.617	1.691	1.733	—	p	+		Rods & irregular fragments
Pyrathiazine.HCl	1.690	—	1.737				82° large	Stout prismatic forms; no figs.
Pyrilamine maleate (unsatisfactory for optical crystallographic study)								
Pyrrobutamine phosphate	1.566	1.614	1.653					Rods & irregular fragments
Thenylamine.HCl	1.590	—	1.680					Square plates & stubby prisms
Thonzylamine.HCl	1.612	1.679	1.691	—	p	+		Rods & platy material
Tripenennamine.HCl	1.580	1.655	1.705	—				Rectangular plates & prisms from water; op. ax. figs. common

Compound	$\alpha$	$\beta$	$\gamma$	Optic Sign	Extinction	Elongation	2V	Remarks
Barbiturates								
Allobarbitol	1.516	1.572	1.625	—	s		large	Op. ax. fig. common
Alphenal (5-allyl-5-phenylbarbituric acid)	1.551	1.578	1.645	+	p	—	67°	Op. ax. fig. common
Amobarbital	1.467	1.533	1.560	—	p	+		
Amobarbital sodium	n 1.505							Isotropic
Aprobarbital	1.520	1.581	1.600	—	i		medium	Rods
Barbital	1.445	1.548	1.580					All n's common
Barbital sodium	1.512	1.532	1.615				40°	
Butabarbital sodium	1.465	1.529	1.532	—	p	+	very small	
Butalbital	1.508	n <sub>i</sub> 1.521	1.577	+	p	+	medium	Rods and plates
Butallylonal	1.524	1.577	1.603	—	p	+	medium	Rosettes of tiny rods and blades; bx. ac. figs. occasional
Butethal	1.454	1.518	1.556	—	i		large	Rods & needles; op. ax. and bx. ac. figs. common
Cyclobarbitol	1.515	1.546	1.621	+		±	69°	Bx. ac. & bx. ob. figs. common
Cyclopal® (5-allyl-5-(2-cyclopenten-1-yl) barbituric acid)	1.520	1.575	1.626	—		—	85°	Bx. ac. fig. common
Hexethal (5-ethyl-5-n-hexylbarbituric acid)	1.473	1.519	1.549	—		—	76°	
Hexobarbital	1.546	1.608	1.634	—	p	+	64°	Bx. ac. & op. ax. figs. common
Mephobarbital	1.594	1.610	1.651	+	p	—	65°	Bx. ac. fig. common
Pentobarbital	1.465	—	1.565	—	i		very large	
Pentobarbital sodium	1.477	—	1.523					
Phenobarbital	1.557	1.620	1.667		p	—		$\beta$ very common
Phenobarbital sodium (unstable)								
Probarbital	1.477	1.573	1.624	—	i	+	73°	Rods
Probarbital sodium	1.532	—	1.629		p	+		Rods & needles
Secobarbital	1.487	1.557	1.563	—	p	+	31°	
Secobarbital sodium	1.490	n <sub>i</sub> 1.500	1.525					
Sigmodal® (5-(2-bromoallyl)-5-(1-methyl-butyl) barbituric acid)	1.519	1.583	1.634	—		+	80°	
Thiopental	1.534	1.634	—	—	i		40–45°	Lamellar
Vinbarbital	1.506	1.544	1.672	+	p	—	61°	

(Continued)

52.024 Optical crystallographic properties of some crystalline drugs<sup>a</sup>—Continued.

Compound	$\alpha$	$\beta$	$\gamma$	Optic Sign	Extinction	Elongation	2V	Remarks
Hallucinogens								
d-Lysergic acid diethylamide tartrate (LSD-25)	1.540	1.596	1.676	+	i		83°	Bx. ob. figs. common  $\alpha$ lengthwise, $\gamma$ crosswise  Broad plates; extinction sl i and almost symmetrical Uniaxial figs. and biaxial figs. with small 2V
4-Methyl-2,5-dimethoxyamphetamine.HCl ("STP".HCl) (DOM®)	1.518	1.622	1.632	—			33°	
3,4-Methylenedioxyamphetamine carbonate (MDA carbonate)	1.564	1.586	1.598	—	p or sl i	—		
3,4-Methylenedioxyamphetamine.HCl (MDA.HCl)	1.517	1.612	1.679	—	i, s		large	
3,4-Methylenedioxyamphetamine sulfate (MDA sulfate)	1.537	—	1.629					
Phencyclidine.HBr	1.572	1.620	1.654					$n_\beta$ and $n_\gamma$ common
Phencyclidine.HCl	1.572	1.618	1.654	—			80°	
Psilocybin	1.527	1.554	1.672	+			55°	
Steroids								
Betamethasone	1.554	—	1.667		p	+		Very small rods
Cholesterol	1.520	1.532	1.566	+			60°	Elongated plates
Cortisone	1.552	1.572	1.625	+	p	+	medium	$n_\alpha$ and $n_\beta$ most common
Cortisone acetate	1.512	1.552	1.621	+	p	±	medium	
Dehydrocholic acid	1.510	1.542	1.572	—	p, i	±	80°	
Desoxycorticosterone acetate	1.529	1.550	1.630	+			54°	$r > v$
Dexamethasone	1.553	1.572	1.648	+			52°	Bx. ac. common
Diethylstilbestrol, trans	1.594	1.611	1.73	+	p	—		Orthorhombic system
Equilin	1.534	1.677	1.705	—			40°	Plates
Estradiol benzoate	1.586	1.603	1.633	+	p	—	large	
Estradiol dipropionate	1.506	—	1.598	—				2E = 46°
Estrone, phase 1	1.520	1.642	1.692	—	i		60°	Ext. angle = 12°; $r > v$
Estrone, phase 2	1.511	1.621	1.697	—			75°	$r > v$ weak
Estrone, phase 3	1.594	1.628	1.647	—	p		73°	Metastable crystals, 6-sided plates
Ethisterone	1.576	1.625	1.645	—			67°	2E = 127°
Fluorometholone	1.562	1.568	1.704	+			26°	$r > v$ strong
Hydrocortisone	1.531	1.550	1.638	+	p	n		Tiny rods & plates
Hydrocortisone acetate	1.543	1.589	1.627	—	p, i	±	83°	Monoclinic; $r > v$
Methylprednisolone acetate	1.562	1.575	1.700	+			38°	$v > r$
Methylprednisolone sodium succinate	1.552	—	1.561	+			very small	
Methyltestosterone	1.555	ca 1.565	1.620	+	p	—	medium

<sup>b</sup> The second set of optical properties in each case represents intermediate data which are commonly found in some commercial samples. They probably represent an anhydrous form or merely a different common orientation of the crystal.

**52.026 Nomograph relating absorbance, concentration, and absorptivity (1 cm cell)**

(A straight edge placed at known values on two appropriate axes (i.e., absorbance and absorptivity) will intersect the corresponding value on the third axis (i.e., concentration).)

Reprinted from *The Analyzer* 4, No. 2 (1963)  
Beckman Instruments, Inc., Fullerton, Calif.

# Index

Entries are located by section numbers, rather than by page numbers. A single number refers to the first section of a multiple section method; an inclusive set of numbers refers to several methods included within the group of numbers.

Entries usually will be found under the constituent sought rather than under the product in which it is to be determined, *e.g.*, the determination of potassium in fruits will be found under potassium rather than under fruits. Commodities and products may often be located more easily through the Table of Contents when basic composition methods are desired. They are entered here when commodities and products are a part of a general topic, *e.g.*, filth or pesticide residue analysis.

Secondary determinations (*e.g.*, water-soluble ash) have been included with the primary determination (ash). Negative prefixes (*e.g.*, nonsugar, unfermentable) are usually not indexed when there is a corresponding positive entry for the same determination.

Ordinary reagents are not indexed unless they are "named" (*e.g.*, Keller-Kiliani reagent) or are likely to be useful in other methods (*e.g.*, coupling reagent). Buffer solutions are indexed only if a specific pH is given in the description.

The number in brackets at the end of a line listing a chemical is the *Chemical Abstracts Service* registry number. For synonyms, the CAS registry number is given with the common name. If two compounds are listed on the same line, the registry number refers to the first.

In placing entries, positional prefixes are ignored (*e.g.*, numerals, Greek letters unless spelled out, *o*-, *m*-, *p*-, atomic symbols, etc.). The alphabetical order is word by word with hyphenated words treated as closed up.

sodium hypochlorite solutions, 6.113
- Available phosphorus**, in fertilizers, 2.048–2.053

- Azacyclonol hydrochloride**, optical properties, 52.024, 52.025 [1798-50-1]
- Azide method**, for dissolved oxygen, 33.028
- Azo Rubin Extra**, analysis, 34.015(e)
- Azolectin solution**, 4.023(c)
- Azure A solution**, 20.131(e)
- Babcock cheese bottle**, Paley-type, 18.045
- Babcock cream-test bottle**, 16.157(a)
- Babcock method**, for fat, in cream, 16.157  
for fat, in fish, 18.045  
in milk, 16.060
- Babcock milk-test bottle**, 16.060(a)
- Bacillus anthracis**, as test organism, 4.015(b)
- Bacillus cereus**, preparation of test culture, 42.199(c)
- Bacillus stearothermophilus**, as test organism, 16.131  
in sugars, 46.026
- Bacillus subtilis**, as test organism, 4.015(b), 16.137  
preparation of test culture, 42.199(d)
- Bacitracin**, in feeds, 42.202, 42.206 [1405-87-4]
- Bacteria**, in food and cosmetics, spiral plate method, 46.110  
in maple sap, 31.199
- Bacteriological can opener**, 46.020(a)
- Bacteriostatic activity**, of laundry additives, 4.051
- Bacto-hemoglobin substrate**, 14.054(b)
- Bailey-Andrew method**, for caffeine in coffee, 15.023, 15.024  
modified, for caffeine in tea, 15.051
- Baird-Parker medium**, 46.013(e)
- Baked products**, 14.117–14.129  
filth in, 44.054–44.060  
microbiological examination, 46.013  
mixes, *Salmonella* in, 46.068  
saccharin in, 20.184
- Baking powders**, fluorine in, 25.051
- Baking powders and chemicals**, Chapter 8
- Baking premixes**, acetone peroxides in, 20.142
- Balan**, in pesticides, 6.203, 6.209 [1861-40-1]
- Banminth (Pyrantel tartrate)**, in feeds, 42.135
- Barbital**, microchemical test, 36.098, 36.102 [57-44-3]  
optical properties, 52.024, 52.025
- Barbital sodium**, in drugs, 38.111 [144-02-5]  
optical properties, 52.024, 52.025
- Barbiturates**, in drugs, 37.065–37.067, 38.111  
microchemical tests, 36.098, 37.067  
optical properties, 52.024, 52.025
- Barium**, emission spectrographic method, [7440-39-3]  
49.001–49.007  
in water, 33.100, 33.102
- Barium chloride solution**, 2.160(a)  
standardization, 47.034(c), 47.040(a)
- Barium hydroxide**, standard solution, 18.051(e)
- Barium monochloroacetate**, optical properties, 20.067
- Barium perchlorate solution**, standardization, 47.043(a)
- Barium sulfate**, in face powders, 35.045 [7727-43-7]
- Barium sulfate standards**, for standardization of culture suspensions, 4.026
- Barley and barley products**, 14.062–14.082  
 $\alpha$ -amylase in flour and meal, 14.049  
ochratoxins in, 26.096  
pesticide residues in, 29.001–29.028  
piperonyl butoxide residues on, 29.161  
sterigmatocystin in, 26.117
- Barrett water trap**, 19.006
- Basal diet**, for hemoglobin repletion test, 43.217(b)
- Base-exchange silicate**, purification, 43.024(e)
- Bases**. See Alkalies
- Basic slag**, mechanical analysis, 2.008  
phosphorus in, 2.020
- Basil**, filth in, 44.121
- Bates divider**, for hops, 10.146
- Bathophenanthroline solution**, 43.090(g)
- Baumé**, commercial, table for corn sirup and corn sugar sirup, 31.213  
of sugar solutions, table, 52.008
- Bay leaves**, filth in, 44.121
- Beans**, cyanogenetic glycosides in, 26.135, 26.136  
filth in, 44.038, 44.107  
pinto, piperonyl butoxide residues on, 29.161  
protein in, 14.068  
weevils in, 44.107  
See also Green beans
- Beer**, 10.001–10.091 [8029-31-0]  
quaternary ammonium compounds in, 20.084
- Beets**, pesticide residues on, 29.001–29.028  
pureed, filth in, 44.104
- Beets, sugar**, 31.203, 31.204  
products, sucrose and raffinose in, 31.027, 31.029
- Belladonna**, and stramonium alkaloids, in ointments, [1406-53-7]  
38.031, 38.032
- Bellier test**, for peanut oil, 28.114
- Bellucci's reagent**, 13.021(d)
- Bemegride**, microchemical test, 36.098 [64-65-3]
- Benadryl hydrochloride (Diphenhydramine hydrochloride)**, microchemical test, 36.102  
optical properties, 52.024, 52.025
- Bendroflumethiazide**, in tablets, 37.168 [73-48-3]
- Benedict solution**, 16.269(a), 24.054(c)
- Bentonite**, absorbed formaldehyde in, 6.351 [1302-78-9]
- Benzaldehyde**, in almond extract, 19.099–19.103 [100-52-7]  
in cordials and liqueurs, 9.128  
nonalcoholic beverages and concentrates, 12.029
- Benzaldehyde sulfonic acids**, in FD&C Blue No. 1, 34.046
- Benzalkonium chloride solution**, standardization, 2.103(a)
- Benzedrine**. See Amphetamine
- Benzene**, in alcoholic products as denaturant, 5.012 [71-43-2]  
neutral, 17.034(a)  
redistilled, 29.099(c), 42.080(a)  
safety aspects, 51.045  
water-saturated, 38.057(c)
- Benzene hexachloride**, distinction from lindane, [608-73-1]  
29.066  
in pesticides, 6.192–6.202  
residues in foods, 29.001–29.028, 29.064–29.066
- Benzene-insoluble matter**, in color additives, 34.032
- Benzethonium chloride**, determination of purity, [121-54-0]  
20.131(f)  
optical properties, 52.024, 52.025
- Benzo(a)pyrene**, in food, 21.001 [50-32-8]
- Benzoate**, in soda beverages, 12.050
- Benzocaine**, and antipyrine, in drugs, 38.144 [94-09-7]  
in drugs, 38.138, 38.143  
microchemical test, 36.102
- Benzoic acid**, in almond extract, 19.104 [65-85-0]  
in flour, 14.039  
food, 20.016–20.028  
milk, 16.110  
microchemical test, 36.102  
with salicylic acid, in drugs, 37.001, 37.002
- 1,2-Benzopyrone (Coumarin)**, in wines, 11.079
- p-Benzoquinone solution**, 42.132(a)  
precautions, 42.132(a)
- Benzoyl peroxide**, in flour, 14.039 [94-36-0]
- Benzthiazide**, in drugs, 37.189 [91-33-8]
- Benztropine mesylate**, in drugs, 38.149 [132-17-2]
- Benzyllmorphine**, microchemical test, 36.095 [14297-87-1]
- Berberine**, microchemical test, 36.095 [2086-83-1]  
optical properties, 52.024, 52.025
- Berberine hydrochloride**, optical properties, 52.024, 52.025 [633-65-8]
- Bergamot oil**, citral in, 19.129 [8007-75-8]
- Berlin Institute method**, for invert sugar, 31.048
- Berries**, maggots in, 44.081  
rot in, 44.080  
seeds in, 22.023
- Beta acids**, in hops, 10.151
- Betaine**, in orange juice, 22.055 [107-43-7]
- Beta-**. See also main chemical name
- beta-Lactamase (Penicillinase)**, 16.132(b)
- Betamethasone**, optical properties, 52.024, 52.025 [378-44-9]
- Beverages**, benzoic acid in, 20.019, 20.021  
mercury in, 25.117  
nonnutritive sweeteners in, 20.157–20.172  
quaternary ammonium compounds in, 20.084
- Beverages, carbonated**, brominated vegetable oils in, 20.146  
monochloroacetic acid in, 20.068–20.072
- Beverages, chocolate**, alginates in, 12.054
- Beverages, distilled liquors**, Chapter 9
- Beverages, malt beverages and brewing materials**, Chapter 10  
beer, quaternary ammonium compounds in, 20.084
- Beverages, nonalcoholic and concentrates**, Chapter 12  
5-nitro-2-propoxylaniline (P-4000) in, 20.179  
nonnutritive sweeteners in, 20.157–20.172  
saccharin in, 20.184, 20.185, 20.188
- Beverages, soda**, benzoate, caffeine, and saccharin in, 12.050

- Beverages, wines**, Chapter 11  
 monochloroacetic acid in, **20.068–20.072**
- Beverages and beverage materials**, extraneous materials in, **44.005–44.013**
- BF method**, for aflatoxins in peanuts and peanut products, **26.032**
- BHA**, in breakfast cereals, **20.009** [25013-16-5]  
 in fats and oils, **20.006**
- BHC**. See Benzene hexachloride
- BHT**, in breakfast cereals, **20.009** [128-37-0]  
 in fats and oils, **20.006**
- Bicarbonate**, in waters, **33.076**
- Bidwell-Sterling moisture receiver**, **16.235(a)**
- Bifuran**, in feeds, **42.075**
- Bioassay method**, chick edema factor, **28.127**  
 eye irritation test, for cosmetics, **35.083**  
 for histamine, in fish, **18.060**  
 mydriatic and myotic drugs, **36.094**  
 paralytic shellfish poison, **18.079**  
 toxicity of aflatoxin B<sub>1</sub>, **26.084**  
 vitamins and other nutrients, **43.194–43.219**
- Bioavailability**, of iron, hemoglobin repletion test, **43.217**
- Biochemical identification**, of *Salmonella*, commercial kits for, **46.072**
- Biochemical oxygen demand (BOD)**, of domestic wastes, industrial water, and industrial waste water, **33.019**
- Biochemical reactions**, of microorganisms, **46.016**  
 of salmonellae, **46.060–46.063**
- Biological material**, fluorine in, **25.051**  
 mercury in, **25.117**  
 monofluoroacetic acid residues in, **29.140, 29.142**
- Biphenyl**, residues in citrus fruit, **29.067** [92-52-4]
- Bird excrement**, in food and containers, **44.177, 44.183**
- Bis (N,N'-Methylenebisacrylamide)**, **18.090**
- Bis(dimethylthiocarbamoyl)disulfide (Thiram)**, in pesticides, **6.342**
- S-1,2-Bis(ethoxycarbonyl)ethyl O,O-dimethyl phosphorodithioate (Malathion)**, residues in foods, **29.127, 29.128**
- Bis(ethyl acetoacetato) copper**, **9.102(c)**
- Bishydroxycoumarin (Dicumarol)**, in drugs, **37.144**
- 2,4-Bis(isopropylamino)-6-methoxy-s-triazine (Prometon)**, in pesticides, **6.431**
- 2,4-Bis(isopropylamino)-6-(methylthio)-s-triazine (Prometryn)**, in pesticides, **6.431**
- 2,2-Bis(p-methoxyphenyl)-1,1,1-trichloroethane (Methoxychlor)**, residues in foods, **29.001–29.028, 29.137**
- Bismuth**, in drugs, **36.044, 36.045** [7440-69-9]  
 removal, in lead determination, **25.103**
- Bismuth iodide solution**, **36.095(d), 36.095(e)**
- Bismuth sulfite agar**, **46.054(f)**
- Bithionol**, in feeds, **42.041** [97-18-7]
- Bitterness**, in beer, **10.084, 10.087**
- Biuret**, in fertilizers, **2.085**  
 in urea, **2.082, 2.085**  
 purification, **2.082(c)**  
 recrystallization, **2.085(f)**
- Biuret test**, for proteins, **7.010**
- Black malt**, color in, **10.111**
- Bleaching powders**, **6.117**
- Blender**, explosion-proof, **26.070(a)**  
 high speed, xv (item 18), **44.002(c)**  
 precautions, **51.004**
- Blood cells**, red, washed, **46.047(d)**
- Blood counting cell**, **44.002(d)**
- Bloom Gelometer**, **23.007, 23.013**
- Blue tetrazolium solution**, **39.047(d)**
- Bluish Orange TR**, analysis, **34.015(e)**
- BOD**. See Biochemical oxygen demand
- Bolting cloth**, **44.002(e)**
- Bone**, identification in feeds, **7.129**  
 mechanical analysis, **2.008**
- Bone meal**, fluorine in, **25.051**
- Boot pycnometer**, **10.106(i)**
- Borate buffer solutions**. See Buffer solutions, borate
- Borates**, in food, **20.029–20.050**
- Borax**, **44.003(h)** [1303-96-4]  
 standard, preparation, **50.014(c)**  
 standard buffer solution, **50.007(f)**
- Borax method**, for standardizing hydrochloric acid, **50.014**  
 for sulfuric acid, **50.040**
- Bordeaux mixture**, **6.067–6.094**  
 arsenic in, **6.074–6.076, 6.082, 6.083, 6.090, 6.091**  
 carbon dioxide in, **6.068, 6.073, 6.081, 6.089**  
 copper in, **6.015, 6.016, 6.070, 6.071, 6.077–6.079, 6.084, 6.085, 6.087, 6.092–6.094**  
 lead in, **6.014, 6.086, 6.087**  
 moisture in, **6.004, 6.067, 6.072, 6.080, 6.088**  
 with arsenicals, arsenic in, **6.005, 6.013**  
 moisture in, **6.004**  
 calcium arsenate, **6.088–6.094**  
 lead arsenate, **6.080–6.087**  
 Paris green, **6.072–6.079**  
 zinc in, **6.017**
- Bordeaux Red**, analysis, **34.015(e)**
- Boric acid**, in caviar, **20.030, 20.037** [10043-35-3]  
 in deodorants and antiperspirants, **35.024**  
 face powder, **35.041**  
 food, **20.029–20.050**  
 meat, **20.033**  
 water, **33.125, 33.134, 33.135**
- Boron**, emission spectrographic method, **49.001–49.007** [7440-42-8]  
 in caviar, **20.030, 20.037**  
 cold wave neutralizers, **35.059**  
 fertilizers, **2.114, 2.117**  
 plants, **3.102, 49.001–49.007**  
 qualitative test, **35.059(c)**

**Copper serum method**, for added water in milk, 16.098  
**Copper-reducing substances**, in spices and other condiments, 30.014  
**Copra**, and copra meal, aflatoxins in, 26.044  
**Cordials**, 9.104–9.129  
**Coriander**, filth in, 44.119–44.123, 44.127, 44.142  
**Corn and corn products**, 14.062–14.082  
    aflatoxins in, 26.014, 26.020, 26.049  
    chips, filth in, 44.061  
    field, in canned mixture of field and sweet corn, 32.042  
    filth in, 44.038, 44.039, 44.042–44.044, 44.046, 44.047, 44.061, 44.118  
    flour, filth in, 44.046, 44.047  
    grits, assortment of, 10.128  
    filth in, 44.043, 44.044  
    meal, filth in, 44.042, 44.043  
    pesticide residues in, 29.001–29.028  
    monofluoroacetic acid residues in, 29.140–29.142  
    thiamine in, 43.031  
    thiram residues on, 29.165  
    volatile fumigant residues in, 29.056  
    zearalenone in, 26.124  
**Corn Industries Research Foundation method**, for moisture in starch conversion products, 31.210  
    for saccharides, in corn sirup, 31.228  
**Corn kernels**, pesticide residues on, 29.058  
**Corn sirup**, high fructose, in honey, 31.148, 31.150  
**Corn sirup products**, in honey, 31.150  
**Corn sirups**, 31.205–31.236  
**Corncobs**, minerals in, 2.111(h)  
**Correction table**, for gasometric determination of carbon dioxide, 52.007  
**Cortisone**, optical properties, 52.024, 52.025 [53-06-5]  
**Cortisone acetate**, optical properties, 52.024, 52.025 [50-04-4]  
**Cosmetics**, Chapter 35  
    bacteria in, spiral plate method, 46.110  
    color additives for, 34.015  
    color additives in, 34.001–34.004  
**Cotarnine**, microchemical test, 36.095 [82-54-2]  
**Cottage cheese**, gelatin in, 16.109, 16.273  
    sampling, 16.231  
**Cotton**, absorbent, metal-free, 25.022(i)  
**Cotton acid succinate**, 18.064(b)  
    column, 18.065  
**Cottonseed hulls**, minerals in, 2.111(b)  
**Cottonseed meal**, aflatoxins in, 26.014  
    phosphorus in, 2.020  
**Cottonseed oil**, cyclopropene fatty acids in, 28.109  
    Halphen test, 28.108  
    specifications, 43.196(c)  
**Cottonseed products**, aflatoxin in, 26.052  
**Coumarin**, in vanilla extract and substitutes, 19.016, 19.017 [91-64-5]  
    in wine, 11.079  
    spectrophotometric characteristics, 19.023  
**Counting plate**, for rot fragment counting, 44.002(t)  
**Count-rate meter**, 48.030(a)  
**Coupling reagent**, 7.042(f), 41.003(d), 42.017(d), 42.070(c)  
**CQC (2,6-Dichloroquinonechloroimide) solution**, 16.125(c)  
**Crabmeat**, ammonia in, 18.027  
    filth in, 44.069  
    frozen, drained weight, 18.016, 18.018  
    in seafood cocktail, 18.022  
    indole in, 18.072  
    shell in, 44.068  
**Cracked wheat**, filth in, 44.042  
**Crackers**, raisin-filled, 14.130, 14.131  
**Cranberries**, DDT residues on, 29.097  
    maleic hydrazide residues on, 29.129  
**Cranberry sauce**, mold in, 44.085  
**Cream**, 16.144–16.165  
    DDT residues in, 29.097  
    filth in, 44.019  
    gelatin in, 16.109  
    half-and-half, protein in, 16.037  
    lactic acid in, 16.027  
    pesticide residues in, 29.001–29.028  
    phosphatase in, 16.127  
    pressurized, sampling, 16.146  
    sediment in, 44.024  
    vanishing, 35.076–35.082  
**Cream of tartar**, in baking powders and baking chemicals, 8.014 [868-14-4]  
**Cream-test bottle**, Babcock, 16.157(a)  
**Creatine**, in meat and meat products, 24.043, 24.066 [57-00-1]  
**Creatinine**, in meat and meat products, 24.043, 24.067 [60-27-5]  
**Cresol red indicator**, 3.098(c), 16.222(f), 18.051(d)  
**Cresols**, commercial, phenol in, 5.014  
    saponified solutions, phenol in, 5.014  
**Critical temperature of dissolution**, of cacao fat, 13.044  
    of oil from butter and margarine, 16.215  
**Croceine Scarlet MOO**, analysis, 34.015(e)  
**Crude fat**. *See* Fat  
**Crude fiber**. *See* Fiber, crude  
**Crude protein**. *See* Protein  
**Cryolite**, fluorine in, 6.019 [15096-52-3]  
**Cryoscope**, 16.100  
**Cryoscopic method**, for added water in milk, 16.099, 16.100  
**Crystal violet indicator**, 3.156(d), 44.003(p)  
**Crystallographic properties**, of hydrazino-γ-undecalactone, 9.127  
    optical, of drugs, 36.106  
    table, 52.024, 52.025  
**CTC**. *See* Chlortetracycline  
**Cubé powder**, 6.160–6.165  
**Cucumbers**, pesticide residues on, 29.001–29.034  
**Culture media**, for antibiotics in feeds, 42.196  
    for *Clostridium botulinum* and its toxins, 46.039  
    *Clostridium perfringens*, 46.033  
    disinfectants, 4.001, 4.036, 4.045(b)  
    eggs and egg products, 46.005  
    fecal coliforms and *E. coli*, 46.118(b)  
    food, 46.013  
    fungicidal test, 4.019  
    germicide and detergent sanitizers, 4.023(a), 4.023(b)  
    low-acid canned foods, 46.019  
    microbiological methods, 46.005, 46.006, 46.013, 46.019, 46.026, 46.033, 46.039, 46.054, 46.079, 46.118, 46.120  
    penicillins in milk, 16.131, 16.137  
    phenol coefficient method, 4.001  
    *Salmonella*, 46.054  
    spores in sugars, 46.026  
    sporicidal test, 4.015(a)  
    staphylococcal enterotoxin, 46.079  
    swimming pool water disinfectants, 4.036, 4.037  
    tuberculocidal activity, 4.045(b), 4.048(a)  
    vitamins, 43.126, 43.127, 43.134, 43.142, 43.150, 43.159, 43.168, 43.177–43.179, 43.188(a), 43.188(q), 43.188(r)  
    yeast count, of honey, 31.196  
**Culture suspensions**, standardization, barium sulfate standards for, 4.026  
    per cent 7 for, 4.026, 4.042  
**Cumin**, filth in, 44.119–44.123, 44.142  
**Cumdiff-Markunas method**, for alkaloids, in tobacco, 3.156  
**Cuprethol solution**, 10.068(c)  
**Cuprous iodide**, preparation, 29.166(c) [7681-65-4]  
**Cuprous oxide**, for determination of sugars, 31.039 [1317-39-1]  
    precipitation, 31.038  
**Curculio larvae**, in pecan pieces, 44.029  
**Curcuma**, in macaroni, egg noodles, and similar products, 14.154  
**Curcumin solution**, 20.030(d)  
**Curd cheese**, gums in, 16.269  
**Cured meats**, nitrites in, 24.041  
**Curing pickle**, and dry cure mix, nitrites in, 20.073  
**Curry powder**, filth in, 44.119–44.123  
**Cyanamide**, water-insoluble nitrogen in, 2.071  
**Cyanate**, potassium, in pesticides, 6.098  
**Cyanide**, in calcium cyanide, 6.095  
    in potassium cyanide, 6.100  
    sodium cyanide, 6.100  
    spirits, 9.101  
    wines, other nondistilled products, and products containing sulfur dioxide, 11.057  
**Cyanides**, precautions, 51.041, 51.050  
    sodium and potassium, in pesticides, 6.100–6.102  
**Cyanocobalamin**, microbiological method, [68-19-9]  
    43.126–43.141  
**Cyanogen bromide solution**, 43.044(e)  
**Cyanogenetic glycosides**, in beans, 26.135, 26.136  
    in feeds and similar materials, 26.134  
**Cyclamate (Cyclohexylsulfamate)**, in foods, 20.157–20.167 [100-88-9]  
    in fruit products, 20.164, 20.168  
    nonalcoholic beverages, 20.157–20.163  
    salts, in clear carbonated beverages, 20.163  
**Cycloate (Ro-Neet)**, in herbicides, 6.426 [1137-23-2]  
**Cyclobarbital**, microchemical test, 36.098 [52-31-3]  
    optical properties, 52.024, 52.025

- 5-(1-Cyclohepten-1-yl)-5-ethylbarbituric acid (Heptabarbital), microchemical test, 36.098
- Cyclohexane, safety aspects, 51.051 [110-82-7]
- Cyclohexanol test, for artificial colors, 9.096
- 5-Cyclohexenyl-1,5-dimethylbarbituric acid (Hexobarbital), optical properties, 52.024, 52.025
- 5-(1-Cyclohexenyl)-5-ethylbarbituric acid (Cyclobarbital), microchemical test, 36.098
- optical properties, 52.024, 52.025
- Cyclohexylamine, in artificial sweetener concentrates, [108-91-8]
- 20.168
- in food, 20.168
- Cyclohexylsulfamate. *See* Cyclamate
- Cyclone, 44.002(h)
- Cyclopal, optical properties, 52.024, 52.025
- Cyclopropene fatty acids, in cottonseed oil, 28.109

and MCPA, in pesticides, 6.270  
in herbicides, 6.265
- S-(1,2-Dicarbethoxyethyl) O,O-dimethyl phosphorodithioate (Malathion),  
residues in foods, 29.001-29.024, 29.044, 29.050, 29.128
- Dichlobenil, in herbicides, 6.250 [1194-65-6]
- Dichlone, residues in fruits and vegetables, 29.103 [117-80-6]
- Dichlorimide method, for 2,5-diaminotoluene, 35.056  
for paraphenylenediamine, 35.058
- Dichloro diphenyl dichloroethane. See DDD
- Dichloro diphenyl trichloroethane. See DDT
- Dichloroacetic acid, precautions, 51.082  
solution, 17.043(b)
- 3,6-Dichloro-o-anisic acid (Dicamba), in herbicides, 6.265
- 2,6-Dichlorobenzonitrile (Dichlobenil), in herbicides, 6.250
- 3,5-Dichloro-2,6-dimethyl-4-pyridinol (Clopidol), in chicken tissues and  
eggs, 41.013
- 1,2-Dichloroethane. See Ethylene dichloride
- Dichlorofluorescein, analysis, 34.015(e)  
indicator, 6.441(b)
- Dichlorofluorescein NA, analysis, 34.015(e)
- 2,6-Dichloroindophenol method, for vitamin C, 43.056
- 2,3-Dichloro-1,4-naphthoquinone (Dichlone), residues in fruits and veg-  
etables, 29.103
- Dichlorophene, in drugs, 39.130 [97-23-4]
- 2,4-Dichlorophenoxyacetic acid. See 2,4-D
- 2,2-Dichloropropionic acid (Dalapon), sodium salt, in herbicides, 6.280
- 2,6-Dichloroquinonechloroimide (CQC) solution, 16.125(c)
- Dichlorotetraiodofluorescein, analysis, 34.015(e)
- 4,4'-Dichloro- $\alpha$ -(trichloromethyl)-benzhydrol (Dicofol), in pesticides,  
6.283
- 2,2-Dichlorovinyl dimethyl phosphate, in pesticides, [62-73-7]  
6.324, 6.328
- Dicofol, in pesticides, 6.283 [115-32-2]
- Dicumarol, in drugs, 37.144 [66-76-2]
- Dicyclohexylamine acetate, preparation, 39.001(b)
- Dieldrin, as contaminant in pesticide formulations, [60-57-1]  
6.027  
in pesticides, 6.177, 6.182  
residues, in foods, 29.001-29.028  
in soil, 29.013
- Dienestrol, in drugs, 39.018 [87-17-3]
- Diethanolamine, purification, 6.224(c) [111-42-2]  
solution, 10.068(a)
- Diethyl diphenyl dichloroethane (Perthane), residues in foods,  
29.001-29.028, 29.092
- Diethyl ether. See Ether
- O,O-Diethyl O-p-nitrophenyl phosphorothioate (Parathion), residues in  
foods, 29.001-29.024, 29.039-29.054, 29.160
- Diethylamine reagent, 42.086(d)  
aged, 42.116(a)  
safety aspects, 51.052
- Diethylaminoethyl (DEAE) dextran sulfate solution, 46.120(a)
- 5,5-Diethylbarbituric acid (Barbital), microchemical test, 36.098, 36.102  
optical properties, 52.024, 52.025
- Diethylcarbonate, in food, 20.051 [105-58-5]  
in wines, 11.076
- 4,4'-(1,2-Diethylethylene diphenol) (Hexestrol), in drugs, 39.023, 39.024
- O,O-Diethyl S-(ethylthio)methyl phosphorodithioate (Phorate, Thimet),  
6.415
- Di-(2-ethylhexyl)phosphoric acid (DEHP) solution, 38.012(b)
- O,O-Diethyl-O-(2-isopropyl-6-methyl-4-pyrimidinyl) phosphorothioate  
(Diazinon), in pesticides, 6.331, 6.431  
residues in foods, 29.001-29.024, 29.044, 29.050
- 5,5-Diethyl-1-methylbarbituric acid (Metharbital), microchemical test,  
36.098
- Diethyl-p-nitrophenyl phosphate (Paraoxon), residues in foods, 29.039
- Diethylstilbestrol, in drugs, 39.014 [56-53-1]  
in feeds, 42.059
- trans, optical properties, 52.024, 52.025
- Digestion apparatus, for mercury residues, 25.110(e), 25.115, 25.119
- Digitonin method, for sterols, 14.149
- Digitonin recovery, 28.088
- Digitoxin, in drugs, 39.059 [71-63-6]
- Digitoxosides, in drugs, 39.064, 39.073
- Diglycerides, analysis, 28.133, 28.148  
hydroxyl value, 28.016
- Digoxin, in drugs, 39.065, 39.073 [36-35-1]
- Dihydroanethole, in nonalcoholic beverages and concentrates, 12.046
- Dihydrocodeinone, in drugs, 38.016 [125-29-1]  
with antihistamines, 38.017
- 2,3-Dihydro-2,2-dimethyl-7-benzylfuranyl methylcarbamate (Carbo-  
furan), residues on foods, 29.058
- 6,7-Dihydrodipyrido(1,2-a:2',1'-c) pyrazinediium ion (Diquat), in pesti-  
cides, 6.332
- 1,2-Dihydro-6-ethoxy-2,2,4-trimethylquinoline. See Ethoxyquin
- Dihydromorphine, microchemical test, 36.095 [466-99-9]
- Dihydrosafrole, in nonalcoholic beverages and con-  
centrates, 12.046 [94-58-6]
- Dihydrostreptomycin hydrochloride, optical proper-  
ties, 52.024, 52.025 [7177-56-2]
- Dihydrostreptomycin sulfate, optical properties, [5490-27-7]  
52.024, 52.025
- Diiododibromofluorescein, analysis, 34.015(e)
- Diiodofluorescein, analysis, 34.015(c) [518-40-1]
- Dilaudid (Dihydromorphine), microchemical test, 36.095
- Dill seed, filth in, 44.119-44.123, 44.142
- Dill weed, filth in, 44.121
- Dilution water, 46.005(a)  
peptone, 46.032(a)
- Dimenhydrinate, optical properties, 52.024 [523-87-5]
- Dimethisterone, in drugs, 39.037 [79-64-1]
- 3,3'-Dimethoxybenzidine, precautions, 51.084  
solution, 20.006(c)
- Dimethoxymethane, 42.221 [109-87-5]
- N'-(2,6-Dimethoxy-4-pyrimidinyl)sulfanilamide (Sulfadimethoxine), in  
feeds, 42.168
- O,O-Dimethyl dithiophosphate of diethyl mercaptosuccinate. See Mal-  
athion
- O,O-Dimethyl S-(N-formyl-2-mercapto-N-methylacetamide) phospho-  
rodithioate (Formothion), in pesticides, 6.356
- O,O-Dimethyl O-p-nitrophenyl phosphorothioate. See Methyl parathion
- O,O-Dimethyl S-(4-oxo-1,2,3-benzotriazin-3-(4H)-yl methyl) phospho-  
dithioate (Guthion), residues in foods, 29.107
- Dimethyl yellow-methylene blue, mixed indicator, 6.150(g)
- p-Dimethylaminobenzaldehyde (DMAB), color reagent, 3.162(d)  
purification, 18.072(a)  
solution, 9.066(a)  
spray, 44.163(e)
- 1,1'-Dimethyl-4,4'-bipyridinium ion (Paraquat), in pesticides, 6.334
- Dimethyldichlorosilane, 43.231(c)
- Dimethylformamide, purification, 42.107(a)  
precautions, 51.053
- N,N-Dimethylformamide solution, 42.100(a)
- Dimethylglyoxime reagent, 25.144(c)
- 1,2-Dimethyl-5-nitroimidazole (Dimetridazole), in feeds, 42.063
- N-(4,6-Dimethyl-2-pyrimidinyl) sulfanilamide. See Sulfamethazine
- Dimethylsulfoxide (DMSO), 37.085(f)  
precautions, 42.124(c)
- Dimethyl-2,3,5,6-tetrachloroterephthalate (Dacthal), in pesticides, 6.259,  
6.262
- O,O-Dimethyl-O-(2,4,5-trichlorophenyl) phosphorothioate (Ronnell), in  
feeds, 42.145-42.152  
residues in foods, 29.001-29.024
- 1,1-Dimethyl-3-( $\alpha,\alpha,\alpha$ -trifluoro-m-tolyl)urea (Fluometuron), in pesticides,  
6.289

- Dimetridazole**, in feeds, 42.063 [551-92-8]  
**3,5-Dinitrobenzamide (Nitromide)**, in feeds, 42.116  
**Dinitrobenzene solution**, alkaline, 39.073(a)  
**4,4'-Dinitrocarbanilide.2-hydroxy-4,6-dimethylpyrimidine (Nicarbazin)**, in feeds, 42.088  
**m, m'-Dinitrodiphenyldisulfide (Nitrophenide)**, in feeds, 42.120  
**Dinitrophenol**, in drugs, 37.116 [51-28-5]  
 microchemical test, 36.102  
**2,4-Dinitrophenylhydrazine reagent**, 11.054(b), 19.100  
**Dinitrophenylhydrazine sulfate solution**, 39.088  
**3,5-Dinitrosalicylic acid (5-nitrofurfurylidene) hydrazide (Nifursol)**, in feeds, 42.098  
**3,5-Dinitro-o-toluamide**. See *Zoalene*  
**Dionine**. See *Ethylmorphine*  
**Dioxins**, in fats and oils, 28.127, 28.128  
**Diphenhydramine hydrochloride**, microchemical test, [147-24-0]  
 36.102  
 optical properties, 52.024, 52.025  
**s-Diphenylcarbazone indicator**, 47.007(a)  
**s-Diphenylcarbazone-bromophenol blue indicator**, 33.068(e)  
**Diphenylhydantoin**, and phenobarbital, 37.077 [57-41-0]  
 optical properties, 52.024, 52.025  
**Diphenylthiocarbazone**. See *Dithizone*  
**Dips**, coal tar, phenol in, 5.014  
 **$\alpha,\alpha$ -Dipyridyl solution**, 14.011(b), 36.069(a)  
**Diquat**, in pesticides, 6.332 [2764-72-9]  
**Dirt**, in eggs, 44.063  
**Disinfectants**, Chapter 4  
 for swimming pool water, 4.036  
 phenol in, 5.014  
 seed, formaldehyde in, 6.351  
 organic mercurial, 6.130-6.138

- Ephedrine sulfate**, in drugs, 38.002, 38.111, 38.206 [134-72-5]
- /-Ephedrine sulfate**, optical properties, 52.024, 52.025
- Epinephrine**, in dosage forms, norepinephrine in, [51-43-4]
- 38.056
  - microchemical test, 36.100
  - optical properties, 52.024, 52.025
- Epinephrine bitartrate**, in ointments, 38.056 [51-42-3]
- Epinephrine hydrochloride**, in drugs, 38.056 [55-31-2]
- EPN**, residues in foods, 29.039 [2104-64-5]
- Eptam (EPTC)**, in herbicides, 6.426
- EPTC**, in herbicides, 6.426 [759-94-4]
- Equilin**, in drugs, 39.001, 39.006 [474-86-2]
- optical properties, 52.024, 52.025
- Equipment**, safety aspects, 51.001-51.016
- Equivalent combining weights**, and reciprocals, for radicals and salts in waters, 33.137
- Ergotamine**, in drugs, 38.042, 38.047 [113-15-5]
- Eriochrome black T indicator**, 33.083(b)
- solution, 1.002(d), 10.057(c)
- Erioglaucine X**, analysis, 34.015(e)
- Erucic acid**, in rapeseed oil, 28.066 [112-86-7]
- Erythritol tetranitrate**, in drugs, 39.109 [7297-25-8]
- Erythrodextrin test**, for commercial glucose, 15.035(b)
- Erythromycin**, in feeds, 42.221 [114-07-8]
- salts and derivatives, optical properties, 52.024, 52.025
- Erythrosine**, analysis, 34.015(b) [568-63-8]
- separation, 34.005
- Erythrosine Yellowish K**, analysis, 34.015(e)
- Erythrosine Yellowish NA**, analysis, 34.015(c)
- Erythrosine Yellowish NH**, analysis, 34.015(e)
- Escherichia coli**, as test organism, 4.023(g), 4.040(g)
- in foods, biochemical classification, 46.016
  - most probable number, 46.013
  - in shellfish growing waters, 46.117
  - preparation of test culture, 42.199(h)
- Eserine**. *See* Physostigmine
- Essential oil**, in emulsion, 19.127
- in extracts and toilet preparations, 19.126
  - fruits and fruit products, 22.088
  - nonalcoholic beverages and concentrates, 12.031
- Essential Oils Association**, color value, 30.002
- Esters**, in cordials and liqueurs, 9.125
- in lemon oil, 19.092
  - nonalcoholic beverages and concentrates, 12.023
  - spirits, 9.049, 9.053
  - of hormone-type herbicides, volatility, 6.032
- $\beta$ -Estradiol**, in drugs, 39.007 [50-28-2]
- Estradiol benzoate**, optical properties, 52.024, 52.025 [50-50-0]
- Estradiol dipropionate**, optical properties, 52.024, 52.025 [113-38-2]
- Estradiol valerate**, in drugs, 39.008 [979-32-8]
- Estrogens**, conjugated, in drugs, 39.001
- Estrone**, in drugs, 39.001, 39.006 [53-16-7]
- optical properties, 52.024, 52.025
- Ethanol**. *See* Alcohol; Ethyl alcohol
- Ethchlorvynol**, in drugs, 37.100 [113-18-8]
- purification and assay, 37.100(a)
- Ether**, anhydrous, 7.055, 43.090(f)
- dried, 17.017(d)
  - in drugs, 36.011
  - peroxide-free, xv (item 3), 43.003(c)
  - safety aspects, 51.054
  - washed, 37.029(b), 38.169(c)
  - water-saturated, 38.009(d)
- Ether extract**, in cereal adjuncts, 10.142
- in cereals and cereal products, 14.067
  - color additives, 34.040-34.043
  - confectionery, 31.102, 31.103
  - derris and cubè powder, 6.165
  - dried milk products, 7.059
  - eggs and egg products, acidity, 17.034
  - feeds, 7.055-7.060
  - fish meal, 7.060
  - flour, 14.018
  - grain and grain products, 14.067

- Isocetane**, purification, **10.084(a)**, **21.004(a)**, **28.047(b)**, **41.025(a)** [26635-64-3]  
 safety aspects, **51.062**
- Isopentane**, purification, **19.051(a)** [78-78-4]
- Isopropanol**. See **Isopropyl alcohol**

- o-Isopropoxyphenyl methylcarbamate (Propoxur)**, residues on foods, 29.058
- Isopropyl alcohol**, in alcoholic products as denaturant, 5.012  
in cassia, cinnamon, and clove extracts, 19.111  
drugs, 36.006, 36.007  
lemon and orange flavors and extracts, 19.057, 19.060  
peppermint, spearmint, and wintergreen extracts, 19.120  
spirits, 9.083  
saturated with heptane, 44.003(w)
- Isopropyl ether extract**, of color additives, 34.038
- Isopropyl-4,4'-dichlorobenzilate (Chloropropylate)**, in pesticides, 6.431
- 2-Isopropyl-4-pentenyl urea (Sedormid)**, in drugs, 37.098
- Isoproterenol**, microchemical test, 36.100 [51-31-0]
- Isosafrole**, in nonalcoholic beverages and concentrates, 12.046 [120-58-1]
- Isotonic solutions**, quaternary ammonium compounds in, 20.082
- Isosuprine hydrochloride**, optical properties, 52.024, 52.025 [579-56-6]
- Ito-barbital (Allylbarbital)**, microchemical test, 36.098
- IUPAC**, 26.026, 26.037, 26.044  
carbamate method for copper, 25.038  
See also AOAC-IUPAC method
- Jackson-Mathews**, densities of fructose solutions, table, 52.011  
modification of Nyns method for fructose, 31.057
- Jalap**, in drugs, 39.102
- Jams**, benzoic acid in, 20.019, 20.021  
filth in, 44.088  
sample preparation, 22.008  
solids in, 22.018
- Jellies**, benzoic acid in, 20.019, 20.021  
filth in, 44.088  
sample preparation, 22.008  
solids in, 22.024
- Jelly strength**, of gelatin, 23.007  
of gelatin dessert powders, 23.013
- Jones modification**, of Robertson method for nitrate nitrogen, in fertilizers, 2.070
- Jones reductor**, 35.068(a)  
modified, 16.249(a)
- Jorissen test**, for salicyclic acid, 20.095
- Juices**, fruit,  
anthocyanins in, 22.094  
benzoic acid in, 20.021  
carbohydrates in, 22.080  
consistency, 22.009  
laevo-malic acid in, 22.069  
lemon, 22.105-22.110  
malvidin glucosides in, 22.099  
monochloroacetic acid in, 20.068-20.072  
orange, betaine in, 22.055  
thiourea in, 20.115, 20.117  
recoverable oil in, 22.090  
saccharin in, 20.185  
sample preparation, 22.008  
sodium chloride in, 32.025
- Kale**, canned, filth and aphids in, 44.112  
pesticide residues on, 29.001-29.028, 29.044, 29.058
- Karl Fischer method**, for moisture, in milk chocolate and confectionery coatings, 13.003  
for water, in dried vegetables, 32.047  
in fertilizers, 2.015  
molasses, 31.068
- Karl Fischer reagent**, preparation, 31.069(a), 32.048(a)
- Katalase Fähigkeit, K<sub>1</sub>**, for catalase activity, 32.065
- Keller-Kiliani reagent**, 39.073(b)
- Kelthane**. See Dicofo
- Kernel weight**, of malt, 10.098
- Kernels**, broken, in malt, 10.101
- Ketones**, in spirits, 9.083
- Ketosteroids**, 39.006
- Kieserite**, magnesium in, 2.138 [14567-64-7]
- Kilborn funnel**, 44.002(i)(f)
- Kingsley-Schaffert distilling apparatus**, for arsenic, 25.016(b)
- Kirchner's medium**, 4.048(a)(4)
- Kjeldahl apparatus**, automated, 7.021  
micro, 11.009
- Kjeldahl method**, for nitrogen, in feeds, 7.015, 7.021  
for nitrogen, in fertilizers, 2.057, 2.058  
in meat and meat products, 24.027  
plants, 3.116, 3.117  
tobacco, 3.140  
waters and wastes, 33.051  
micromethod, 47.021  
in colors, 34.021
- Kleber method**, for aldehydes, in orange oil, 19.086  
Kirsten modification, for aldehydes, in lemon oil, 19.088
- Klebsiella pneumoniae**, aberrant, as test organism, 4.051(b)
- Knapheide-Lamb method**, for iodine in mineral mixed feeds, 7.114
- Knorr alkalimeter**, 1.010
- Knorr-type extraction tube**, 14.093, 14.149, 17.021(d)
- Koettstorfer number**, of fats and oils, 28.025
- Koser sodium citrate test**, 46.016(c)
- Koser's citrate broth**, 46.005(e)
- Kovac test**, for indole production, 46.016(a)
- Kovac's reagent**, 46.055(a)  
test for salmonellae, 46.061(c)(3)
- Krober table**, for pentoses and pentosans (surplus), 43.021 (10th ed.)
- Kuderna-Danish concentrator**, 20.168(a), 29.005(e)
- Kymograph**, 18.060(a)
- Laboratory safety**, Chapter 51
- Lactated Ringer's injection**, calcium, potassium, and sodium in, 36.055
- Lactic acid**, in butter and margarine, 16.219 [50-21-9]  
in dairy products, 16.027  
eggs and egg products, 17.036, 17.040  
fruits and fruit products, 22.076  
vegetable products, canned, 32.041  
wines, 11.048  
standard solution, 14.057, 16.027(a)
- Lactobacillus casei** subsp. *rhannosus*, preparation of stock culture, 43.128(d)
- Lactobacillus leichmannii**, preparation of stock culture, 43.128(a)
- Lactobacillus plantarum**, preparation of stock culture, 43.128(c), 43.180(b)
- Lactometer**, Quévenne, 16.033  
correction table, 52.023
- Lactone**, in honey, 31.160
- Lactose**, 31.061, 31.062 [63-42-3]  
Hammond table, 52.019  
in bread, 14.113  
cacao products, 13.048  
condensed milk, sweetened, 16.187  
cream, 16.155  
evaporated milk, 16.176  
meat products, 24.054  
milk, 16.055-16.058, 16.078  
process cheese, 16.268  
sugars and sirups, 31.063  
Munson and Walker table (surplus), 43.012 (10th ed.)
- Lactose broth**, 4.037(d), 46.005(f)
- Lactose-gelatin medium**, 46.033(e)
- Laevo-malic acid**, in cordials and liqueurs, 9.123, 9.124 [97-67-6]  
in fruits and fruit products, 22.065, 22.067-22.075, 22.108  
lemon juice, 22.108  
nonalcoholic beverages and concentrates, 12.020, 12.021
- Lake Red C**, analysis, 34.015(c) [2092-56-0]
- Lake Red C Amine**, in D&C Red Nos. 8 and 9, 34.052
- Lake Red CBA**, analysis, 34.015(c) [5160-02-1]
- Lake Red D**, analysis, 34.015(e)
- Lake Red DBA**, analysis, 34.015(e)
- Lake Red DCA**, analysis, 34.015(e)
- Lakes**, analysis, 34.001-34.004, 34.015  
lead in, 34.084, 34.087  
separation, 34.002-34.004
- Lane-Eynon method**, for fructose, 31.055  
for glucose, 31.050  
invert sugar, 31.034  
lactose, 31.061  
maltose, 31.059  
reducing sugars, in brewing sugars and sirups, 10.166  
honey, 31.120(b)  
starch conversion products, 31.220(a)  
sugars, in molasses, 31.077  
tables, 52.017, 52.018
- Langer method**, for santanin, 39.087
- Lanthanum solution**, 2.110(d), 32.035(f)
- LaParola-Mariani test**, for dulcin, 20.175
- Lard**, foreign fats in, 28.119

- Lasalocid**, in feeds, 42.231, 42.304 [25999-31-9]
- Latent fingerprints**, development, 45.001, 45.002
- Laundry additives**, bacteriostatic activity, 4.051
- Lauryl sulfate tryptose broth**, 46.013(b)  
test for coliforms and *E. coli*, 46.016(d)
- Lead**, as residue, in foods, 25.061–25.108 [7439-92-1]  
by chelometric titration, 19.028(c)  
in baking powders and baking chemicals, 8.039  
Bordeaux mixtures, 6.014, 6.086, 6.087  
color additives, 34.015(a), 34.081–34.087  
earthenware, 25.031, 25.035  
lead arsenate, 6.049  
paint, 5.001  
pesticides, 6.014  
salt, 33.146  
water, 33.136  
waters and wastes, 33.089
- Lead acetate**, dry basic, preparation, 31.021(c) [301-04-2]  
tribasic, preparation, 22.073(c)
- Lead acetate solution**, 22.073(a), 22.078(b), 23.014(b), 26.053(b)  
basic, 15.004(a), 31.021(a)  
standard, 31.178  
neutral, 19.048(a), 31.021(d), 31.086(b)  
tribasic, standard, 22.073(b)
- Lead arsenate**, 6.042–6.049 [7784-40-9]  
arsenic in, 6.005, 6.013, 6.043–6.048  
lead in, 6.049  
moisture in, 6.004, 6.042  
with Bordeaux mixture, 6.080–6.087
- Lead chlorofluoride**, preparation, 6.019(b)
- Lead clarification**, of sugars, in plants, 3.105
- Lead dioxide**, preparation, 9.102(f) [1309-60-0]
- Lead dioxide pellets**, preparation, 47.009(e)
- Lead iodide solution**, 36.095(k)
- Lead nitrate**, purification as standard, 25.062 [10099-74-8]
- Lead number**, of maple products, 31.177, 31.178  
of vanilla extract and its substitutes, 19.025
- Lead triethanolamine solution**, 36.102(n)
- Least squares**, treatment of data, xvi (item 24)
- Leaves and stems**, in hops, 10.147(a)
- Lecithin**, in cacao products, 13.045 [8002-43-5]
- Lecithovitellin solution**, 46.047(b)
- Legal test**, for thujone, 9.129
- Leibovitz medium (L-15)**, 46.120(f)
- Lemon**, oil of, in extracts, 19.065–19.067  
in oil base flavors, 19.068, 19.070
- Lemon extracts**, and flavors, 19.053–19.077  
essential oil in, 19.126
- Lemon juice**, 22.105–22.110  
recoverable oil in, 22.090
- Lemon oil**, 19.078–19.095  
citra in, 19.129  
physical constants of 10% distillate, 19.082  
ultraviolet absorbance characteristics, 19.081
- Lemonade**, frozen concentrate for, soluble solids in, 22.025
- Lemongrass oil**, citral in, 19.129
- Letheen broth**, 4.001(d)(3)
- Lettuce**, DDT residues on, 29.097  
pesticide residues on, 29.001–29.028, 29.044
- Levallophan tartrate**, optical properties, 52.024, 52.025 [71-82-9]
- Levamisole succinate**, optical properties, 52.024, 52.025 [5634-40-2]
- Levant worm seed**, santonin in, 39.095
- Levulose**. *See* Fructose
- Light Green CF Yellowish**, analysis, 34.015(e)
- Light Green SF Yellowish**, analysis, 34.015(f)  
separation, 34.005  
solution, 38.178(b)
- Lignin**, in feeds, 7.069 [9005-53-2]  
in plants, 3.122, 3.126
- Lima beans**, canned, calcium in, 32.020
- Lime**, burnt, safety aspects, 51.036 [1305-78-8]  
*See also* Calcium
- Lime**, oil of, in oil base flavors, 19.068, 19.070
- Lime extracts and flavors**, 19.053–19.077  
citral in, 19.129
- Lime sulfur solutions**, and dry lime sulfur, 6.103–6.110
- Lime suspension**, low fluorine, 25.052(a)
- Limestone**, 1.001, 1.007 [1317-65-3]
- Liming materials**, Chapter 1
- Limit-dextrin substrate**, buffered, 10.121(g)
- d-Limonene**, in citrus juices, 22.090 [5989-27-5]
- Linadryl hydrochloride**, optical properties, 52.024, 52.025 [525-01-9]
- Lincomycin**, in feeds, 42.237, 42.241 [154-21-2]
- Lindane**, distinction from technical BHC, 29.066 [58-89-9]  
in pesticides, 6.192–6.202  
residues, in food, 29.001–29.028  
in soil, 29.013
- Lindo-Gladding method**, for potassium in fertilizers, 2.088
- Line test**, for vitamin D, 43.206
- Linoleic acid**, in fats and oils, 28.045 [60-33-3]
- Linolenic acid**, in fats and oils, 28.045 [463-40-1]
- Lintner starch**, for diastatic power, 10.118(g)
- Lipids and lipid phosphorus**, in eggs and egg products, 17.014  
in flour, 14.028, 14.029  
macaroni, egg noodles, and similar products, 14.145
- Lipoxidase solutions**, 28.071(c)
- Liqueurs**, 9.104–9.129
- Liquid**, drained, in shucked oysters, 18.014
- Liquors**, distilled, Chapter 9
- Lithium**, safety aspects, 51.034 [7439-93-2]
- Lithium bromide**, in elixir of five bromides, 36.061 [7550-35-8]
- Lithol Red**, analysis, 34.015(g) [1248-18-6]
- Lithol Red BA**, analysis, 34.015(g) [1103-38-4]
- Lithol Red CA**, analysis, 34.015(g) [1103-39-5]
- Lithol Red SR**, analysis, 34.015(g) [6371-67-1]
- Lithol Rubin B**, analysis, 34.015(c)
- Lithol Rubin BCA**, analysis, 34.015(c) [5281-04-9]
- Litmus indicator**, 6.348(d)
- Liver broth**, 46.028(b)
- Liver-veal-egg yolk agar (LVEY)**, 46.039(c)
- Livestock sprays**, thiocyanate nitrogen in, 6.423
- Loss on drying**, of roasted coffee, 15.010, 15.012  
*See also* Moisture; Solids
- Lovibond number**, color units, 9.008  
tintometer, 30.080
- Low temperature filtering device**, 17.021(d)
- LSD**, 40.008 [50-37-3]  
precautions, 40.008
- LSD-25**, microchemical test, 40.001 [113-41-7]  
optical properties, 52.024, 52.025
- Luminal**. *See* Phenobarbital
- Lupulin grains**, in hops, 10.147(c)
- Lye**, soda, carbonate and hydroxide in, 5.019 [1310-73-2]

- Malted milk**, 16.190–16.202
- Malted wheat flour**, nitrogen in, 14.054
- proteolytic activity, 14.054
- Maltose**, in flour, 14.023, 14.046 [69-79-4]
- in honey, 31.123, 31.130
- sugars and sirups, 31.059, 31.060, 31.063
- Munson and Walker table, 52.019, surplus, 43.012 (10th ed.)
- Wein table (surplus), 43.016 (10th ed.)
- Maltose-sucrose ferricyanide**, conversion table, for flour, 14.025
- Maltulose**, in corn sirup, 31.228
- Malvidin glucosides**, in grape juice, 22.099
- Mandarin oil**, citral in, 19.129 [8008-31-9]
- Mandelic acid**, in drugs, 37.008 [90-64-2]
- microchemical test, 36.102
- Maneb**, in pesticides, 6.338 [301-03-1]
- Manganese**, as residue in foods, 25.109 [7439-96-5]
- emission spectrographic methods, 49.001–49.007
- in feeds, 7.091, 7.116
- fertilizers, 2.109, 2.139–2.142
- fruits and fruit products, 22.036
- liming materials, 1.032
- plants, 3.006, 3.018, 49.001–49.007
- waters and wastes, 33.089, 33.125–33.128
- Mannitol hexanitrate**, and phenobarbital, 39.113 [130-39-2]
- in drugs, 39.109, 39.113
- D-Mannose**, in sugars and sirups, 31.063 [3458-28-4]
- Manometer**, for calibrating gages, 10.049(a)
- nitrogen, 28.046(a)(5)
- Manometric method**, for carbon dioxide in beer, 10.049
- for carbon dioxide in wine, 11.058
- Maple products**, 31.161–31.202
- Margarine**, 16.203–16.230
- isolated *trans* isomers in, 28.075
- peroxide value, 28.022
- vitamin A in, 43.001
- Marihuana**, qualitative test, 40.012 [8001-45-4]
- Marine animal oils**, in vegetable oils, 28.121
- Marine products**, Chapter 18
- Marine toxins**, 26.133
- Marinelli beaker**, 48.026(c)
- Mariotte bottle**, 47.026(q)
- Marjoram**, filth in, 44.119–44.123, 44.142
- Marl**, sampling, 1.001
- Marmalades**, benzoic acid in, 20.019
- sample preparation, 22.008
- solids in, 22.018, 22.024
- Marsh test**, for artificial colors, 9.094
- Martius Yellow**, in color additives, 34.075 [887-79-6]
- Mashing apparatus**, 10.106(d)
- Masseccutes**, moisture in, 31.007, 31.008
- preparation of sample, 31.001(b)
- Mathers test**, for artificial colors, 9.095
- for caramel, in wines, 11.054
- Matter**, insoluble, in color additives, 34.029–34.037
- in salt, 33.140, 33.141
- soluble, in color additives, 34.100–34.102
- volatile, in color additives, 34.028
- Mayonnaise**, alginates in, 30.058
- cholesterol in, 43.229
- filth in, 44.157
- gums in, 30.054
- MBTH (3-Methyl-2-benzothiazolinone hydrazone) hydrochloride solution**, 26.113(e)
- McFarland No. 1**, turbidity standard, 46.079(h)
- McIlvaine's citrate-phosphate buffer**, 3.108(b)
- MCPA (2-Methyl-4-chlorophenoxyacetic acid)-di-camba**, in pesticides, 6.270 [94-76-6]
- MDA carbonate (3,4-Methylenedioxyamphetamine carbonate)**, optical properties, 52.024, 52.025
- MDA hydrochloride (3,4-Methylenedioxyamphetamine hydrochloride)**, optical properties, 52.024, 52.025
- MDA sulfate (3,4-Methylenedioxyamphetamine sulfate)**, optical properties, 52.024, 52.025
- Meal**,  $\alpha$ -amylase in, 14.049
- corn, iron in, 14.066
- cottonseed, phosphorus in, 2.020
- fish, crude fat or ether extract in, 7.060
- nitrate and nitrite nitrogen in, 7.041
- Mealiness**, of malt, 10.097
- Meat and meat products**, Chapter 24
- arsenic in, 25.014
- benzo(a)pyrene in, 21.001
- boric acid and borates in, 20.033
- DDT residues in, 29.097
- extracts, 24.060–24.071
- filth in, 44.073, 44.074
- fluorine in, 25.051
- glass in, 44.067
- lead in, 25.095
- mercury in, 25.117
- microbiological examination, 46.013
- Salmonella* in, 46.068
- sodium chloride in, 32.025
- sulfites in, 20.112
- viral contamination, 46.120
- Mebaral (Mephobarbital)**, optical properties, 52.024, 52.025
- Mecadox (Carbadox)**, in feeds, 42.047
- Mechanical analysis**, of bone, tankage, and basic slag, 2.008
- of liming materials, 1.002
- peat, 2.168
- phosphate rock, 2.009
- See also* specific product
- Media**. *See* Culture media
- Medicated feeds**, Chapter 42
- Medroxyprogesterone acetate**, in drugs, 39.037 [71-58-9]
- Meissl-Hiller method**, for invert sugar, 31.046
- table of factors for invert sugar in materials containing sucrose (surplus), 43.015 (10th ed.)
- Melengestrol acetate**, in animal tissues, 41.029 [2919-66-6]
- Melting point**, of acetylsalicylic acid, 37.042
- of  $\gamma$ -BHC, 6.197
- color additives, 34.103
- fat in cacao products, 13.036
- fats and fatty acids, 28.009, 28.011
- Menadione sodium bisulfite**, in feed premixes, 43.120 [130-37-0]
- in injections, 39.122
- Menthol**, in drugs, 39.083 [1490-04-6]
- in tobacco, 3.162, 3.165
- Meperidine (Demerol)**, in drugs, 38.157, 38.158 [57-42-1]
- Meperidine hydrochloride**, optical properties, 52.024, 52.025 [50-13-5]
- Mephentermine**, in drugs, 38.181 [100-92-5]
- Mephentermine sulfate**, in drugs, 38.159 [1212-72-2]
- optical properties, 52.024, 52.025
- Mephobarbital**, optical properties, 52.024, 52.025 [115-38-8]
- Meprobamate**, and pentaerythritol tetranitrate, 39.118 [57-53-4]

- Meprobamate** (*Contd*)  
 in drugs, 39.125  
 optical properties, 52.024, 52.025
- Merbromin**, 36.083–36.085 [129-16-8]
- 2-Mercapto-4-hydroxypyrimidine** (Thiouracil), in drugs, 37.188
- Mercurial seed disinfectants**, organic, 6.130–6.138
- Mercurials**, precautions, 51.041
- Mercuric iodide**, mercury in, 36.079 [7774-29-0]
- Mercuric nitrate solution**, 16.188  
 standard, 33.068(d), 33.068(f)  
 standardization, 47.007(c)
- Mercuric oxide ointment**, mercury in, 36.079
- Mercurochrome** (Merbromin), 36.083–36.085
- Mercurous chloride** (Calomel), in ointments, 36.086  
 in tablets, 36.087
- Mercurous iodide**, in tablets, 36.088 [7783-30-4]
- Mercurous nitrate solution**, 36.102(q)
- Mercury**, as residue in foods, 25.110–25.124 [7439-97-6]  
 in drugs, 36.079–36.090  
 mercurial ointments, 36.089, 36.090  
 mercurochrome, 36.085  
 organic mercurial seed disinfectants, 6.130–6.138  
 waters and wastes, 33.095  
 safety aspects, 51.065, 51.079
- Mestranol**, in presence of ethynodiol diacetate, 39.033 [72-33-3]  
 in presence of norethindrone and norethynodrel, 39.029
- Metal fragments**, in eggs, 44.063
- Metals and other elements**, as residues in foods, Chapter 25  
 in beer, 10.062–10.077  
 color additives, 34.081–34.089  
 plants, 3.006–3.058

 optical properties, 52.024, 52.025
- "O" ring seal**, 38.160(a)
- Oats and oat products**, 14.062–14.082  
 pesticide residues in, 29.001–29.028  
 piperonyl butoxide residues on, 29.161
- Ochratoxins**, 26.096–26.110  
 precautions, 26.096
- Octachloro-4,7-methanotetrahydroindane (AG chlordanes)**, in pesticides, 6.232, 6.236
- n*-Octyl sulfoxide of isosafrole (Sulfoxide)**, in pesticides, 6.419
- Office International du Cacao et du Chocolat**, 13.005, 13.007, 13.010, 13.011, 13.032
- Ofner method**, corrections to be applied to iodine titer, table (surplus), 43.014 (10th ed.)  
 for invert sugar, 31.045
- Oil**, in cereal adjuncts, 10.132  
 in dressings for foods, identification, 30.053  
 flaxseed, by refraction, 28.154  
 mineral oil-soap emulsions, 6.126  
 soybean flour, 14.088
- Oil, essential**, in anise and nutmeg extracts, 19.123, 19.124  
 essential, in cassia, cinnamon, and clove extracts, 19.112  
 in emulsions, 19.127  
 extracts and toilet preparations, 19.126  
 fruits and fruit products, 22.088  
 nonalcoholic beverages and concentrates, 12.031  
 peppermint, spearmint, and wintergreen extracts, 19.121  
 spices, 30.020–30.027
- Oil, recoverable**, from citrus juices, 22.090
- Oil, volatile**, in eugenol, 30.024  
 volatile, in ginger, 30.025  
 in mustard seed, 30.026  
 spices, 30.020  
 refractive index, 30.023  
 specific gravity, 30.022
- Oil base flavors**, oils of lemon, lime, and orange in, 19.068, 19.070
- Oil Red OS**, analysis, 34.015(e) [26-12-5]  
 separation and identification, 34.009
- Oil Red XO**, analysis, 34.015(e) [12-12-5]  
 separation, 34.005  
 and identification, 34.009
- Oil separator trap**, 19.127
- Oils**, coconut and palm kernel, in cacao products, 13.042, 13.043  
 coconut and palm kernel, silver number of, 13.043  
 crude and refined, free fatty acids in, 28.029  
*See also* specific products
- Oils and fats**, Chapter 28  
 antioxidants in, 20.006, 20.013  
 arsenic in, 25.008(e)  
 DDT residues in, 29.097  
 pesticide residues in, 29.001–29.028, 29.097  
 polysorbate 60 in, 20.127  
 vitamin E in, 43.088
- Ointments**, belladonna and stramonium alkaloids in, 38.031  
 benzoic acid in, 37.001, 37.002  
 butacaine sulfate in, 38.153  
 camphor in, 39.078  
 dexamethasone phosphate in, 39.047  
 epinephrine bitartrate in, 38.056  
 iodine, 36.067  
 iodoform in, 32.032  
 mercurous chloride (calomel) in, 36.086  
 mercury in, 36.079, 36.086, 36.089, 36.090  
 phenazopyridine hydrochloride in, 38.178  
 physostigmine in, 38.062  
 salicylic acid in, 37.001, 37.002
- Oklahoma State filter screen**, 7.063(d)
- Oleandomycin**, in feeds, 42.268 [3922-90-5]  
 [112-80-1]
- Oleic acid**, in oils and fats, 28.045
- Oleoresins**, spice, solvents in, 20.192
- Olive oil**, tea seed oil in, 28.117 [8001-25-0]
- Onion powder**, filth in, 44.130
- Salmonella* in, 45.054
- Onions**, maleic hydrazide residues on, 29.129
- Opium**, morphine in, 38.020 [8008-60-4]
- Opium alkaloids**, 38.001–38.025
- OPT (*o*-Phthalicdicarboxaldehyde) solution**, 18.068(c)
- Optic axial angle**, of crystalline drugs, 36.106
- Optic character and optic sign**, of crystalline drugs, 36.106
- Optical crystallographic properties**, of barium monochloroacetate, 20.067  
 of crystalline drugs, tables, 36.106, 52.024, 52.025  
 hydrazino- $\gamma$ -undecalactone, 9.127  
 $\beta$ -ionone-*m*-nitrobenzhydrazide, 19.135  
 reineckates, 20.078
- Optical rotation**, of lemon and orange oils, 19.080
- Orange I**, analysis, 34.015(f) [523-44-4]  
 separation, 34.005
- Orange II**, analysis, 34.015(c) [633-96-5]
- Orange B**, analysis, 34.015(b)
- Orange extracts and flavors**, 19.053–19.077  
 essential oil in, 19.126
- Orange G**, analysis, 34.015(e)
- Orange juice**, betaine in, 22.055  
 monochloroacetic acid in, 20.068–20.072  
 recoverable oil in, 22.090  
 thiourea in, 20.115, 20.117
- Orange oil**, 19.078–19.095  
 citral in, 19.129  
 in extracts, 19.065–19.067  
 oil base flavors, 19.068, 19.070  
 physical constants of 10% distillate, 19.082  
 ultraviolet absorbance characteristics of, 19.081
- Orange peel**, thiourea in, 20.123
- Orange SS**, analysis, 34.015(e) [15-51-0]  
 separation, 34.005  
 and identification, 34.009
- Orange TR**, analysis, 34.015(e)
- Ordram (Molinate)**, in herbicides, 6.426
- Oregano**, filth in, 44.119–44.123, 44.145
- Oregon sampler**, for hops, 10.146
- Organic**. *See also* specific constituent
- Organic matter**, in peat, 2.176
- Organic mercurial seed disinfectants**, mercury in, 6.130–6.138
- Organic pesticide residues**, in foods, Chapter 29
- Organochlorine pesticides**, as contaminants of pesticide formulations, 6.027  
 multiresidue methods, 29.001–29.028  
 precautions, 51.041  
*See also* specific compound
- Organoleptic examination**, of 5-nitro-2-propoxyaniline (P-4000), 20.177  
 of saccharin, 20.182  
 vinegars, 30.062
- Organometallic pesticides**, 6.034–6.142
- Organophosphorus pesticides**, multiple residue methods, 29.039–29.055  
 multiresidue methods, 29.001–29.024  
 precautions, 51.041  
*See also* specific compound
- Original**. *See* specific constituent
- Ost solution**, 31.057
- Overflow can**, 16.280, 22.003(a)
- Oxalic acid**, in vegetable products, canned, 32.035 [144-62-7]  
 safety aspects, 51.027  
 standard solution, 22.073(e)
- Oxides**, of iron, aluminum, phosphorus, and titanium, in liming materials, 1.018  
 of iron, titanium, and aluminum, in face powders, 35.049  
 mixed, in color additives, 34.089  
*See also* specific constituent
- Oxidizing agents**, safety aspects, 51.069, 51.070, 51.076, 51.077, 51.080
- 6,6'-Oxybis(2-naphthalenesulfonic acid)**, in FD&C Red No. 40, 34.063  
 in FD&C Yellow No. 6, 34.053
- Oxygen**, dissolved, in waters, 33.027–33.033 [7782-44-7]  
 microchemical method, 47.024
- Oxyquinoline (8-Hydroxyquinoline)sulfate**, in drugs, 37.129, 37.131  
 microchemical test, 36.102
- Oxytetracycline**, in feeds, 42.272, 42.275 [79-57-2]
- Oxytetracycline dihydrate**, optical properties, 52.024, [6153-64-6]  
 52.025
- Oxytetracycline hydrochloride**, optical properties, [2058-46-0]  
 52.024, 52.025
- Oysters**, canned, shell in, 44.070  
 detection of frozen and thawed, 18.004  
 drained liquid in, 18.014  
 indole in, 18.072

- paralytic shellfish poison in, 18.079  
solids in, 18.023, 18.024  
volume determination, 18.013  
Ozone, precautions, 51.008 [10028-15-6]
- P-4000 (5-Nitro-2-propoxyaniline)**, 20.177–20.181  
in nonalcoholic beverages, 20.157, 20.179
- Paint**, lead in, 5.001  
methyl alcohol in, 5.008  
solids in, 5.002
- Paint remover**, methyl alcohol in, 5.008
- Palm kernel oil**, in cocoa butter and milk chocolate fat, 13.042  
silver number for detection, 13.043
- Pamaquine**, in drugs, 38.177 [491-92-9]
- Pancreatin solution**, 44.003(z)
- Pantothenic acid**, microbiological method, 43.126–43.133, 43.159–43.167 [79-83-4]
- Papain**, filth in, 44.189 [9001-73-4]  
proteolytic activity, 20.134, 20.138
- Papain activity unit**, definition, 20.141
- Papaverine**, microchemical test, 36.095 [58-74-2]  
optical properties, 52.024, 52.025
- Papaverine hydrochloride**, optical properties, 52.024, 52.025 [61-25-6]
- Paper chromatography apparatus**, 19.036, 29.007  
application tubes, preparation, 22.101(c)
- Paprika**, filth in, 44.132, 44.137, 44.138  
oleoresin, extractable color in, 30.002
- Paraffin**, in confectionery, 31.104 [8002-74-2]
- Paraldehyde**, in elixirs, 37.105 [123-63-7]
- Paralytic shellfish poison**, bioassay, 18.079  
safety aspects, 18.079
- Paraoxon**, residues in foods, 29.039
- Paraphenylenediamine**, in hair dyes and rinses, 35.057, 35.058 [106-50-3]
- Paraquat**, in pesticides, 6.334 [4685-14-7]
- Parathion**, in pesticides, 6.379–6.399 [56-38-2]  
in pesticides, separation from *p*-nitrophenol, 6.392  
residues in foods, 29.001–29.024, 29.039–29.054, 29.160  
See also Methyl parathion
- Paragoric**, morphine in, 38.020 [8029-99-0]
- Paris green**, 6.034–6.041 [82-94-0]  
antimony in, 6.036–6.039  
arsenic in, 6.005, 6.035–6.039  
copper in, 6.040, 6.041  
moisture in, 6.004, 6.034  
with Bordeaux mixture, 6.072–6.079
- Parnas-Wagner distillation apparatus**, 47.022(b)
- Parr bomb**, precautions, 51.013
- Parr table**, for density of carbon dioxide, 52.006
- Parsley**, filth in, 44.121
- Patent Blue CA**, analysis, 34.015(e) [3374-30-9]
- Patent Blue NA**, analysis, 34.015(f) [6417-61-4]
- Patulin**, in apple juice, 26.111
- PCB**, commercial mixtures, 29.036(d)  
in paper and paperboard, 29.035  
residues in food, 29.001–29.028
- PE-2 medium**, modified, 46.019(b)
- Pea pods**, DDT residues on, 29.097
- Peach cordial**,  $\gamma$ -undecalactone in, 9.126
- Peaches**, captan residues on, 29.076  
dodine residues on, 29.108  
frozen, thiourea in, 20.121  
Guthion residues on, 29.107  
maleic hydrazide residues on, 29.129  
pesticide residues on, 29.001–29.028
- Peanut butter**, 27.015, 27.016  
extraneous materials in, 44.031–44.036  
sodium chloride in, 32.025
- Peanut oil**, in fats and oils, 28.113, 28.114 [8002-03-7]
- Peanuts**, aflatoxins in, 26.014, 26.026, 26.032  
decomposed, in coarse peanut butter, 44.035  
monofluoroacetic acid residues in, 29.140, 29.142
- Pears**, arsenic on, 25.006  
captan residues on, 29.076  
dodine residues on, 29.108  
fluoride on, 25.056  
glycidin residues on, 29.119  
lead on, 25.106  
pesticide residues on, 29.001–29.028  
thiram residues on, 29.165
- Peas**, Alaska, piperonyl butoxide residues on, 29.161  
canned, alcohol-insoluble solids in, 32.012  
filth in, 44.038, 44.107  
frozen, alcohol-insoluble solids in, 32.056  
pesticide residues on, 29.001–29.028  
pureed, filth in, 44.104  
weevils in, 44.107
- Peat**, analysis, 2.164–2.192
- Pebulate**, in herbicides, 6.426 [1114-71-2]
- Pecans**, curculio larvae in, 44.029  
dodine residues on, 29.108  
extraneous materials in, 44.027–44.029
- Pectic acid**, in cacao products, 13.014 [9046-40-6]  
in fruits and fruit products, 22.053
- Pectic enzyme**, 32.014(d)
- Pectin**, in cacao products, extraction, 13.014(a)(3) [9000-69-5]  
removal from fruits and fruit products, 22.063, 22.064, 22.067, 22.076
- Pectin solution**, 11.054(a)
- Pediococcus cerevisiae**, preparation of stock culture, 43.180(c)
- Pellets**, rodent, in food. See Chapter 44, Rodent contamination; or  
Extraneous materials: isolation
- Penicillin**, in feeds, 42.278 [1406-05-9]  
in milk, 16.131, 16.137  
optical properties, 52.024, 52.025
- Penicillin cups (carriers, Penicylinders)**, 4.008(d), 4.016(g), 42.198(a)
- Penicillin G benzathine**, optical properties, 52.024, 52.025 [1538-09-6]
- Penicillin G dibenzylamine**, optical properties, 52.024, 52.025 [7173-27-5]
- Penicillin G *l*-ephedrine**, optical properties, 52.024, 52.025
- Penicillin G *l*-ephedrine**, optical properties, 52.024, 52.025 [7177-43-7]
- Penicillin G hydrabamine**, optical properties, 52.024, 52.025 [3344-16-9]
- Penicillin G hydroiodide diethylaminoethyl ester**, optical properties, 52.024, 52.025 [7778-19-0]
- Penicillin G potassium**, optical properties, 52.024, 52.025 [113-98-4]
- Penicillin G procaine**, optical properties, 52.024, 52.025 [54-35-3]
- Penicillin G sodium**, optical properties, 52.024, 52.025 [69-57-8]
- Penicillin O chloroprocaine**, optical properties, 52.024, 52.025 [575-52-0]
- Penicillin O potassium**, optical properties, 52.024, 52.025 [897-61-0]
- Penicillinase ( $\beta$ -Lactamase)**, 16.132(b)
- Pentacyanoammonioferroate**, precautions, 51.050  
test, for thiourea in orange juice, 20.115
- Pentaenoic acid**, in fats and oils, 28.045
- Pentaerythritol tetranitrate (PETN)**, in drugs, 39.109, 39.117 [78-11-5]  
precautions, 39.118  
with meprobamate, 39.118
- Pentane**, safety aspects, 51.074 [109-66-0]
- Pentazocine**, optical properties, 52.024, 52.025 [359-83-1]
- Pentazocine hydrochloride**, optical properties, 52.024, 52.025 [2276-52-0]
- Pentobarbital**, and carbromal, 37.064 [76-74-4]  
optical properties, 52.024, 52.025
- Pentobarbital sodium**, optical properties, 52.024, 52.025 [57-33-0]
- Pentosans**, in feeds, 7.085  
in wines, 11.051
- Pentoses and pentosans**, Kober table (surplus), 43.021 (10th Ed.)
- Pentothal (Thiopental)**, optical properties, 52.024, 52.025
- Pentylene tetrazol**, microchemical test, 36.102 [54-95-5]
- Pepper**, filth in, 44.121, 44.125–44.127, 44.132, 44.142, 44.147  
nitrogen in nonvolatile ether extract of, 30.011
- Pepper sauce**, filth in, 44.148
- Peppermint extract**, 19.117–19.121  
essential oil in, 19.126
- Peppers**, pesticide residues on, 29.001–29.028
- Pepsin digestibility**, of animal protein feeds, 7.048
- Peptone dilution water**, 46.032(a)
- Peptone solution**, photolyzed, 43.126(g)
- PER (protein efficiency ratio)**, 43.212
- Perborates**, precautions, 51.069  
in cold wave neutralizers, 35.059
- Perchlorates**, precautions, 51.069
- Perchloric acid**, in acetic acid, standard solution, 20.131(c)  
precautions, 51.028  
solution, 25.052(b)  
standard, 6.346(a)

- Perchromic acid**, safety aspects, **51.023**
- Percolator**, for extraction of extraneous materials, **44.002(i)(2)**  
laboratory continuous, **19.038(b)**
- Performic acid**, safety aspects, **51.024**
- Permanent Orange**, analysis, **34.015(c)**
- Permanent waves**, cold, thioglycolate solutions in, **35.064, 35.065**
- Permanganate oxidation number**, of vinegar, **30.085**
- Permanganate solution**. See Potassium permanganate
- Permanganates**, precautions, **51.069, 51.080**
- Permatone (Permanent) Orange**, analysis, **34.015(c)** [3468-63-1]
- Peronine (Benzylmorphine)**, microchemical test, **36.095**
- Peroxidase**, in vegetables, **32.069** [9003-99-0]
- Peroxide value**, for oils and fats, **28.022**
- Peroxide-free ether**, xv (item 3), **43.003(c)**
- Peroxides**, precautions, **51.069, 51.070**
- Peroxides, acetone**. See Acetone peroxides
- Persulfates**, precautions, **51.069**
- Perthane**, residues in foods, **29.001-29.028, 29.092** [72-56-0]
- Pesticide formulations**, Chapter 6
- Pesticide residues**, general method, **29.001-29.028**  
in foods, Chapter 29
- Pesticides**, precautions, **51.041**
- Pet foods**, crude fat or ether extract in, **7.058**  
 $\alpha$ -tocopheryl acetate in, **43.106**  
vitamin E in, **43.088**
- Pethidine (Meperidine)**, in drugs, **38.157, 38.158**
- Petitgrain oil**, citral in, **19.129**
- PETN**. See Pentaerythritol tetranitrate
- Petroleum ether**, for chromatography, **43.003(d)** [8030-30-6]  
precautions, **51.073**  
purification, **6.141(b), 10.132, 43.090(a)**  
reagent, **20.013(a)**
- Petroleum ether extract**, of cereal adjuncts, **10.132**  
of coffee, roasted, **15.033**  
soybean flour, **14.088**  
tea, **15.047**
- PG (Propyl gallate)**, in fats and oils, **20.006, 20.013**
- pH**, buffer solutions for calibration, **50.007**  
indicator paper, short-range, **32.035(a)**  
of baked products other than bread, **14.128**  
beer, **10.035**  
bread, **14.116**  
brewing sugars and sirups, **10.163**  
cacao products, **13.010**  
canned food, **46.024**  
flour, **14.022**  
macaroni, egg noodles, and similar products, **14.144**  
peat, **2.171**  
starch conversion products, **31.218**  
waters and wastes, **33.006**  
wines, **11.036**  
wort, **10.176**  
test papers, **20.169(f)**  
values for standard buffer solutions, table, **50.007**
- Phanodorn (Cyclobarbitol)**, microchemical test, **36.098**  
optical properties, **52.024, 52.025**
- Pharmaceutical Manufacturers Association-Food Chemicals Codex-AOAC method**, **20.138**
- Pharmaceutical preparations**, niacin in, **43.044**  
niacinamide in, **43.044, 43.052**  
 $\alpha$ -tocopherol in, **43.097**  
vitamin D in, **43.068, 43.079**  
vitamin E in, **43.111**
- Phenacetin**. See Acetophenetidin
- Phenaglycodol**, in drugs, **37.109** [79-93-6]
- Phenalkanolamine salts**, in drugs, **38.206**
- Phenanthroline ferrous sulfate indicator**, **11.010(c), 33.036(f)**
- 1,10-Phenanthroline reagent**, **36.074(a)**
- o-Phenanthroline solution**, **3.011(f), 10.072(a)(2), 14.011(a)**
- Phenazopyridine hydrochloride**, in drugs, **38.178** [136-40-3]  
microchemical test, **36.102**
- Phenbenzamine hydrochloride**, optical properties, **52.024, 52.025** [2045-52-5]
- Phencyclidine hydrobromide**, optical properties, **52.024, 52.025**
- Phencyclidine hydrochloride**, in powders, **40.016** [956-90-1]  
optical properties, **52.024, 52.025**
- Phendimetrazine hydrochloride**, optical properties, **52.024, 52.025** [7635-51-0]
- Phendimetrazine tartrate**, optical properties, **52.024, 52.025** [21102-82-9]
- Phenethylamines**, in drugs, **38.181**
- Pheniramine maleate**, in presence of APC, **38.135** [132-20-7]  
optical properties, **52.024, 52.025**
- Phenmetrazine**, microchemical test, **36.100** [134-49-6]
- Phenmetrazine hydrochloride**, optical properties, **52.024, 52.025** [1707-14-8]
- Phenobarbital**, acetophenetidin, aminopyrine, and caffeine, **37.038** [50-06-6]  
and acetylsalicylic acid, **37.048**  
aminophylline, **37.073**  
diphenylhydantoin, **37.077**  
mannitol hexanitrate, **39.113**  
theobromine, **37.082**  
in drugs, **38.111**  
microchemical test, **36.098, 36.102**  
optical properties, **52.024, 52.025**
- Phenobarbital sodium**, optical properties, **52.024** [57-30-7]
- Phenol**, in caustic poisons, **5.014, 5.018** [108-95-2]  
solution, alkaline, **24.030(c)**  
standard, **16.116(g)**  
standardization, **4.002(f)**
- Phenol coefficient**, of disinfectants, **4.001-4.006**
- Phenol red carbohydrate broth**, **46.054(p)(1)**  
dulcitol, test for salmonellae, **46.061(b)**  
lactose, test for salmonellae, **46.062(a)**  
sucrose, test for salmonellae, **46.062(b)**
- Phenol red indicator**, **17.049(c), 38.108, 50.008**
- Phenoldisulfonic acid**, preparation, **39.113(a)**
- Phenolic drugs**, **37.112-37.151**
- Phenolphthalein**, and acetylsalicylic acid, **37.054** [81-90-3]  
in chocolate preparations, **37.134**  
emulsions, **37.137**  
tablets, **37.138**
- Phenolphthalein indicator**, xv (item 6), **11.042(d), 33.053(e)**
- Phenolphthalein monophosphate solution**, **16.121(a)**
- Phenolphthalein-thymolphthalein indicator**, **11.063(e)**
- Phenols**, total, in diethylstilbestrol, **39.017**
- Phenolsulfonates**, in deodorants and antiperspirants, **35.035, 35.036**  
in drugs, **37.139**
- Phenol-sulfuric acid test**, for saccharin, **20.184**
- Phenothiazine**, in drugs, **38.185** [92-84-2]  
in feeds, **42.128**  
purification, **38.185(a)**
- Phenprocoumon**, in drugs, **37.144** [435-97-2]
- Phensuximide**, optical properties, **52.024, 52.025** [86-34-0]
- Phenyl salicylate**, acetophenetidin, and acetylsalicylic acid, **37.036** [118-55-8]  
and acetophenetidin, **37.040, 37.041**
- 1-(Phenylazo)-2-naphthol**, purification, **43.091(i)**
- Phenylbutazone**, optical properties, **52.024, 52.025** [50-33-9]
- Phenylephrine hydrochloride**, in drugs, **38.111, 38.187-38.200** [61-76-7]
- Phenylhydrazine solution**, **19.086, 42.100(c)**
- Phenylhydrazine hydrochloride solution**, **42.075(a)**
- Phenylmercuric chloride**, mercury in, **36.079** [100-56-1]
- Phenylpropanolamine**, microchemical test, **36.100** [492-41-1]
- Phenylpropanolamine hydrochloride**, in drugs, **38.111, 38.201-38.210** [4345-16-8]  
optical properties, **52.024, 52.025**
- Phenylpropylmethylamine**, in drugs, **38.181** [93-88-9]  
optical properties, **52.024, 52.025**
- Phloxine B**, analysis, **34.015(c)** [4618-23-9]
- Phorate**, in pesticides, **6.415** [298-02-2]
- Phosdrin**, residues in foods, **29.055** [298-01-1]
- Phosphatase**, in butter and margarine, **16.230**  
in cheese, **16.275, 16.278**  
cream, **16.127, 16.162-16.165**  
ice cream and frozen desserts, **16.300**  
milk, **16.115-16.130**
- Phosphate**, in baking powders and baking chemicals, **8.034**  
standard solution, **2.022(b)**  
buffer, **50.007(d), 50.007(e)**  
See also Phosphorus

- Scopolamine**, microchemical test, 36.095 [51-34-3]
- Scopolamine hydrobromide**, optical properties, [114-49-8]  
52.024, 52.025
- Scraper**, for thin layer chromatography plates, 26.076(b)
- Scrubber trap**, for ammonia distillation, 39.104(d)
- SDA (Specially denatured alcohols)**, xv (item 2)
- Seafoods**. *See* Fish and other marine products; specific product
- Secobarbital**, microchemical test, 36.098 [76-73-3]  
optical properties, 52.024, 52.025
- Secobarbital sodium**, and amobarbital sodium, [309-43-3]  
37.068  
optical properties, 52.024, 52.025
- Seconal**. *See* Secobarbital
- Sediment**. *See* Chapter 44, Extraneous materials: isolation
- Sedormid (Apronalide)**, in drugs, 37.098 [528-92-7]
- Seed disinfectants**, formaldehyde in, 6.351  
organic mercurial, 6.130–6.138
- Seeds**, foreign, in malt, 10.101  
in berry fruits, 22.023  
hops, 10.147(d)  
mercury in, 25.117  
protein in, 14.068  
weed, as standards for animal feed microscopy, 7.126(b)
- Seitz filter**, 46.046(b)
- Selenite cystine broth**, 46.054(b)
- Selenium**, as residue in foods, 25.126, 25.130 [7782-49-2]  
in plants, 3.096, 3.097
- Self-rising flour**, calcium in, 14.014  
carbon dioxide in, 14.017  
enriched, iron in, 14.011  
original ash in, 14.009
- Semolina**, carotene and carotenoids in, 14.156  
filth in, 44.043, 44.044
- Separation of color additives**, 34.001–34.014
- Sesame oil**, Villavecchia test, 28.118 [8008-74-0]
- Sevin**. *See* Carbaryl
- S-F agar**, 4.037(f)
- Shaffer-Somogyi**, sugar-thiosulfate equivalents, table, 31.063
- Shaffer-Somogyi carbonate 50 reagent**, 31.052(a)
- Shaffer-Somogyi dextrose-thiosulfate equivalents**, table, 31.053
- Shaffer-Somogyi method**, for glucose, 31.052
- Shaker**, wrist-action, 38.092(b)
- Shaw dispenser**, 42.198(c)
- Shaw-Eckles table**, for total solids in milk, 52.022
- Shell**, in cacao products, 13.012–13.026  
in canned seafood, 44.068, 44.070
- Shellac**, in confectionery, 31.105 [9000-59-3]
- Shellfish**, paralytic shellfish poison in, 18.079  
*See also* Fish and other marine products; specific product
- Shellfish growing waters**, fecal coliforms and *E. coli* in, 46.117
- Shellfish poison**, paralytic, bioassay, 18.079  
safety aspects, 18.079
- Shortenings**, glycerides in, 28.143, 28.148  
isolated *trans* isomers in, 28.075
- Shrimp**, arsenic in, 25.008(e)  
canned, filth in, 44.072  
frozen, drained weight, 18.016  
in shrimp cocktail, 18.020  
indole in, 18.072, 18.075
- Sichert-Bleyer modification**, of Steinhoff method, for glucose, 31.222  
in cacao products, 13.053
- Sieve designations**, xv (item 16)
- Sigma value method**, for foam collapse rate of beer, 10.051
- Sigmodal**, optical properties, 52.024, 52.025 [1216-40-6]
- Silage**, carotenes in, 43.014, 43.018  
DDT residues in, 29.097  
nitrate and nitrite nitrogen in, 7.041  
pesticide residues on, 29.001–29.028
- Silanes**, precaution, 43.231

- Silica**, in face powders, 35.053 [7631-86-9]  
 in liming materials, 1.017  
 plants, 3.005  
 water, 13.077
- Silica gel**, for column chromatography, 26.015(g)(2), 26.027(a), 26.071(b) [7699-41-4]  
 for thin layer chromatography, 26.002(d), 26.027(b), 26.098(b)  
 water in, 28.134
- Silicate**, base-exchange, 43.024(e)
- Siliceous earth**, purification, 36.002
- Silicic acid**, column, standardized, 18.057 [7699-41-4]  
 silicon dioxide in, 19.018(a)  
 test for suitability and standardization of column, 14.098(b)
- Silicon**, in liming materials, 1.041 [7440-21-3]  
**Silicon dioxide**, in silicic acid for chromatography, 19.018(a) [7631-86-9]
- Silicone grease**, high vacuum, 11.059(e)
- Silver**, in drugs, 36.092, 36.093 [7440-22-4]  
 in waters and wastes, 33.089
- Silver diethyldithiocarbamate**, preparation, 25.006(l)
- Silver iodate**, precautions, 51.077
- Silver nitrate**, precautions, 51.076  
 purification, 50.002(a)  
 solution, ammoniacal, 36.095(a)  
 precautions, 51.044  
 standard, 6.220(b), 6.285(c), 11.030(d), 50.027
- Silver nitrate-acetic acid standard solution**, 6.298(b)
- Silver nitrite**, preparation, 14.037(c)
- Silver number**, for detection of coconut and palm kernel oils, 13.043
- Silver proteinates**, in drugs, 36.092, 36.093
- Silver ribbon**, 47.009(d)
- Silver wire**, 47.009(d)
- Silver wire electrode**, preparation, 29.050(b)
- Silver-ammonium hydroxide solution**, 24.039(b)
- Silylating mixture**, 19.138(a)
- Simazine**, in pesticides, 6.431 [122-34-9]
- Simmon's citrate agar**, 46.054(j)  
 test for salmonellae, 46.062(d)
- Siphon**, 20.117
- Sirups**, brewing, 10.155–10.168  
 corn, 31.205–31.236  
 high fructose, in honey, 31.148, 31.150  
 ethylmorphine in, 38.015  
 filth in, 44.094  
 hypophosphites in, 36.064, 36.065  
 malt, diastatic power, 10.160  
 maple, 31.161  
 morphine in, 38.019  
 quaternary ammonium compounds in, 20.084  
 sugar, 31.001–31.063
- $\beta$ -Sitosterol**, in butter oil, 28.093 [83-46-5]  
 **$\beta$ -Sitosterol acetate**, in butterfat, 28.089
- Skellysolve B**, purification, 3.029(o)
- Skim milk**, dry, ash, 16.197  
 lactic acid in, 16.027
- Skimmer**, 18.014
- Slag**, basic, mechanical analysis, 2.008  
 calcium silicate, 1.012, 1.013  
 sulfide sulfur in, 1.013  
 phosphorus in, 2.020
- Snyder column**, 20.168(c), 29.005(g), 29.088(b)
- Soap**, 6.123, 6.124  
 emulsions with mineral oil, 6.125–6.129  
 in mineral oil-soap emulsions, 6.127
- Soda beverages**, benzoate, caffeine, and saccharin in, 12.050
- Soda lye**, carbonate and hydroxide in, 5.019 [1310-73-2]
- Sodium**, emission spectrographic method, 49.001–49.007 [7440-23-5]  
 in anhydrous methyl alcohol, 20.147(c)  
 baking powders and baking chemicals, 8.030  
 chloramine T, 6.120  
 electrolyte replenishers, 36.055  
 fertilizers, 2.147  
 fish and other marine products, 18.038  
 fruits and fruit products, 22.034  
 low-sodium food, 43.220  
 plants, 3.019, 3.020, 3.027, 49.001–49.007  
 soap, 6.124  
 spirits, 9.026  
 waters and wastes, 33.107  
 wines, 11.026  
 safety aspects, 51.034
- Sodium acetate**, in color additives, 34.099 [6131-90-3]  
**Sodium acetate buffer solutions**. See Buffer solutions, acetate
- Sodium acid pyrophosphate**, neutralizing value, 8.010 [7758-16-9]
- Sodium alizarin sulfonate indicator**, 6.023(a), 47.018(a)
- Sodium aluminum phosphate**, neutralizing value, 8.011 [7785-88-8]
- Sodium amobarbital**, and sodium secobarbital, 37.068 [64-43-7]
- Sodium benzoate**. See Benzoic acid
- Sodium bicarbonate solution**, alcoholic, 26.098(e)  
 methanolic, 26.098(d)  
 standard, 11.058(a)
- Sodium biphenyl**, precautions, 51.038  
 reagent, preparation, 6.178(b)
- Sodium bisulfite standard solution**, 32.063(c)
- Sodium borate buffers**. See Buffer solutions, borate
- Sodium bromide**, in bromide elixirs, 36.061, 36.063 [7647-15-6]
- Sodium butabarbital**, in tablets, 37.085 [143-81-7]
- Sodium cacodylate**, arsenic in, 36.043 [124-65-2]
- Sodium carbonate**, for standardization of hydrochloric acid, 50.016 [5968-11-6]  
 in soda lye, 5.019  
 saturated solution, 9.098(b)
- Sodium carbonate, anhydrous**, preparation of standard, 50.016(c) [497-19-8]
- Sodium carbonate fusion**, of agricultural liming material residues from acid digestion, 1.017
- Sodium chloride**, 33.138–33.150 [7647-14-5]  
 in acid and basic dyes, 34.095, 34.096  
 ash of macaroni, egg noodles, and similar products, 14.137  
 butter and margarine, 16.208, 16.209  
 canned foods, 32.023–32.030  
 cheese, 24.011  
 eggs and egg products, 17.025–17.027  
 fish and other marine products, 18.034–18.037, 24.011  
 meat and meat products, 24.010, 24.011  
 nuts and nut products, 27.012  
 standard solution, 6.220(a), 32.027(c)
- Sodium cyanide**, in pesticides, 6.100–6.102 [143-33-9]
- Sodium cyclamate**, in beverages, 20.163 [139-05-9]  
 in fruit products, 20.164, 20.168
- Sodium 5-(1-cyclohexen-1-yl)-1,5-dimethylbarbiturate (Hexobarbital sodium)**, microchemical test, 36.098
- Sodium diphenylhydantoin**, in capsules, 37.089 [630-93-3]
- Sodium dithionite solution**, 6.334(a)
- Sodium ethylate**, precautions, 51.038  
 standard solution, 17.034(b)
- Sodium ethylenediamine tetraacetate solution**, 16.064(b)
- Sodium 5-ethyl-5-(1-methylbutyl) barbiturate (Sodium pentobarbital)**, microchemical test, 36.098  
 optical properties, 52.024, 52.025 [518-47-8]
- Sodium fluorescein**, in drugs, 39.145 [16893-85-9]
- Sodium fluosilicate**, fluorine in, 6.019  
 in pesticides, 6.025
- Sodium halides**, in halogenated fluorescein colors, 34.098
- Sodium hydroxide**, in soda lye, 5.019 [1310-73-2]  
 in sodium hypochlorite solutions, 6.115  
 precautions, 51.037  
 solution, alcoholic, 6.169(d)  
 carbonate-free, 11.058(c)  
 alcoholic, 17.014(b)  
 methanolic, 28.055(b)  
 preparation of various strengths, table, 50.034  
 standard, 6.348(b), 7.118(c), 50.032
- Sodium hypochlorite**, in sodium hypochlorite solutions, 6.111 [7681-52-9]
- Sodium  $\beta$ -hydroxybutyrate solution**, standard, 17.036(f)
- Sodium hypobromite solution**, 25.006(b)
- Sodium hypochlorite solution**, 17.020(f), 24.030(b), 25.120(e), 44.006(b)  
 analysis, 6.111–6.116  
 carbon dioxide in, 6.116  
 chlorine in, 6.113, 6.114  
 sodium hydroxide in, 6.115
- Sodium lauryl sulfate**, in egg products, 20.131 [151-21-3]  
 purity determination, 20.131(h)
- Sodium methoxide solution**, 28.068(c)
- Sodium methylate**, precautions, 51.038 [124-41-4]  
 standard solution, 6.150(c), 29.099(e)
- Sodium nitrate**, potassium in, 2.088, 2.089 [7631-99-4]  
 solution, alcoholic, 38.073(b)  
 standard, 6.389(d)

- Sodium o-nitrosocresol solution**, 3.029(r)  
**Sodium oleate solution**, 25.095(k)  
**Sodium pentobarbital**, microchemical test, 36.098 [57-33-0]  
     optical properties, 52.024, 52.025  
**Sodium perborate**, in cold wave neutralizers, 35.059 [7632-04-4]  
**Sodium peroxide**, precautions, 51.035 [1313-60-6]  
**Sodium saccharin**, in nonalcoholic beverages, 20.157 [6155-57-3]  
**Sodium salicylate**, and acetanilid, 37.026 [54-21-7]  
**Sodium 5-sec-butyl-5-ethylbarbiturate (Butabarbital sodium)**, micro-chemical test, 36.098  
     optical properties, 52.024, 52.025  
**Sodium secobarbital**, and sodium amobarbital, 37.068 [309-43-3]  
**Sodium sulfapyridine monohydrate**, microchemical test, 36.102 [6101-41-3]  
     optical properties, 52.024, 52.025  
**Sodium sulfate**, anhydrous, 41.031(i) [7757-82-6]  
     in color additives, 34.097  
     saturated solution, 26.091(c)  
**Sodium tetrachloromercurate**, 20.109(c)  
     precautions, 51.079  
**Sodium tetraphenylboron (STPB) solution**, standardization, 2.103(b)  
**Sodium thiosulfate solution**, standard, 10.118(d), 14.042(i), 50.037 [7772-98-7]  
     sterile, 4.038(a)  
**Sodium trichloroacetate**, in herbicides, 6.312 [650-51-1]  
**Sodium warfarin**, in drugs, 37.144 [129-06-6]  
**Soft drinks**, benzoic acid in, 20.021  
     *Geotrichum* mold in, 44.005  
**Soil**, in canned greens and broccoli, 44.114  
     in frozen fruits and vegetables, 44.091  
     frozen spinach, 44.111  
     sample preparation for pesticide residue analysis, 29.013

     yogurt, 20.102  
**Sorbitol**, in foods, 20.151 [50-70-4]  
     in fruit juices, 22.080  
**Sorbose**, in sugars and sirups, 31.063 [3615-39-2]  
**Sorensen method**, for amino nitrogen in meat, 24.046  
**Sour cream**, filth in, 44.020  
     sorbic acid in, 20.102  
**Soxhlet extractor**, 44.174(a)  
**Soxhlet modification**, of Fehling solution (Soxhlet solution), 31.034  
     factors for Lane-Eynon method, table, 52.017, 52.018  
**Soybean flour**, 14.084–14.089  
     filth in, 44.048–44.050  
     in meat products, 24.048  
     uncooked cereal products, 14.060  
**Soybeans**, aflatoxin in, 26.069  
**Spaghetti**, canned, mold in, 44.102  
**Sparteine**, microchemical test, 36.095 [90-39-1]  
**Spearmint extract**, 19.117–19.121  
**Specially denatured alcohols**, xv (item 2)  
**Species identification**, fish, 18.086–18.098  
**Specific conductance**, of waters and wastes, 33.002  
**Specific gravity**, apparent, of sucrose solutions, table (surplus), 43.006 (10th ed.)  
     at various temperatures, corresponding to percentages of volume of ethyl alcohol, table, 52.003  
     of beer, 10.016  
     cordials and liqueurs, 9.105  
     corn grits extract, 10.140  
     fats and oils, 28.003  
     lemon and orange oils, 19.078  
     lemon extracts and flavors, 19.053  
     lime extracts and flavors, 19.053  
     methyl and ethyl alcohol solutions, table, 9.090  
     milk, 16.021  
         correction table, 52.023  
         Quévenne lactometer, 16.033  
         table for determining total solids, 52.022  
     molasses, 31.010(b)  
     nonalcoholic beverages and concentrates, 12.002  
     oils and fats, 28.003  
     orange extracts and flavors, 19.053  
     spirits, 9.009  
     sucrose solutions, table, 52.008, 52.020, 52.021  
     sugar sirups, 31.010(a)  
     sugar solutions, tables, 52.008, 52.009  
     tomato products, canned, 32.017  
     vanilla extract and substitutes, 19.003  
     volatile oil, of spices, 30.022  
     water, 33.001  
     wines, 11.002  
     wort, 10.108(d), 10.170  
**Specific gravity method**, for standardization of sulfuric acid, 50.041  
**Spectinomycin**, in feeds, 42.283  
**Spectrographic methods**, emission, for metals, Chapter 49  
**Spectrophotometer**, calibration, 26.004(a)  
     standardization, xvi (item 23e)  
**Spectrophotometric absorbance characteristics**, of lemon and orange oils, 19.081  
**Spectroscopic methods**, emission, for metals, Chapter 49  
**Spekker acid**, 7.104(c)  
**Spice oleoresins**, ethylene dichloride and trichloroethylene in, 20.192  
**Spicer-Edwards flagellar (H) test tube test**, for *Salmonella*, 46.067  
**Spicer-Edwards *Salmonella* flagellar (H) antisera**, 46.055(k)  
     reactions, table, 46.055(k)  
     screening test, 46.060(b)  
**Spices and other condiments**, Chapter 30  
     extraneous materials in, 44.119–44.158  
     whole spices, filth in, 44.141

- Spinach**, carbaryl residues on, **29.087**  
 DDT residues on, **29.097**  
 ethylenethiourea residues on, **29.112**  
 frozen, solids in, **32.053**  
 nicotine residues on, **29.154**  
 pesticide residues on, **29.001–29.028**  
 pureed, filth in, **44.104**
- Spiral plate method**, for bacterial count of foods and cosmetics, **46.110**
- Spiral vessel count**, for shell in cacao products, **13.015**
- Spirits**, distilled, **9.001–9.103**
- Spirits of camphor**, **39.077**
- Sporicidal test**, for disinfectants, **4.015**
- Sporulation broth**, **46.033(f)**
- Spraying chromatograms**, precautions, **51.017**
- Sprays**, livestock or fly, thiocyanate nitrogen in, **6.423**
- Squalene**, in fats and oils, **28.082** [111-02-4]
- Squash**, DDT residues on, **29.097**  
 pesticide residues on, **29.001–29.028**  
 pureed, filth in, **44.104**
- Stabilizer solutions**, for filth analysis, **44.003(gg)**
- Staining solution**, Thiazine Red R, **46.079(f)**
- Standard solutions and materials**, Chapter 50
- Staphylococcal enterotoxin**, in food, **46.077**
- Staphylococci**, hemolytic, in eggs and egg products, **46.010**  
 in food, **46.013**
- Staphylococcus aureus**, as test organism, **4.005, 4.010, 4.012(d), 4.023(g), 4.033, 4.051(b)**  
 in food, most probable number, **46.017**  
 surface plating method, **46.075**
- Staphylococcus epidermidis**, preparation of test culture, **42.199(f)**
- Starch**, filth in, **44.053**  
 in baking powders and baking chemicals, **8.019, 8.020**  
 beer, **10.044**  
 cacao products, **13.056, 13.057**  
 cereals and cereal products, **14.075, 14.081**  
 coffee, roasted, **15.031**  
 condensed or dried milk products, **7.084**  
 confectionery, **31.100**  
 dessert powders, **23.022**  
 dressings for foods, **30.060**  
 dry mustard, **30.016**  
 face powders, **35.054**  
 feeds, **7.080–7.084**  
 flour, **14.031**  
 fruits and fruit products, **22.087**  
 grain and grain products, **14.075, 14.081**  
 meat products, **24.057**  
 peanut butter, **27.016**  
 plants, **3.120**  
 prepared mustard, **30.040**  
 spices and other condiments, **30.014–30.016**  
 stock feeds, **14.075**  
 Lintner, **10.118(g)**  
 potato, hydrolyzed, **18.087(c)**  
 unconverted, in beer, iodine reaction for, **10.044**  
 in brewing sugars and sirups, **10.161**  
 wort, **10.174**
- Starch conversion products**, **31.205–31.236**
- Starch dessert powders**, **23.017–23.022**
- Starch gel-zone electrophoresis**, for identification of fish species, **18.086**
- Starch indicator**, **6.005(f), 10.118(h), 24.057(f), 28.140(b), 28.144(f), 31.052(d), 32.065(g), 33.028(f), 38.153(b), 47.048(c)**  
*See also* Starch solution
- Starch iodide paper**, **6.389(e)**
- Starch solution**, **2.085(d), 2.144(b), 10.118(g), 14.075(k), 24.054(j), 31.156(e), 50.022**  
 chloride-free, **3.075(d)**  
 for diastatic power, **10.118(g)**
- Starch-potassium iodide solution**, **14.023(e)**
- Starchy flour**, in meat and meat products, **24.047**
- Steam distillation apparatus**, **6.024, 9.082, 12.047(a), 18.050(a), 18.072(e), 20.024(a), 20.084, 20.098, 32.062**
- Steam generator**, **12.025(a)**
- Stearic acid**, in face powders, **35.040** [57-11-4]
- Steffen waste and wash waters**, table, **31.028**

 meat extracts, 24.069, 24.070  
 wines, 11.069  
 precautions, 51.081  
 standard solution, 20.109(d)
- Sulfuric acid**, fluorine-free, 20.056(f) [7664-93-9]  
 fuming, 6.121  
 methanolic, 39.018(b), 39.025(a), 39.034(d)  
 precautions, 51.030, 51.069  
 preparation of various strength solutions, table, 50.039, 52.002

- Sulfuric acid** (*Contd*)  
 standard solution, 50.039
- Sulfurous acid**, in foods, 20.105–20.114 [7782-99-2]  
 in wines, 11.069
- Sulphenone**, residues in foods, 29.091 [80-00-2]
- Sunset Yellow**, in macaroni, egg noodles, and similar products, 14.154
- Sunset Yellow FCF**, analysis, 34.015(b) [2783-94-0]  
 separation, 34.005
- Suntan preparations**, amyl *p*-dimethylaminobenzoate in, 35.071
- Suppositories**, benzocaine in, 38.138  
 ergotamine in, 38.044(b)
- Surface water**, acidity, 33.009  
 alkalinity, 33.014  
 chemical oxygen demand, 33.034–33.040  
 chloride in, 33.067  
 mercury in, 33.095  
 metals in, 33.089  
 nitrogen in, 33.051–33.066  
 organic carbon in, 33.044  
 pH, 33.006  
 phosphorus in, 33.111, 33.116  
 potassium in, 33.103  
 sodium in, 33.107  
 specific conductance, 33.002  
 sulfate in, 33.120
- Surfactant**, anionic, 44.063(a)
- Surplus methods**, definition, xx (item 31)
- Suspensions**, of test organisms, for antibiotics in feeds, 42.199
- Sutan** (Butylate), in herbicides, 6.426
- Suture loop carriers**, 4.016(f)
- Sweep codistillation method**, for organophosphorus pesticide residues, 29.044
- Sweet potatoes**, pesticide residues on, 29.001–29.028
- Sweetened condensed milk**, 16.180–16.189  
 lactic acid in, 16.027
- Sweeteners**, artificial (nonnutritive), 20.157–20.188
- Swimming pools**, water disinfectants for, 4.036
- Sympathomimetic amines**, optical properties, 52.024, 52.025
- Sympathomimetics**, microchemical tests, 36.100
- dl*-Synephrine base** (Desoxyepinephrine), optical properties, 52.024, 52.025 [94-07-5]
- Synephrine hydrochloride**, optical properties, 52.024, 52.025 [5985-28-4]
- dl*-Synephrine (+) tartrate** (neutral salt), optical properties, 52.024, 52.025 [67-04-9]
- Synthetic broth**, 4.001(b)
- Synthetic drugs**, microchemical tests, 36.102
- Synthetic organic color additives**, 34.005–34.013, 34.015  
 in spirits, 9.005, 9.094
- Syrosingopine**, optical properties, 52.024, 52.025 [84-36-6]
- 2,4,5-T**, esters, volatility, 6.032
- Tables**, reference, Chapter 52  
 index, p. 885
- Tablets**, sampling, 36.003
- Tagathen** (Chlorothen citrate), optical properties, 52.024, 52.025
- Talbutal**, microchemical test, 36.098 [115-44-6]
- Talc**, absorbed formaldehyde in, 6.351 [14807-96-6]
- Tamales**, mold in, 44.102
- Tamarind pulp**, filth in, 44.154
- Tangerine juice**, recoverable oil in, 22.090
- Tangerine oil**, citral in, 19.129
- Tankage**, mechanical analysis, 2.008  
 minerals in, 2.111(b)
- Tannic acid**, purification, 6.166(b) [1401-55-4]
- Tannin**, in cloves and allspice, 30.018 [1401-55-4]  
 in spirits, 9.098  
 wines, 11.049
- Tannins**, in cacao products, extraction, 13.014(a)(2)
- Tarragon**, filth in, 44.121
- Tartaric acid**, in baking powders and baking chemicals, 8.013–8.018 [526-83-0]  
 in cheese, 16.258, 16.259  
 cordials and liqueurs, 9.121  
 fruits and fruit products, 22.063  
 nonalcoholic beverages and concentrates, 12.018  
 wines, 11.045, 11.046
- Tartrate powders**, free tartaric acid in, 8.014–8.018
- Tartrate solution**, alkaline, 2.082(a), 24.030(a), 24.057(d), 31.034(b)  
 standard buffer, 50.007(b)
- Tartrazine**, analysis, 34.015(b) [1934-21-0]
- in macaroni, egg noodles, and similar products, 14.154, 14.155  
 separation, 34.005
- TB broth base**, 4.048(a)(5)
- TDE** (DDD), residues, in foods, 29.001–29.028 [72-54-8]  
 in soil, 29.013
- Tea**, 15.037–15.058  
 copper and nickel in, 25.044  
 filth in, 44.012, 44.013  
 lead in, 25.095
- Tea seed oil**, in olive oil, 28.117
- TEMED** (*N,N,N',N'*-tetramethylethylenediamine), 18.090
- Temperature corrections**, for buret volumes, 50.001  
 for polarization of sugars, 31.022  
 refractive index of sucrose solutions, table, 52.010, 52.016  
 saccharometer readings, table, 52.010  
 specific gravity, of milk, 52.023  
 of oils, 28.005  
 volume of aqueous solutions, table, 50.001  
 Williams field test, table, 9.020
- Temperature of dissolution**, of cacao fat, 13.044  
 of oil from butter and margarine, 16.215
- TEPP** (Tetraethylpyrophosphate), in pesticides, 6.420
- Terbutryn**, in pesticides, 6.431 [886-50-0]
- Terpin hydrate and codeine elixir**, 38.009 [8030-43-1]
- Test cell**, for exposing flexible barrier materials, 21.011
- Testosterone**, optical properties, 52.024, 52.025 [58-22-0]
- Tetrabromofluorescein**, analysis, 34.015(c)
- Tetrachloroethylene**, in drugs, 36.013, 36.028 [127-18-4]
- Tetrachlorofluorescein**, analysis, 34.015(e)
- Tetrachlorofluorescein K**, analysis, 34.015(e)
- Tetrachlorofluorescein NA**, analysis, 34.015(e)
- Tetrachlorotetrabromofluorescein**, analysis, 34.015(c) [2134-15-8]
- Tetracycline hydrochloride**, optical properties, 52.024, 52.025 [64-75-5]
- Tetracycline trihydrate**, optical properties, 52.024, 52.025 [6416-04-2]
- Tetradifon**, residues in apples and cucumbers, 29.029 [116-29-0]
- O,O,O',O'*-Tetraethyl S,S'-methylene bis-phosphorodithioate** (Ethion), in pesticides, 6.352  
 residues in food, 29.001–29.024, 29.044
- Tetraethylpyrophosphate**, in pesticides, 6.420 [107-49-3]
- Tetrahydrofuran**, peroxide-free, 26.062(a) [109-99-9]
- 1,4,5,6-Tetrahydro-1-methyl-2-(*trans*-2-(2-thienyl)vinyl) pyrimidine tartrate** (Pyrantel tartrate), in feeds, 42.135
- Tetrahydroxyquinone** (THQ) sulfate indicator, 47.034(f), 47.040(f)
- N,N,N',N'*-Tetramethylethylenediamine** (TEMED), 18.090
- Tetramethylthiuram disulfide** (Thiram), in pesticides, 6.342  
 residues in food, 29.165
- Tetrasodium EDTA solution**, 44.003(ii)
- Tetrasul**, residues in apples and cucumbers, 29.029 [2227-13-6]
- Tetraphosphate broth**, 46.054(c)
- Tetroxalate standard buffer solution**, 50.007(a)
- Thallous sulfate**, in ant poisons and rodenticides, 6.140 [7446-18-6]
- Thawing frozen fruit**, 22.006
- Thawing frozen vegetables**, 32.052
- Thenyldiamine hydrochloride**, optical properties, 52.024, 52.025 [958-93-0]
- Thenylene hydrochloride** (Methapyrilene hydrochloride), in drugs, 38.111  
 optical properties, 52.024, 52.025
- Theobromine**, and phenobarbital, 37.082 [83-67-0]  
 in cacao products, 13.060  
 theobromine-calcium salicylate, 38.107, 38.108  
 microchemical test, 36.103
- Theophylline**, in solutions and tablets, 38.110 [58-55-9]  
 microchemical test, 36.103
- Thermal analysis**, for stereochemical composition of amphetamines, 38.128
- Thermal expansion**, of sucrose solutions, table, 52.021
- Thermionic detector**, potassium chloride, 29.008(d)
- Thermistor method**, for added water in milk, 16.100
- Thermocouple cleaning solution**, 16.106(c)
- Thermometer**, titer test, specifications, 28.012
- Thermophilic bacterial spores**, in sugars, 46.026
- Thiabendazole**, in feeds, 42.185, 42.188 [148-79-8]
- Thiamine**, bioassay, 43.194 [59-43-8]  
 chemical methods, 43.024–43.038
- Thiazides**, in drugs, 37.189
- Thiazine Red R staining solution**, 46.079(f)
- 2-(4-Thiazolyl)-benzimidazole** (Thiabendazole), in feeds, 42.185, 42.188
- Thimet** (Phorate), in pesticides, 6.415
- Thin layer chromatography**, apparatus, 29.006  
 plate scraper, 26.076(b)

- Thiobarbituric acid solution**, 20.099(c), 37.164(b)  
**2,2'-Thiobis(4,6-dichlorophenol) (Bithionol)**, in feeds, 42.041  
**Thiocarbamate herbicides**, 6.426  
**Thiochrome method**, for thiamine, 43.024–43.038  
**Thiocyanate**. *See also* Ammonium thiocyanate; Potassium thiocyanate  
**Thiocyanate solution**, ammonium or potassium, standard, 50.002  
**Thiocyanates**, organic, in livestock or fly sprays, 6.423  
**Thiocyanogen number**, of oils and fats, 28.024  
**Thioglycolate medium**, fluid, 4.001(d)(2)  
     modified, 4.015(a)(3)  
**Thioglycolates**, in cold permanent waves, 35.064, 35.065  
**Thiopental**, optical properties, 52.024, 52.025 [76-75-5]  
**Thiopropazate dihydrochloride**, optical properties, [146-28-1]  
     52.024, 52.025  
**Thiosalicylic acid solution**, 29.140(b)  
**Thiosulfate solution**, standard, 14.023(f), 31.040  
     *See also* Sodium thiosulfate solution  
**Thiosulfate sulfur**, in lime sulfur solutions and dry lime sulfur, 6.105  
**Thiouracil**, in drugs, 37.188 [141-90-2]  
**Thiourea**, as fruit preservative, 20.115–20.126 [62-56-6]  
     in frozen peaches, 20.121  
     orange peel, 20.123  
**Thiram**, in pesticides, 6.342 [137-26-8]  
     residues in food, 29.165  
**Thonzylamine hydrochloride**, in presence of APC, [63-56-9]  
     38.135  
     optical properties, 52.024, 52.025  
**Thorin indicator solution**, 47.043(f)  
**Thorium nitrate solution**, 25.052(l)  
     standard, 6.023(b), 47.018(c)  
**d/-Threo-2,2-dichloro-N-(β-hydroxy-α-(hydroxymethyl)-p-(methylsulfonyl) phenethyl) acetamide (Racephenicol)**, in feeds, 42.139, 42.140  
**Thrips**, in canned greens and broccoli, 44.113(b)  
**Thujone**, in cordials and liqueurs, 9.129 [546-80-5]  
**Thyme**, filth in, 44.119–44.123  
**Thyme extract**, essential oil in, 19.126  
**Thymol**, in drugs, 37.140–37.143 [89-83-8]  
**Thymol blue indicator**, 6.285(d), 16.222(e), 25.022(h), 25.040(e), 28.039(g), 34.081(g), 43.057(d)  
**Thymolphthalein indicator**, 6.150(i)  
**Tillam (Pebulate)**, in herbicides, 6.426  
**Tin**, as residue in foods, 25.131–25.138 [7440-31-5]  
     dibutyltin dilaurate, in feeds, 42.055  
     organic compounds, 6.436  
     removal from lead, 25.102  
**Tinctures**, quaternary ammonium compounds in, 20.082  
**Tiron solution**, 1.038(c)  
**Titan yellow**, indicator, 2.102(e)  
**Titanium**, as residue in cheese, 25.139 [7440-32-6]  
     in face powders, 35.046, 35.048, 35.049  
     liming materials, 1.018, 1.038  
**Titanium oxide**. *See* Titanium  
**Titanium trichloride standard solution**, 50.042  
**Titer test**, for fats and oils, 28.012  
**Titrate acidity**, of fruits and fruit products, 22.060, 22.061  
     *See also* Acidity  
**Titration factors**, for alkaloids, table, 38.002  
     for titanium trichloride, for synthetic organic color additives, table, 34.018  
**Tobacco and tobacco products**, 3.135–3.167  
     arsenic in, 25.008(e)  
     maleic hydrazide residues on, 29.129  
     nicotine, 6.175  
     normnicotine, 6.175  
**α-Tocopherol**, 43.087 [59-02-9]  
     in feeds and food, 43.088, 43.097  
     in pharmaceuticals, 43.097  
     nomenclature, 43.087  
**α-Tocopheryl acetate**, in foods and feeds, 43.088 [7695-91-2]  
     supplemental, in foods and feeds, 43.106  
**α-Tocopheryl succinate**, 43.106 [4345-03-3]  
**Toilet preparations**, 19.125–19.140  
**Tolazoline hydrochloride**, optical properties, 52.024, 52.025 [59-97-2]  
**Toluene**, dried, 18.031(b) [108-88-3]  
     in alcoholic products as denaturant, 5.012  
**4-Toluene-azo-2-naphthol-3-carboxylic acid**, in D&C Red Nos. 6 and 7, 34.080  
**Toluene-insoluble matter**, in color additives, 34.031  
**p-Toluenesulfonic acid solution**, 19.088(a)  
**Toluidine Maroon**, analysis, 34.015(e)  
**Toluidine Red**, analysis, 34.015(e) [12-12-0]  
     separation and identification, 34.009  
**Tomato products**, benzoic acid in, 20.019, 20.021  
     canned, calcium in, 32.020  
     extraneous materials in, 44.096–44.102  
     mold count of, 44.096, 44.102  
     sodium chloride in, 32.025  
     soluble solids in, 32.014  
     specific gravity, 32.017  
**Tomatoes**, DDT residues on, 29.097  
     pesticide residues on, 29.001–29.028  
     thiram residues on, 29.165  
**Toney Red**, analysis, 34.015(c) [85-86-9]  
**Total**. *See* specific constituent  
**Toxaphene**, as contaminant in pesticide formulations, [8001-35-2]  
     6.027  
**Toxic solvents**, precautions, 51.040  
**Toxins**, marine, 26.133  
     natural, Chapter 26  
**TPTZ (2,4,6-Tripyridyl-s-triazine) solution**, 9.040(d)  
**Tragacanth**, volatile acidity, 39.103 [9000-65-1]  
**Tranquilizers**, optical properties, 52.024, 52.025  
**Trans isomers**, of fatty acids, 28.075  
**Transfer loop**, for microbiological methods, 4.002(d)  
**Transmission, % T**, for standardization of culture suspensions, 4.026, 4.042  
**Transmittance**, definition, xvi (item 23d)  
**Trap flask**, Wildman, 44.002(i)(3)  
**Travers method**, modified, for fluorine, 6.021  
**Triamcinolone acetonide**, optical properties, 52.024, [76-25-5]  
     52.025  
**Triamcinolone diacetate**, optical properties, 52.024, [67-78-7]  
     52.025  
**Triazines**, in pesticides, 6.431  
**Tribasic lead acetate**, 22.073(b)  
**Trichloroacetic acid**, precautions, 51.082 [76-03-9]  
     solution, 20.138(e), 24.050(a), 42.033(d), 42.168(c)  
**1,1,1-Trichloro-2,2-bis(p-chlorophenyl)ethane**. *See* DDT  
**1,1,1-Trichloroethane**, purification, 38.099(a) [25323-89-1]  
**Trichloroethylene**, in drugs, 36.013, 36.029 [79-01-6]  
     in spice oleoresins, 20.192  
     residues in grain, 29.056  
**1,1,1-Trichloro-2-methyl-2-propanol (Chlorobutanol)**, in drugs, 36.018, 36.019  
**N-(Trichloromethylthio)-4-cyclohexene-1,2-dicarboximide (Captan)**, in fungicides, 6.215  
     residues on fruits and vegetables, 29.076  
**N-(Trichloromethylthio)phthalimide (Folpet)**, in pesticides, 6.294  
**2,4,5-Trichlorophenoxyacetic acid (2,4,5-T)**, esters, volatility, 6.032  
**Trichophyton interdigitale**, 4.018, 4.033  
**Trichophyton mentagrophytes**, as test organism, 4.018, 4.033  
**Trier**, for fertilizers, 2.001  
     for frozen fruit, 22.001(c)  
**Triethanolamine**, microchemical test, 36.102 [102-71-6]  
**Triethylamine**, purification, 38.006(a) [121-44-8]  
     safety aspects, 51.052  
     specifications, 38.051(a)  
**Triethylene glycol**, in tobacco, 3.147 [112-27-6]  
**Trifluoroacetic acid**, precautions, 51.082  
**α,α,α-Trifluoro-2,6-dinitro-N,N-dipropyl-p-toluidine (Trifluralin)**, in herbicides, 6.203, 6.209, 6.314 [1582-09-8]  
**Trifluralin**, in herbicides, 6.203, 6.209, 6.314  
**Triglycerides**, analysis, 28.133, 28.148  
**cis-2,4,5-Trimethoxy-1-propenylbenzene (β-Asarone)**, in wines, 11.081  
**Trimethylacetylhydrazide ammonium chloride (Girard reagent T)**, 39.001(c)  
**Trimethylamine nitrogen**, in fish and other marine products, 18.031  
**Trimethylchlorosilane**, 43.231(k)  
**2,2,4-Trimethylpentane**. *See* Isooctane  
**N,α,α-Trimethylphenethylamine sulfate**. *See* Mephentermine sulfate  
**Trimethylsilyl reagent**, 43.231(l)  
**Trional (Sulfonethylmethane)**, in drugs, 37.099  
**Tripelennamine citrate**, in drugs, 38.111 [6138-56-3]  
**Tripelennamine hydrochloride**, microchemical test, [154-69-8]  
     36.102  
     optical properties, 52.024, 52.025  
**2,3,5-Triphenyl tetrazolium chloride**, 4.051(c)  
**Triphenyltin compounds**, in pesticides, 6.436  
**Triple sugar iron agar (TSI)**, 46.054(g)  
**2,4,6-Tripyridyl-s-triazine (TPTZ) solution**, 9.040(d)  
**Tris (2-Amino-2-hydroxymethyl-1,3-propanediol)**, 18.090  
**Tri-Sil reagent**, 19.048(c)  
**Tristearin**, in foreign fats, in lard, 28.119 [555-43-1]  
**Trisulfapyrimidines**, 37.157

- Trithion (Carbophenothion)**, residues in foods, **29.039, 29.044**  
oxygen analog, residues in food, **29.039**
- Tritium**, in water, **48.005** [10028-17-8]
- Trolene**. *See* Ronnel
- Trypticase soy agar**, **4.037(b)**
- Trypticase soy broth**, with 10% sodium chloride, **46.013(f)**

- Tuberculocidal activity**, of disinfectants, **4.045, 4.048**
- Turbidity**, in beer, **10.010–10.015**
- Turbidity standard**, formazon, for beer, **10.010(c)**  
McFarland No. 1, **46.079(h)**
- Turmeric**, filth in, **44.121, 44.142**  
in macaroni, egg noodles, and similar products, **14.154**
- Turmeric paper**, **20.033(a)**
- Turnips and turnip greens**, canned, filth and aphids in, **44.112**  
pesticide residues on, **29.001–29.028, 29.058**
- Tylosin**, in feeds, **42.295** [1405-53-4]
- Tyrocidine hydrochloride**, optical properties, **52.024, 52.025**
- Ultraviolet absorbance characteristics**, of lemon and orange oils, **19.081**
- Ultraviolet radiation**, precautions, **51.016**
- Unconverted starch**, in beer, iodine reaction for, **10.044**  
in brewing sugars and sirups, **10.161**
- $\gamma$ -Undecalactone**, in cordials and liqueurs, **9.126** [104-67-6]  
in nonalcoholic beverages and concentrates, **12.030**
- Unfermentable reducing substances**, in molasses, **31.086**
- Unsaponifiable matter**, of cocoa butter, **13.040**  
of eggs and egg products, **17.017**  
fats and oils, **28.035**
- Unsaponifiable residue**, of fats and oils, **28.081**  
of mineral oil, **6.121**  
flour, **14.030**  
macaroni, egg noodles, and similar products, **14.146**
- Unsaturated fatty acids**, in fats and oils, **28.044**
- Unulfonated amines**, nonvolatile, in color additives, **34.045**
- Unulfonated residue**, of mineral oil-soap emulsions, **6.128**
- Uranine**, analysis, **34.015(c)** [518-47-8]
- Uranine K**, analysis, **34.015(e)**
- Uranyl acetate**, method for sodium, in plants, **3.027**  
precautions, **51.083, 51.084**
- Urea**, in deodorants and antiperspirants, **35.038** [57-13-6]  
in feeds, **7.033, 7.035**  
fertilizers, **2.080**  
tests for, **44.160, 44.161**
- Urea broth**, **46.054(k)**
- Urea nitrogen**, in feeds, **7.033**
- Urea-formaldehyde compounds**, nitrogen activity index, **2.078**
- Urease mixture**, **44.160**
- Urease solution**, standardization, **2.080, 7.033(b)**
- Urease test**, for salmonellae, **46.060(a)**  
for urea, **44.160**
- Urease-bromothymol blue test**, for urea, **44.169**
- Uric acid**, in flour, **44.178** [69-93-2]  
in foods and containers, **44.183**
- Uricase solution**, **44.179(e)**
- Urine**, in cereal grains, **44.165–44.176**  
stains on foods and containers, **44.159–44.164**  
ultraviolet detection, **44.159, 44.168**
- Use-dilution method**, for disinfectants, **4.007–4.011**
- Vacuum operations**, safety aspects, **51.015**
- Vacuum pump**, **11.059(d)**
- Vacuum system**, calibration, **11.060**
- Vacuum tester**, **11.059(b)**
- Vacuum-desiccation methods**, for free water, in fertilizers, **2.013, 2.014**
- Valeric acid**, in bread, **14.099** [109-52-4]
- Valser's reagent**, **36.079(b)**
- Van Slyke method**, for amino nitrogen in meat, **24.045**
- Vanadomolybdate method**, for phosphorus, in fertilizers, **2.021, 2.043, 2.046(b), 2.052**  
automated, **2.032**
- Vanilla extract**, and its substitutes, **19.003–19.052**  
authentic, preparations, **19.038**
- Vanilla resins**, in vanilla extract, **19.032, 19.033**
- Vanillin**, ethyl vanillin, and coumarin, in vanilla extract and substitutes, **19.010–19.024** [121-33-5]  
spectrophotometric characteristics, **19.023**
- Vanishing cream**, **35.076–35.082**
- Vapor pressure osmometer**, **16.106(a)**
- Vapor pressure osmometric method**, for added water, in milk, **16.105**
- Veal infusion agar**, **46.006(d)**
- Vegetable drugs**, and their derivatives, nonalkaloidal, **39.059–39.103**
- Vegetable fats**, in butterfat, **28.085, 28.089**
- Vegetable flakes**, filth in, **44.121**
- Vegetable juices**, mold in, **44.106**  
vitamin C in, **43.056**
- Vegetable oils**, brominated, in carbonated beverages, **20.146**  
fish oil and marine animal oils in, **28.121**  
heated, non-elution materials of polymers and oxidation products of, **28.070**  
pesticide residues in, **29.001–29.028**
- Vegetable products**, microbiological examination, **46.013**  
processed, Chapter 32
- Vegetable tissues**, identification, in feeds, **7.127**
- Vegetables**, arsenic on, **25.006**  
canned, **32.001–32.042**  
mold in, **44.106**  
carbaryl residues on, **29.087**  
DDT residues on, **29.097**  
dichloro residues on, **29.103**  
dried, **32.043–32.049**  
ethylenethiourea residues on, **29.112**  
extraneous materials in, **44.096–44.118**  
frozen, **32.050–32.072**  
green, captan residues on, **29.076**  
Guthion residues on, **29.107**  
lead in, **25.095**  
malathion residues on, **29.128**  
maleic hydrazide residues in, **29.129**  
mercury in, **25.117**  
methoxychlor residues on, **29.137**  
monofluoroacetic acid residues on, **29.140, 29.142**  
naphthaleneacetic acid residues on, **29.149**  
nicotine residues on, **29.154**  
pesticide residues in, **29.001–29.034, 29.039–29.055, 29.058**  
piperonyl butoxide residues on, **29.161**  
thiram residues on, **29.165**  
*See also* specific product
- Vernam (Vernolate)**, in herbicides, **6.426**
- Vernolate**, in herbicides, **6.426** [1929-77-7]
- Vigreux column**, **29.005(h)**
- Villavecchia test**, for sesame oil, **28.118**
- Vinbarbital**, microchemical test, **36.098** [125-42-8]  
optical properties, **52.024, 52.025**
